2025 YILI ALMANAK ÖNSÖZÜ

“Safranbolu Başak Cengiz Mimarlık Fakültesi 2025 Yılı Yayın Kataloğu” başlığı altında hazırlanan bu çalışma, fakültemiz akademisyenlerinin bir yıl boyunca ortaya koyduğu bilimsel üretimi bir araya getirerek akademik çalışmalarımızın kapsamını ve çeşitliliğini ortaya koymaktadır. Makaleler, kitap bölümleri, bilimsel bildiriler ve kitaplar aracılığıyla ortaya konulan bu çalışmalar, fakültemizin bilgi üretimine sunduğu katkıları görünür kılmakta ve akademik birikimimizi gelecek yıllara taşıyan önemli bir kaynak niteliği taşımaktadır.

Köklü bir akademik geleneğe sahip olan fakültemiz, kıdemli akademisyenlerimizin deneyimi ile genç ve enerjik araştırmacılarımızın dinamizmini bir araya getiren güçlü bir akademik yapıya sahiptir. Üniversitemizin en köklü birimlerinden biri olan Safranbolu Başak Cengiz Mimarlık Fakültesi, bu birikim ve enerji sayesinde hem bilimsel üretim kapasitesini geliştirmekte hem de güncel araştırma alanlarını yakından takip ederek çağdaş ve yenilikçi (cutting-edge) çalışmalar ortaya koymaktadır.

Safranbolu gibi tarihî ve kültürel değeri yüksek bir kentte bulunmak, mimarlık eğitimi ve araştırmaları açısından fakültemize önemli bir avantaj sağlamaktadır. Dünya mirası niteliğindeki bu özgün çevre, öğrencilerimiz ve akademisyenlerimiz için hem ilham verici bir araştırma alanı hem de mimarlığın kuramsal ve uygulamalı yönlerinin birlikte ele alınabileceği zengin bir laboratuvar niteliği taşımaktadır.

Mimarlık disiplini doğası gereği birçok alanın kesişiminde yer almaktadır. Sanat, kültür ve toplum ile güçlü bağlara sahip olan mimarlık, aynı zamanda mühendislik ve teknik bilgiyle şekillenen çok yönlü bir meslektir. Tarih boyunca mimarlar arasında edebiyatla, müzikle ve farklı sanat dallarıyla ilgilenen pek çok isim bulunması, mimarlığın üretken ve sanatsal yönünü ortaya koymaktadır. Bununla birlikte mimarlık, güçlü bir teknik altyapı ve mühendislik bilgisi gerektiren disiplinler arası bir alanda yer alır. Fakültemizde yürütülen akademik çalışmalar da bu çok yönlü yapıyı yansıtarak mimarlığın sanatsal, sosyal ve teknik boyutlarını birlikte ele almaktadır.

Bu katalogda yer alan çalışmalar, fakültemizin bilimsel üretkenliğini ve akademik potansiyelini ortaya koyan önemli bir birikimi temsil etmektedir. Bu değerli çalışmalara katkı sunan tüm akademisyenlerimize teşekkür ediyor, bilim dünyasına sundukları katkılardan dolayı her birine şükranlarımı sunuyorum.

Safranbolu Başak Cengiz Mimarlık Fakültesi 2025 Yılı Yayın Kataloğunun fakültemizin akademik gelişimine katkı sağlamasını ve tüm okuyucular için yararlı bir kaynak olmasını temenni ederim.

Saygılarımla.

Prof. Dr. İsmail Rakıp KARAŞ

Sustainable Heritage Planning for Urban Mass Tourism and Rural Abandonment: An Integrated Approach to the Safranbolu–Amasra Eco-Cultural Route

Emre Karataş [1,*], Aysun Özköse [1] and Muhammet Ali Heyik [2]

[1] Department of Architecture, Karabük University, 78600 Karabük, Türkiye; aysunozkose@karabuk.edu.tr
[2] Department of Architecture, Yıldız Technical University, 34349 İstanbul, Türkiye; aheyik@yildiz.edu.tr
* Correspondence: emrekaratas@karabuk.edu.tr

Abstract: Urban mass tourism and rural depopulation increasingly threaten heritage sites worldwide, leading to socio-economic and environmental challenges. This study adopts a holistic approach to sustainable tourism planning by examining 84 cultural and natural heritage sites in and around Safranbolu and Amasra, two cities in Türkiye that are listed on the UNESCO World Heritage List and the Tentative List. Inspired by historical travelers' itineraries, it proposes an eco-cultural tourism route to create a resilient heritage network. A participatory methodology integrates charettes within Erasmus+ workshops, crowdsourcing, various analysis methods while engaging stakeholders, and AI-powered clustering for route determination. The study follows a four-stage framework: (1) data collection via collaborative GIS, (2) eco-cultural route development, (3) stakeholder participation for inclusivity and viability, and (4) assessments and recommendations. Results highlight the strong potential of heritage assets for sustainable tourism while identifying key conservation risks. Interviews and site analysis underscore critical challenges, including the absence of integrated site management strategies, insufficient capacity-building initiatives, and ineffective participatory mechanisms. Moreover, integrating GIS-based crowdsourcing, machine learning clustering, and multi-criteria decision-making can be an effective planning support system. In conclusion, this study enhances the sustainability of heritage and tourism by strengthening participatory eco-cultural development and mitigating mass tourism and abandonment's negative impacts on the heritage sites.

Keywords: heritage sites; sustainable tourism; eco-cultural rote; multi-criteria evaluation; participatory approach; mass tourism; rural abandonment; Safranbolu; Amasra

1. Introduction

Ecotourism integrates heritage conservation, local communities, and sustainable travel [1]. Eco-cultural routes and trails reinterpret pathways by embedding them with historical values, memories, narratives, and heritage, assigning them new meanings and significance [2].

Recent studies explore their role in heritage preservation through sustainable tourism. Zhang et al. (2025) highlight the role of eco-cultural networks in integrating cultural heritage and ecological resources within a sustainable network [3]. Lukoseviciute et al. (2024) develop a stakeholder-driven eco-cultural trail management strategy, balancing conservation and tourism [4]. Lin et al. (2024) provide a global review of cultural routes, analyzing 38 cases in terms of distribution, typology, planning, and tourism tools [5]. Trakala et al. (2023) map, assess, and propose eco-cultural tourism routes, estimating their

carrying capacity for sustainable area management [6]. Zhou and Zheng (2022) examine their role in connecting scattered villages and fostering a multicultural model for rural development [7].

This approach offers visitors the opportunity to engage with nature and culture in a sustainable manner, in alignment with the principles of ecotourism [4]. The development of tourism within routes in the context of natural and cultural values is often promoted by governments, non-profit organizations, and various international institutions such as ICOMOS, UNWTO, and the Council of Europe (COE). Such planning processes encompass a wide range of objectives, including the preservation and promotion of heritage, enhancing social interaction and collaboration, supporting sustainable development through culture, sports, arts, research, and education, developing unique tourism products, improving visitor experiences, and ensuring sustainability within heritage sites [8–12].

Around the world, there are tourism routes of various scales that embrace journey-based memories and narratives as their central theme. For example, Route 66 in the USA spans multiple states and reflects values associated with national identity [13]. The Santiago de Compostela Routes, one of the most significant pilgrimage paths for Christians since the Middle Ages, serve to connect countries across Western Europe [14]. There are also route examples that trace the journeys of historical travelers such as Marco Polo and Evliya Çelebi, who explored various parts of the world. Additionally, Stevenson's Path is a regional example in southern France, following the 220 km journey of traveler and writer Robert Louis Stevenson while referencing the concept of responsible tourism [15]. The Lycian Way is Türkiye's first long-distance heritage route, extending 760 km from Fethiye to Antalya. It is renowned for its wealth of ancient cities and the diverse natural landscapes of the Mediterranean region.

Conversely, the role in and impact of tourism on heritage sites have become increasingly prominent topics in scholarly debates over the past decades. Inhabited areas, in particular, have witnessed the adverse consequences of urban mass tourism, including the restriction of local residents' access to essential urban services, shifts in traditional lifestyles, declines in socio-economic well-being, and an increase in the displacement and depopulation of local communities. In cultural heritage sites, tourism may lead to physical degradation and cultural erosion due to profit-driven exploitation of urban spaces and heritage [16–18]. Moreover, the uncontrolled expansion of coastal tourism—fueled by large-scale projects, excessive urbanization, sprawling hotels, and marinas—poses significant threats to natural areas and fragile ecotonal systems. In particular, the coasts, which have long been exposed to the destructive impacts of mass tourism, are witnessing the irreversible degradation of their ecological habitats [19].

Urban areas are the largest contributors to climate change, accounting for 71% to 76% of global CO_2 emissions [20]. At the same time, they are among the most vulnerable regions, highly susceptible to the impacts of climate change, as well as to other crises, including wars, pandemics, and economic crises [20,21]. In 1960, 66% of the global population resided in rural areas, whereas by 2023, this figure had declined to 43% [22]. The decline in the rural population alongside the growth of the urban population weakens socio-economic resilience and adversely affects heritage sites in rural areas. In Türkiye, this demographic shift has been even more dramatic. According to World Bank data, while 68% of the population lived in rural areas in 1960, this figure had dropped to 23% by 2023 [23]. Due to rural abandonment, production has come to a complete halt in many settlements, leading to the loss of deeply rooted heritage sites [24,25].

The tourism sector in Türkiye has become increasingly significant in recent years. As of 2023, Türkiye ranked as the fifth most visited country globally. With over 76 million do-

mestic tourists, tourism emerges as a critical factor in balancing rural and urban population dynamics while contributing to the sustainable preservation of heritage sites [26].

The research focuses on the Western Black Sea region of Türkiye and specifically two significant historical towns: Safranbolu and Amasra. Safranbolu, situated in Karabük Province, is recognized as a UNESCO World Heritage Site for its well-preserved Ottoman architecture. Amasra, part of Bartın Province, is listed on the Tentative List of UNESCO World Heritage Sites under the title *"Trading Posts and Fortifications on Genoese Trade Routes from the Mediterranean to the Black Sea"*. Both towns have faced considerable challenges in tourism management and planning in recent years. UNESCO reports, and various studies indicate that, particularly during peak tourist seasons, visitor numbers exceed the towns' carrying capacities. This massive tourism leads to adverse effects on local communities, disrupts daily life, and poses significant threats to both cultural and natural heritage in the region [27–34]. The prolonged pressure of mass tourism has recently sparked debates over the reduction of protected site boundaries and non-sensitive urban plans, particularly concerning the preservation of cultural heritage [31]. On the other hand, migration and abandonment in the region's vast rural areas are irreversibly impacting heritage sites, socio-cultural memory, and collective consciousness in a negative manner [35]. The pandemic period clearly revealed how rural abandonment and dependence on mass tourism have rendered the region highly vulnerable.

Within the framework of the Western Black Sea Tourism Master Plan, the creation and promotion of thematic cultural routes have been identified as key strategies. Over the past five years, various initiatives have been introduced in Karabük and Bartın provinces to develop tourism routes aimed at extending visitor stays, diversifying tourism revenues, fostering branding, enhancing promotion, and supporting product development and planning efforts [36]. However, the unplanned development of mass tourism and the increasing abandonment of heritage sites highlight the urgent need for comprehensive planning to control tourism levels and mitigate their impacts. The pandemic, as a minor reflection of the climate crisis, has clearly demonstrated how rural abandonment and dependence on mass tourism have made the region highly vulnerable.

The study area encompasses the cities of Safranbolu and Amasra, along with the natural and cultural heritage surrounding 82 sites (Figure 1). This study introduces an eco-cultural route aimed at guiding tourism planning in the region to foster sustainable conservation and development. The proposed route integrates the journeys of five travelers who visited the region during the 19th and early 20th centuries. These travelers documented the region's significant natural and cultural assets, each from the perspective of their respective fields of study.

By promoting lesser-known and mostly abandoned vernacular landscapes, the proposed route supports sustainable tourism while preserving the cultural and natural heritage of the region. It fosters economic resilience, encourages the return of local communities, and mitigates the adverse effects of mass tourism in central heritage sites. Additionally, it adopts a participatory approach to route planning, ensuring a viable and inclusive tourism strategy that balances visitor distribution across multiple sites, thereby preventing over-tourism in significant destinations such as Safranbolu and Amasra. Building on participatory approaches to ecotourism in the region's collective memory, this study marks the initial phase of a broader agenda that is expected to inspire new research questions, interdisciplinary studies, and pilot projects in the future.

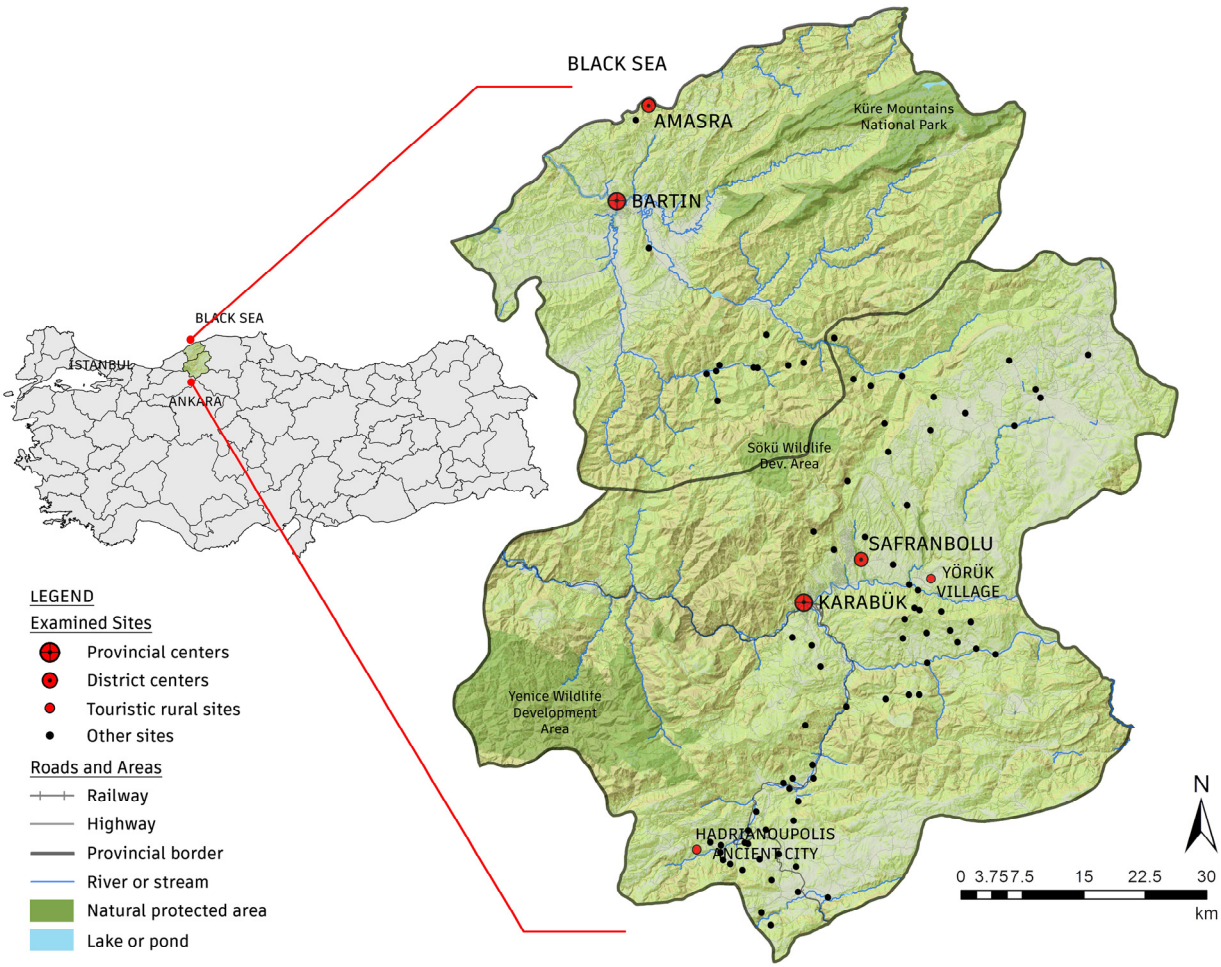

Figure 1. Examined sites in the research area.

Methodologies related to route proposals in the literature vary depending on their context and objectives. Unlike many qualitative studies, several researchers employ analytical techniques to develop or evaluate routes [37,38]. This study aims to fill a significant gap in the literature on tourism route planning in complex contexts by incorporating mixed data collection and analysis methods, including Geographic Information Systems (GIS), Analytic Hierarchy Process (AHP), clustering, SWOT analysis, charrette workshops, and interviews.

Furthermore, there is a gap in research addressing their systematic development planning in the early stages of route proposals and through participatory and data-driven methods within the context of heritage conservation in Türkiye and its Black Sea region [5]. This study seeks to bridge this gap by proposing an eco-cultural tourism route based on a replicable model that harnesses collective intelligence, historical narratives, and extensive site analysis. The study area offers a valuable opportunity to examine globally prevalent issues in heritage sites, such as rural abandonment and urban mass tourism.

2. Materials and Methods

This article focuses on the initial phase of developing a tourism route, emphasizing the capacity development of the sites and their integration into a cohesive and resilient route scenario. To achieve this, a heritage-based participatory strategy has been developed, aiming to preserve cultural and natural heritage, enhance the well-being of local communities, and promote sustainable development.

The methodology adopts an integrated approach, combining diverse data sources with insights from various stakeholder groups. It consists of four interrelated phases, characterized by participatory methods, as outlined below (Figure 2):

1. Data collection and analysis,
2. Development of the eco-cultural route proposal,
3. Stakeholder participation to ensure inclusivity and viability,
4. Overall assessment and policy recommendations.

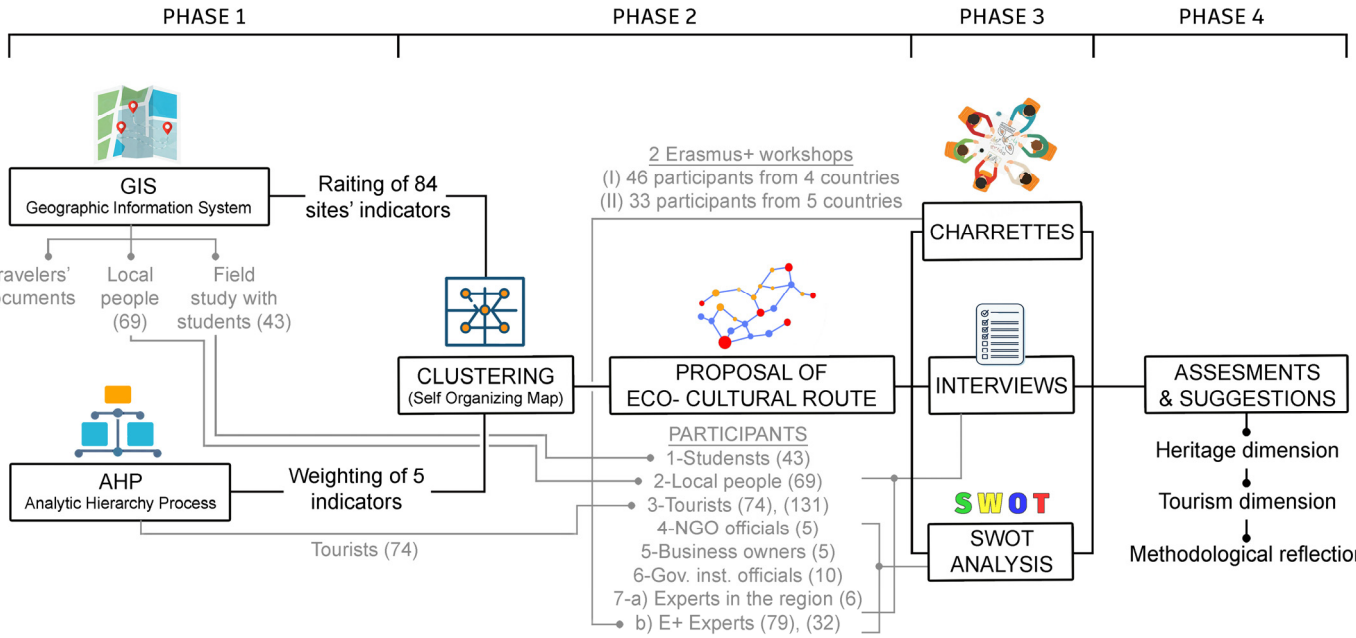

Figure 2. Methodological flowchart.

The methods employed and their benefits are outlined as follows:

- Geographic Information System (GIS): It facilitates data collection for 84 sites through crowdsourcing field studies, with sites' data being analyzed according to five indicators and ratings being assigned to each site's indicators.
- Analytic Hierarchy Process (AHP): The 5 indicators used in GIS analysis are weighted through surveys using the Saaty scale (1–9) to identify tourist preferences in the field.
- Clustering: Based on the normalized ratings for each site's 5 indicators obtained from GIS and the indicator weights obtained from AHP, the sites are clustered using Self-organizing Map (SOM), which is a neural network algorithm. According to their similar characteristics, site potential levels (high, medium, and low) are then determined.
- SWOT Analysis: A comprehensive analysis of internal and external factors regarding the proposed eco-cultural route with stakeholders, and data (strengths, weaknesses, opportunities, and threats) are obtained to develop strategies.
- Charrette: The data obtained through GIS, AHP, clustering, interviews, and SWOT analysis are evaluated using multidisciplinary workshops, the potential impacts of the eco-cultural route are discussed, and key strategies for planning are developed.

2.1. Data Collection

2.1.1. Documents of Historical Travelers

Before the Industrial Revolution, commercial activities, production infrastructure, military facilities, administrative units, and population centers were concentrated along the Silk Road. These routes also served as one of the most influential channels for cultural

exchange [39]. After the mid-17th century, Safranbolu emerged as one of the prominent settlements along the Istanbul-Tabriz branch of the Silk Road [40]. Although the region was close to important centers on the Silk Road in Asia Minor, it did not attract the attention of researchers and travelers until the 19th century, the late period of the Ottoman Empire. This part of Anatolia, which deeply impressed travelers with its picturesque appearance and untouched features, has been a focus of researchers and travelers from the first quarter of the 19th century to the beginning of the 20th century.

To plan the eco-cultural route, the travel routes of five travelers with sufficient data regarding their journeys are identified and analyzed. These investigations specifically provide insights into different perspectives on the local history, transportation, and socio-economic structure of the period by utilizing information, maps, and photographs (Figure 3). Ainsworth (1836) provided detailed information on geographical, geological, and archaeological values; Mordtmann (1856) on social and political structure; Anton (1893) on transportation routes, production methods, and archaeological values; Leonhard (1903) on geographical, geological, and archaeological values; and Woods (1906) on transportation routes, the condition of the roads, and social structure in that period [41–45].

(**a**) (**b**)

Figure 3. (**a**) A photograph by Woods documenting villagers in Zopran (1906) [45]. (**b**) The same location as (**a**) in Zopran Village, years later.

The works written by travelers in various languages were used to identify the historical traveler routes. The settlements mentioned in the travelers' writings and maps were cross-referenced with the field.

2.1.2. Field Study

The study examined 84 sites, incorporating historical traveler routes. A comprehensive range of tangible cultural heritage (TCH), intangible cultural heritage (ICH), natural heritage (NH), and other site-specific attributes were systematically identified and documented. Data collection employed a multi-source approach, incorporating written, printed, and electronic materials; official protected area designations and registration lists issued by governmental authorities [46,47]; direct field observations; and semi-structured interviews with local community members.

The documentation process was augmented by the participation of 43 students enrolled in conservation and restoration courses during the Fall and Spring semesters of 2023–2024. As part of the fieldwork, photographs of heritage assets were captured, and corresponding electronic data forms were systematically compiled (Figure 4). The incorporation of crowdsourced data collection methodologies further reinforces the study's broader research impact and participatory scope.

(**a**) (**b**)

Figure 4. (**a**) A field study conducted with students in a rural site. (**b**) A screenshot of the crowdsourcing (Fulcrum) app.

2.1.3. Stakeholders

The importance of stakeholder participation in sustainable tourism planning and the preservation of cultural heritage sites has long been recognized [48,49]. Recent meta-analysis of participatory design and planning practices indicates that stakeholder groups vary based on the context and participatory setting, with distinct empowerment levels such as informing, consulting, collaboration, and empowerment [50]. In studies on cultural routes and regional tourism planning, the formation of inclusive stakeholder groups is essential to ensure sustainable and contextually appropriate developments [25,51,52]. Accordingly, seven stakeholder groups were identified within the scope of this study: (1) students, (2) local people, (3) tourists, (4) NGOs, (5) business owners, (6) government institution officials, and (7) experts.

Semi-structured, face-to-face interviews were conducted with 69 residents across the study sites. The limited number of participants reflects the extensive depopulation observed in many villages, with certain settlements entirely devoid of residents. The interviews addressed key topics, including prominent cultural and natural heritage values, potential products for promotion, strategies for utilizing historic building stock, and site management approaches aimed at preserving local identity, supporting local production, encouraging reverse migration, and fostering sustainable development. Furthermore, the tourism potential of these settlements was examined. To ensure diverse perspectives, participants were encouraged to engage other community members during the interview process.

The field study was conducted with the participation of 43 university students studying in the field of cultural heritage conservation. The study also incorporated interviews with 131 tourists from the settlements of Safranbolu and Amasra; and 79 international experts participating through the Erasmus+ blended intensive program (2023–2024); 5 representatives from non-governmental organizations (NGOs) dedicated to the preservation of heritage and the promotion of regional tourism; 5 business stakeholders, including hotel, restaurant, and travel agency operators; 10 officials from government institutions directly engaged in heritage and tourism management; and 6 experts from universities in the region and museums specializing in heritage and tourism studies. A total of 348 individuals participated across different phases of the study—diagnosing problems, pooling ideas, deliberating solutions, and co-creation—thereby enhancing the depth, rigor, and comprehensiveness of the research.

This study was approved by the ethics committee of the author's institution (2023/04-30, 18 May 2023). Informed consent was obtained from all subjects involved

in the study. The authors informed all interviewees about the purpose of data collection and their rights.

2.2. Data Analysis

2.2.1. Data Management and Spatial Mapping at GIS

The literature indicates that geographic information systems (GIS) are widely used in similar studies focusing on route planning [25,53,54].

In this study, data pertaining to identified cultural and natural heritage values, along with other relevant parameters, were systematically archived within ArcMap 10.8, an integrated GIS platform and database designed to support comprehensive spatial analyses (Table S1).

Additionally, the Fulcrum mobile and web application [55] was used to obtain visual evidence and enter information about it. The crowdsourced, multi-layered field data collected through the mobile app not only supports the identification of endangered heritage assets but also provides a critical infrastructure for promoting their protection and registration by making this information openly accessible.

Indicators and parameters must be determined to analyze the study area and rate the sites. In particular, the identification of indicators is one of the most critical stages influencing the outcome. In the literature, indicators for tourism route development vary based on the route's context, theme, and objectives. However, studies focusing on cultural and natural heritages commonly categorize indicators under three main headings: (1) cultural and social, (2) natural and ecological, and (3) infrastructure and transportation [37,56,57].

In developing the indicators and parameters for this study, the primary objective was to achieve meaningful and reliable scoring outcomes. To this end, both stakeholder perspectives and the specific characteristics of the sites were considered. Each site was assigned a raw score for each indicator, ranging from 0 to 3, based on predefined parameters (Table 1).

1. Tangible Cultural Heritage (TCH): This indicator evaluates architectural and archaeological assets within the examined sites and their immediate surroundings. The assessment criteria include the presence of archaeological sites (AS) and urban sites (US), the integrity of heritage elements, and the number of monumental structures. Data from the Turkish Ministry of Culture and Tourism database [46] and observations from fieldwork were used to inform this evaluation;
2. Intangible Cultural Heritage (ICH): This indicator encompasses belief and celebration rituals, traditional games, music, literature, cuisine, artisanal crafts, production methods, and trade culture. The identification of ICH relied not only on printed sources but also heavily on interviews conducted with local residents. The applicability and current influence of heritage elements were key criteria for determining appropriate parameters. Additionally, ICH provides valuable insights into the social dynamics and cultural activities present at each site;
3. Natural Heritage (NH): This indicator evaluates Natural Sites (NS), Wildlife Development Areas (WDA), Nature Parks (NP), Registered Caves (RC), potential conservation areas, and sustainable habitats. The identification of NS, WDA, NP, and RC, which are designated according to national legislation, was based on data from the Ministry of Environment, Urbanization, and Climate Change and the Ministry of Agriculture and Forestry [47,58]. Potential conservation areas and sustainable habitats were assessed through consultations with experts. Urban areas lacking nature conservation zones and habitats degraded by activities such as mining or quarrying were assigned a rating of "0";
4. Accessibility to Basic Services (ABS): Three key services were identified as significantly contributing to the assessment of the examined sites: sale of basic goods (SBG),

indicating the availability of essential items such as food, healthcare products, and hygiene goods; settings for social interaction (SSI), referring to spaces that facilitate social engagement, such as museums, exhibition halls, traditional coffee houses, and village meeting rooms; and accessibility to public transport (APT), defined by the presence of public transportation access points within 3 km of the site. For each of these services—SBG, SSI, and APT—1 point was added to the overall rating.

5. Connectivity with Attraction Centers (CAC): CAC measures the connectivity of sites to existing tourist destinations and major population centers. The identified attraction centers within the study area include Safranbolu, Amasra, Yörük, Hadrianoupolis, Karabük, and Bartın. To determine the appropriate parameter for each site, the average distance to the three nearest attraction centers was calculated. Ratings were assigned based on 15 km intervals, as shown in Table 1.

Table 1. Indicators and parameters used for the evaluation of sites.

Indicators	Parameters	Rating
Tangible Cultural Heritage (TCH)	Values forming a fabric or presence of a protected site or multiple monuments	3
	Values forming a group or presence of a monument	2
	Preservation of some examples of values	1
	Authenticity is vastly degraded, or value is not detected	0
Intangible Cultural Heritage (ICH)	The value creates regional attractiveness	3
	The value creates local attractiveness	2
	The value only exists in memory	1
	Not enabling to identify value (due to abandonment, etc.)	0
Natural Heritage (NH)	Presence of protected site/area/registered cave	3
	Presence of a potential protected site/area/registered cave	2
	The presence of sustained natural habitat	1
	Irreversible degradation of natural values	0
Accessibility to Basic Services (ABS)	Three of the specified basic services can be provided	3
	Two of the specified basic services can be provided	2
	One of the specified basic services can be provided	1
	Lack of specified basic services	0
Connectivity with Attraction Centers (CAC)	Avg. of 0–15 km from the 3 nearest specified centers	3
	Avg. of 15.1–30 km from the 3 nearest specified centers	2
	Avg. of 30.1–45 km from the 3 nearest specified centers	1
	An average of at least 45 km	0

2.2.2. Multi-Criteria Decision-Making with AHP

Data used in decision-making processes for heritage and tourism management often contain qualitative evaluations. In such cases, it becomes essential for decision-makers to quantitatively assess which components best serve their objectives. The Analytic Hierarchy Process (AHP) is a multi-criteria decision-making method designed to quantitatively prioritize criteria through pairwise comparisons. The hierarchical structure established among indicators facilitates decision-making in complex problems, providing AHP to evaluate and rank alternatives [59].

- The AHP-based route assessment consists of two main stages: (1) identification of indicators and parameters, and (2) weighting of indicators according to tourist preferences.

- The AHP indicators must be consistent with the indicators used in site analysis to ensure the connection between site characteristics and tourist preferences. Identification of indicators and parameters was based on a combination of literature review, context, and expert evaluations (Table 1).
- A type of survey was presented to tourists, created using the Saaty scale (1–9) [59], based on the comparisons of the 5 indicators (TCH, ICH, NH, ABS, CAC) with each other. As a result of comparing the indicators in pairs, a decision matrix was created according to tourist preferences in the region, and indicator weights were determined (Section 4.2).

2.2.3. Clustering

In the literature, clustering techniques have been widely used to support tourism route planning and sustainable development strategies. Examples include the identification of landscape classes using IsoCluster [60], the proposal of tourism routes through hierarchical clustering [61], and the classification of socio-ecological systems in traditional villages to develop conservation and development strategies [62].

The Self-Organizing Map (SOM) is an artificial neural network algorithm that visualizes data on a two-dimensional map, clustering data points with similar characteristics close together while positioning dissimilar elements farther apart, thereby revealing relational structures [63]. This study provides a comprehensive decision-making framework for eco-cultural tourism route planning by integrating GIS analyses and the systematic prioritization of AHP with the neural network capabilities of SOM.

The normalized ratings of each indicator based on GIS data and the indicator weights from AHP Stage 2 were incorporated as priority values in the SOM-Ward clustering method, enabling a robust assessment of site potential for each indicator. By combining these techniques, the study offers a novel approach to addressing multiple criteria across diverse sites, identifying routes with significant cultural and ecological value, and promoting sustainable tourism development.

2.2.4. SWOT Analysis

Considering the contextual dynamics of the area, the SWOT analysis method was employed to investigate and evaluate all factors that could influence tourism and heritage management from a holistic perspective. SWOT analysis is regarded as a critical tool for the success of developed strategies, as it enables the simultaneous assessment of internal factors (strengths and weaknesses) and external factors (opportunities and threats). This method has been widely applied in the field of regional planning [64,65].

The proposed eco-cultural route was presented to 5 NGO representatives, 5 business stakeholders, 10 government officials, and 38 experts, who were asked to provide input through SWOT analysis regarding heritage conservation and tourism practices within the study area. To enhance the depth of the analysis, a detailed map of the study area was used as a reference tool. Participants were instructed to spatially allocate strengths, weaknesses, opportunities, and threats onto the map using green, yellow, blue, and red stickers, respectively. This method facilitated the identification of specific locations where key factors were concentrated, allowing for a spatially contextualized understanding of the issues. The data collected from each stakeholder group were subsequently synthesized and analyzed to provide a comprehensive evaluation.

2.3. Charrettes

To introduce an international perspective, enhance a multidisciplinary approach, and integrate the study into educational processes, charrette workshops were conducted. A charrette is a participatory planning method involving short-term, collaborative efforts

by multidisciplinary professionals and non-professionals to address specific tasks [66]. These workshops were organized through working groups established under the Erasmus+ Blended Intensive Program, which aims to strengthen collaboration and mobility among individuals and institutions across Europe.

Two workshops were held in 2023–2024, covering Safranbolu, Amasra, Yörük, and Hadrianoupolis, with the participation of 79 students and faculty members from universities in Türkiye, Spain, Germany, Poland, Lithuania, Croatia, Romania, and Portugal. Eight working sub-groups addressed diverse, interconnected issues such as walkability, visual identity, and nature-based solutions by creating collective cartographies (Figure 5).

(**a**) (**b**)

3. Research Area

3.1. Historical Background

The study area, located in the western part of the ancient region of Paphlagonia in Anatolia, features a wide distribution of cultural heritage remains from the Phrygian, Roman, and Genoese civilizations, including tumulus, rock-cut tombs, necropolises, churches, ancient settlements, and fortifications. The cities of Hadrianoupolis and Amastris were prominent centers in the region during the Roman period. Hadrianoupolis served as a significant commercial hub along regional trade routes, particularly during the Eastern Roman (Byzantine) period [67], while Amastris retained its importance as a port city due to its natural harbor [68].

During the Ottoman period, the cities of Safranbolu and Bartın emerged as two significant centers in the region. In the 17th century, Safranbolu became an important commercial hub on the Silk Road, linking Istanbul and the interior regions of Anatolia to the Black Sea coast and the city of Kastamonu. At the same time, Bartın, despite being located inland, leveraged the advantages of the Bartın River to develop into a center for shipbuilding and product export [69]. The flourishing trade and craftsmanship during this period also contributed to the region's architectural enrichment [70].

Another element that enriched the region's architecture was the presence of structures belonging to the Greek minority, who lived peacefully in various settlements until the 1923 population exchange between Türkiye and Greece [71]. In this context, the region's cultural diversity and architectural richness provide valuable data for the study of its sociological structure and cultural heritage.

3.2. Heritage, Conservation and Tourism

3.2.1. Urban Areas

Since the 1970s, the collaboration between universities, the Ministry of Culture and Tourism, local authorities, and the community has significantly contributed to the preservation of cultural heritage in Safranbolu. The city was designated as an urban conservation area, comprising three sections: Çukur (the commercial center and Turkish quarters, Figure 6a), Kıranköy (the Greek quarter), and Bağlar (the area of summer residences) [46]. Safranbolu's inclusion on the UNESCO World Heritage List in 1994 increased its national and international visibility, turning the city into a major tourist attraction. Initially, tourism investments had widely observed positive effects, particularly on the preservation of tangible cultural heritage.

(**a**) (**b**)

Figure 6. (**a**) A view of Safranbolu (Çukur) from the south. (**b**) Traffic congestion in the historic center of Safranbolu.

However, subsequent reports prepared by the Turkish National Commission for UNESCO highlighted several issues arising from site management policies. These reports noted that tourism activities in Safranbolu have led to increased prices for essential goods and services, adversely affecting the lives of local residents, especially in the Çukur area. Negative impacts were observed on local trade, traditional crafts, transportation, and intangible cultural heritage, contributing to the displacement of local populations and narrowing the city's functions to tourism-related activities (Figure 6b). Furthermore, concerns about profit-driven development have been reported to limit cultural heritage preservation efforts, exerting pressure on traditional architecture, particularly in the city's peripheral areas [28,29]. The recent evaluation suggests that unplanned mass tourism activities may pose a more severe threat to the World Heritage Site in the future [27].

In the coastal town of Amasra, tourism activities can be traced back to the 1940s. The initial conservation efforts began in 1976 with the implementation of preservation regulations. However, despite these measures, including the 1988 Amasra Conservation Development Plan, conservation efforts have failed to prevent uncontrolled construction driven by mass tourism, resulting in the degradation of archaeological sites and civil architectural heritage [32,33] (Figure 7).

Beyond the impacts of urban development, natural areas have also suffered due to increased human activity. For example, the endemic sand lily (Pancratium maritimum), once thriving in Amasra's dune ecosystems, has been eradicated due to intensive coastal tourism, and its habitat has become severely restricted in surrounding areas. Additionally, the expansion of mining and quarrying operations, the proliferation of unregulated landfill

sites, and the planning of energy production facilities have further contributed to the destruction of the region's natural heritage [34].

(**a**) (**b**)

Figure 7. (**a**) The fortifications of Amasra as seen from the ancient harbor. (**b**) The overlooked fortifications in the touristic center of Amasra.

Amasra Fortress was added to the Tentative List of UNESCO World Heritage Sites in 2020 as part of the "Trading Posts and Fortifications on Genoese Trade Routes from the Mediterranean to the Black Sea" initiative, alongside sites in other countries [72]. While the city is home to 21 archaeological sites, scientific excavations began only after the fortress's inclusion on the Tentative List. Despite this, there have been no significant efforts to establish a site management unit or to control mass tourism in the area. Furthermore, ongoing debates regarding Amasra's urban conservation plan underscore the need for the development of sustainable preservation strategies [31].

In addition to Safranbolu and Amasra, two urban conservation areas are located in the provincial centers of Karabük and Bartın. In Karabük, the Yenişehir neighborhood, which contains the residential quarters of Türkiye's first heavy industrial complex, holds this designation, while in Bartın, the city's traditional commercial center is recognized as a conservation area [46]. However, the visibility of these sites remains largely confined to the local level, and both areas face significant preservation challenges.

Efforts to preserve intangible cultural heritage in urban areas have remained notably limited. Over time, traditional markets have lost much of their authenticity, and the production of traditional crafts and artisanal works persists only in a few workshops within historic city centers. Nevertheless, initiatives supported by various institutions—such as festivals centered on traditional products like saffron and grapes, city festivals, and certification programs for traditional artisans and artists—have contributed to the revitalization of intangible cultural heritage.

3.2.2. Rural Areas

Migration from rural areas in the region has accelerated since the late 20th century, driven by factors such as the inability of agricultural production to provide sufficient and stable income and limited access to essential services. Field research indicates that many rural settlements now have a significantly reduced permanent population, predominantly consisting of elderly individuals. While some villages still have a few households, the traditional settlements of such villages as Yürük (Üçevler), Kuzyakaöteköy, and Kayı have been completely abandoned. The majority of the remaining rural population consists of

individuals over the age of 65, leading to a marked decline in agricultural activities. This reduction in rural production adversely affects both social and economic resilience.

The depopulation of rural areas also poses a serious threat to cultural heritage. Abandoned structures deteriorate due to neglect and exposure to natural elements, while those still in use are often improperly repaired due to insufficient financial support and a lack of awareness regarding proper preservation methods. Furthermore, archaeological sites in these depopulated areas are increasingly vulnerable to looting by treasure hunters and vandalism by uninformed or malicious individuals.

According to the Turkish Ministry of Culture and Tourism, there are 40 archaeological sites located in the rural areas within the study region. Thirteen of these sites are clustered around the settlements of Hacılarobası and Sallar, while the remaining sites are dispersed across various parts of the area. Hadrianoupolis Ancient City has recently been officially designated as an Open-Air Museum. The rural areas of the study region also contain Urban Conservation Areas, specifically in the villages of Yörük and Bulak [46] (Figure 8). Field studies have also revealed numerous sites that exhibit the characteristics of archaeological or urban conservation areas but have not yet received official designation. Examples include Yazıköy, Hacılarobası, and Ilbarıt (Üçbölük), which have retained their architectural integrity, as well as Toprakcuma, known for preserving its traditional commercial structures.

(**a**) (**b**)

Figure 8. (**a**) A street in Bulak Village, located within the urban site area. (**b**) Karakoyunlu rock-cut tomb, currently within the archaeological site, documented by traveler Leonhard in 1903.

Karabük and Bartın are among Türkiye's richest provinces in terms of natural heritage, encompassing vast forests, rivers, canyons, and rare geological formations (Figure 9). Karabük holds the highest proportion of forested land in Türkiye, with 73% of its territory covered by forests [73]. The Yenice Forests within Karabük are recognized as one of the "Hot Spots of European Forests" and are among the 100 most ecologically significant forest areas in Europe [74]. A large portion of these forests falls under the Yenice Wildlife Development Area designation. Within the study area, there are two Nature Parks near Bartın and Amasra; two Wildlife Development Areas near Susunduk and Yörük; seven designated Natural Sites in İmanlar, Karabük (Yenişehir), Safranbolu, Tayyip, Bartın, and Amasra; and one Registered Cave in Mencinis [47,58].

However, the exploitation of forests for raw materials poses a significant barrier to expanding protected areas. Additionally, rural depopulation has led to the abandonment of agricultural lands, prompting environmentally destructive practices—such as the establishment of hydroelectric power plants (HPPs), mining operations, and quarries—to extract short-term economic gains from these areas (Figure 10).

(a) (b)

Figure 9. (a) Extensive forest areas between the provinces of Karabük and Bartın; (b) A canyon and geological formations near the village of Karapınar.

(a) (b)

Figure 10. (a) Yazkavak Village, surrounded by a quarry; (b) A waterway, dividing the area and restricting access to water for living organisms, leads to an electricity generation facility.

Among the rural settlements, Yörük Village emerges as a significant tourist destination due to its rich cultural heritage. Conservation efforts in the village are notably more organized and community-driven compared to other settlements in the region. In 2024, Yörük Village was included in the UNWTO Best Tourism Villages Upgrade Programme [75]. However, representatives from the local Cultural Heritage Preservation Association report that funding for the restoration of public buildings remains inadequate. Furthermore, the return migration of residents and the revival of rural production are insufficient to achieve sustainable long-term development in the village.

Markets and fairs in the villages have been discontinued, and workshops engaged in traditional production methods have ceased operations. However, prior to the COVID-19 pandemic, villages with strong sociocultural foundations, such as Yazıköy and Karapınar, continued to hold authentic celebrations of traditional festivals, including Bayram, Hıdrellez (spring festival), and special occasions like henna nights and weddings, which served as local attractions. In Yörük Village, Village Day events were organized to promote intangible cultural heritage (Figure 11). Despite these efforts, participation in such activities had been steadily declining since the early 2000s, and their scope was further diminished in the aftermath of the pandemic.

Among the rural settlements, Yörük Village emerges as a significant tourist destination due to its rich cultural heritage. Conservation efforts in the village are notably more organized and community-driven compared to other settlements in the region. In 2024, Yörük Village was included in the UNWTO Best Tourism Villages Upgrade Programme [75]. However, representatives from the local Cultural Heritage Preservation Association report that funding for the restoration of public buildings remains inadequate. Furthermore, the return migration of residents and the revival of rural production are insufficient to achieve sustainable long-term development in the village.

Markets and fairs in the villages have been discontinued, and workshops engaged in traditional production methods have ceased operations. However, prior to the COVID-19 pandemic, villages with strong sociocultural foundations, such as Yazıköy and Karapınar, continued to hold authentic celebrations of traditional festivals, including Bayram, Hıdrellez (spring festival), and special occasions like henna nights and weddings, which served as local attractions. In Yörük Village, Village Day events were organized to promote intangible cultural heritage (Figure 11). Despite these efforts, participation in such activities had been steadily declining since the early 2000s, and their scope was further diminished in the aftermath of the pandemic.

(**a**) (**b**)

Figure 11. (**a**) Folk dances performed to the accompaniment of traditional music during the Village Day in Yörük (2000s) [76]. (**b**) Local women preparing traditional treats for guests during Yörük Village Day (2000s) [76].

3.2.3. Regional Tourism Experiences

The Western Black Sea Tourism Master Plan, implemented in 2020 and encompassing the provinces of Karabük, Bartın, and Zonguldak, highlights the challenges of irregular urban development and infrastructure deficiencies resulting from the overconcentration of tourism activities in specific areas. The plan identifies the absence of integrated regional tourism strategies and the lack of spatial and temporal diversification in tourism activities as significant obstacles to achieving sustainable tourism. Similarly, the Cultural Tourism Focus Group Report by the Western Black Sea Development Agency (BAKKA) emphasizes the need to promote the region's cultural and natural assets through a comprehensive and holistic approach [36]. Moreover, the 2024–2028 Western Black Sea Regional Plan outlines the development of tourism routes within various contexts [77].

Currently, these initiatives are being primarily advanced by relevant public institutions. In alignment with these objectives, several regional tourism routes have been proposed, including the Safranbolu-Eflani Mule Track, the Amastris and Kromna Route, and the Karaelmas Tourist Express. However, the implementation of the Safranbolu-Eflani and Amastris-Kromna routes has been hindered by inadequate infrastructure investments. The Karaelmas Tourist Express, launched in 2024 along the Ankara-Karabük-Zonguldak line, failed to meet expectations and was subsequently discontinued. The primary reasons for its failure included disagreements among stakeholders regarding stop locations and waiting times, as well as elevated ticket prices due to the inaugural trip coinciding with the peak tourism season.

3.2.4. Participatory Planning Experience

The initial steps toward the sustainability of cultural heritage in Safranbolu and the nearby Yörük village in the 1990s were spontaneous yet centered on "participatory tourism". The key actors in this movement included local representatives of the Ministry of Culture and Tourism, local governments (governor's office, municipality, village headman), academics, civil society organizations, and volunteer citizens. Over an extended period, this coalition, led by the governor's office, developed and implemented various projects and activities with a shared objective. As a result, the conservation and restoration of cultural heritage were achieved, and a portion of the local population returned to the region. All stakeholders were actively involved at various stages, including awareness-raising, project development, and implementation. This participatory conservation movement was encapsulated by the slogan "*if Safranbolu succeeds, Türkiye succeeds*", and it served as a model for other cities in Türkiye with cultural heritage sites (Figure 12).

(**a**) (**b**)

Figure 12. (**a**) A meeting organized in Safranbolu by an international civil society organization with the participation of local stakeholders (1998). (**b**) An on-site study conducted as part of a participatory workshop in Yörük Village (1993).

In recent years, it has been observed that the policies pursued in the region have diverged from the philosophy of participatory conservation and development. The connections among local stakeholders have weakened, communication and coordination between local governments have diminished, and the supervisory roles in participatory initiatives have become less effective. Moreover, experts have had fewer opportunities to contribute to the policy development processes. Periodic reports and recommendations provided by UNESCO are often insufficiently considered. This situation has negatively impacted the conservation of cultural heritage and the development of sustainable tourism approaches in Safranbolu and the surrounding rural areas. Both the conservation and tourism experiences in the region, along with the findings from various studies conducted within the scope of this article, strongly highlight the significance of local residents, local businesses, and other stakeholders. Thus, it is confirmed that a solution that does not incorporate a participatory approach is not sustainable and viable.

4. Results

4.1. GIS Application

4.1.1. Spatial Mapping

The map generated using ArcMap 10.8 integrates identified historical traveler routes, analyzed sites, cultural and natural heritage conservation areas, public roads, and other relevant geographic data. A variety of open-source datasets were employed for elevation data [78], administrative boundaries, and settlement information [79], as well as data on public roads and water resources [80]. Information regarding conservation areas was obtained from officially declared protected area lists [46] and government GIS databases [47,58]. Figure A1 shows that the theme of historical travelers' routes has a spatial pattern of conservation areas suitable for route tourism.

Cultural and natural heritage elements within the study area were documented through photographs and texts using a crowdsourcing approach. The collected materials were systematically categorized based on their attributes and subsequently uploaded to the Fulcrumapp platform for open use in further analysis and evaluation (https://web.fulcrumapp.com/shares/15956227ecc9e0c9?&popup_properties=status,label,administrative_units,type,detection_date,information,photo&title, accessed on 10 February 2025).

4.1.2. Rating of Sites

This study proposes a quantitative approach to assess the potential significance of destinations within the eco-cultural route. A total of 84 sites were evaluated using data from the attribute table in ArcGIS ArcMap 10.8 (Table S1). Each site was scored based on five indicators—TCH, ICH, NH, ABS, and CAC—according to the parameters outlined in Table 1. The raw scores for each indicator, along with their normalized values, are presented in Table A1.

The indicator density maps derived from the normalized values are presented in Figure 13. The distribution patterns of TCH, ICH, and NH demonstrate significant similarities, while ABS and CAC exhibit distinct variations. These patterns are further analyzed in relation to the SOM findings in the following section.

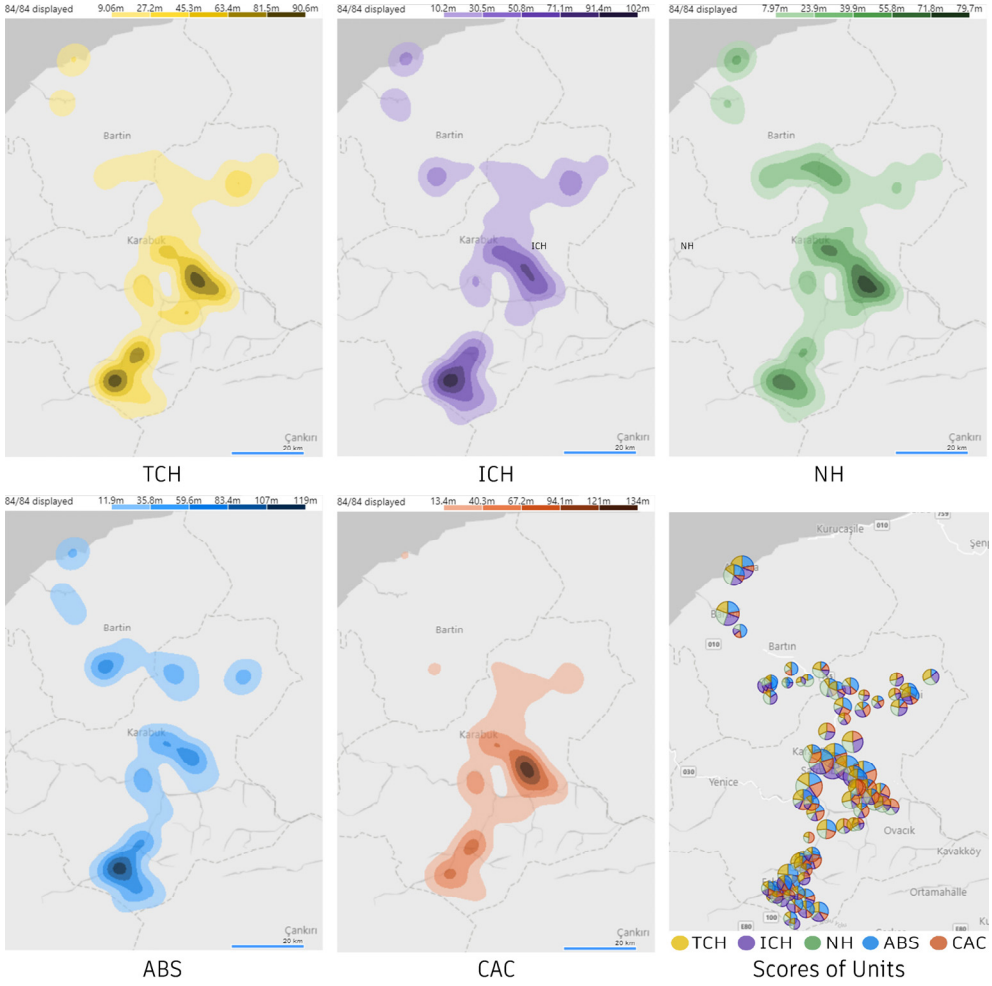

Figure 13. Indicator density maps and radial charts of site scores.

4.2. AHP Application

To assign weights to the indicators (TCH, ICH, NH, ABS, and CAC), a survey utilizing pairwise comparisons was administered to 131 tourists in the centers of Safranbolu and Amasra. Participants were asked to evaluate each pair of indicators by selecting a value between 1 and 9, where 1 indicated equal importance of both indicators, and 9 signified extreme importance of one indicator over the other.

In both locations, an equal number of responses met the AHP consistency criteria. The geometric mean of 74 matrices was calculated to generate a single aggregated matrix. Following the standardized AHP computation procedures [59], indicator weightings and rankings are presented in Table 2.

Table 2. Weights and rankings of indicators according to the decision matrix.

Indicators	TCH	ICH	NH	ABS	CAC	Weighting	Rank
Tangible Cultural Heritage	1.00	1.72	0.87	2.08	1.27	0.25	2
Intangible Cultural Heritage	0.58	1.00	0.43	1.08	0.72	0.14	5
Natural Heritage	1.15	2.35	1.00	1.82	1.76	0.29	1
Accessibility to Basic Services	0.45	0.93	0.55	1.00	0.85	0.14	4
Connectivity with Attraction Centers	0.79	1.38	0.57	1.17	1.00	0.18	3

Table 2. Weights and rankings of indicators according to the decision matrix.

Indicators	TCH	ICH	NH	ABS	CAC	Weighting	Rank
Tangible Cultural Heritage	1.00	1.72	0.87	2.08	1.27	0.25	2
Intangible Cultural Heritage	0.58	1.00	0.43	1.08	0.72	0.14	5
Natural Heritage	1.15	2.35	1.00	1.82	1.76	0.29	1
Accessibility to Basic Services	0.45	0.93	0.55	1.00	0.85	0.14	4
Connectivity with Attraction Centers	0.79	1.38	0.57	1.17	1.00	0.18	3

4.3. Clustering Results

4.3. Clustering Results

We employed Self-Organizing Map (SOM) analysis to generate routes based on the attributes of 84 sites. Weighted scores were calculated to determine the relative importance of each site (Table A1), using AHP, five key indicators representing diverse tourist expectations were assessed (Table 2). These scores were then analyzed using SOM, which clustered the sites into groups based on underlying patterns and relationships, enabling a detailed evaluation of potential routes.

We employed Self-Organizing Map (SOM) analysis to generate routes based on the attributes of 84 sites. Weighted scores were calculated to determine the relative importance of each site (Table A1), using AHP, five key indicators representing diverse tourist expectations were assessed (Table 2). These scores were then analyzed using SOM, which clustered the sites into groups based on underlying patterns and relationships, enabling a detailed evaluation of potential routes.

The clustering results, presented in Figure 14, reveal three distinct clusters, highlighting the distribution of 84 spatial sites across the indicators. These clusters demonstrate varying levels of site significance, with a specific emphasis on higher-scoring clusters (red and yellow areas in the "Location of Sites"), which inform targeted strategies and optimize route planning. In the "Location of Sites", the red cluster represents high potential sites, the yellow cluster corresponds to medium potential sites, and the blue cluster comprises low potential sites.

The clustering results, presented in Figure 14, reveal three distinct clusters, highlighting the distribution of 84 spatial sites across the indicators. These clusters demonstrate varying levels of site significance, with a specific emphasis on higher-scoring clusters (red and yellow area in the "Location of Sites"), which inform targeted strategies and optimize route planning. In the "Location of Sites", the red cluster represents high potential sites, the yellow cluster corresponds to medium potential sites, and the blue cluster comprises low potential sites.

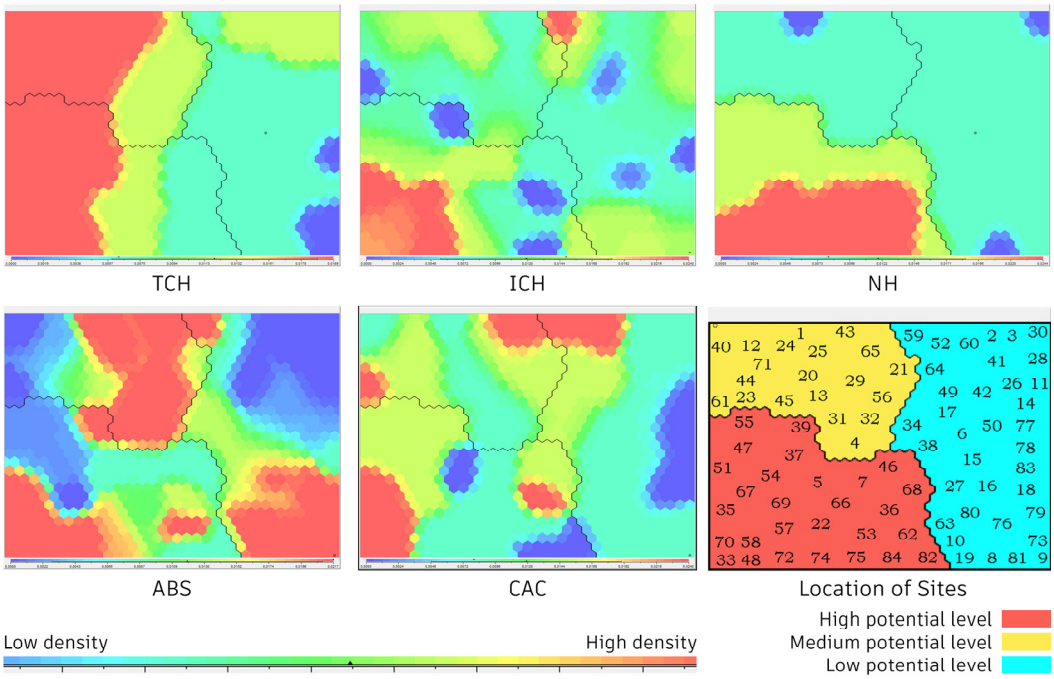

Figure 14. SOMs for each indicator.

Figure 14. SOMs for each indicator.

The SOM clustering reveals distinct spatial distribution patterns for each indicator. Heritage-based indicators (TCH, ICH, and NH) display significant spatial overlap, indicating a cohesive heritage landscape. In contrast, service- and connectivity-based indicators (ABS and CAC) exhibit fragmented and dispersed patterns, distinguishing them from the heritage indicators.

The SOM clustering reveals distinct spatial distribution patterns for each indicator. Heritage-based indicators (TCH, ICH, and NH) display significant spatial overlap, indicating a cohesive heritage landscape. In contrast, service- and connectivity-based indicators (ABS and CAC) exhibit fragmented and dispersed patterns, distinguishing them from the heritage indicators.

A comparative analysis of the protected areas' distributions (Figure A1), indicators' density (Figure 13), and clustering results (Figure 14) indicates that the spatial distribution

A comparative analysis of the protected areas' distributions (Figure A1), indicators' density (Figure 13), and clustering results (Figure 14) indicates that the spatial distribution patterns of the heritage values present considerable opportunities for the development of heritage-focused route tourism in the region. However, to effectively support tourism, ABS requires substantial infrastructure enhancements. Furthermore, improving the CAC indicator could involve introducing targeted attractions at specific points along the route to strengthen connectivity and enhance the overall visitor experience.

4.4. Proposal for the Eco-Cultural Route

The proposed eco-cultural route prioritizes the conservation of natural and cultural heritage sites and the minimization of environmental impact. To achieve this, the entire route follows existing roads, eliminating the need for new infrastructure development. As illustrated in Figure 14 ("Location of Sites" map), the route connects settlements classified as having high and medium potential. The route design focuses on maintaining short travel distances between settlements, ensuring high travel comfort, and maximizing exposure to heritage sites along the way. Where feasible, the route integrates authentic historical roads and historic bridges to enhance cultural authenticity. To avoid increasing environmental impact and potential legal complications, the route avoids traversing Wildlife Development Areas and Nature Reserves. Figure 15 presents the proposed eco-cultural route and the associated heritage sites located throughout the route.

The designated routes are classified based on their difficulty and comfort levels.

- Group A: Routes accessible by public transportation, offering the highest level of comfort.
- Group B: Routes suitable for wheeled eco-vehicles, providing a moderate level of comfort, higher than Groups C and D.
- Group C: Routes consisting primarily of unpaved or deteriorated roads, generally unsuitable for eco-vehicles.
- Group D: Routes where the use of vehicles is not recommended, designed specifically for trekking. These paths offer scenic vistas and natural landscapes, enhancing the traveler's experience.

4.5. SWOT Analysis

An in-depth analysis of the proposed eco-cultural route was conducted using a SWOT analysis. The factors in the SWOT analysis are organized under headings and ranked in tables based on the frequency of mentions by participants. The specific areas where participants primarily associated these factors are depicted in Figure S1. To ensure clarity and ease of interpretation, each participant and factor was assigned a unique identifier (ID) in both the maps and tables.

4.5.1. Strengths

A substantial number of participants concurred on the strengths of the region's natural, archaeological, and architectural heritage. The emphasis on religious heritage, cultural diversity, historical narratives, authentic products, and gastronomic heritage indicates a strong potential for developing alternative tourism strategies centered on intangible cultural heritage. Furthermore, the continued enhancement of tourism infrastructure and facilities to support alternative tourism, the presence of diverse accommodation options, and the organization of festivals and related cultural events contribute to the advancement of eco-tourism in the region (Table S2).

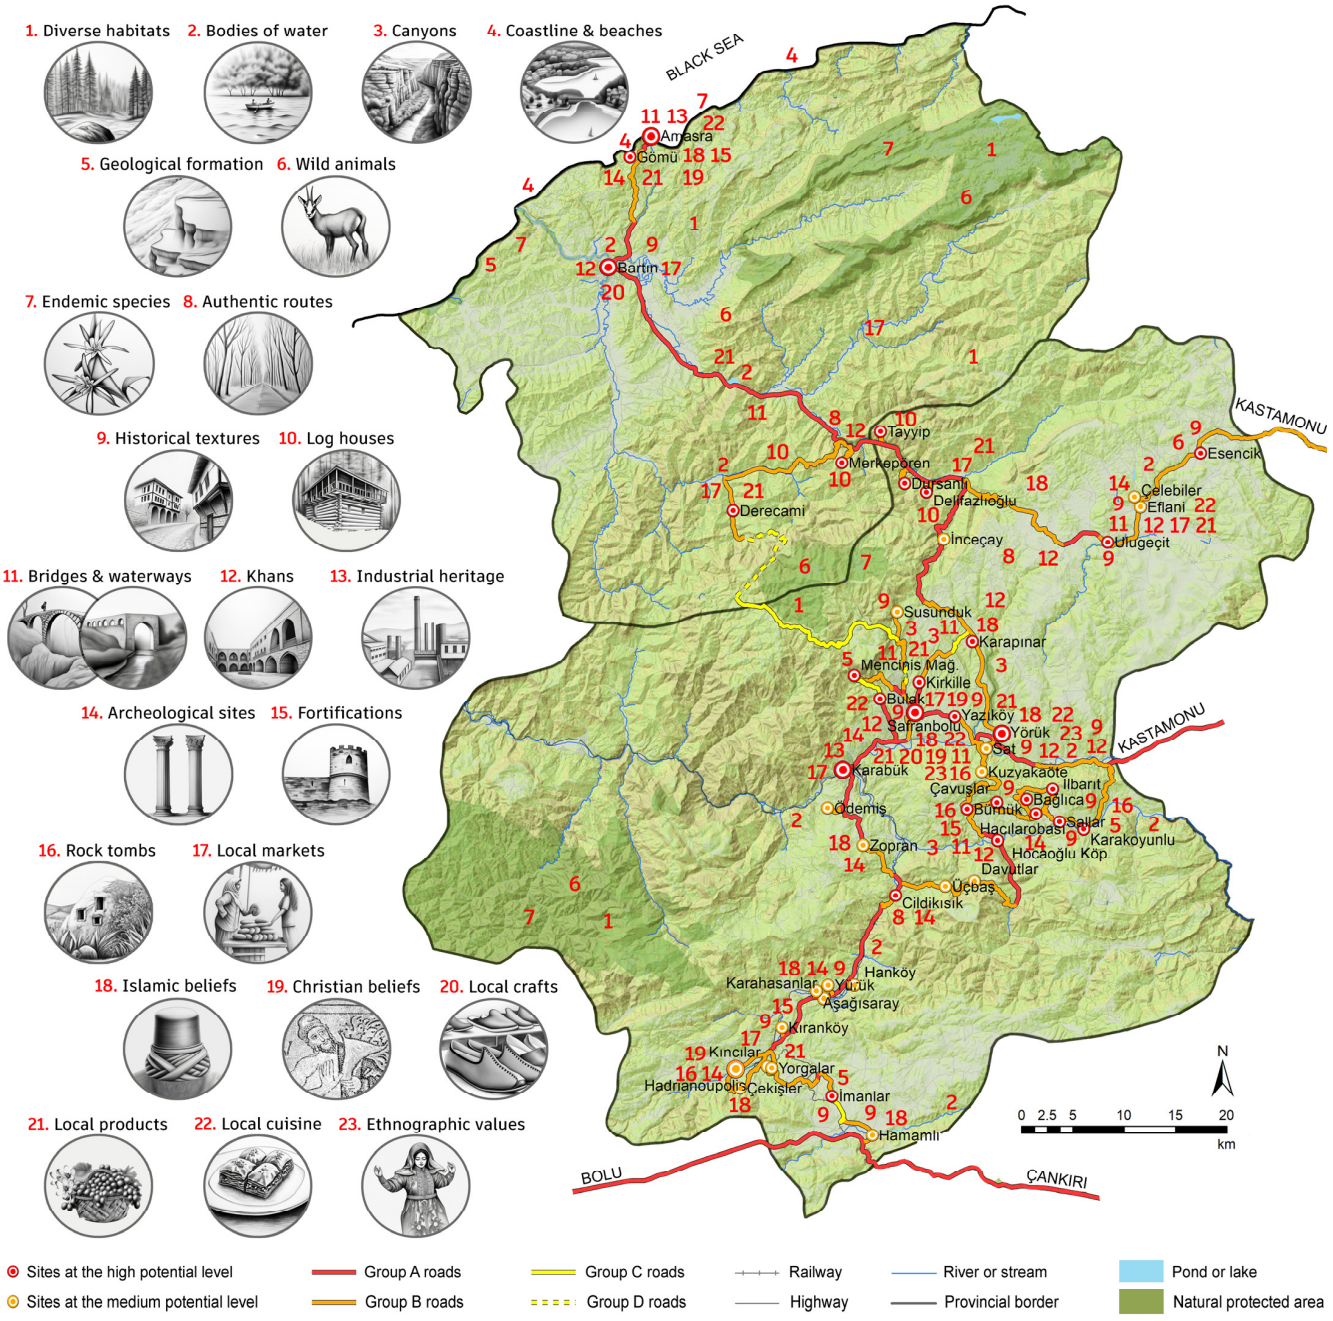

Figure 15. Proposal for eco-cultural route and heritage components along the route.

4.5.2. Weaknesses

The analysis reveals significant management challenges related to both conservation and tourism. Key issues include the absence of effective site management mechanisms, a lack of integrated strategies, and limited adoption of participatory approaches. Furthermore, the insufficient involvement of citizens and lack of transparency in policy-making, coupled with political conflicts among stakeholders, were identified as major weaknesses hindering the implementation of participatory management frameworks.

Several factors have been identified as contributing to the deterioration risks of heritage sites, including excessive traffic, irregular and unauthorized construction, industrial pollution, faulty restoration practices, migration, and property ownership challenges (e.g., public buildings under private ownership and fragmented landholdings). Additionally, the lack of awareness among local communities and insufficient funding for conservation and restoration efforts further exacerbate these risks.

Participants also highlighted weaknesses in the management of tourism revenues, the promotion of heritage sites, and the quality control of services and products. In particular, there are significant deficiencies in tourism infrastructure, particularly in rural areas. For example, despite efforts to promote the necropolis sites in the Soğanlı River Valley within Karabük Province, no infrastructure has been developed to support tourism activities in the region (Table S3).

4.5.3. Opportunities

Participants underscored the importance of engaging with international recognition and certification programs such as the UNESCO World Heritage List (Safranbolu), the UNESCO World Heritage Tentative List (Amasra Fortress), the UNWTO Best Tourism Villages Upgrade Programme (Yörük Village), PAN Parks (Küre Mountains National Park), and Cittaslow (Safranbolu). It is widely believed that active participation in these initiatives contributes significantly to both the region's global visibility and the enhancement of heritage conservation standards. Particular emphasis was placed on the inclusion of Amasra in the UNESCO World Heritage List, which was identified as a critical objective for both the region and the proposed eco-cultural route.

The region's proximity to major metropolitan centers, such as Ankara and Istanbul, combined with the availability of alternative transportation—including railways, maritime routes, and historic pathways—was identified as a significant opportunity for tourism development. Notably, participants positively rated initiatives to enhance maritime tourism, which was recognized for its high revenue potential.

Ongoing archaeological excavations in the ancient cities of Amastris (Amasra) and Hadrianoupolis, along with the continuous discovery of new findings, were highlighted as contributing not only to academic knowledge but also to the promotion of the region. The importance of supporting similar scientific research in other cultural and natural heritage sites was also emphasized as a key opportunity (Table S4).

4.5.4. Threats

Participants identified several critical threats to cultural heritage sites, including construction pressures driven by economic interests, the reduction of protected areas, and the proximity of planned mining, energy, and industrial facilities to heritage sites. Seismic activity was also highlighted as a significant risk factor. Both cultural and natural heritage sites are increasingly vulnerable to climate change-related threats, such as wildfires, flooding, and droughts. Additionally, damage caused by treasure hunters and vandals in cultural heritage areas, along with illegal hunting, harvesting, and biological trafficking in natural heritage sites, were identified as pressing concerns that require mitigation through awareness campaigns and regulatory enforcement.

Concerns regarding the environmental, social, and economic impacts of tourism were prominently highlighted. Specifically, the adverse effects on local lifestyles and the overexploitation of natural resources emphasize the necessity for developing a sustainable tourism model.

Participants expressed concerns over the limited scope of legal protection zones, the absence of buffer areas, and inadequate oversight of projects within protected sites. These concerns are exemplified by two recent cases: In Bulak Village, within a designated site in Karabük, the original cobblestone pavements were entirely removed and replaced with new materials under the pretext of improving road comfort, compromising the integrity of the heritage fabric. Similarly, in Bartın, excessive modifications made along the Bartın River as part of a flood prevention project have resulted in the degradation of the natural landscape (Table S5).

4.6. Charrettes

The charrettes marked the final phase of the study, where preliminary findings were critically analyzed and expanded through an interdisciplinary approach. These workshops enabled in-depth discussions of the SWOT analysis results and the potential impacts of the proposed eco-cultural route, promoting collaborative evaluation and refinement of planning strategies. Collective and interdisciplinary perspectives emerged during the Erasmus+ workshops—featuring site excursions, sub-group co-creations (Figure 16), concluding presentations, and deliberations—emphasizing key themes such as cultural and natural heritage, transportation and routes, local communities, inclusivity, capacity building, circularity, and crafts.

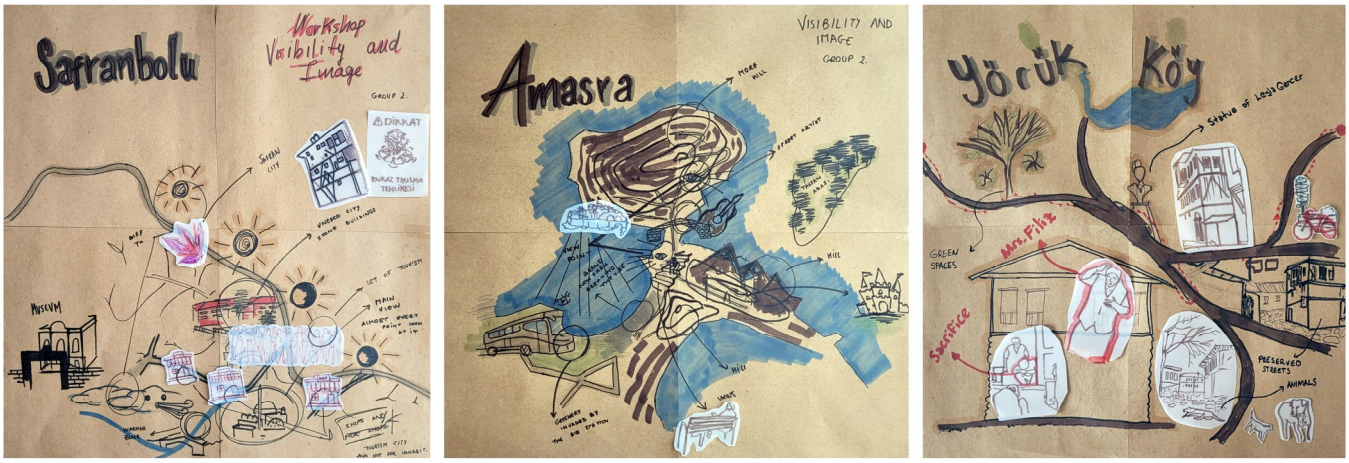

Figure 16. Collective cartographies created by sub-groups.

In the urban centers of Safranbolu and Amasra, the groups' discussions highlighted the detrimental impacts of unsustainable human activities—such as over-tourism, excessive traffic, and intensified commercial operations—on cultural heritage sites and coastal zones. The adverse effects of uncontrolled urban sprawl, rapid and dense construction, and inappropriate interventions were also identified as critical threats to heritage preservation. Conversely, in Yörük Village and other rural areas, attention was drawn to the declining local population, insufficient conservation planning, and the absence of effective preservation measures.

One participant identified the primary factor threatening the sustainability of heritage as "*environmental, social, and economic management that lacks the involvement of local communities and stakeholders*". The participant further argued that "*a participatory approach will be effective if all stakeholders are adequately informed about the potential outcomes of strategies and implementations. Therefore, participation must be as broad and democratic as possible*".

Another participant outlined the necessary measures for ensuring the sustainability of heritage sites as follows: *"It is essential to retain local communities within their places of origin and traditional cycles. By doing so, local populations can sustain heritage both materially and spiritually. In the context of the built environment, we have observed a significant disparity between structures that are inhabited and those that are not. Specifically, in Yörük Village, the local community emphasized the critical role of residents in the maintenance of buildings. Cultural heritage is inherently fragile and is sustained through the presence of those who inhabit it. These individuals possess knowledge of their homes' histories, construction methods, and unique attributes. In my view, this intimate connection is what constitutes cultural heritage"*.

The key outcomes of the two interconnected charrettes emphasize the following strategic recommendations:

- Integration of Cultural and Natural Heritage Sites: Establishing eco-cultural routes that link cultural and natural heritage areas to promote comprehensive and diverse visitor experiences.
- Community Participation: Developing mechanisms that facilitate the active and effective involvement of local communities in regional and local planning processes while ensuring transparency as a core principle for institutional practice.
- Regulation of Transportation: Differentiating between motor vehicle roads, eco-friendly transport routes, and pedestrian pathways to mitigate traffic congestion and carbon emissions while promoting walkable environments.
- Accessibility: Implementing inclusive principles and infrastructure to create a barrier-free environment, ensuring accessibility for all individuals.
- Enhancement of Infrastructure: Expanding and improving critical infrastructure and public services to better accommodate the needs and expectations of both locals and tourists. Most notably, prioritizing nature-based solutions and resilience for the climate crisis, including the rehabilitation of green corridors and coastal ecotonal areas, is vital.
- Advancement of Conservation and Promotion Efforts: Developing innovative and robust methods for the protection and presentation of heritage sites to ensure their preservation while fostering collaboration with various stakeholders.

These collectively identified principles and discussions highlight the essential dimensions required to plan an eco-cultural route that is feasible, sustainable, and viable. While the primary outcome of the study may appear to be the route proposal, these collective processes are of critical importance and are indispensable for future progress. To ensure continued development, it is necessary to diversify participants and expand the scope of involvement.

5. Discussion

This section examines the following critical dimensions in the context of the findings and existing paradigms in the literature: (1) the sustainable conservation of heritage and the management of heritage sites, (2) the role of tourism in sustainable conservation and development, and (3) the evaluation of the proposed integrated approach.

5.1. Heritage Dimension

The need to manage a range of issues within the extensive area, including tangible and intangible cultural heritage, natural heritage, the negative impacts of mass tourism, and rural depopulation, presents complex, multi-dimensional challenges.

SWOT analyses reveal that factors perceived as threats by some participants can be seen as opportunities by others, underscoring the controversies surrounding the heritage dimension. In our study, we included the diverse perspectives of local residents, organizations, and experts on the future of the region. These perspectives collectively shape 'the common' both in physical (streets, squares, community gardens) and conceptual (norms, laws, bureaucracy) terms [81]. Sennett [82] argues that when the practical and institutional spheres are disconnected, both lose their potential. Therefore, a heritage-driven approach should integrate and enhance both domains to promote the emancipation of citizenship and long-term sustainability.

The study reveals that lack of coordination and collaboration among various stakeholders and institutions in the protection of cultural and natural heritage are one of the primary obstacles to the development of sustainable conservation actions. It has been observed that, in many cases, management plans can mitigate such challenges [83]. However, there is currently no active area management plan within the study area or any of its

sub-areas. Although, as Bozkurt suggests [84], area management units in Türkiye often function more like civil society organizations—coordinating relevant authorities, collecting statistics, and preparing reports—rather than acting as effective public authorities, the establishment of area management units and plans is crucial. Sokka et al. [85] also highlight that the success of heritage management processes is without substantial participation of local communities in processes such as goal setting and strategy development. To achieve genuine participation for heritage preservation, reverse migration to rural areas should be supported in the region.

The studies by MacDonald et al. [86] and Zhang et al. [87] indicate that the primary cause of rural depopulation, particularly in mountain villages across various regions, is insufficient economic income. Interviews conducted for this study revealed that local residents, especially in mountain villages, pointed to agricultural disadvantages due to the terrain, the transformation of much of the land into forests after prolonged periods of abandonment, and the lack of subsidies for agricultural products. This study suggests that ecotourism could present a significant opportunity for sites identified as having "high potential" and "medium potential" (Figure 15). If supported through a multi-dimensional approach, ecotourism could help mitigate depopulation and contribute to sustainable conservation and development.

5.2. Tourism Dimension

The perception of nature as an infinite resource has resulted in unchecked exploitation, ignoring biophysical limits [88,89]. Mounting evidence of environmental degradation underscores the urgency of recognizing these limits to growth [90]. Lefebvre highlights the tension between the right to nature and the right to the city [91]. Integrating heritage conservation with contemporary degrowth and post-growth perspectives, informed by an eco-social framework, it seeks to promote sustainable and just nature-based solutions [92,93].

Balancing conservation and tourism activities in vulnerable heritage sites is one of the most crucial factors for ensuring the sustainability [94]. The primary factor influencing the policies to be adopted in achieving this fundamental objective is identifying which tourism approaches are most suitable for the region.

The literature on heritage sites presents two main perspectives regarding the term "mass tourism". Some studies focus on the detrimental impacts of mass tourism on the environment, heritage sites, and local communities [95,96], while others argue that mass tourism can be planned sustainably [97,98]. For instance, Peeters emphasizes that rather than developing alternative tourism approaches for sustainability, the focus should be on making mass tourism destinations sustainable [99]. Hernandez, on the other hand, suggests that the success of rural tourism destinations can be positively influenced by mass tourism destinations [100].

Before tourism activities began in Safranbolu, the city largely appeared abandoned. The 1990s, a period when tourism began to dominate cultural heritage sites worldwide, coincided with the development of tourism in the city [101]. During this time, mass tourism policies were viewed as the most effective means of preserving cultural heritage. As a result, the city's previously abandoned appearance changed rapidly, and with the return of the local population, steps were taken to preserve both tangible and intangible cultural heritage.

In Amasra, tourism began with camping activities in the 1940s and expanded rapidly after the 1960s. Despite the city's rich cultural heritage, cultural heritage has never been a central focus of the tourism activities carried out. Consequently, for an extended period, tourism activities and cultural heritage sites in Amasra have represented two conflicting aspects [31,34]. Therefore, addressing these two cities together is one of the promising aspects of this study.

Today, both centers are subject to serious criticism regarding tourism approaches and practices. It is evident that adopting a holistic and participatory approach to evaluating the region is crucial for the sustainability of heritage conservation, tourism, development, and the well-being of the local community. Drawing on lessons from the pandemic and, more broadly, the climate crisis, the need for long-term ecosocial approaches was emphasized. Ecocentric approaches, in particular, propose a more democratic paradigm shift by advocating for the inclusion of nature's rights in decision-making processes, especially concerning the commercialization, appropriation, exploitation, and privatization of vulnerable ecological urban and rural areas.

5.3. Methodological Reflection

This study adopts a mixed-methods approach to examine the complex socio-spatial dynamics within the research area. Integrating diverse analytical tools and frameworks offers a holistic perspective to address multifaceted challenges. The collaborative engagement of students played a pivotal role in sustaining extensive fieldwork across the rural region. The incorporation of a crowdsourcing digital participatory platform (DPP) effectively streamlined synchronous and asynchronous data collection, significantly improving efficiency. Furthermore, leveraging this platform in university–public collaborations proved instrumental in identifying and formally registering structures requiring recognition and protection. Unlike technocratic planning support systems, DPPs foster collaboration, empowering people in decision-making, reporting, and co-creation [102].

The selection of indicators and parameters for AHP and unit ratings directly shaped the quantitative outcomes. Adjustments to AHP weightings and the inclusion of new parameters can further refine the SOM-generated route clusters to reflect evolving priorities. AHP's application to assess tourists' expectations and perceptions yielded reliable and consistent findings, facilitating data integration into route planning. Future research will extend AHP surveys to encompass diverse stakeholders, enabling comparative analyses based on variables such as tourist profiles and local versus international preferences.

The comprehensive datasets, shared as open-access resources in Supplementary Materials, provide a foundation for further research and the development of conservation and tourism applications. The study framework is adaptable, allowing variations in themes, locations, and indicators to spark new inquiries. Given the interdisciplinary nature of the topic, further research across economic, sociological, ecological, cultural, and architectural domains is essential. Establishing interactive platforms for stakeholder dialogue is required to strengthen implementation strategies.

Ultimately, our methodology serves as a living laboratory, continuously assessing site-specific dynamics and promoting sustainable eco-cultural development. Future iterations will expand interdisciplinary perspectives and active participation through onsite and digital platforms, enhancing inclusivity and collaboration. Continuous input from local stakeholders and experts, alongside follow-up mechanisms, will support ongoing refinements to ecological, social, and economic dimensions, maintaining relevance and effectiveness over time.

The novel and flexible methodology introduced in this study offers a data-driven and inclusive tourism route planning strategy, presenting a replicable model for other regions facing similar challenges. Designed to support a participatory approach, the methodology provides a holistic framework that strengthens decision-making processes in conservation and tourism planning.

6. Conclusions and Recommendations

This study proposes a participatory approach to develop an eco-cultural route that promotes sustainable conservation, development, and the well-being of local communities in 84 heritage sites affected by urban mass tourism or rural depopulation. The key findings highlight the potential of historical travelers' routes to link the region's cultural and natural heritage sites with sustainable tourism strategies. Moreover, the study reveals significant potential and risks for eco-cultural tourism development in the region, particularly by connecting less-visited rural areas to established destinations such as Safranbolu and Amasra.

Within the scope of the study, tourist trends in the area have been evaluated. The integrated assessment of TCH, ICH, and NH promotes sustainable tourism. However, shortcomings, challenges, and management issues highlight the need for capacity building and policy interventions to support ecotourism development.

According to AHP results, the relatively high priorities of the NH (29%) and TCH (25%) indicators, along with the lower priorities of the CAC (18%) and ABS (14%) indicators, indicate that heritage tourism is supported despite issues related to the spatial distribution of attraction centers, as well as deficiencies in services, transportation, and tourism infrastructure. Meanwhile, the value of the ICH (14%) indicator highlights the necessity of improvement and promotion actions for intangible heritage in the region.

In addition to the 28 high-potential sites, 20 medium-potential sites have been included to enhance the geographical and social inclusivity of the eco-cultural route. Evaluations and recommendations regarding the proposed route and sites are provided below.

- The existing tourism dynamics support the potential success of the route. According to 2024 statistics, approximately 2,600,000 people (including daily visitors) visit Safranbolu annually [103], while Amasra receives around 2,500,000 visitors (including daily visitors) annually [104]. These figures can be associated with the potential demand for the final product. However, beyond the quantity of tourists, their expectations, socio-economic status, and diversity are crucial for the proper functioning of the route. At the international level, Amasra's heavy reliance on cruise tourism—particularly with a large proportion of Russian tourists—and Safranbolu's dependency on visitors mainly from China, Taiwan, and Thailand contribute to a limited tourist profile. This lack of diversity increases the vulnerability of the tourism sector in both destinations.
- Among the high-potential sites, the following are recommended as priorities during the initial implementation phase to support the development of surrounding areas: (1) Safranbolu, Amasra, and the nearby sites (Yazıköy, Bulak, Kirkille, and Gömü), (2) the sites located together in the Soğanlı Stream Valley, featuring archaeological heritage and traditional architecture (Hacılarobası, Ilbarıt, Karakoyunlu, Bürnük, Hocaoğlu K., Çavuşlar, Bağlıca, and Sallar), and (3) the two provincial centers, Karabük and Bartın.
- Many successful examples have recognized the "cultural route" as a method for preserving and maintaining cultural heritage. However, numerous initiatives have failed due to prioritizing high revenue generation in the short and medium term [105]. Therefore, in the initial stages of implementation, the eco-cultural route must be subsidized by international, national, and local non-profit organizations. Moreover, for long-term economic sustainability, it is essential to gradually increase the financial contributions of cooperatives (including producers and businesses), local community associations, and private sponsors to the central budget.
- Ensuring income diversification is crucial for sustainable development and socio-economic resilience. Tourism revenues alone may not be sufficient to achieve sustainability in sensitive areas that require protection. In this case, "multiple-use manage-

ment" is recommended [106]. Therefore, developing multiple uses (such as agriculture, livestock, and crafts) that align with the identities of the sites is important. Such regional planning requires interdisciplinary efforts.

- To highlight cultural heritage, we recommend removing structures that damage tangible cultural heritage and disrupt the skyline. Sites that have not yet been protected at the building scale should be urgently safeguarded, and restoration and infrastructure work should be carried out. In this regard, sites such as Amasra Castle and the Yenişehir in Karabük (industrial heritage) should be prioritized. In line with the eco-cultural route context, particularly in rural areas, abandoned caravanserais, hammams, historical bazaars, and mansions should be restored and repurposed for tourism and other services.
- The expansion of the ecological conservation cases exemplified within the research area is crucial for the preservation of natural heritage, particularly through increased local awareness. Interventions that promote eco-social transition—such as erosion and flood prevention, protection of endemic species, and restoration of habitat diversity—should be adopted and implemented by regional and local authorities. Mining, quarry activities, and unplanned construction should be prevented within the area, and restoration projects for natural areas should be carried out.
- The proposed route prioritizes roads that require minimal intervention to reduce environmental impact and address geographic and economic challenges. Alternatives exist for less suitable roads. However, improving public transportation and adapting roads for eco-friendly vehicles is essential. In particular, access to İmanlar, Derecami, and Karapınar should be enhanced. To reduce conflicts among different user groups, roads should also be separated based on user types, and appropriate safety measures should be implemented.
- Especially in sensitive areas where natural and cultural heritage intersect, initiatives that integrate social structures with heritage must be consciously sustained over the long term to ensure success [107]. In the regional dynamics, the efforts that began in the 1970s in Safranbolu and the Yörük village only started to yield positive results toward the 2000s. Therefore, to minimize the potential negative impacts of interventions on the local population and heritage sites (such as degradation, gentrification, migration, unplanned construction, the complete abandonment of traditional production methods), planning must be extended over the long term and periodically reviewed.
- Seven main stages, which must be carried out in coordination, are proposed to ensure the successful implementation of the project: (1) establishing the central budget with contributions from non-profit organizations, (2) conducting awareness-raising activities and developing protection and restoration activities for heritage sites, as well as regulatory activities for tourism areas, (3) implementing measures to enhance road safety and accessibility while supporting ecological transportation methods, (4) supporting the return of the local population and increasing local production through social and economic incentives, (5) developing tourism, production, and infrastructure facilities with an approach that aligns with the characteristics of the sites and the theme of the route, (6) encouraging participation in networks that support ecotourism and conducting promotional activities, and (7) gradually increasing the contributions of cooperatives, local community associations, and sponsors to the central budget, ensuring economic sustainability.
- The study area consists of sub-regions with distinct characteristics. To develop a sustainable conservation and tourism approach, including eco-cultural routes, it is essential to adopt a holistic planning process that considers these unique attributes

and encourages collaboration. These efforts, similarly to past experiences in the region, will drive responsible and robust policy implementation as well as future systemic impacts. In Safranbolu, steps can be taken to enhance the sustainability of tourism activities by prioritizing conservation and educational efforts while also integrating natural heritage areas into planning. In Amasra, which has advantages in tourism diversity and potential activities, ecological solutions should include supporting alternative tourism, reducing coastal tourism pressure, mitigating seasonality effects, and focusing on the sustainability of cultural and natural heritage. For rural areas, projects should promote local tourism products through sustainable certification programs and business networks, emphasizing circular and ecological approaches. Considering both regional and global crises, the proposed strategy is expected to be implemented with truly participatory, sustainable, fair, and circular economy practices.

ABSTRACT

3D Concrete Printing (3DCP) is an increasingly popular modern technology in the construction industry. There is a research gap in the basic geometric form decisions of 3DCP in building production about corner-wall combinations and the potential of chamfered corner turns. In this study, it is aimed to provide solutions to this research gap by performing digital fabrication of different architectural design configurations. Additionally, different chamfered turning performances were investigated in relation to the turning difficulties of the nozzle in corner-wall combinations. In this context, a lab-scale 3D printer was used with a cement-based material for the synthesis of prototypes. As a result of 3DCP, comparative analyses were conducted with building evaluation parameters. The obtained results revealed that in corner-wall combinations, chamfered space (r = 5 cm) was the most advantageous in terms of buildability and mass producibility. In geometric form configurations, the chamfered octagon showed optimum behaviour. In terms of buildability, a chamfered octagon offers a 4.2% advantage over a standard octagon. From a cost perspective, chamfered octagon provides a 20% advantage over chamfered square and 46.6% advantage over octagon. In terms of mass producibility, the chamfered octagon is on par with the chamfered hexagon and outperformed the chamfered square by 16.6%.

1. Introduction

3D Printing (3DP) technology started in 1986 with the entrepreneurship of Charles Hull and developed with the RepRap project of Adrian Bouyers and his team in 2005 (de Rubeis et al. 2024; Kumar et al. 2023). Nowadays, the process of transition from digital to production is progressing with different technical equipment and computer-aided arrangements (Ali et al. 2022; Takva and İlerisoy 2023a). The combination of small-scale printers and products continues day by day with the search for larger printers and products. At this point, 3DP technology is integrated with a multidisciplinary working process (Darwish, El-Wakad, and Farag 2021). This technology, which operates in many fields, also shows itself in the construction industry. As a result of the adaptation of metal, polymer, plastic, composite and clay-based materials to 3DP and the combination of aesthetic designs, the architecture sector has gained a different dimension (Chan et al. 2020). In this sector, digitally fabricated products can be built both in indoor and outdoor environments. A successful 3DP process can be achieved by keeping the material, complexity, and environmental conditions of the structure to be built under control (Asaf et al. 2023). The decrease in costs as a result of the reduced need for workers also shows that 3DP can be adopted as a digital and advanced construction method (Khan et al. 2024a). 3DP technology stands out by offering fast solutions in the production of cost-effective structures with short construction times using developed concrete materials (Moghayedi et al. 2024).

With the development of building and building production techniques, various outputs are obtained in the construction and architecture industry. For instance, Mogra et al. (2023) sought solutions to the structural optimization problem based on 3D Concrete Printing (3DCP) and buildability. By designing a structural element, it is aimed to establish a balance between load-bearing performance and stability during the printing process. Prototypes were produced and the effect of the material on buildability and structural design were evaluated. Alabbasi, Agkathidis, and Chen (2023) aimed to increase efficiency by using 3D concrete printing technology in the fabricating of reinforced concrete structural components for housing projects in Saudi Arabia. Finite element analysis, parametric modelling, and topology optimization were integrated with 3D printing methods in the digital fabrication process. Findings related to buildability and mass customization were presented. Giridhar, Prem, and Kumar (2023) proposed a methodology to develop 3D printable concrete mixtures. Smooth and fibrous mixtures were obtained by using local binders in the concrete material. 24 different trials were made and open time was taken as 45–60 minutes. Batikha et al. (2022) designed a two-storey building

© 2025 Informa UK Limited, trading as Taylor & Francis Group

with 5 construction methods: 3DCP, prefabricated modular concrete, cast-in-place reinforced concrete, cold-formed steel, and hot-rolled steel. It is aimed to compare 3DCP with other methods in terms of construction time and cost. Except for precast modular concrete, 3DCP has been shown to reduce construction time by approximately 95%. Additionally, 3DCP has been found to be the most cost-effective. Weger et al. (2021) examined the first 3D printed residential building constructed in Beckum, Germany. Data regarding the concrete material used in the project, architectural design, and planning process were presented. Details were provided regarding the procedure followed in this new construction method. Ooms et al. (2021) proposed a numerical model for simulating the structural behaviour of 3DCP. A parametric tool has been developed for creating finite element models without requiring extensive manual modelling. With this tool, the structural behaviour of a randomly shaped object is simulated during 3DP. Anton et al. (2021) presented an automatic 3DCP process for columns of different geometries. An evaluation method was proposed on the typologies of columns with complex geometries and inferences were made regarding prefabrication.

The number of studies on corner-wall combinations is limited. The general aim of these studies is to ensure constructability. In this direction, stability in terms of material and geometric form becomes important (Cha et al. 2022). Gündüz and Özkar (2024) created a free-form wall module with clay building material and produced prototypes with 3DP by creating a locking system from the corners of these modules. Martínez-Rocamora et al. (2020) planned 3D printed wall designs with different curvature angles and aimed to reduce material consumption. In addition, cost savings have also been made. Literature studies examining the effect of circularity in 3DP are also limited in number. The positive effect of circularity in different construction systems is emphasized (Almalki et al. 2023; Belniak et al. 2013; Chang and Park 2022; Takva and İlerisoy 2023b). In studies focusing on circular walls in 3DP, it was observed that the stability of the structure increased (Khan and Koç 2023; Suiker et al. 2020). This study focuses on the research gap on the effect of circularity on geometric form in 3DCP.

In literature studies, it has been observed that 3DP technology has different applications related to architectural design in the construction industry. In the studies, it has been observed that laboratory environment is generally used as the printing place and environmental conditions (such as humidity, temperature) are taken into consideration (Khosravani et al. 2020). It has been observed that improvements have been made mostly in structural terms on a subject basis. In recent years, there have been studies focusing on materials and structural analysis suitable for 3DP in the structural design (Delavar, Chen, and Sideris 2024). In addition, optimizations have been carried out for architectural design. In the improvement of existing studies, while the use of less material and more durability are at the forefront in structural terms, the focus is on geometric form and aesthetics in architectural terms (Gebel et al. 2024; Miri, Baaj, and Polak 2025; Takva et al. 2024). When looking at the challenges of improvement, the importance of the material and printer equipment comes to the fore. The fluidity of the material content, its integration into 3DP and extrudability affect efficiency. In addition, printer speed, nozzle size and printer movement area are also limiting factors (An, Zhang, and Yang 2024; Hassan et al. 2024).

Based on the given studies from the available literature, it has been seen that three main elements come to the fore in the 3DCP process: 3D printer and technical equipment, building material, and the final product. In the study, prototypes were produced by integrating these three parameters. The final products were obtained by establishing binary connections between 3D printer-building material, 3D printer-final product, building material-final product and triple motivations between 3D printer-building material-final product. After the 3D printer and technical equipment were made ready for printing in the laboratory environment, cement-based mixture experiments were conducted and the optimum material recipe was reached. Focusing on building production with the obtained concrete material, computer-aided architectural designs were made for the final product. In the two-stage planned methodology, first the effect of the same architectural design on 3DCP was examined by creating different corner-wall combinations. Secondly, architectural designs were planned on a building scale of 80 square metres using different geometric forms. Basic-chamfered geometric architectural design alternatives were developed and the external walls of the designs were transformed into prototype products with 3DCP. Two-stage 3DCP prototype products were compared with building evaluation parameter to examine the effectiveness of architectural design decisions. Geometric designs showing optimum behaviour were determined and constructible, low-cost and mass-producible forms suitable for rapid prototyping were demonstrated.

2. Materials and methods

The study consists of four main stages: (i) the development of architectural design alternatives, (ii) the digital planning of designs, (iii) the 3DCP process, and (iiii) comparative analysis and evaluation. A workflow towards digital fabrication was followed by applying different steps at each stage (Figure 1). In the methodology, attention was paid to obtaining a comparable framework by focusing on the production of prototypes of architectural designs as a result of digital fabrication with 3DCP (CAD to CAM). At this point, analyses were conducted with building evaluation parameters obtained from the literature. The geometric form, which offers the best solutions among architectural designs, has been emphasized.

In the study, controlled and balanced planning was made by creating architectural designs with the same square metres and dimensions. The performances of digital and physical output products in geometric detail designs were investigated. Solutions to the following research questions were sought in architectural design alternatives;

(1) How do corner-wall combinations in form decisions affect building construction parameters (printing time, material usage, buildability, defect analysis, cost, and mass producibility) in 3DCP?
(2) What is the potential of chamfered corner turns in basic geometric forms (square, rectangle, hexagon, and octagon) in the construction process?

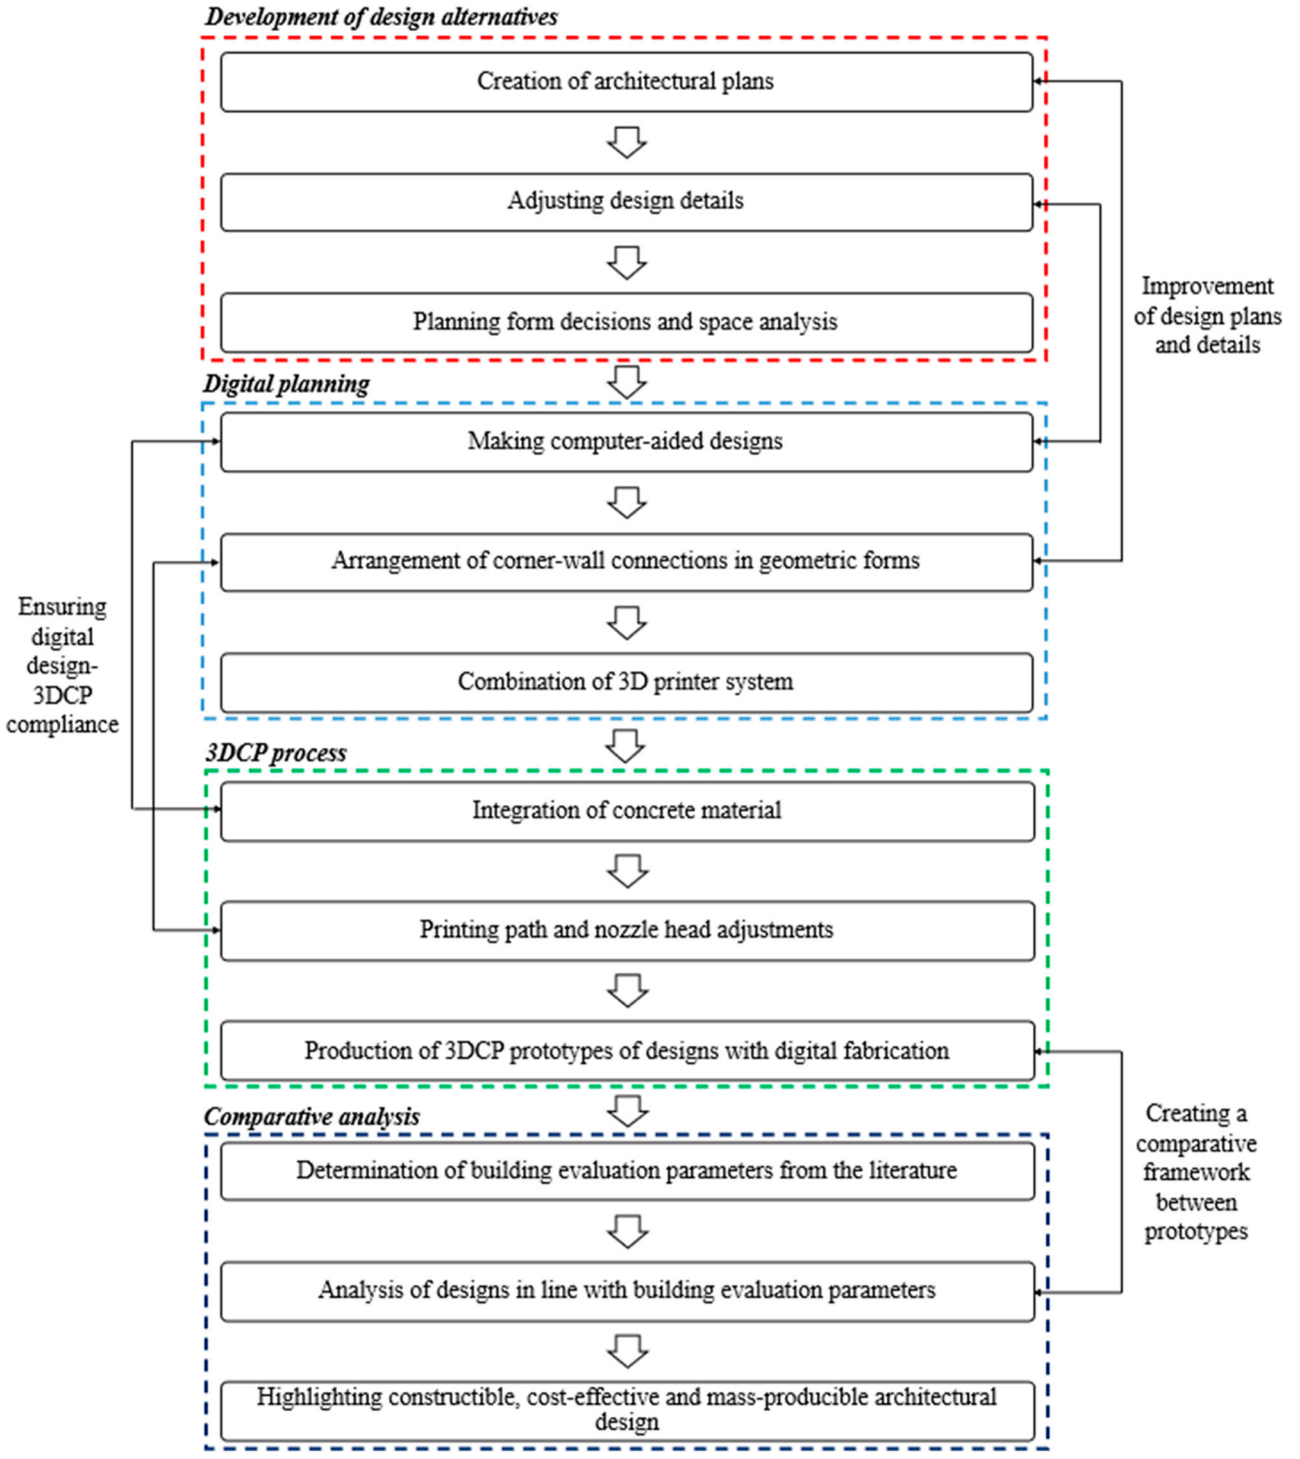

Figure 1. Workflow diagram of the methodology consisting of 4 main stages.

In order to make effective evaluations of the research questions, a road map was drawn, especially for the circularity of the connections in two different planes, by examining the buildings built in the 3DCP production strategy and the studies in the literature. The steps in the flowchart of the study were followed (Figure 2).

In the study, alternative solutions were first developed by creating architectural plans. Residential architectures that differ from each other in formal terms were created and no differences were made in the spatial layouts. The main criteria in evaluation are corner-wall combinations and geometric form decisions. Standard dimensions were applied in space solutions. Parker Morris Standards prepared by the UK Government to determine minimum space standards in residences were taken into account. In the first stage of the design process, the effect of corner-wall connections on 3DCP was examined. To observe the effect of chamfered corner combinations on the same architectural plan geometry, three different space formations with basic-chamfered walls were created (Figure 3).

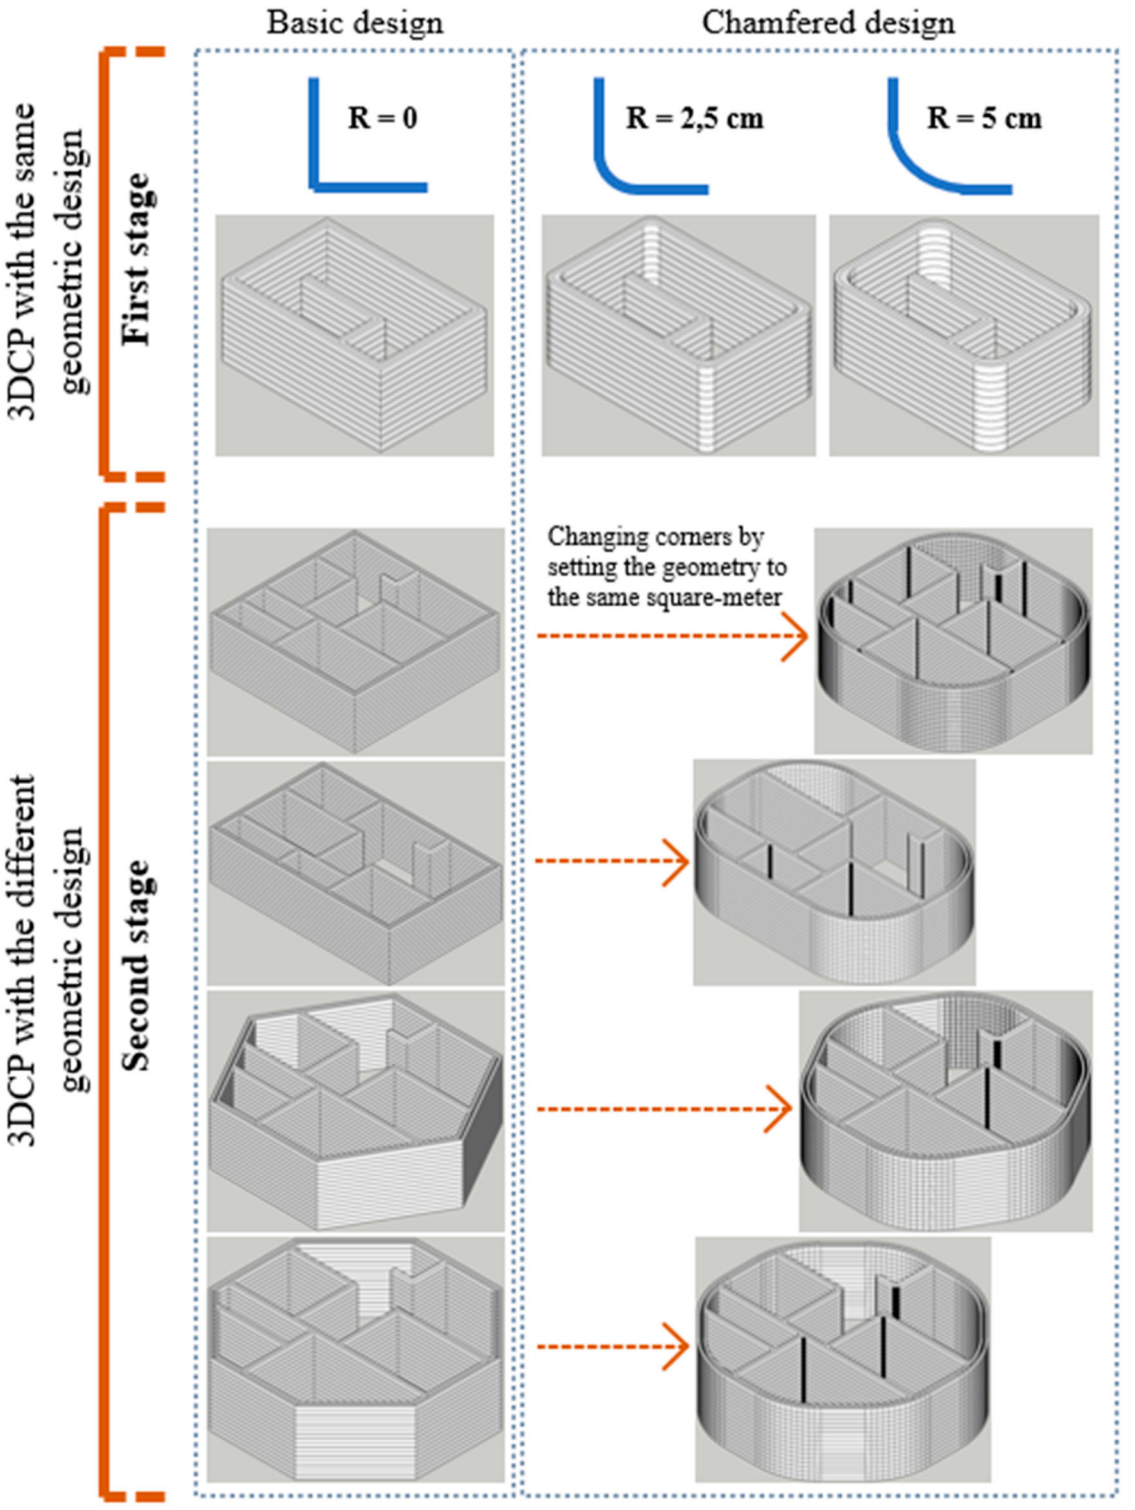

Figure 2. Two-stage 3DCP flowchart by developing design alternatives.

According to Parker Morris Standards, 80 square metres, which is the minimum area of a 3-room house for 5 people, is the basic space parameter in the design process (Buxton 2021; Goodchild and Furbey 1986). Four simple geometric form decisions, namely square, rectangle, hexagon, and octagon, according to the determined floor area, were determined as the second independent variable after corner-wall combinations. Since the inertia of geometric forms changes, the chamfering of planes that meet at different angles becomes important in terms of whether similar behaviours are exhibited. In geometric form-based space solutions, space layouts are kept the same in the functioning schemes designed as central (square, hexagon, and octagon) and linear (rectangle). At the point of production, the thickness of the building elements, window and door gaps and roof construction were taken as constant. The spatial units of the residences were created in line with the operation schemes.

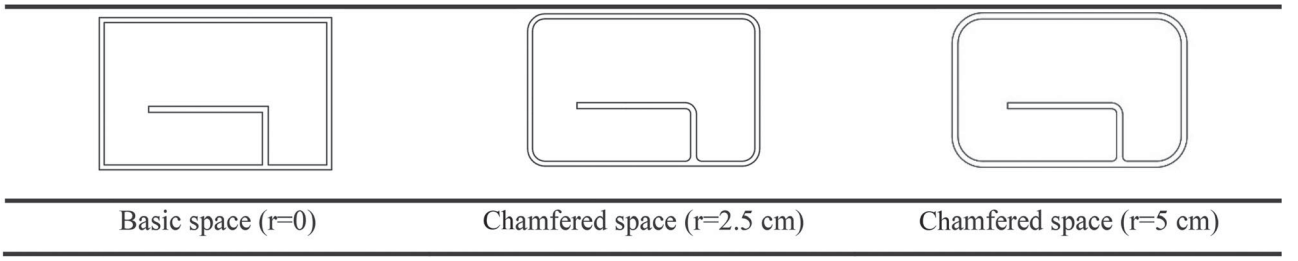

Figure 3. Plan plane of 3 different space formations.

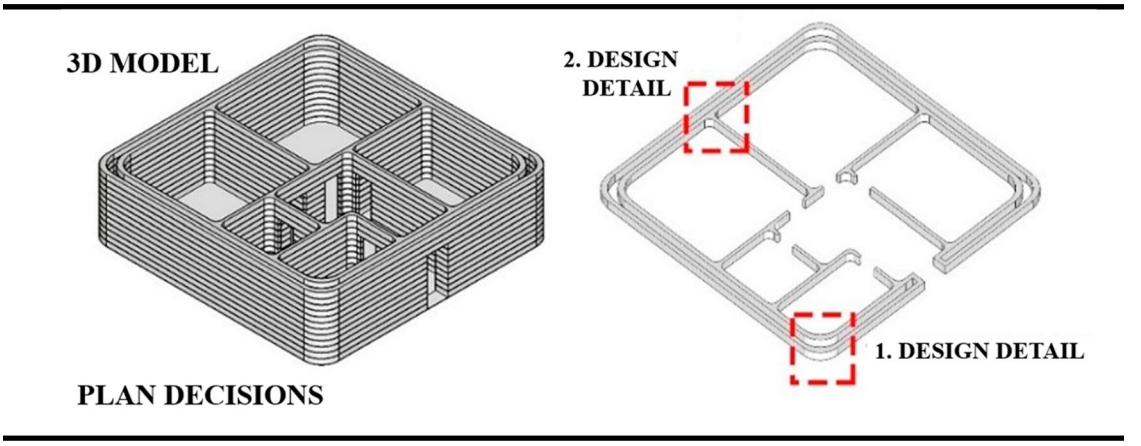

Figure 4. Variables in the digital planning process.

Corner geometries of basic forms were also considered as independent variables in plan configuration. Corners, which represent the union of planes on two different axes, affect both aesthetics and construction processes depending on their angular situations. For this reason, in addition to the basic geometric shapes that count the same square metre in plan solutions, forms with chamfered corner turns were produced. During the digital planning of design alternatives and preparation for the 3DCP process, the residences designed in different geometries were adjusted in the computer environment. In digital planning, the designs were checked with software and adapted to the 3D printer (Figure 4). The materials used in the control process and the system architecture produced are an important part of the efficiency of the 3DCP process.

In the preliminary stage of 3DCP, the steps given in Figure 5 were followed during the analysis process using computers and simulation programmes. First, architectural designs were created in 2D on the plan plane in the AutoCAD programme and then turned into 3D solid models. Solid models integrated into the Ultimaker Cura programme were saved in the '.stl' file format. Secondly, the slicing process of the building models was carried out by taking the parameters within the scope of the printer, environmental qualities and material properties as constant. Features in the Ultimaker Cura programme were used to integrate solid models into the printer and assign materials. Plans were made for real scale (1/1) printing and accordingly, a printer system with dimensions of 12 × 12 m was created, depending on the length and width data of the designs. A circular nozzle was used in the printer system and the diameter of the nozzle mouth was arranged as 10 cm. Depending on the dimensions of the nozzle, the layer height was taken as 10 cm in order to perform the slicing process. Since a 10 mm diameter nozzle head, which was also used in previous studies (Khan et al. 2024b), was used in the 3DCP of scaled prototypes, a 10 cm nozzle head was taken in digital planning due to its proportionality.

After the printing path simulations were made in Ultimaker Cura, the Autodesk ArtCAM programme was used to effectively capture G-code data to ensure the integration of architectural designs into the printer. Scaled designs have been tested to measure the impact of independent variables. A printing path was created by introducing G-code values to the 3D printer. In digital printing, it is aimed to measure buildability parameters without support (Table 1). The performances of the printable models were compared in terms of printing time and material usage and crossed with independent variables.

This phase of transition to 3DCP is the process in which the data obtained from the digital environment is put into real-life application. In this process, buildability with 3DCP was investigated. In order to prevent variations due to material, printer type, and production environment, all variables related to these components were taken under control and the focus was only on the production of structures with formally different architectural design decisions.

Prints were made using the in-situ casting technique using a cement-based mixture. To conduct the printing process successfully, the 3D-printable cementitious mixture, which was prepared following the methodology used in the authors' previous study, was utilized (Takva et al. 2024). The selected cement-based mixture has a viscosity that will not cause restrictions in the process of adjusting operational parameters. The mixture consists of traditional Portland cement, water, quartz sand (< 2 mm), and various additives such as superplasticizer

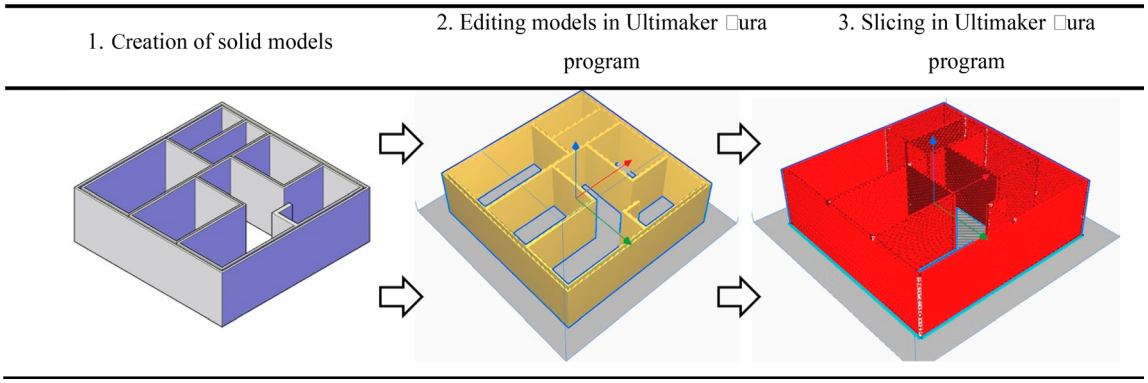

Figure 5. Steps for 3DCP in the computer-aided design and digital fabrication process.

(Polycarboxylate-based), setting retarder (Citric acid), and viscosity modifier (Methyl cellulose-based). These additives were used to optimize the rheological properties of the mixture for 3DP. The proportions of the 3D-printable cement-based mixture are detailed in Table 2.

A 3D printer with dimensions of 100 × 100 × 40 cm in the laboratory environment was used for the synthesis of prototype products with the cement-based mixture compatible with 3DCP (Ilcan et al. 2022; Khan et al. 2023a; Khan et al. 2023b; Khan et al. 2024b; Şahin et al. 2021). The printer and equipment where the 3DCP process is performed are seen in Figure 6 (İlcan, Külak, and Şahmaran 2024). Real-size architectural designs were adjusted according to the 3DCP system in digital planning, and comparable frameworks of scale prototype products were created with building evaluation parameters among themselves. Stability-governed buildability parameters were obtained as a result of comparative analysis of experimental outputs depending on stiffness. In this context, the 3DCP data of the prototypes enabled the evaluation of stability-governed buildability parameters. Based on reasons such as the difficulty of detecting structural problems on a large scale, cost, and material consumption, the formation of the design and technical fiction was analyzed through small-scale outputs, and adjustments were made at positive or negative points in the design by going back depending on the cycle.

Different scales were used to analyze each selected independent variable in detail. In the first stage of the printing process, it is aimed to understand the advantages and disadvantages of interior-exterior, interior-interior, and exterior-exterior wall combinations in space formations in the 3DCP process. To observe the effect of chamfered corner combinations, 1/10 scale prints of three different space designs with basic-chamfered walls were taken. In the second stage of the printing process, the outer walls of 8 different geometries were printed in order to understand the effect of the form decision on the printing in the 3D printing of fixed variable geometric forms. Considering the lengths in the printable area of the printer, 1/25 scale was preferred to achieve the widest direction and length.

A discussion environment was created during the comparison of post-printing structure production parameters. One of the objectives of the study is to identify possible errors and deficiencies by investigating the design parameters on the final products and to reveal the effect of the details through comparative analysis in line with the examined parameters. Building evaluation parameters created based on research results obtained from the literature show the effectiveness of design decisions that are changed in a controlled manner in buildings with the same architectural plan (Table 3). Printing time, material usage, buildability, defect analysis, dimensional consistency, cost, and mass producibility parameters were used to compare 3DCP prototypes.

3. Findings

Depending on the structural features of the 3D printer, factors such as hardware and motion control are kept under control. The open time, which is the time during which the concrete material can flow through the 3D printer's nozzle uninterruptedly and without clogging, was taken as constant. While a nozzle head with a diameter of 10 cm was used in the digital planning phase based on real-scale, a nozzle head with a diameter of 10 mm was

used in the 3DCP of the scale prototypes. By adjusting the height of the nozzle head, it is aimed to extrude the concrete material efficiently and idealize the layer height. Mix design of concrete material was done and such as workability and setting time, were idealized according to the geometry, size and complexity of prototype prints of architectural designs. The printing speed of the 3D printer was taken as 50 mm/s. Environmental factors (temperature, relative humidity, wind) in the laboratory environment were taken into consideration.

3.1. Printing process of corner-wall combinations

The aim at this stage is to determine what role these parameters play in the printing process of 3 designs with the same architectural plans, by changing only the corner-wall combinations. The extent to which corner-wall combinations change the performance of the printer according to the circularity effect and their pros and cons within the scope of buildability were examined. Circularity means a curvilinear path where the nozzle does not move linearly. Circularity effect is the comparison of geometric architectural designs depending on the performance of the 3D printer in curvilinear turns with different diameters. The radius (r) in the designs was changed in order to observe the circularity effect. In this direction, 3 different designs were printed: basic space (r = 0), chamfered space (r = 2.5 cm), and chamfered space (r = 5 cm). In terms of softening corner turns, the outputs also differ. During the printing processes, all geometric designs were collapsed (Figure 7).

According to the 3DCP views in Figure 7 of the space designs with interior and exterior walls shown in Figure 3, it has been observed that the interior walls have greater stability and have not collapsed. Since the external walls consist of a single wall line, their stiffness is lower and therefore they were collapsed. According to the comparison of basic and chamfered space designs, it has been seen that the chamfered space (r = 5 cm) design provides advantages in terms of buildability and applicability in most parameters. Among geometric forms;

- In printing time, chamfered space (r = 5 cm) on a single layer provided an 11.5% advantage over chamfered space (r = 2.5 cm) and 12.25% advantage over basic space.
- In terms of material usage, 2% savings were achieved in the chamfered space (r = 5 cm) on a single layer compared to the chamfered space (r = 2.5 cm) and 5% compared to the basic space.
- In terms of collapse height and number of layers, the chamfered space (r = 5 cm) reached a 31.4% higher position than the chamfered space (r = 2.5 cm) and 40% higher than the basic space.
- According to the perimeter length, the chamfered space (r = 5 cm) covers a perimeter 2% less than the chamfered space (r = 2.5 cm) and 5% less than the basic space.

3.2. Printing process of geometric forms

By keeping the printer and material parameters constant, it is aimed to highlight the effect of geometric forms in the printing process. To create a comparable framework between geometric forms and to realize an efficient 3DCP, the focus was on the printing time in single layer printing, material usage by weighing, collapse heights calculated according to the number of layers, and the maximum number of layers reached during the printing process.

Increasing the number of sides in central forms (square, hexagon, and octagon) where the centre of gravity is at the

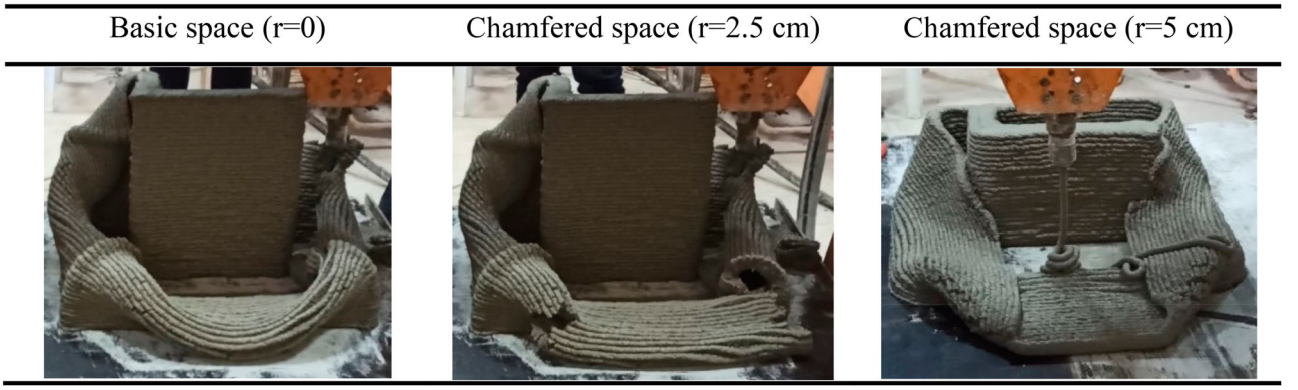

Figure 7. Collapse views of basic and chamfered space designs.

midpoint accelerates the transition towards circularity. The purpose of comparing these forms is to examine to what extent the printing parameters change as we move towards circularity. During the printing processes, square, hexagon, and octagon forms were collapsed. The hexagon and octagon form collapses towards the centre of gravity due to its central geometry. Although the square is a central form, two sides are collapsed towards the centre of gravity and two sides are collapsed opposite the centre of gravity. Hexagon showed the best performance in printing time, octagon in material usage, octagon in collapse height and octagon in the number of layers. In geometric forms;

- In printing time, the hexagon provided a 20.5% advantage over the square and 2.22% advantage over the octagon on a single layer.
- In material usage, octagon geometry on a single layer saved 10.46% compared to square and 2.13% compared to hexagon.
- In terms of collapse height and number of layers, the octagon reached a 31.11% higher position than the square and 26.67% higher than the hexagon.

Comparisons were also made between the basic forms and their designs consisting of chamfered wall combinations. In this regard, square-chamfered square, rectangle-chamfered rectangle, hexagon-chamfered hexagon, octagon-chamfered octagon geometries were discussed. In terms of softening corner turns, the outputs also vary. During the printing processes, the architectural designs of the basic forms were completely collapsed, while only the rectangle form was collapsed in the chamfered designs. Chamfered designs of square, hexagon and octagon geometries have reached the maximum height that the 3D printer can print (Figure 8).

Looking at the square, rectangle, hexagon, and octagon forms and the chamfered designs of these forms, chamfered octagon showed the best performance in printing time, chamfered hexagon in material usage, chamfered square, chamfered hexagon, and chamfered octagon because it did not collapse at collapse height, and chamfered square, chamfered hexagon, and chamfered octagon in the number of layers. As a result, it has been observed that chamfered forms generally perform better in terms of buildability than basic forms. Among the chamfered forms, it was determined that hexagon and octagon forms showed very similar behaviour and were at the forefront compared to other forms. Among geometric forms;

- In printing time, the chamfered octagon on a single layer provided a 2% advantage over the chamfered hexagon, which performed closest to this form, and a 23.6% advantage over the rectangle, which performed the furthest from this form.
- In material usage, the chamfered hexagon on a single layer saved 0.1% compared to the chamfered octagon, which performed closest to this form, and 14.25% compared to the rectangle, which performed the furthest from this form.
- In terms of collapse height and number of layers, chamfered square, chamfered hexagon, and chamfered octagon, since they did not collapse, reached a 21.25% higher position than the octagon, which performed closest to these forms, and 49.25% higher than the rectangle, which performed the farthest from these forms.

4. Discussions

By comparing the results obtained from 3DCP processes consisting of 2 different stages, inferences regarding the research gap in the literature are presented. According to the parameters that play an active role in 3DCP, buildability, cost and mass producibility parameters include and consist of other evaluation criteria (Figure 9). For this reason, in order for the evaluation to be effective, these parameters are given at the end of the discussion section.

Building evaluation parameters obtained from academic studies in the literature include comparative analyses of design decisions that are changed in a controlled manner in buildings with the same architectural plan and similar square metres. Data on the output products of architectural designs printed at 1/10 and 1/25 scales are shown in Table 4. Cost and mass producibility parameters were reached by developing a scoring system. The total cost analysis was conducted by considering both energy consumption and material usage during printing process for single layer. The total cost score was obtained from Table 7. Mass producibility score was obtained from the sum of printing time, material usage, collapse height, and cost.

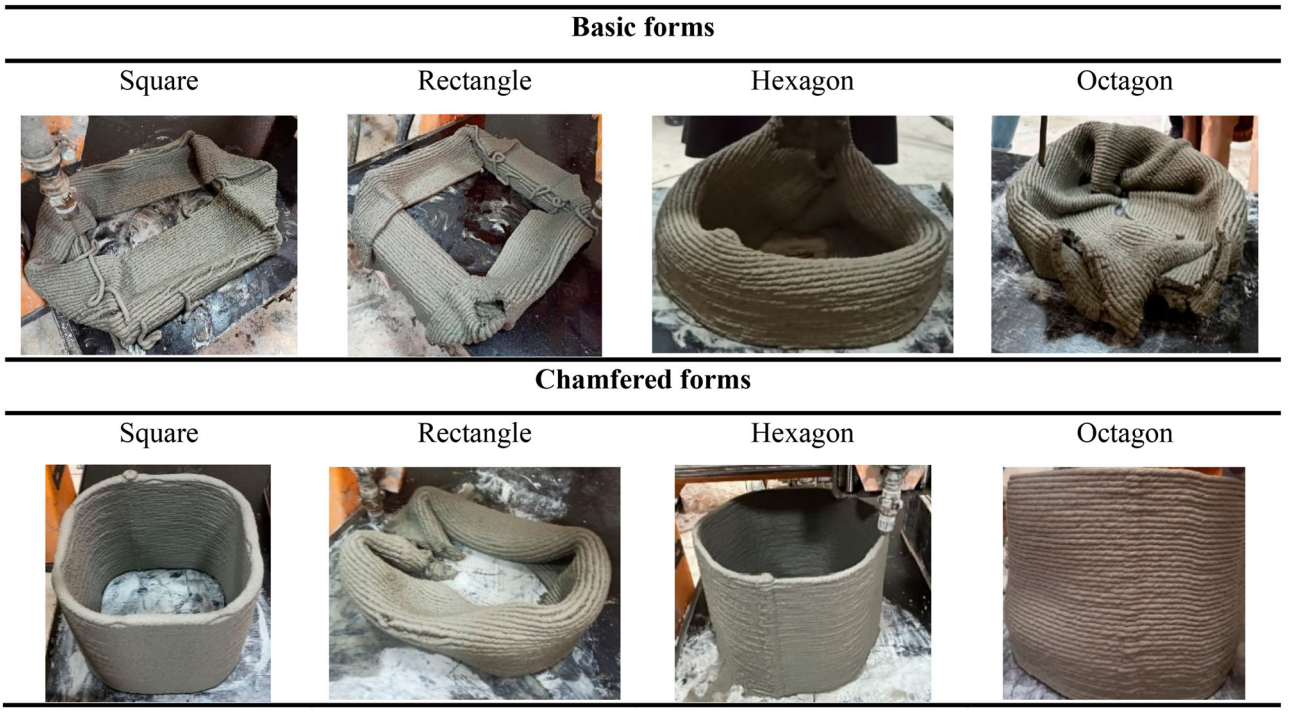

Figure 8. Collapsed views of basic forms and chamfered designs and non-collapsible geometries.

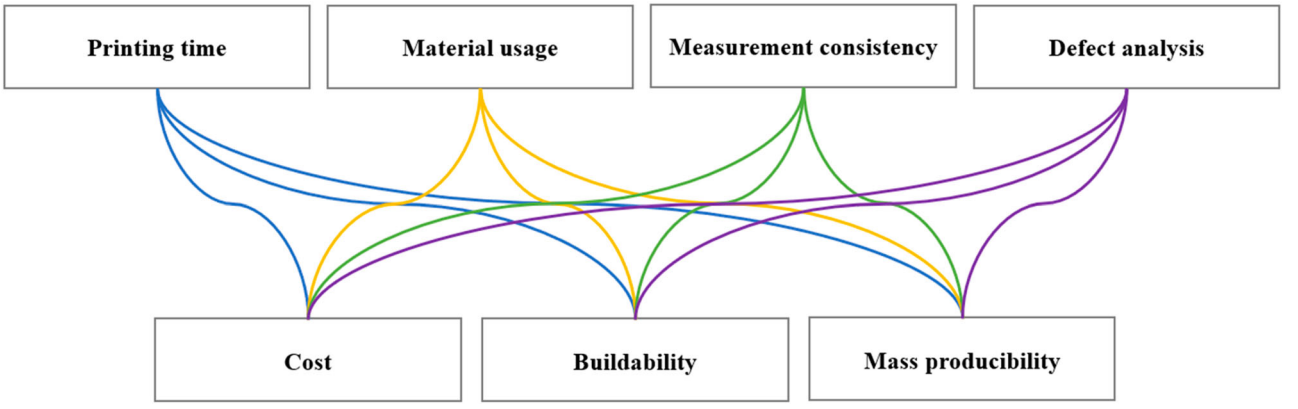

Figure 9. Parameters examined in the comparison of scale prototypes produced with 3DCP.

4.1. Printing time

Within the scope of the numerical data in Table 4, when evaluations are made in terms of printing times in both printing stages;

- It has been observed that the layer heights of chamfered forms increase compared to basic forms. This has shown that chamfered forms have more buildable heights. In both printing stages, the layer heights of the chamfered designs are higher than the basic designs.
- It has been determined that as the movement area of the nozzle head expands, the printing time increases. It has been observed that when the orientation is made towards circularity, the printing time is shortened. Additionally, it has been determined that steep turns (sharp turns) affect printing time.
- In the first printing stage, in the space plans where the effect of corner-wall combinations on 3DCP was measured, it was observed that the printing time decreased as the radius chamfer increased at the combinations points. In this context, the chamfered space ($r = 5$ cm) has the best performance.
- In the second printing stage, it was observed that the chamfered octagon showed the best performance among the architectural forms, reaching the maximum height in the shortest time. Chamfered hexagon and chamfered square come after this form and showed similar performance characteristics.

Evaluations have shown that corner-wall combinations and geometric forms affect structural performance during printing time.

4.2. Material usage

It has been observed that the weight and perimeter length of geometric forms increase in direct proportion, but deviations

Table 4. Printing data of architectural designs.

First stage; corner-wall combinations			
Space	Basic space (r = 0)	Chamfered space (r = 2,5 cm)	Chamfered space (r = 5 cm)
Printing time (single layer) (second)	35.1 (1)	33 (2)	30.8 (3)

Total mass producibility score	8	24	4	16	14	29	18	28

have been observed due to physical changes during printing (thinning-thickening of the printing filaments, accumulations in the corners). These deviations occurred at points where the nozzle's movement area was restricted or slowed down. This situation also negatively affects the 3DCP process. Irregular layer thicknesses in prototype products indicate that building construction will also be disrupted. For this reason, the 3D printer-material-geometric design combination needs to work in coordination. When total weights are evaluated in prototype printing of geometric forms;

- In the first printing, 2% was saved in the chamfered space (r = 5 cm), which showed the best performance on a single layer in terms of material usage, compared to the chamfered space (r = 2.5 cm) that performed closest to this form. Compared to the basic space (r = 0) that performs furthest from this form, 5% was saved.
- In the second printing, the chamfered hexagon, which showed the best performance on a single layer in terms of material usage, saved 0.14% compared to the chamfered octagon, which performed closest to this form, and 16.61% compared to the rectangle, which performed the furthest from this form.

According to data obtained with 3DCP;

- It has been observed that basic geometries are heavier than chamfered geometries. The reason for this is that the nozzle accelerates at chamfered corners and continues the printing path without material accumulation. This shows that basic geometries require a greater amount of material usage. The extrusion-fluidity of the material and the pumpability performance of the 3D printer system also affected whether the filaments formed uniform layers. The movement of the nozzle without material accumulation and deviations at the points where circularity is effective shows that it is advantageous for the rotations to be circular in wall joints. The positive effect of circularity in prototype products indicates that circularity can also be emphasized in large-scale architectural structures.

4.3. Buildability

Buildability with 3DCP enables different architectural designs to be adapted to real life (Huang, Xu, and Li 2022; Nguyen-Van et al. 2023). The focus is on the parameters of corner problems, cracks, collapse, inter-layer deflection amounts, and the height being different in each geometry due to collapse in the layers. The focus is on possible problems encountered in the 3DCP process and the causes of material accumulation. No significant collapse or cracking was observed due to the extrudability and other mechanical properties of the material. In this regard, no parameter has been found where the height is different in each geometry due to collapse in the layers. When prototype products were evaluated, it was determined that the concrete material was at a sufficient constructability level for 3DCP.

It has been observed that there are corner problems and interlayer deviations (overlap problem) in the 3DCP output products of space plans (first printing) and geometric forms (second printing) (Table 5). Material accumulations were detected in the basic forms of square, rectangle, hexagon, and octagon. According to printing processes;

- In space planning, material accumulation occurred at points where the axis of the basic space design (r = 0) changed. This situation arises from the position of the 3DCP architectural product in the coordinate plane (x, y, and z axes), the kinematic properties of the 3D printer system and the rheological characteristics of the material. Changing the coordinate plane in vertical turns (such as transition from x axis to y axis) resulted in the nozzle changing direction by waiting. For this reason, it has been observed that circular rotations have a positive kinematic effect in architectural design-3D printer collaboration.

Material usage (single layer) (gram)	417.19	374.18	430.1	382.79	385.74	368.81	377.68	369.35
Total cost (single layer) (US $)	0.2106	0.1888	0.2171	0.1931	0.1945	0.1860	0.1906	0.1863
Total cost score	2	6	1	4	3	8	5	7

- It has been observed that the circular nozzle slows down and material accumulates at corner joints due to angle or axis changes.
- Material accumulations were detected at the transition points to the upper layer in geometries such as chamfered square, rectangle, hexagon, and octagon.

It has been observed that layers often overlap in 3DCP products. It has been determined that the maximum amount of deviation between layers is 3 mm. While the layer width should be 10 mm under normal conditions, layer widths varying between 10–13 mm have been observed depending on this amount of deviation.

4.4. Defect analysis

The buildability of the material has been questioned along the exterior walls of geometric architectural designs. The fact that there are prototypes reaching a height of 40 centimetres shows the usability of the material for future studies. In the 3DCP of a prototype, the 3D printer operated continuously and the setting status of the material was observed. At this point, it was observed that the fluidity level of the material did not change and the adherence between the layers was achieved.

As seen in Table 4, in terms of printing heights, chamfered designs of square, rectangle, hexagon and octagon geometries were found to be more advantageous than basic designs. In this regard, it has been observed that as the circularity increases, the printable height increases, provided that the concrete material provides sufficient fluidity and bond strength. While material accumulation was observed in basic geometries due to the effect of the nozzle, it was not observed in chamfered turns. The results were made to detect possible defects encountered in the 3DCP process and the durability of geometric forms. Increasing the number of layers of geometric forms can affect the amount of collapse. The data obtained provided a road map for optimizing the 3DCP process and idealizing geometric designs.

4.5. Measurement consistency

Measurement consistency refers to the accuracy between digital planning and 3DCP final product regarding dimensioning. Digital/3DCP compatibility was checked as a result of taking G-code data with slicing programmes of the models designed through architectural modelling programmes and software integrated with 3D printers. Measurements and parameters of 3DCP prototypes are shown in Table 6. The extrudability of the concrete material flowing through the printer's nozzle has shown that there is consistency in the dimensions of the input-output products of the designs. In digital planning, arrangements were made according to the actual printing (1/1) with the Ultimaker Cura programme, and the printing time resulting from the digital analysis is given in Table 6. In the experimental 3DCP process, it was determined that the printing time of prototypes and digital planning was directly proportional. According to material use,

53.837 tons of material were used in the chamfered hexagon in digital planning and it provided advantages over other architectural designs. The fact that chamfered hexagon showed the best performance in material usage in 3DCP showed the stability between digital planning and 3DCP. This validates measurement consistency.

4.6. Cost

Cost provides input for determining economical architectural design, feasibility and mass production. The total cost analysis was conducted by considering both energy consumption and material usage during printing process for single layer. The energy consumption cost was calculated based on the power ratings of the individual components in the 3D-printing system – including the pump (1800 W), CNC router (320 W), and PC (80 W)-multiplied by the printing duration for single layer and the unit cost of electricity. The electricity rate was considered as ~0.14 US $ per kWh. For material costs, the unit price of the material (0.5 US $ per kg) was multiplied by the amount of material used per layer. Finally, the total cost was determined by combining the energy consumption cost and material usage cost,

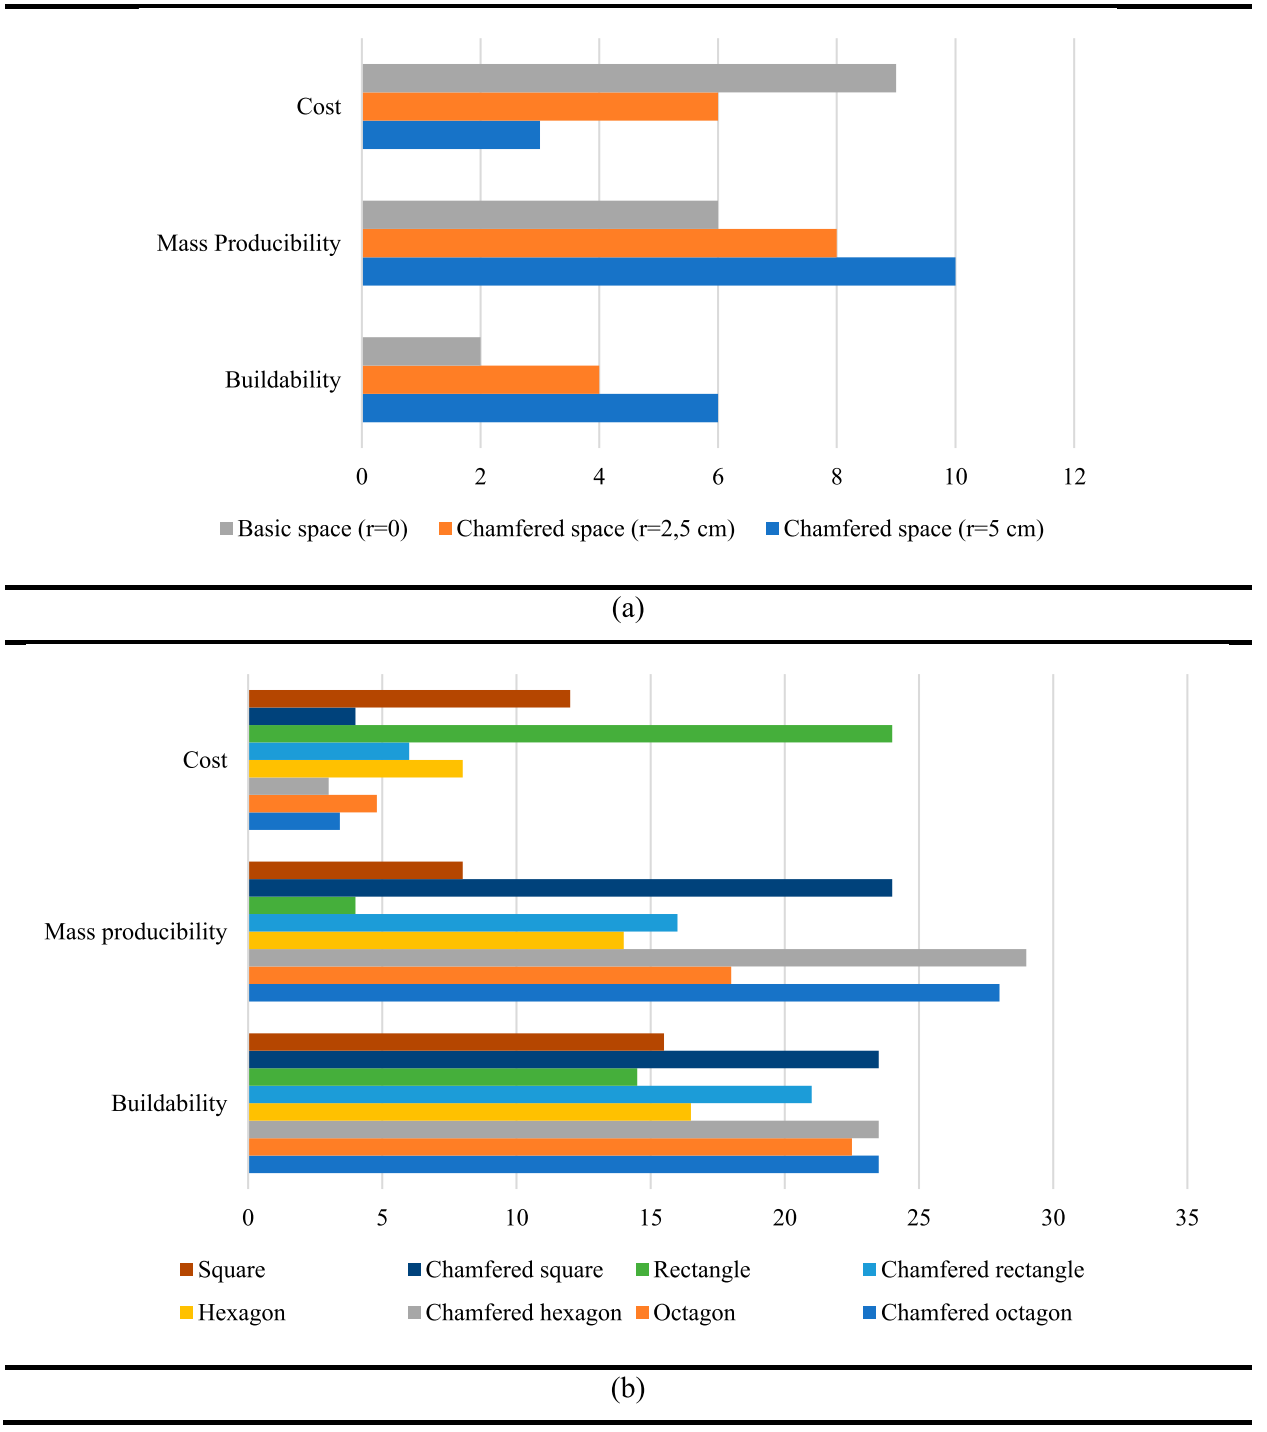

Figure 10. 3DCP results; (a) corner-wall combinations, (b) geometric architectural forms.

enabling a comprehensive comparison of operational expenses. At this point, the cost scores and economic levels of the designs were revealed (Table 7).

4.7. Mass producibility

The mass producibility is a combination of other building evaluation parameters. Based on the outputs obtained from printing time, material usage, buildability, defect analysis, and cost parameters, the best system was highlighted. Determining the mass production potential of the prototype product is critical to predicting future construction potential. In this context, effective results can be achieved by optimizing quality standards, cost and production efficiency activities.

As a result of the data, according to mass producibility scoring;

- In the first printing, the chamfered space (r = 5 cm) showed the best performance based on the total of evaluation parameters. It has been observed that chamfered corner turns and wall combinations provide advantages at many points compared to the basic space. In this regard, it can be said that chamfered joint details offer effective solutions in building production using 3D printers.
- In the second printing, chamfered hexagon and chamfered octagon showed the best performance in the total of evaluation parameters. Based on the data, chamfered hexagon and chamfered octagon geometries were found to be the best architectural plans for building production with the 3DCP construction method.

In the prototypes produced as a result of 3DCP, it was emphasized that structural and architectural design decisions are of critical importance. Designs with the highest values according to cost, mass producibility, and buildability scores showed the best performance (Figure 10). With the analysis, it was seen that space formations and geometric forms should be handled effectively in architectural design planning. The 3DCP steps laid out in the building construction process not only provide guidance on architectural design, but also serve as a reference for multidisciplinary decision-making processes.

5. Conclusions

As the aim and method of the study, 3DCP prototypes based on architecturally different corner-wall combinations and geometric forms were produced and evaluations were made with building evaluation parameters. Within the scope of the study, experiments were conducted on concrete building materials and a cement-based mixture was obtained. Traditional concrete mix design is not a mix design that is valid for production with 3DCP, and different characteristics are focused on to develop a printable building material that provides optimum conditions. These characteristics include extrusion (pumping) ability, multilayer constructability, open time, and adequate interlayer bond strength. The developed concrete material was analyzed in a laboratory environment on architectural designs planned with computer-aided modelling.

An analysis of architectural design decisions was conducted and a two-stage 3DCP planning was made. In the first stage, in line with the first research question stated in the methodology, the corner-wall combinations of the same architectural design were tested and the effectiveness of these decisions in 3DCP was examined. As a result of the analyses, the chamfered space (r = 5 cm) showed optimum behaviour. Chamfered space (r = 5 cm) was the most advantageous in terms of buildability and mass producibility. In the second stage, in line with the second research question stated in the methodology, architectural plan alternatives were developed and spaces were created by designing geometric forms in the same square metres. The design process included geometric arrangements and optimization of spaces used in architectural designs. In terms of cost, the octagon is the most suitable geometric form, followed by the hexagon, square, and rectangle. In terms of mass producibility, the octagon is at the forefront, followed by the hexagon, square, and rectangle.

3DCP technology has been used as a tool to evaluate various aspects of design and fabrication. In the implementation of a building, the chamfered octagonal geometry has come to the fore as a housing design that is constructible, affordable, fast solutions can be obtained and suitable for mass production. With 3DCP analyses using different forms, a housing solution that is suitable for prototyping and can be printed quickly for emergency situations has been achieved. It has been observed that hexagon and octagon geometric forms approaching circularity show ideal results. All the data obtained indicate that a residential structure created by the integration of chamfered octagonal architectural planning and chamfered corner-wall combinations will show optimum behaviour. In future studies, research will be conducted from lab-scale to large-scale in the 3DCP system, in light with the data obtained from the building evaluation parameters.

ABSTRACT

There are many parameters that affect the design, construction and performance of the 3D concrete printing (3DCP) construction process. The aim of this study is to identify and categorize those parameters that are effective in this process, to explain the prominent parameters because of the analysis, and to detail the 3DCP process and how it can be optimized. Therefore, this study optimizes the 3DCP process, which is an important sustainable construction technique. The information obtained from existing research identifies the effective parameters in 3DCP. These parameters were evaluated using the fuzzy AHP method by taking expert opinions. The prominent parameters are explained, and their importance is emphasized. As a result of the analysis, it is determined that material properties are the most important input in the process according to their importance/weight and their criterion level.

KEYWORDS

Sustainability, 3DCP process, Fuzzy AHP, 3D printed structure, 3D printer, Optimization

1. INTRODUCTION

3D printing (3DP) technology (additive manufacturing) is a digital fabrication tool that deals with the process of transforming a geometric representation into a physical object by adding material on top of each other (Shahrubudin et al., 2019). 3D products can be obtained as a result of the integration of the computer-aided design model with software suitable for 3DP. With nanotechnological advances in materials science, 3DP technology has rapidly advanced.

3D products can be made with polylactic acid (PLA) (Ferreira et al., 2017), metal and its alloys (Nichols, 2019), ceramic, clay-based mixtures (Chan et al., 2020; Chen et al., 2019), and cement-based mixtures (concrete) (Buswell et al., 2018). It is possible to see the effects of 3DP technology in health (Chen et al., 2020), agriculture (Crisostomo et al., 2021), automotive (Chinthavali, 2016), aviation (Koca et al., 2023), and similar industries. Developments in these industries have accelerated the mass production of 3DP products.

The construction sector is one of these sectors. Although production is slower compared to other industries with mass production, significant developments have been seen in recent years (Ali et al., 2022). Environmentally friendly and sustainable approaches, which are prominent in many sectors today, are also reflected in the construction sector, and 3DCP technology has an important place in this direction (Raza and Zhong, 2022). This technology offers a faster, more efficient and more economical construction process compared to traditional methods (Liu et al., 2022). In addition, 3DCP technology has made it possible to build more complex and aesthetic structures (Hunde and Woldeyohanne, 2022). Many companies and architectural offices operate in the construction industry and have made advances in construction techniques that employ 3DCP. Parameters such as materials, robotic systems, cost and labor force increasingly provide quality products and structural integrity (Žujović et al., 2022) of 3DCP constructions. Concrete construction material is at the forefront in the building production process. Based on the chemical and physical properties of concrete building material, it can be shaped due to its adaptability to 3DCP technology (Rollakanti and Prasad, 2022).

The number of academic studies contributing to developing 3DCP technology is increasing. 3DCP technology is now being evaluated in the fields of construction, performance and design (Gebel et al., 2023). Academic studies focusing on construction (Nguyen-Van et al., 2022) performance (Bai et al., 2023), and design (Bi et al., 2022) parameters accelerate the building production process using 3DCP. In addition, experimental studies on materials (physical and mechanical properties) also contribute to the durability and aesthetics of structures (Cui et al., 2022). The cumulative research on 3DCP for construction has advanced to the point where we can now indentify prominent criteria for the evaluation of effective parameters in the production of 3D concrete buildings.

Yang *et al.* (2023) reviewed 70 studies to show how nozzle design affects constructability. As a result, it was determined that nozzle travel speed, nozzle size, shape, and nozzle distance from the structure have the highest potential impact on printability. Tay *et al.* (2022) addressed the adaptive use of 3DP technology according to the variable physical properties of concrete building material. An approach was developed to create a functional concrete material by integrating printing parameters with filament property correlations in the material. It was found that the physical property of the concrete material is linked to the printer's flow rate and movement speed. With the optimized material, the strength-to-weight ratio of the structure improved by about 50%. Yuan *et al.* (2022) developed a real-time tool path planning and extrusion control mechanism. Material requirements, extrusion system and real-time control algorithm are discussed. An experiment was conducted to verify the stability of the algorithms and the control system. The results showed that the control system can be used in the building manufacturing process. Xu *et al.* (2022) showed that the production of a 3D concrete building is still in the development stage, suggesting the need for a workflow from design to construction. This workflow includes multidisciplinary studies such as design strategies, planning of the building site including the development of printing systems, material design and structural assessment. They emphasized the need to select appropriate materials and printers and construction methods to

Downloaded from https://jgb.kglmeridian.com at 2025-11-30 by collegepub@mindspring.com via Stephen Mosberg

produce building components for large-scale concrete printing. In the study by Heywood and Nicholas (2023), it was stated that 3DCP technology reduces the need for formwork, optimizes the use of materials and produces complex geometries without additional costs, making it a sustainable construction technology. However, it was emphasized that 3DCP needs more evaluation tools to measure its environmental impact.

Although studies have identified and developed parameters in the 3DP process, there has not been a comprehensive study in which all parameters are evaluated. Recognizing this research gap in the literature, this study aims to identify the effective parameters in the 3DP process and then evaluate these parameters with a multi-criteria decision-making method. Another aim of the study is to contribute to the development of the 3DP process for future studies and to make this technology more efficient in the construction industry. The method of the study is to make evaluations in the light of the data obtained from the literature by conducting interviews with architects and engineers who are competent in their fields. Firstly, within the framework of the interviews with academicians, information about the parameters that may be effective in the 3DCP process was collected and various parameters that are effective in the 3DCP were determined by reviewing the literature and previous studies. In order to determine which of these parameters are effective in the 3DP process, Fuzzy AHP method was used in multi-criteria decision-making (MCDM) methods. This study will increase the quality and efficiency of 3DCP construction methods, products and structures by focusing on these prominent 3DCP parameters. This study will also offer direction for future research.

2. METHODOLOGY

Within the scope of this study, MCDM method was used in line with the objective of "determining and comparing the importance ranking of the factors that are effective in the process of printing a sustainable 3DCP." Decision-making is a process in which alternatives are evaluated to select a choice or course of action to achieve desired goals and objectives. This process starts with first recognizing and defining the problem. These problems are based on multiple criteria and some of the criteria that will affect the decision may conflict with each other (Wu and Abdul-Nour, 2020; Penadés-Plà et al., 2016).

This study's main problem is determining the effective parameters in the 3D concrete building production process and explaining the prominent parameters among these parameters. The 3DCP process, which is an innovative technology, shows that a series of interconnected parameters affect the results (Yang et al., 2023; Tay et al., 2022; Huang et al., 2022; Yuan et al., 2022; Xu et al., 2022). This study, then, becomes a multi-criteria decision-making problem using different aspects in this context. Evaluating and optimizing different parameters together has the potential to increase the efficiency and results of the 3DCP process. The steps followed in this study are given in Figure 1.

2.1 Determination of Design Criteria through Problem Structuring and Content Analysis

The first phase of the methodology was carried out through content analysis (Table 1) and interviews with subject matter experts. Simultaneously, the printers and equipment that influence the printing process were also analyzed (Figure 2). The building production process encompasses many sub-processes, including concrete material mixing, integration into the printer via a pump and the actual printing of the final product. To optimize the printing process with a holistic

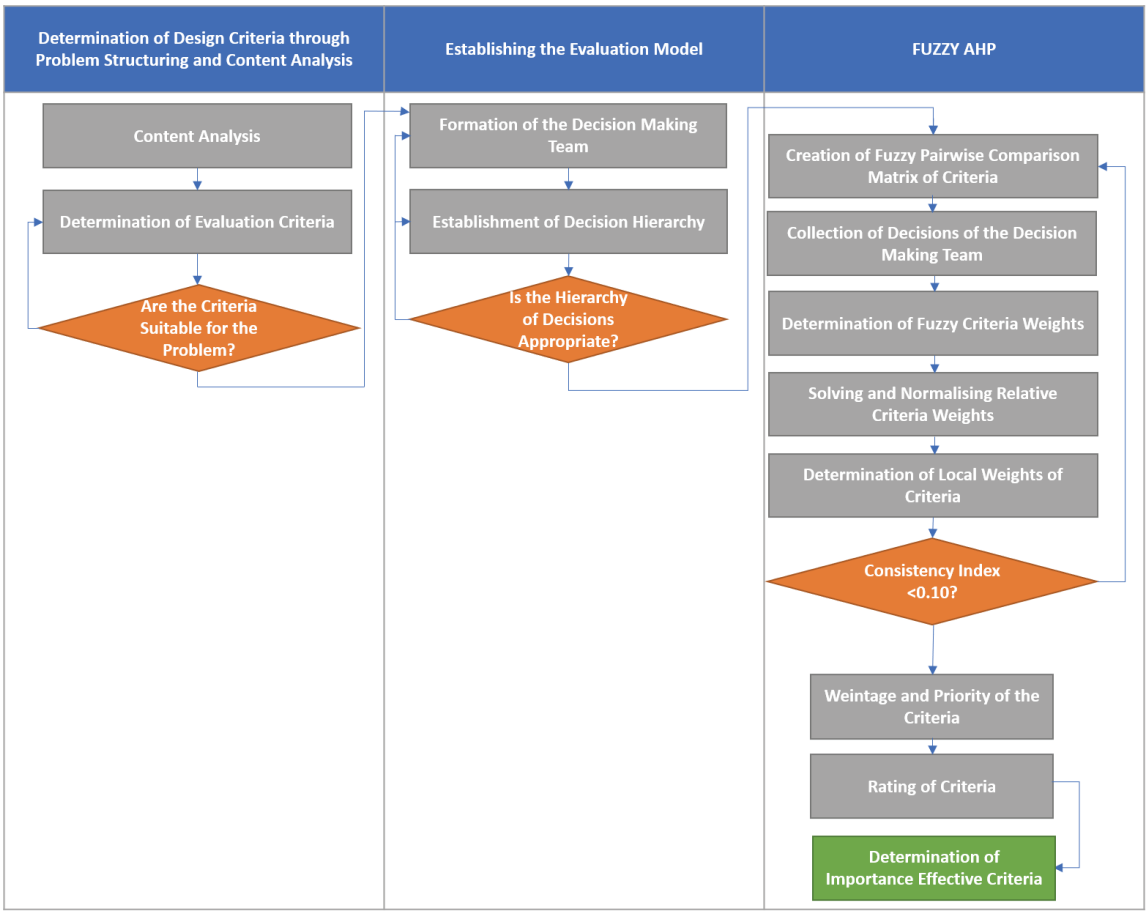

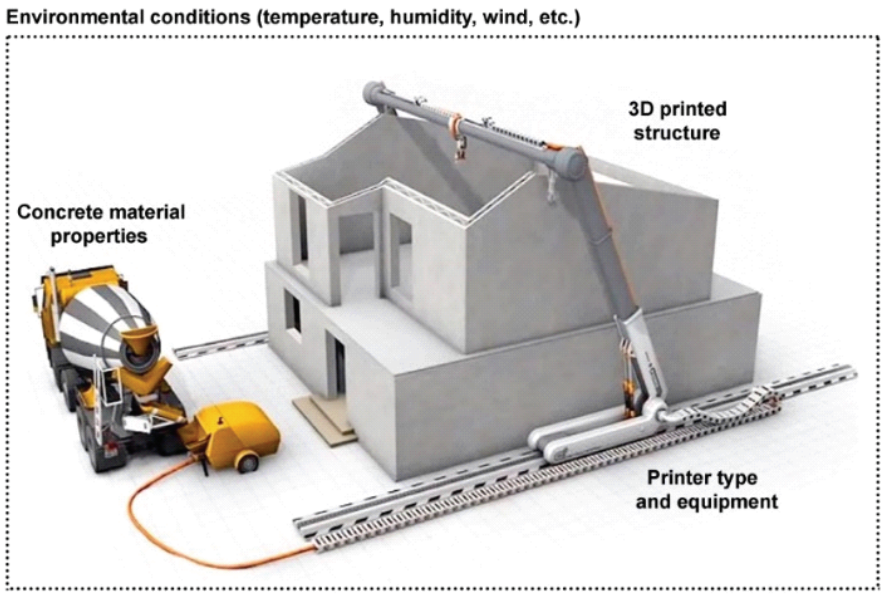

FIGURE 2. Parameters that are effective in the 3DCP process.

Downloaded from https://jgb.kglmeridian.com at 2025-11-30 by collegepub@mindspring.com via Stephen Mosberg

approach, thus achieving an efficient production process, the effects of all parameters affecting the printing process were evaluated at this stage. As a result, we identified and described four main categories into which these parameters can be classified: printer, material, 3DP structure and environmental conditions.

First, the **printer feature parameter** is linked to the structural characteristics of the 3D printer. The change of printer types changes the efficiency, cost and construction process of the printing process. At this point, the printer's feature is important in the 3DP process. Structural characteristics include factors such as printer on-time, nozzle size and motion control, as well as hardware-related ones. The second is **the material property parameter**. It is related to the physical and mechanical properties of the material used in the 3DP. Mixing ratios vary depending on the material recipe. The use of different materials or different mixing ratios of the components in the same material is effective in the final 3D-printed product. In this context, material usage plays an important role in the printing phase. In this study, since concrete material will be printed with a 3D printer, properties such as the fluidity of the mixture and setting time were taken into consideration to evaluate the properties of concrete. Thirdly, the **properties of the final product produced with the 3D printer** is considered. In the final product, static and aesthetic factors are important, including factors such as the structure's geometry, size and complexity. Printer and material properties also change as the final product is printed from small-scale industrial products to large-scale structures. As the complexity of the product increases, complex approaches are adopted in the printer and material. Therefore, the final product is of critical importance in 3DP. Finally, the **environmental conditions parameter** includes various external factors affecting the 3DP, such as temperature, humidity, etc., that are relevant for the other parameters to work effectively. The wide-ranging effects of environmental factors must be considered in every printing process. A printing area should be created where the printer can work actively, and the material will not be affected by the physical environment. In this respect, the printing environment directly or indirectly impacts the final product. In order to make a clear assessment of each main category affecting the effectiveness of the 3DP production, literature studies affecting each parameter are given in Table 1.

The open time in the **printer feature parameter** is the time that cement or similar materials can flow through the nozzle of the 3D printer without interruption and clogging (Jo et al., 2020). According to previous studies, the printing times of printers that can print small and large-scale products are different. During the time the machine is on, the hardware that makes up the printer heats up due to factors such as heat dissipation and friction. In this case, the structural tolerance of the printer decreases and deviations can be seen in the print path of the printer (Mueller et al., 2015). ***Nozzle characteristics*** include parameters such as the speed of movement of the nozzle, the size of the nozzle tip, and the nozzle's height. These are the factors that play a major role in structure production when printing cementitious materials. Nozzle characteristics are important to optimize print quality and make the printing process more efficient (Jo et al., 2020; Bos et al., 2016; Tay et al., 2016). ***Motion control*** determines the movement of the nozzle and how the material is layered to form the object to be 3D printed. Changing the motion characteristics can affect printing speed, angle, and distance. As the speed at which the nozzle moves increases, the printing speed can also increase. Similarly, changes in the ability to move in different axes can cause changes in printing angle and distance. Motion control ensures that printers operate accurately and ultimately improves production quality. In addition, it helps to manage printer motion more efficiently, improving energy efficiency (Zhao et al., 2019).

	P.3. Motion Control	Bos et al., 2016 Lyu et al., 2021 Zhao et al., 2019	E. Environmental Condition Parameters	E.1. Relative Humidity	Diggs-McGee et al., 2019 Ma *et al.*,2022 Moelich et al., 2022
M. Material Feature Parameters	M.1. Filling Density	Lyu et al., 2021 Qaidi et al., 2022 Ćwikła et al., 2017 Gosselin et al., 2016 Karalia et al., 2021		E.2. Temperature	Diggs-McGee et al., 2019 Ma *et al.*,2022
	M.2. Extrudability	Malaeb et al., 2019		E.3. Wind	Ma *et al.*,2022 Moelich et al., 2022
	M.3. Setting Time	Gunzel, 2021 Lyu et al., 2021 Özalp and Yilmaz, 2020		E.4. Radiation	Pacewicz et al., 2018 Siddika et al., 2020
				E.5. Chemical Material	Pacewicz et al., 2018 Siddika et al., 2020

The material property parameter is specific to concrete material and includes mix flowability, extrudability and setting time (Qaidi et al., 2022; Lyu et al., 2021; Gunzel, 2021; Özalp and Yilmaz, 2020; Malaeb et al., 2019; Bos et al., 2016). The ***flowability of the mixture*** is critical to ensure that the structure to be printed has the desired strength, durability and dimensional accuracy. The flowability of the mixture affects its ability to flow through the nozzle and the quality and accuracy of the printed structure (Qaidi et al., 2022). A mixture that is too thick or viscous can clog the nozzle, while a mixture that is too runny or watery can collapse or sag without hardening. ***Extrudability*** is the ability to continuously squeeze the concrete out of the nozzle and this property depends on the flowability. If the concrete is not fluid, it cannot be extruded, and if it cannot be extruded, the constructability mode cannot be achieved (Malaeb et al., 2019). ***Setting time*** is related to the strength gain of concrete. It should be fast and in

Downloaded from https://jgb.kglmeridian.com at 2025-11-30 by collegepub@mindspring.com via Stephen Mosberg

accordance with the required stiffness to prevent deformation of the layers (Lyu et al., 2021; Gunzel, 2021; Özalp and Yilmaz, 2020). The parameters evaluated under this parameter are criteria that contribute to sustainability; sustainable concrete material should have low natural energy requirements, low waste, durability and high thermal mass to minimize their total environmental impact (Naik, 2007). Such concretes contribute to sustainability with low energy costs, high durability and low maintenance requirements.

The parameters of the constructed structure consist of wall design, filling denstiy and wall joint (Lim, 2023; Žujović et al., 2022; Karalia et al., 2021; Khan et al., 2021; Martínez-Rocamora et al., 2020; Ćwikła et al., 2017; Gosselin et al., 2016). In construction projects using 3D concrete printers, the design of the wall to be printed plays an important role in the printing process. In this process, the material properties, geometry and design of the wall type to be printed affect the print quality, durability and cost of the final product (Žujović et al., 2022; Khan et al., 2021; Martínez-Rocamora et al., 2020; Gosselin et al., 2016). ***Wall joints*** in 3D printing technology affect the strength, durability and overall performance of the structure (Marais et al., 2021; Suntharalingam et al., 2021; Wang et al., 2020). Form corner joints can be formed at different angles due to aesthetic, cost, durability and functional properties. Angled corner joints are generally simpler and less costly and increase the rigidity of the structure. It also provides an organic look in terms of visual appearance (Lim, 2023).

The environmental conditions parameter plays an active role in the 3DCP process. Humidity and temperature are among these factors (Wolfs et al., 2018). In outdoor printing processes, depending on temperature and humidity, the mixing ratios in the concrete material should be adjusted according to the printability and extrudability parameters (Diggs-McGee et al., 2019). Evaporation of moisture from pressurized concrete reduces the hydration of cement and affects the development of the mechanical properties of concrete. In addition, it has been observed that the concrete printing material is affected in the context of temperature and wind (Ma et al., 2022). Low humidity and high wind speed can increase evaporation from the surface of the concrete print (Moelich et al., 2022; Ma et al., 2022). Exposure to ultraviolet radiation and chemicals can also adversely affect the structure resulting from concrete printing. To prevent deterioration of the printed product's durability, environmental factors affecting the printing process should be carefully controlled (Siddika et al., 2020; Pacewicz et al., 2018).

2.2 Establishing the Evaluation Model

The selected parameters were then weighted and compared by a panel of experts. The experts' opinions and experiences were crucial in determining the weights of the parameters and criteria. The Fuzzy AHP method was used to evaluate the proposed model. The weights of the predefined criteria were determined with the input of eight experts. These experts came together within the scope of a scientific project and are competent in the subject. These experts consist of two civil engineering academics with more than 10 years of professional experience, actively engaging with 3DP, and contributing to academic research. Furthermore, this expert group comprises four architectural academics who develop projects in 3DP. The remaining two experts are mechanical engineering professionals working in the industry and holding managerial roles within their respective firms. Pairwise comparison matrices were generated using responses from the experts. The Fuzzy AHP weighting method was used to build the model, as there are both quantitative and qualitative criteria in the decision problem. The aim is to obtain more accurate results by converting qualitative evaluations into quantitative ones.

Downloaded from https://jgb.kglmeridian.com at 2025-11-30 by collegepub@mindspring.com via Stephen Mosberg

2.3 Fuzzy AHP

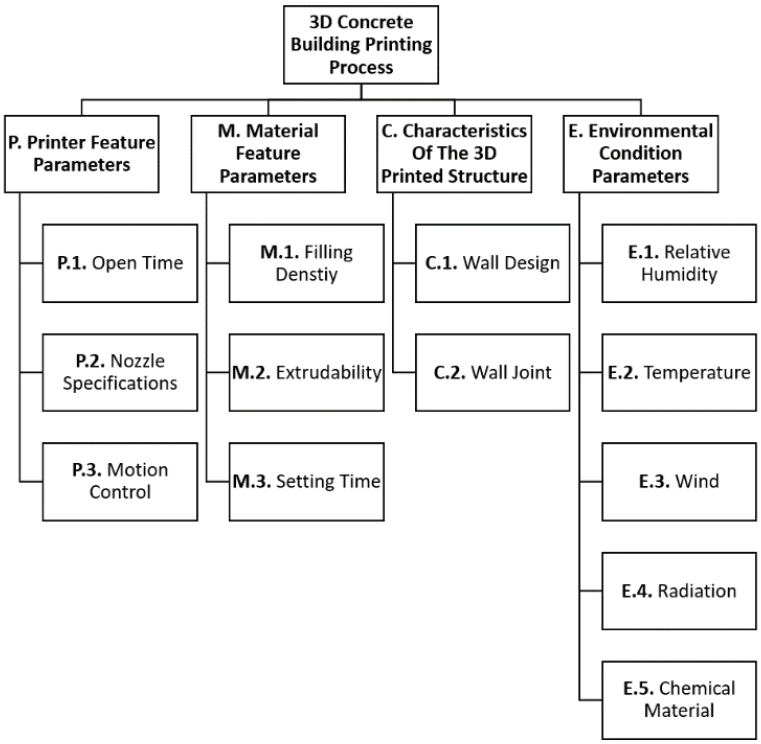
Fuzzy AHP is used in real world problems where observed values are often uncertain (Zhu 2022; Meixner et al., 2020; Meharie et al., 2019). Imprecise or uncertain data can be the result of unmeasurable, incomplete and unobtainable information. The scale used in creating the fuzzy pairwise comparison matrices used in the study is expressed in Table 2.

The fuzzy AHP method used in the study was applied in accordance with the following steps after defining the problem and determining the main and sub-criteria:

- For each pair of criteria, fuzzy pairwise comparisons were made between experts and fuzzy decision matrices were obtained as a result of these comparisons.
- For the fuzzy numbers obtained as a result of the comparisons, the fuzzy scale expressed in Table 1 was used.
- Fuzzy weights were calculated, and these weights were normalized.
- The consistency levels of the obtained fuzzy weights were checked.
- Global fuzzy preference rankings for each alternative were created by combining the weights and sub-criteria values.
- The obtained results are interpreted in detail to guide the decision-making process.

As a result, the decision-making process is supported based on the fuzzy preference rankings obtained using the fuzzy AHP method.

The parameters classified as headings and subheadings because of literature research and expert opinions are given in Figure 3. The fuzzy AHP method was used to determine and rank the importance weights of the categorized parameters. As a result of the applied Fuzzy AHP method and expert evaluations obtained, the relative importance weights of the parameters effective in the 3DCP process were established.



According to the hierarchy given in Figure 3, pairwise comparison matrices were created by the expert group using the linguistic values given in Table 2. The comparison matrix for evaluating the main criteria is given in Table 3 as linguistic data and their corresponding numbers.

TABLE 2. Linguistic variables (Huang et al., 2012).

Code	Linguistic Variables	L	M	U
1	Equally important	1	1	1
2	Intermadiate value between 1 and 3	1	2	3
3	Slightly important	2	3	4
4	Intermediate value between 3 and 5	3	4	5
5	Important	4	5	6
6	Intermadiate value between 5 and 7	5	6	7
7	Strongly important	6	7	8
8	Intermadiate value between 7 and 9	7	8	9
9	Extremely Important	9	9	9

Downloaded from https://jgb.kglmeridian.com at 2025-11-30 by collegepub@mindspring.com via Stephen Mosberg

FIGURE 3. 3DCP process evaluation hierarchy.

The study's results enable the identification of the main criteria according to the significance/weight values at the criterion level. As a result of this evaluation, the main criteria ranked according to the criterion level were determined as material feature parameters (0.407164238), characteristics of the 3D printed structure parameters (0.308620265), printer feature parameters (0.211054974) and environmental conditions parameters (0.073160522).

The term "fuzzy weight" refers to the weight value calculated based on fuzzy logic. In this context, it is a metric that addresses uncertainties and aims to obtain precise results. While the fuzzy weight expresses the degree of importance of a particular criterion or alternative, fuzzy logic operations are used to calculate this value. The concept of "normalized" refers to the process of transforming data into a specific range or a standard scale. This step is performed to make data with different units comparable and improve the analysis processes. Normalisation of data helps calculations to produce more consistent and meaningful results.

TABLE 3. Pairwise comparison matrix.

	P			M			C			E		
P	1	1	1	¼	1/3	1/2	1	1	1	2	3	4
M	2	3	4	1	1	1	1	1	1	4	5	6
C	1	1	1	1	1	1	1	1	1	4	5	6
E	1/4	1/3	1/2	1/6	1/5	1/4	1/6	1/5	1/4	1	1	1

Downloaded from https://jgb.kglmeridian.com at 2025-11-30 by collegepub@mindspring.com via Stephen Mosberg

After the comparative matrices for the main criteria were completed, the same steps were applied for the sub-criteria of the main criteria. Following the determination of the importance ranking of the main criteria, it was determined which sub-criteria were prioritised within these main criteria. Connections between the main criteria and sub-criteria were established by adopting a flow from general to specific. As a result of these connections, it was observed to what extent which feature is effective in the 3DCP. The sub-criteria weights and rankings are given in Table 4.

According to the significance/weights for the level of criteria shown in Table 4, the ranking of the sub-criteria are wall design (0.64385314), filling density (0.45364546), extrudability (0.45364546), wall joint (0.35614686) and motion control (0.30793335) in the top 5. These criteria are the most useful and decisive in solving or understanding a particular situation or problem. Firstly, **wall** design stands out as the criterion with the highest weight and constitutes a fundamental element for sustainable buildings. **Filling density** and **extrudability** rank second with equal weights, indicating that they are critical to the structural integrity and applicability of the material. **Wall jointing** is instrumental in joining the structural elements together and is an important criterion for durability and stability. Finally, **motion control ranks** fifth as an important factor for the safe production of the structure in the 3DP process.

Looking at the criteria at the end of the ranking, it is seen that the importance weights of the environmental characteristics sub-criteria temperature (0.2838975), wind (0.18032923), radiation (0.07334621) and chemicals (0.07334621) are low. This result implies that the effect

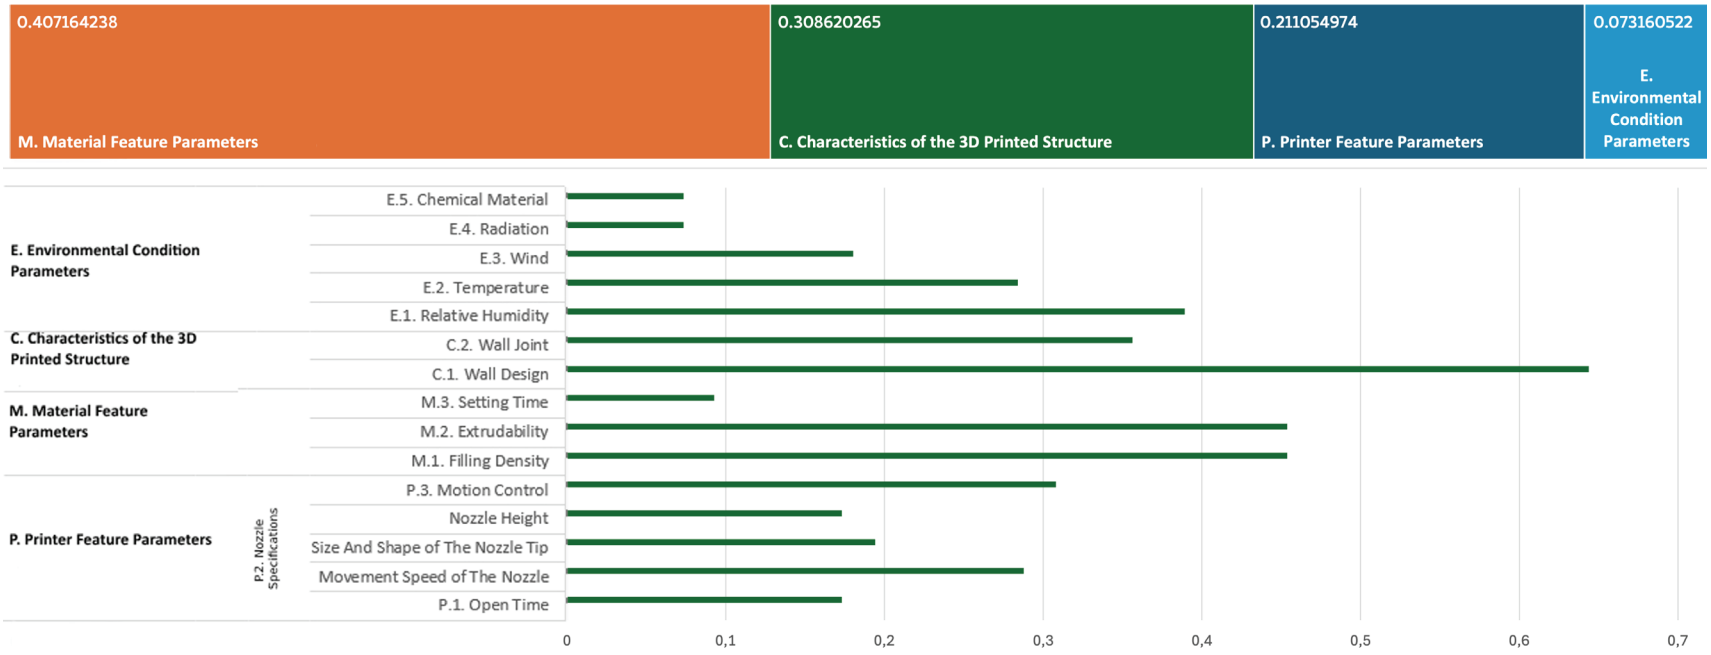
Downloaded from https://jgb.kglmeridian.com at 2025-11-30 by collegepub@mindspring.com via Stephen Mosberg

of such criteria on the overall results of the study is less, but relative humidity is effective in the building production process with a 3D concrete printer. The ranking of these criteria emphasizes which elements are prioritized in sustainable building design and which areas more attention and care should be paid. In this way, more informed and effective decisions can be made in designing and implementing sustainable concrete structures produced with 3DP.

3. DISCUSSION

According to the results obtained from the evaluations, it was concluded that material properties, which have the highest criterion weight among the main criteria, play a fundamental role in the production of 3D concrete buildings. As stated in the literature, the physical and mechanical properties of concrete have a direct impact on the durability of structures (Qaidi et al., 2022; Lyu et al., 2021; Karalia et al., 2021; Özalp and Yilmaz, 2020; Malaeb et al., 2019; Ćwikła et al., 2017; Gosselin et al., 2016). Fluidity of the mixture, extrudability and setting time criteria, which are sub-criteria of material properties, are decisive for the safety and quality of the design produced in 3D building production.

Following the material properties, the second most important criterion for criteria weight is the constructed structure. 3D concrete buildings are constructed in accordance with specific intended use and design requirements. In addition to being statically strong, the constructed structure is also important in terms of its comfort and aesthetics (Lim, 2023; Žujović et al., 2022; Suntharalingam et al., 2021; Khan et al., 2021; Marais et al., 2021; Wang et al., 2020). The features of the constructed building should be selected according to safe and functional spaces that meet the users' needs. Since the constructed building can be designed as a residence, hotel, office, etc., a separate planning and printing process should be planned for each function. Accordingly, the features of the building are at the center of the printing process.



Printer features, the third criterion in the evaluations, affect the precision of the production process and the quality of the results in 3D concrete building production. Printer features, which include open time, nozzle features and motion control elements, also vary in hardware and software according to the product applied (Lyu et al., 2021; Jo et al., 2020; Zhao et al., 2019; Tay et al., 2016; Bos et al., 2016; Mueller et al., 2015). To implement a 3D printed concrete structure, digital planning and simulations must be performed with the printer. Printer parameters are critical for the correct implementation of the design. The correct adjustment of printers ensures that the desired structural properties are obtained.

According to the parameters determined, environmental conditions are the least important. Environmental conditions vary according to the location of the product to be printed. Measures should be taken depending on whether the concrete product is constructed in an open, semi-open or closed environment (Ma et al., 2022; Moelich et al., 2022; Siddika et al., 2020; Diggs-McGee et al., 2019; Pacewicz et al., 2018). Sub-criteria such as the printer's printing speed and the material's setting feature are important at this point. In the criteria weight ranking made with the Fuzzy AHP method, it was concluded that it indirectly affects the building production process compared to other parameters in the 3D concrete building production. Figure 4 shows the prominent main criteria parameter.

The main features that affect the printing process are the sub-criteria that make up the main criteria. As a result of the findings in the sub-criteria, the wall design, which is the characteristic of the constructed structures, is most prominent based on criterion weight. Factors such as whether the wall is hollow, filled, reinforced or unreinforced change the cost, static stability

Downloaded from https://jgb.kglmeridian.com at 2025-11-30 by collegepub@mindspring.com via Stephen Mosberg

FIGURE 4. Main criteria weights.

Downloaded from https://jgb.kglmeridian.com at 2025-11-30 by collegepub@mindspring.com via Stephen Mosberg

and construction process. In addition, straight, curved or parametric wall designs also offer a wide framework by creating different applications in the concrete printing process (Žujović et al., 2022; Khan et al., 2021; Martínez-Rocamora et al., 2020; Gosselin et al., 2016). The wall design should be considered together with the concrete material. In this context, extrudability, filling density and the relative humidity parameters, which come after wall design in the criteria weight ranking, provide integration with wall design. These properties support structural stability and functional effectiveness by ensuring that the wall combinations work in harmony. The wall combination completes the resulting triple combination. At this point, it can be said that wall and material properties constitute the basic conditions for forming spaces in the 3DCP. Printer properties and environmental factors follow these parameters.

As a printer feature, nozzle-related features should be considered according to the static, aesthetic and geometric synthesis of the printed final product. There are heads with different diameters such as 10, 19, and 24 millimeters for nozzle size. Nozzles in square, rectangular and circular shapes are selected according to wall designs. The fact that the nozzle is at different heights to the ground where the structure is applied also affects the layer height. The layer height of the concrete material coming from a nozzle that is too close to the ground is low. In this context, it is also necessary to pay attention to the height of the nozzle from the ground to adjust the layer height. Regarding environmental factors, the temperature, humidity and wind factors affecting the concrete material should be calculated according to the climate and the location where it is applied. At this point, the concrete material should be tested and adjusted to the optimum conditions before the construction process begins. Figure 4 shows the prominent sub-criteria parameters.

With the 3DP process, it is possible to produce structures in different architectural forms with minimal environmental impact. By enabling mold-free construction with higher speed and accuracy (minimum human error) (Lloret et al., 2015), the 3DP method provides advantages to the building industry in terms of material savings, design freedom, reduced carbon dioxide emissions and energy efficiency (Hamidi and Aslani, 2019). Avoiding formwork in construction processes can reduce the total cost of a project by 30–60% as it is one of the major cost inputs of construction (Perrot et al., 2015; Shakor et al., 2017). Considering that the building industry consumes one-third of the world's resources, it is inevitable that production systems with 3DM will provide significant benefits in building production by favoring efficiency and effective construction strategies (Özer, 2020).

When the results for all parameters are analyzed, it is seen that the success of the structures built with 3D printers depends on the presence of well-thought-out and carefully designed walls. Therefore, the importance of architectural design is a key factor determining the future success of this technology. Design is an essential component to continue the revolution and evolution of 3D printers in the construction industry and contribute to the construction of more functional, aesthetic and sustainable buildings.

4. CONCLUSION

3DP technology provides fast manufacturing and construction, economic solutions and labor convenience compared to traditional construction methods. It is a promising advance for the construction industry and in the reduction of environmental harm caused by construction projects because it allows for the freedom of design, reduces waste during the construction phase, creates complex structures and is suitable for mass production. These features benefit from the ability to draw from the use of many parameters such as material and printer properties.

Downloaded from https://jgb.kglmeridian.com at 2025-11-30 by collegepub@mindspring.com via Stephen Mosberg

Optimizations in concrete materials, advances in software and hardware in printer systems, and innovations in 3D construction techniques have made it possible to build environmentally sensitive and sustainable structures in relatively short time periods. 3DP technology's successful integration for the construction industry, and its performance and design synthesis advantages, represent the successful integration of human-robot interaction.

This study focuses on optimizing the parameters affecting 3DCP technology in the construction industry and evaluating these parameters for sustainable building production. Focusing on the prominent features in these parameters will facilitate the construction of structures. As a result of literature research and expert opinions, four main categories were identified under the headings of printer, material, manufactured structure features and environmental conditions; the prominent parameters were revealed with the Fuzzy AHP method. With the same method, sub-categories of the four main categories were created, and the parameters were detailed and analyzed. As a result of the analysis, the material category was designated with the highest criterion weight, and it is demonstrated that 3D concrete is the main beneficiary of this process. In the sub-criteria, wall design is another feature of building construction identified by the criterion weight findings that is noted as a critical component of the 3DCP construction process. It is concluded, therefore, that there is a need to focus on concrete material and wall design in building production. In the construction industry, while engineers are effective in performance tests such as material strength, it is the architects who dominate design. Construction projects would benefit from a multidisciplinary working environment that encompasses both engineers and architects

With this study, we see that the necessary regulations for green transformation can be realized in line with net zero emission targets by taking advantage of 3D concrete building production. 3D concrete building production achieves low emissions, especially when integrated with digital production techniques and environmentally friendly planning at the start of a construction project. Future studies will help engineers and architects focus on 3DCP findings that will foster new designs for multi-storey construction while expanding and advancing the printer technology to make such construction more widespread and successful.

Reviving and Documenting Architectural Heritage Through Augmented Reality: A New Mobile Interface Experience at the Konya (Türkiye) People's House

Osman Ziyaettin Yağcı * and Ayşen Esra Bölükbaşı Ertürk

Faculty of Architecture, Karabuk University, 7850 Karabük, Türkiye; esrabolukbasi@karabuk.edu.tr
* Correspondence: osmanyagci@karabuk.edu.tr

Abstract

Traditional methods for documenting cultural heritage often remain inadequate for preserving structural data, making it virtually impossible to archive architectural works that no longer survive. This study investigates the use of augmented reality (AR) technology to improve the sustainability of architectural heritage in the digital environment. The former People's House (Halkevi) building, once located in Konya, Türkiye but no longer standing, was selected as the case study. Drawing on available photographs and historical documents, a 3D model of the building was generated using Autodesk Revit, further refined in 3ds Max, and transferred to an interactive digital platform via AR applications (ARki, Augmentecture, and a custom AR solution developed with Unity 3D + Vuforia). These applications offer an accessible solution for art and architectural historians thanks to their user-friendly interfaces and the fact that they do not require coding knowledge. Among the tested AR platforms, the Unity + Vuforia-based application yielded the most consistent performance, especially in terms of interactivity, visual stability, and environ-mental integration. The findings indicate that augmented reality can serve as a practical tool for the digital documentation of cultural heritage, demonstrating that researchers without advanced technical expertise can effectively utilize these technologies. This study contributes to digital heritage preservation by proposing a simplified AR-based methodology that reduces the need for cross-disciplinary expertise, enabling wider participation of local stakeholders in the documentation and visualization of lost architectural heritage.

1. Introduction

Documenting architectural heritage involves not only recording the physical form of structures but also preserving their cultural and contextual significance [1–3]. Conventional archiving based on physical materials risks deterioration and loss over time. In particular, for heritage structures that no longer exist physically today, the limitations of archival resources necessitate the adoption of alternative visualization techniques [4,5].

AR has become a key tool for documenting and re-visualizing heritage. These technologies not only serve technically proficient professionals but also offer practical and accessible solutions for researchers in fields such as art history and architectural history, who may have limited experience in digital design and programming [6–8]. The interactive visualization capabilities provided by AR facilitate the reconstruction of models using

archival documents, historical photographs, and written records, thereby contributing to their circulation within both academic and cultural spheres [9,10].

The core research problem of this study lies in addressing how cultural heritage buildings that have completely disappeared can be preserved and transmitted through accessible digital methods. Among such structures, the Konya People's House (Halkevi) was chosen as a case study because of its symbolic significance in the early Republican period of Türkiye. As one of the first People's Houses established in 1932, the building played a central role in the dissemination of cultural, educational, and social reforms, functioning as a hub for literacy, artistic activities, and collective memory. Its demolition and absence today present a critical challenge not only for architectural documentation but also for safeguarding the intangible heritage associated with the modernization policies of the Republic. Accordingly, this research emphasizes the importance of digitally reconstructing the Konya People's House as both a methodological experiment and a response to the broader problem of preserving lost heritage.

In this study, the potential of AR technology for documenting architectural heritage is explored through the example of the Konya People's House (Halkevi) Building—constructed as part of the Republic period's social transformation projects but no longer extant today. Based on a limited number of archival photographs and written documents, the building was digitally modeled using Autodesk Revit 2023 and 3ds Max 2023 software and subsequently transferred to an AR environment via the Unity platform. The model was tested through mobile AR applications such as ARki, Augmentecture, and a custom Unity 3D 2021.3.36f1 (LTS) + Vuforia 10.22.5 (Unity package) solution. Considering the limitations of these existing tools, a new AR prototype was developed as an alternative model. In this context, the primary aim of this study is to present an accessible method that enables disciplines less familiar with digital technologies to benefit from AR, thereby supporting the digital sustainability of lost architectural heritage.

Despite the growing number of studies on AR-based heritage documentation, most approaches require advanced coding or cross-disciplinary expertise, which limits their accessibility for researchers in the humanities. This study addresses this gap by asking: How can AR technologies be simplified and adapted to allow non-technical users, such as art and architectural historians, to actively participate in the digital preservation of lost heritage? By tackling this question, the research positions itself as a methodological contribution that extends the usability of AR beyond technically specialized domains.

2. The Role of Augmented Reality Technologies in Documenting Cultural Heritage

The digital documentation and presentation of cultural heritage play a key role beyond aesthetics, as they enable the structuring, interpretation, and dissemination of scientific datasets [11–13]. Visualization techniques make reproducible objects meaningful for scientific communities while ensuring accuracy and reliability [14]. Their effectiveness lies not only in the rapid transmission of information but also in fostering insights that help users build mental models [13,15,16].

The distinction among data, information, and scientific visualization is crucial for disciplines in this field, as these concepts, though often used interchangeably, differ in content and methodology [17,18]. Data visualization refers to structured representation based on attributes and variables, while information visualization involves methods for analyzing abstract data through interactive interfaces. Scientific visualization, in contrast, focuses on physical phenomena, mathematical models, and glyph-based structures [13–19].

Within this framework, the use of VR and AR technologies for transferring cultural heritage into digital environments has grown considerably [20]. Although often seen

as a recent trend, their origins date back to the 1950s with Morton Heilig's "Sensorama", considered the first interactive virtual environment [21]. Today, VR/AR are applied not only in entertainment and gaming but also in the preservation, presentation, and accessibility of cultural heritage [5–22].

Recent studies highlight diverse applications of AR for reviving lost or deteriorated heritage. Fornés et al. (2023) [23] reconstructed the ruins of Ademuz Castle in Valencia with AR/VR, while Anay et al. (2023) [24] developed an AR model to enhance visitor experiences at the Alexandria Troas site. Banfi et al. (2020) [25] digitized the Tomb of Caecilia Metella to sustain Italy's tourism sector during the COVID-19 pandemic. Cannella et al. (2022) [26] virtually reconstructed a Tribuna element in Palermo Cathedral, and Spallone et al. (2022) [27] applied AR/VR to recreate missing parts of a Buddha statue in the Museum of Oriental Art, Turin.

A review of the relevant literature reveals that the digitization of cultural heritage typically relies on existing building remains or photogrammetric data. However, two exceptional studies in this field have succeeded in virtually reconstructing non-extant structures based solely on archival data. One such notable example is the study by Günay (2022) [5], who digitally visualized lost buildings in Izmir and Thessaloniki using a limited set of historical photographs and written documents and applied VR/AR technologies to bring these structures back to life. Using the Image-Based Modeling (IBM) method, the buildings were modeled in SketchUp and then processed in Twinmotion for immersive visualization (Figures 1 and 2).

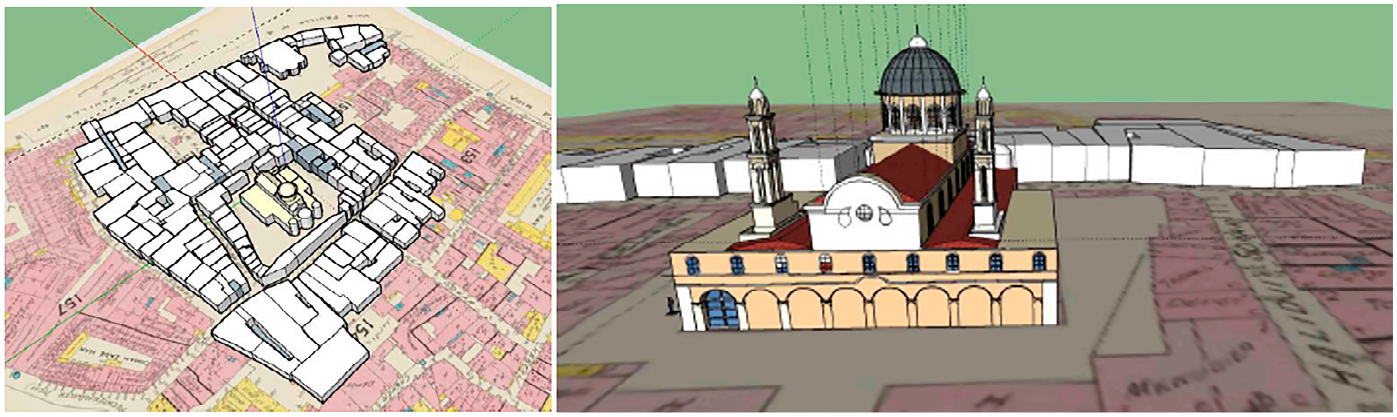

Figure 1. The digital reconstruction process of St. George Church by overlaying historical cartographic documents; the modeling was carried out using SketchUp [5].

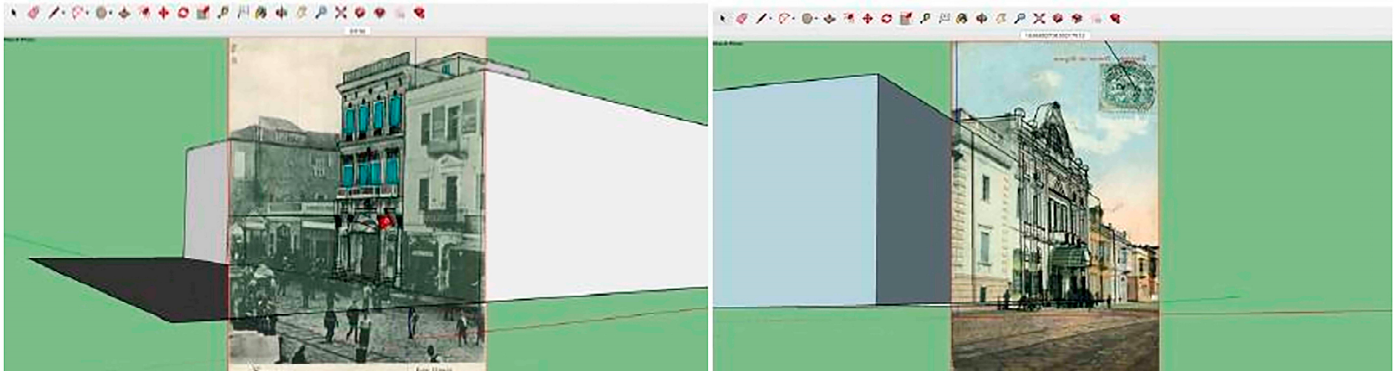

Figure 2. Two architectural examples digitally reconstructed in SketchUp using the Image-Based Modeling (IBM) technique: the London Hotel (**left**) and the Smyrna Theatre (**right**); both structures were recreated virtually based on a limited number of archival photographs and written sources [5].

In this regard, augmented reality technologies have become effective tools not only for the preservation of physically extant architectural heritage structures but also for the revival and sustainability of structures that survive only in historical documents.

In their study, Dewitz et al. (2019) [13], examined the Gothic Sophienkirche in Dresden, Germany, a significant example of 13th-century architecture that survived various interventions until the early 1960s but was later completely demolished. The researchers not only virtually reconstructed this structure but also developed the "Urban History 4D" system, which aims to ensure the sustainability of urban memory in the digital realm. Historical photographs of Dresden were digitally scanned, overlaid with a simplified 3D model of the city map, and systematically analyzed based on their shooting angles and spatial positions (Figure 3).

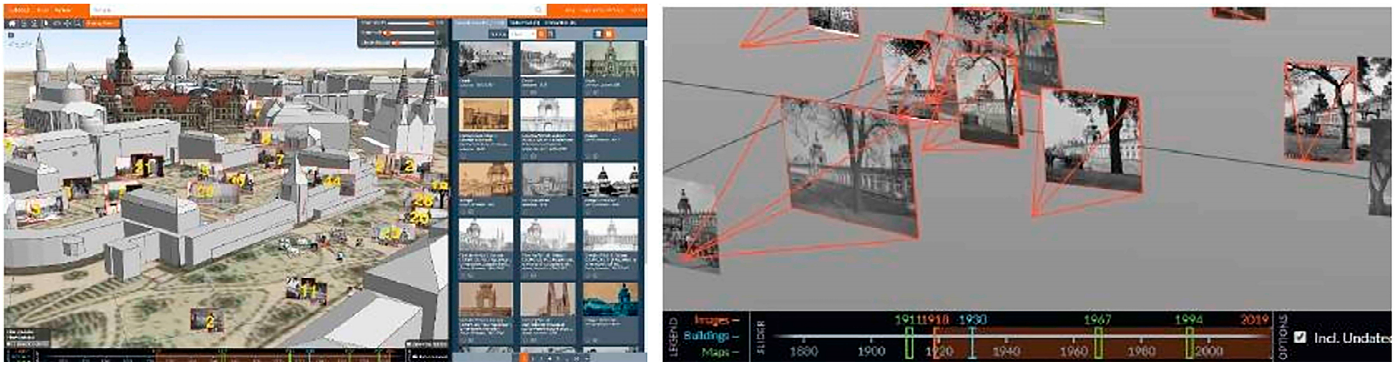

Figure 3. Archival photographs positioned with spatial accuracy in the "Urban History 4D" platform (**left**) and the angular distribution chart illustrating the shooting directions (**right**) [13].

In this system, the visual representations of buildings were matched with their spatial locations, and metadata such as the number of photographs, their shooting angles, and associated structures were integrated into the digital platform. Additionally, heat maps were created using this information, allowing researchers to identify which buildings or areas were most frequently photographed and from which perspectives. This integrated system not only provides a foundation for 3D visualization processes but also serves as an interactive digital platform that facilitates access to historical photographs for researchers across disciplines. Furthermore, the virtual reconstruction of the Sophienkirche was realized using AR technology, enabling the structure's original form to be experienced digitally (Figures 4 and 5).

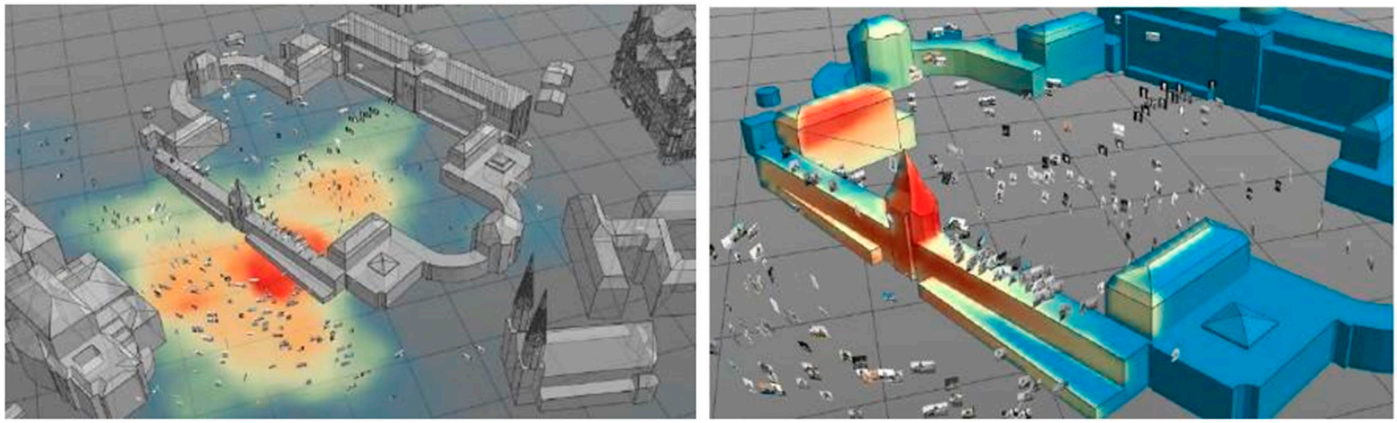

Figure 4. Heat map showing the spatial density and frequency of the historical images integrated into the system; areas associated with more documented structures are color-coded accordingly [13].

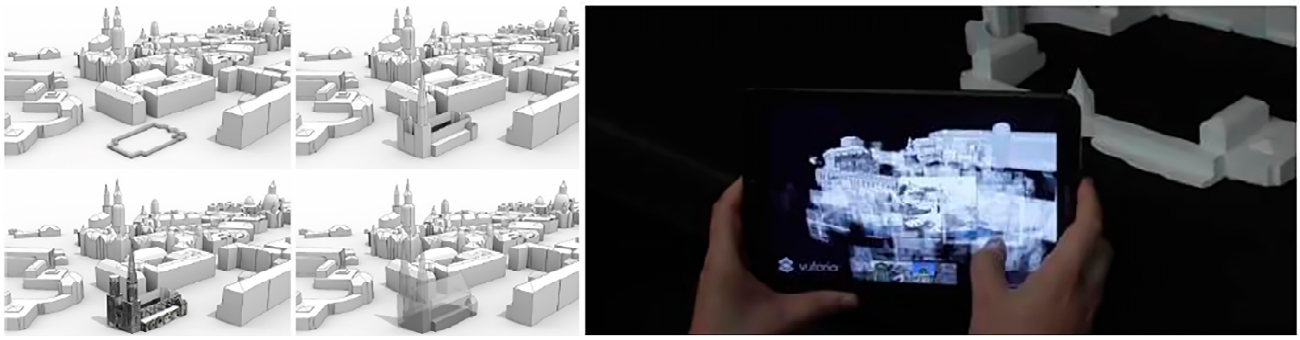

Figure 5. The abstract 3D digital model of the Sophienkirche generated from existing data and its integration with AR technology to produce a virtual output [13].

This literature review demonstrates that AR technology is recognized as an effective tool, particularly for digitizing architectural and cultural heritage elements that have entirely disappeared physically. In this regard, the present study aims to digitally reconstruct the Konya People's House (Halkevi) Building in Turkey—a structure that no longer exists physically but which holds significant historical value within local and national education policies. Archival research revealed that only a few historical photographs of specific facades and a limited number of written documents were available. Based on this restricted dataset, a virtual reconstruction of the building was achieved, thereby proposing a digital preservation model to prevent the complete loss of heritage assets with severely limited documentation. Furthermore, following the methodological approach presented by Günay (2022) [5]—which emphasizes generating modeling data through Image-Based Modeling (IBM) before developing an AR application—previously unpublished visual materials related to the Konya People's House were processed technically. These materials were made accessible and experienceable via mobile devices, contributing to the preservation of the structure's cultural memory and its transmission to future generations in a sustainable digital format.

Beyond the technological perspective, it is also necessary to emphasize the historical and cultural significance of the case study selected in this research, namely the Konya People's House (Halkevi).

The Konya People's House, established in 1932, represents one of the earliest examples of the nationwide People's House movement initiated during the early Republican era in Türkiye. These institutions were designed to promote literacy, disseminate cultural and social reforms, and function as hubs of modernization and civic engagement. The Konya People's House, with its library, concert hall, and educational facilities, served as a focal point for cultural and intellectual life in the city. Its complete demolition in later decades not only erased a significant architectural landmark but also left a gap in the cultural memory of the region. For this reason, the building constitutes an important case for exploring how augmented reality can contribute to the digital preservation of architectural heritage that has been entirely lost.

3. Developed Methodology

3.1. Case Studies

This research focuses on the Konya People's House (Halkevi), a building that no longer exists today. The case was selected due to its representative value as one of the earliest People's Houses constructed in the early Republican period. Archival visual materials, including unpublished photographs from private collections, were used as the main sources for the reconstruction process. Despite limitations such as the lack of original drawings

and the black-and-white nature of photographs, the available data provided a sufficient basis for creating a digital model to be tested in AR environments.

The Konya People's House was chosen primarily because its complete demolition left no surviving architectural documentation, creating a critical challenge for digital preservation. Limited photographs and written records were analyzed to reconstruct the building's spatial organization. This scarcity of data underscores the importance of developing accessible methodologies for reviving architectural heritage that has otherwise been erased [28].

3.2. Significance of the Konya (Türkiye) People's House Building

Following the proclamation of the Republic in 1923, Türkiye embarked on a significant socio-political transformation process, with public education placed at the core of this modernizing agenda. Under the leadership of Mustafa Kemal Atatürk, various educational policies were developed to raise the educational level of the population, build a contemporary social structure, and disseminate the principles of the republican revolutions across society. In this context, the People's Houses (Halkevleri) were officially established on 19 February 1932 by decision of the Grand National Assembly of Türkiye, launching a major social education initiative aimed at supporting individual development, securing public endorsement of the reforms, and promoting cultural advancement [29].

The People's Houses were designed to spread the fundamental values of the Republic to all segments of society, with the mission of fostering "national culture", strengthening "social equality", and supporting the "modernization of the nation" [30]. Within this framework, the Konya People's House began its activities in 1932, initially operating from a temporary building located near the government mansion. However, due to rapidly increasing interest and participation, it was relocated to a larger building within the same year [29].

The Konya People's House building was constructed with three floors, comprising a basement, ground floor, and first floor. The basement served as storage, the ground floor housed a library, and the first floor was used as a concert and conference hall. Individual rooms within the building were allocated for administrative purposes. Given the proximity of the adjacent Military Officers' Club (Orduevi), national celebrations were also organized inside this building [30]. The People's House functioned as a crucial intellectual hub for the people of Konya at the time, providing a rich library that supported literacy initiatives and offered students a resource for their studies [30]. The Konya People's House Library was instrumental in communicating the ideals of the Republican reforms to wider audiences and became an integral component of the early modernization process.

In later years, the structure, which was also repurposed as a municipal cinema, did not survive to the present day [31]. However, this study presents previously unpublished archival photographs related to the building; Figure 6 includes both original visuals from Hasan Çopur's private collection and images already documented in the literature. These visual materials have enabled a more comprehensive documentation of the building's historical context.

The primary reason for selecting the Konya People's House as a case study in this research is that it represents an example of architectural heritage that no longer exists. While literature reviews reveal historical narratives and analyses related to the building, the majority of these studies focus on its educational functions or the architectural features of the later structures constructed afterward [29–31].

Figure 6. (**a**) Konya Halkevi rear façade [32]. (**b**) Konya Halkevi front façade [31]. (**c**) Konya Halkevi right side façade [32]. (**d**) Konya Halkevi perspective view [31]. (**e**) Konya Halkevi right side façade [32]. (**f**) Konya Halkevi general view [32].

Consequently, no comprehensive document reflecting the original plan layout or precise measurements of the building could be located.

As a result of extensive archival research, a drawing believed to depict the basement floor plan was identified; this plan was redrawn digitally using AutoCAD 2023 software and incorporated into the analysis (Figure 7). A comparison of the plan with archival photographs revealed that the building featured two separate entrances accessible via independent staircases. However, the spatial functions described in the literature (such as the library, concert hall, administrative offices, etc.) did not correspond precisely with the measurements indicated in the plan, raising questions about its accuracy.

To obtain more definitive plan drawings of the building, extensive searches were conducted in the Ottoman Archives and the Republican Archives of the Prime Ministry; however, no concrete and reliable documents were found. Therefore, the building plan was reconstructed based on the limited available photographs and written records. Window openings and their relative distances were analyzed using the raster image function in the AutoCAD environment, while door openings were determined by referencing similar contemporary public buildings and incorporated into the model.

The digital modeling process continued by transferring the completed drawings, developed in AutoCAD using data from photographs and literature, into the Revit 2023 software (Figure 8). The modeling in Revit was designed to reflect the spatial layout and architectural features of the building as accurately as possible within the constraints of the available data.

The inability to access original architectural drawings and the fact that the structure was demolished long ago lend a unique value to the reconstruction process presented in this study [33]. Digitally reviving the Konya People's House—one of the first People's Houses built in Anatolia as part of the Republic's educational reforms—not only strengthens its place in architectural memory but also contributes to transmitting its cultural significance to future generations.

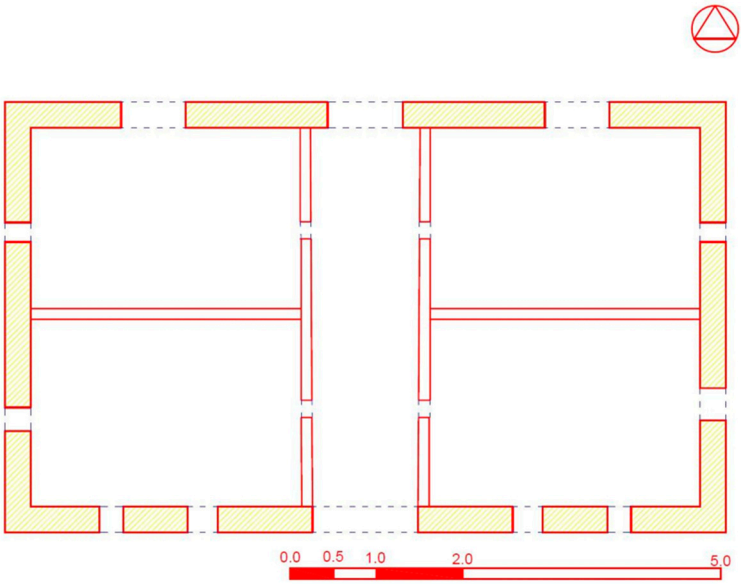

Figure 7. Basement floor plan scheme of the Konya People's House as documented in the literature [34] and its digital drawing created in AutoCAD.

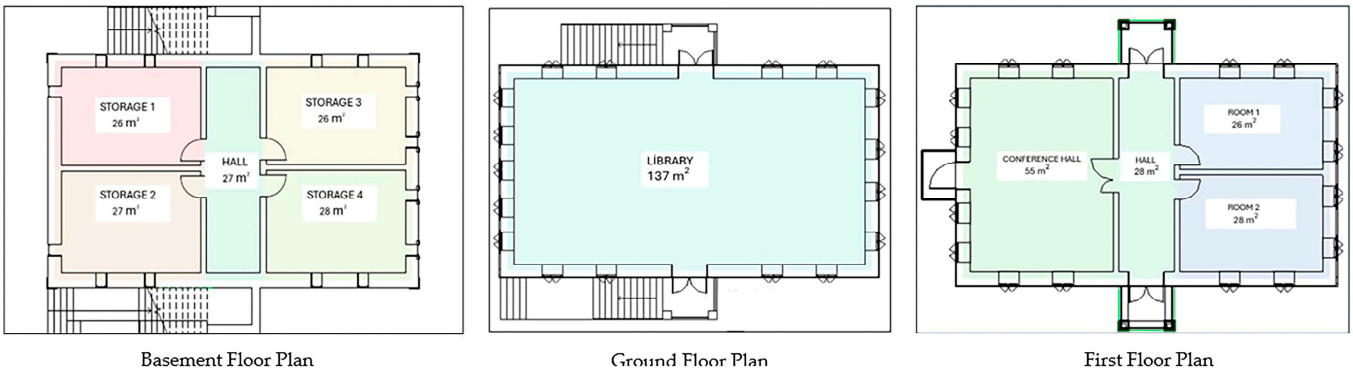

Figure 8. Plan schemes created in Revit 2023 based on archival photographs and historical documents of the Konya People's House.

4. Methodology

The virtual reconstruction process of the Konya People's House required a multi-stage methodological approach shaped by various constraints. The primary challenge was the building's complete loss, which meant that no physical data could be obtained through conventional digital scanning techniques. Furthermore, the absence of architectural plans, sectional drawings, or technical documents related to the structure in the existing literature further complicated the reconstruction efforts.

In this context, the first stage involved an extensive review of official institutional archives, historical sources pertaining to the relevant period, scholarly publications, and visual materials from private collections. The photographs from the Hasan Çopur archive presented in the table in Figure 6 were entrusted to the authors by the collector prior to his passing, with the intention that they be used for documentation and archival studies, and to serve as a basis for this research. These materials have made a significant contribution to the study. Based on the limited data gathered, two-dimensional plan drawings of the building were recreated using Autodesk AutoCAD 2023 software and subsequently transferred to the Revit 2023 platform. Within the Revit environment, the building was modeled three-dimensionally by referencing historical photographs and material data derived from comparable structures built in the same period. Since no original information on façade cladding was available, a material typology was proposed based on the analysis of similar public buildings constructed in the same region and era (Figure 9).

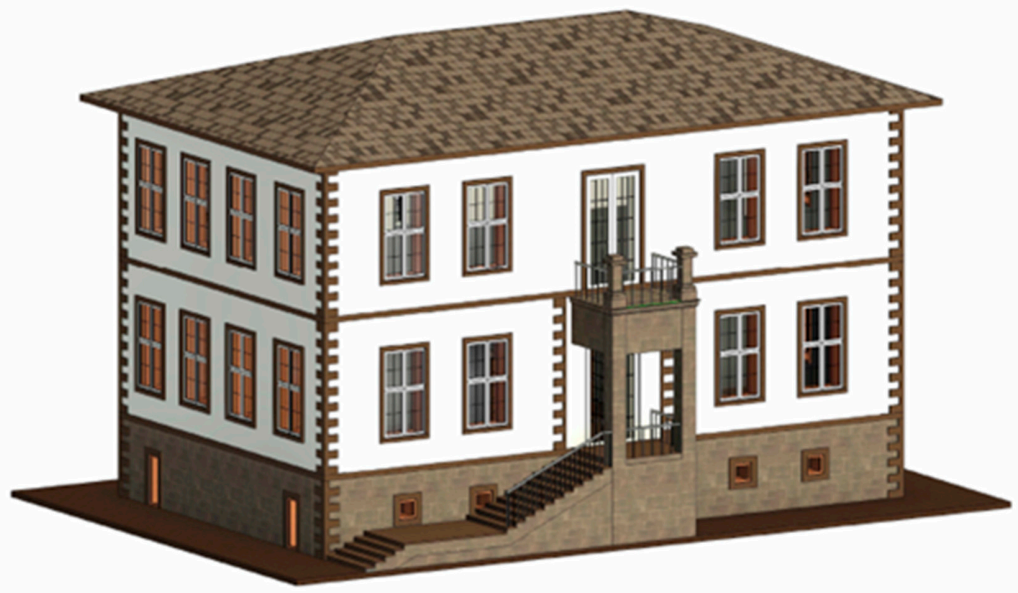

Figure 9. Digital reconstruction model of the Konya People's House developed using Revit 2023 software.

To make the three-dimensional model accessible within an augmented reality (AR) environment, software solutions compatible with local conditions in Türkiye were evaluated to enhance user accessibility. In this regard, integration tests were conducted using two different AR applications: Augmentecture, a plug-in specifically developed for Revit, and ARki, a mobile platform application. Additionally, a customized AR application was developed using Unity 3D 2021.3.36f1 (LTS) software, and its performance was analyzed comparatively.

The selected example of the Konya People's House served as a prototype for the proposed augmented reality method, demonstrating that the approach could be applied to

other lost architectural heritage structures of different scales and typologies that also suffer from limited archival data.

Through these tools, the generated model was experienced across multiple platforms, and the results were evaluated through comparative analysis. The entire workflow was structured into four main stages: archival research, creation of two-dimensional technical drawings, three-dimensional digital modeling, and integration with augmented reality applications. The table below (Figure 10) summarizes the key components of this process along with the digital tools utilized.

Figure 10. Methodological workflow diagram for the virtual reconstruction process of the Konya People's House.

The model was validated by systematically cross-checking the reconstructed elements with available archival photographs, written records, and secondary architectural sources. Particular attention was given to façade proportions, window placements, and spatial arrangements. While no original architectural drawings survived, triangulating these resources ensured visual and contextual consistency. This validation process reduced subjectivity and enhanced the reliability of the reconstruction despite inevitable interpretative elements. The AR platforms used in this study were chosen based on four criteria: accessibility (requiring no coding knowledge), user-friendliness for non-technical researchers, mobile compatibility for broader accessibility, and performance in terms of stability, interactivity, and environmental integration. These parameters were considered essential to ensure that the methodology could be replicated by researchers in art history and architecture without advanced technical skills. Accordingly, three platforms (ARki, Augmentecture, and Unity + Vuforia) were evaluated to provide a comparative perspective.

5. Findings

5.1. Augmented Reality Testing with the Augmentecture Application

The first stage of testing involved the Augmentecture plug-in, which offers direct integration with Revit. The application provided relatively straightforward access, allowing the digital model to be elevated onto a printed plan through marker-based align-

ment. In practice, once limiting markers were added to the footprint, the model aligned more stably with the plan lines and remained attached even when the printed sheet was moved (Figures 11 and 12).

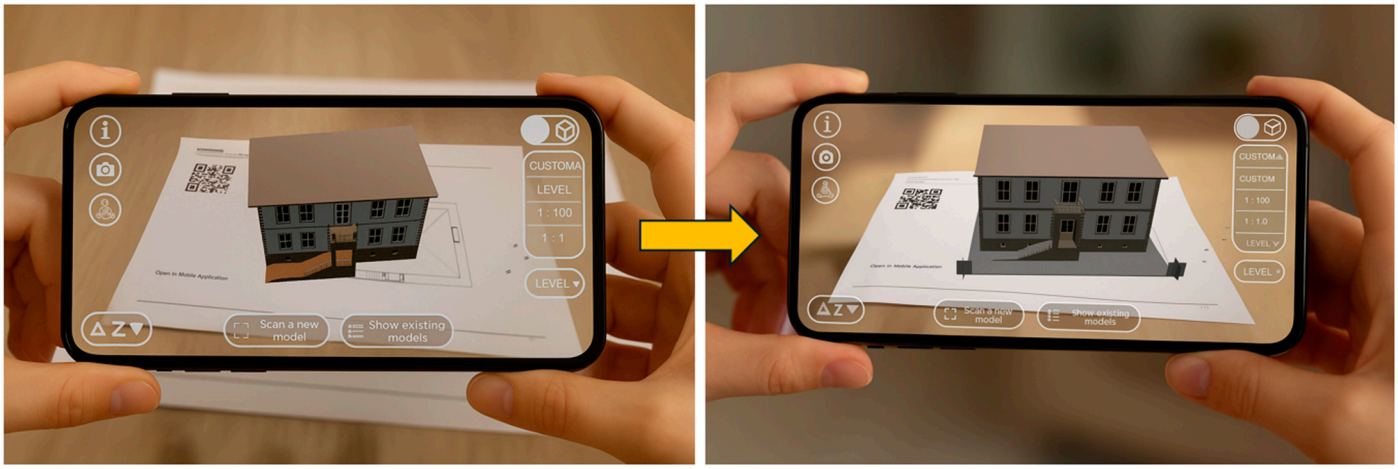

Figure 11. Elevation of the Konya People's House on the printed base sheet via the Augmentecture application, aligned with the drawing lines using limiting markers. (QR code for in-app visualization only.)

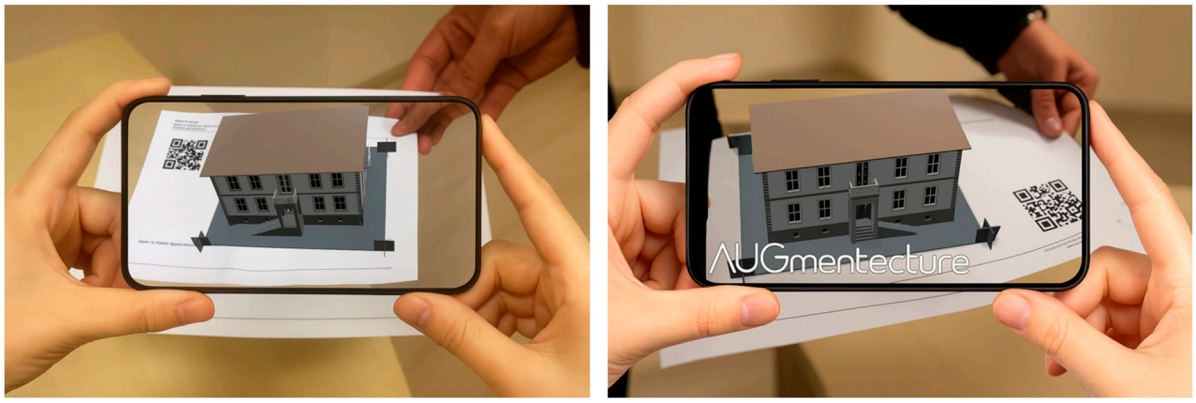

Figure 12. AR view of the Konya People's House via the Augmentecture application while the printed base sheet is being moved. (QR code for in-app visualization only.)

Despite these advantages, the platform exhibited some limitations. Its reliance on physical markers restricted scalability and introduced sensitivity to positional errors. Moreover, Augmentecture was constrained to Revit's environment and offered no dedicated data integration beyond basic visualization. These factors limited its use for larger heritage projects, though its ease of setup made it suitable for rapid prototyping. A summary of its evaluation is presented in Table 1.

Table 1. Evaluation of the Augmentecture application according to architectural heritage documentation criteria.

Compatibility with Base Plans	Data Integration	Installation Process	Image Capturing	Material Assignment	Compliance with Architectural Heritage Documentation
Moderate (requires marker)	No dedicated data integration module	Easy installation, complex application settings	Minimal delays during movement	Revit-dependent only	Moderate

5.2. Augmented Reality Testing with the ARki Application

The second platform tested was ARki, which supports FBX file formats compatible with multiple modeling tools. This allowed greater flexibility compared to Augmentecture, and the model could be projected directly over a plan sheet in mobile environments. During tests, the model aligned accurately with plan lines and textures were preserved, ensuring a realistic impression of material assignments (Figure 13).

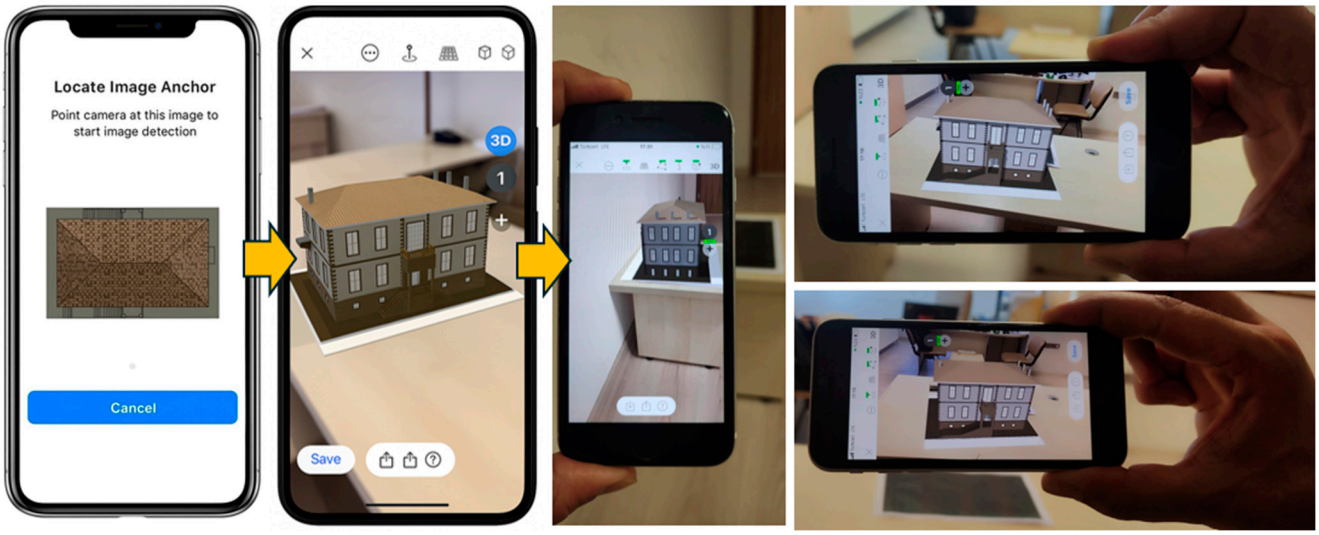

Figure 13. Process of adding the site plan image and running the model in the ARki application via a mobile device in the augmented reality environment.

However, the platform required a more complex setup process, including multi-stage preparation of base files, which reduced its accessibility for non-technical users. Additionally, when the printed plan was moved, the digital model followed with a noticeable delay. While this issue did not significantly distort the plan-based alignment, it affected user interaction fluidity. The overall evaluation, highlighting its strengths in file compatibility but limitations in performance, is summarized in Table 2.

Table 2. Evaluation of the ARki application according to architectural heritage documentation criteria.

Compatibility with Base Plan	Data Integration	Installation Process	Image Capture	Material Assignment	Suitability for Architectural Heritage Documentation
Adequate	No dedicated data integration module	Complex application settings	Significant delays during movement	Processed via 3ds Max	Moderate

5.3. Testing the Newly Developed Augmented Reality Application

In the final stage, a custom Unity + Vuforia-based application was developed to address the shortcomings observed in the commercial tools. Unlike the previous platforms, this prototype eliminated the need for physical markers and supported the integration of multiple content layers, including textual and visual annotations. This capability provided an enriched user experience and extended the application beyond basic visualization.

Testing revealed that the prototype achieved stable alignment under varying lighting conditions and moved synchronously with the printed plan. The application also demonstrated faster and more consistent behavior than the commercial tools, providing smoother interaction and greater reliability for heritage documentation (Figures 14 and 15).

Figure 14. Testing of the new AR application (Arsiv) on an Android mobile device.

Figure 15. Demonstration of the developed AR application both when the reference plan is static and when it is moved across the surface.

While the Unity + Vuforia system required more technical expertise to configure, it offered advanced data integration and superior synchronization, making it more suitable for projects where comprehensive documentation and public presentation are critical. Its comparative advantages are summarized in Table 3.

Table 3. Evaluation of the developed AR application based on architectural heritage documentation criteria.

Alignment with Base Plan	Data Integration	Installation Process	Image Capture	Material Assignment	Compatibility with Architectural Heritage Documentation
High level; occurs quickly after QR code is scanned	Customized data integration module available	Application settings are complex	Base plan and model operate synchronously during movement	Through Unity 3D	High level

Across the three approaches, the findings highlight that plan-coherent registration, stability during motion, and capacity for data-layer integration are decisive criteria in AR-based heritage documentation. The custom Unity + Vuforia application outperformed the commercial tools particularly in synchronization and content integration, demonstrating its potential as a more robust and inclusive solution.

Beyond the technical performance, user experience emerged as a decisive factor in evaluating the tested AR platforms. While Augmentecture provided a straightforward entry point with minimal setup, its marker dependency limited flexibility for broader applications. Conversely, ARki enabled richer visualization but required multiple preparation steps, thereby reducing accessibility for non-technical users. The developed Unity + Vuforia prototype, despite its more demanding configuration process, offered smoother interactions and greater consistency, ultimately enhancing usability and interpretability for both experts and general audiences.

Particular attention must be drawn to the accessibility challenges of ARki, which restrict its adoption among researchers and institutions lacking advanced technical skills. In contrast, the proposed workflow, designed to minimize coding requirements while ensuring stability, provides a more inclusive framework. Furthermore, the Unity + Vuforia application demonstrated potential for long-term sustainability by enabling flexible integration of content layers and supporting reuse across different heritage sites. This adaptability highlights its value not only as a visualization tool but also as a sustainable method for digital archiving and heritage preservation.

To synthesize the comparative results, a radar chart was generated to visualize the relative strengths and weaknesses of the three AR applications across multiple criteria (Figure 16). As illustrated, the Unity + Vuforia prototype demonstrated superior performance in plan alignment, stability, and data integration, whereas Augmentecture excelled in setup simplicity and accessibility. ARki offered intermediate results with notable flexibility in platform compatibility but limitations in stability. This comparative visualization reinforces the argument that while commercial tools remain valuable for rapid deployment, the proposed prototype provides a more sustainable and comprehensive solution for architectural heritage documentation.

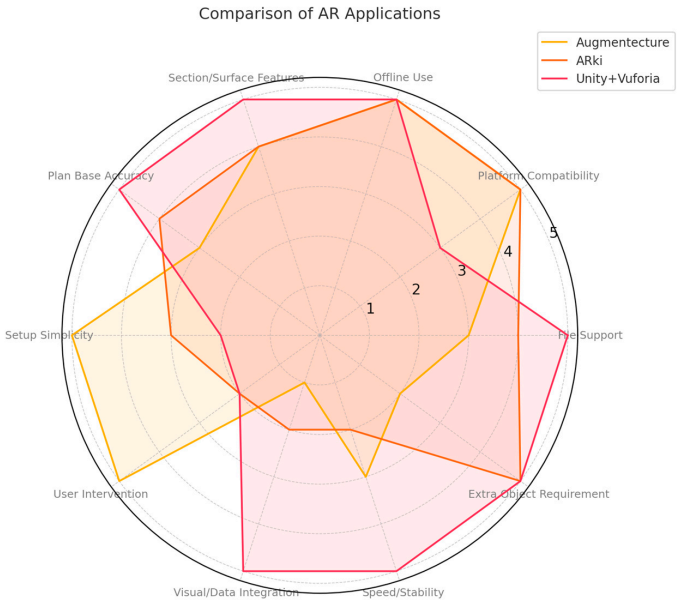

Figure 16. A radar chart developed to illustrate the relative strengths and weaknesses of the three AR applications (Augmentecture, ARki, and Unity + Vuforia) across multiple evaluation criteria, serving as a synthesis of the comparative results.

It should be noted that the radar chart does not represent absolute quantitative measurements but rather a comparative visualization derived from the qualitative evaluations summarized in Tables 1–3. The 1–5 scale was applied following observational analysis and expert judgment, in line with common practices in usability and technology assessment studies [35,36]. This approach allowed qualitative findings to be translated into a standardized comparative format, providing a clearer overview of relative strengths and weaknesses. However, the results remain inherently interpretative and may vary across different user groups, reflecting the methodological limitation of expert- and observation-based scoring.

6. Evaluation

This study examines the potential use of augmented reality (AR) technology for the digital documentation and visualization of lost architectural heritage, comparing the performance of Augmentecture, ARki, and a custom-developed Unity + Vuforia-based application (Table 4).

Table 4. Comparative assessment of the tested AR applications according to architectural heritage documentation criteria.

Comparison Criteria	Augmentecture	ARki	Unity + Vuforia
File Format Compatibility	Revit plugin via QR code connection	FBX format supported via 3ds Max platform	FBX format natively supported
Platform Support	Compatible with iOS and Android devices	Compatible with iOS and Android devices	Compatible with iOS and Android devices
Offline Usability	Available	Available	Available
Section and Surface Visualization Capability	Includes sectioning and surface detection modes	Supports positioning on real surfaces and plan drawings	Enables interactive overlay of text, images, and videos
Plan-Based Projection Accuracy	Medium accuracy (requires physical marker for alignment)	High accuracy	High accuracy; operates without the need for physical markers
Installation and Configuration Complexity	Low (direct use via integrated plugin)	Medium (requires multi-platform and software compatibility)	High (requires Unity and Vuforia integration)
User Interaction Requirement	Low; operates with limited user intervention	High; requires intensive user input	High; requires application development knowledge
Visual and Data Integration Capabilities	Limited; supports only basic 3D model visualization	Limited; no direct data integration module	Advanced; enables holistic integration of static and dynamic content
Operational Speed and Processing Stability	Moderate performance and stability	Low; tracking delays were observed	High performance; stable processing under variable lighting and surfaces
Physical Marker Requirement	Required for base alignment	Not required	Not required

Each application demonstrated distinct characteristics in terms of user interaction level, technical complexity, and content integration capacity. The Augmentecture platform, which operates as a Revit plug-in, offers users a straightforward installation and basic integration process. However, while its visualization accuracy based on plan overlays is moderate, its support for dynamic content integration is limited, and it requires additional physical markers for spatial alignment.

In contrast, ARki stands out with its broad cross-platform file format support, enabling integration with various software such as 3ds Max and Google Drive. However, this advantage requires a multi-layered setup process (Figure 17), which can result in time delays and performance issues during model tracking, with limited support for integrating local multimedia content.

Despite its technically more complex configuration, the custom-developed Unity + Vuforia application provides a comprehensive set of features that enable the projection of both static and dynamic content (e.g., images, text, videos) in real time onto a physical plan base. Moreover, this system demonstrated high levels of synchronization and stability even under varying lighting conditions and in mobile scenarios.

In conclusion, while Augmentecture [37] and ARki [38] offer practical solutions for rapid prototyping and basic-level AR visualization needs, the Unity + Vuforia-based system presents a more advanced and holistic approach for the documentation, archiving, and digital presentation of lost architectural heritage [39].

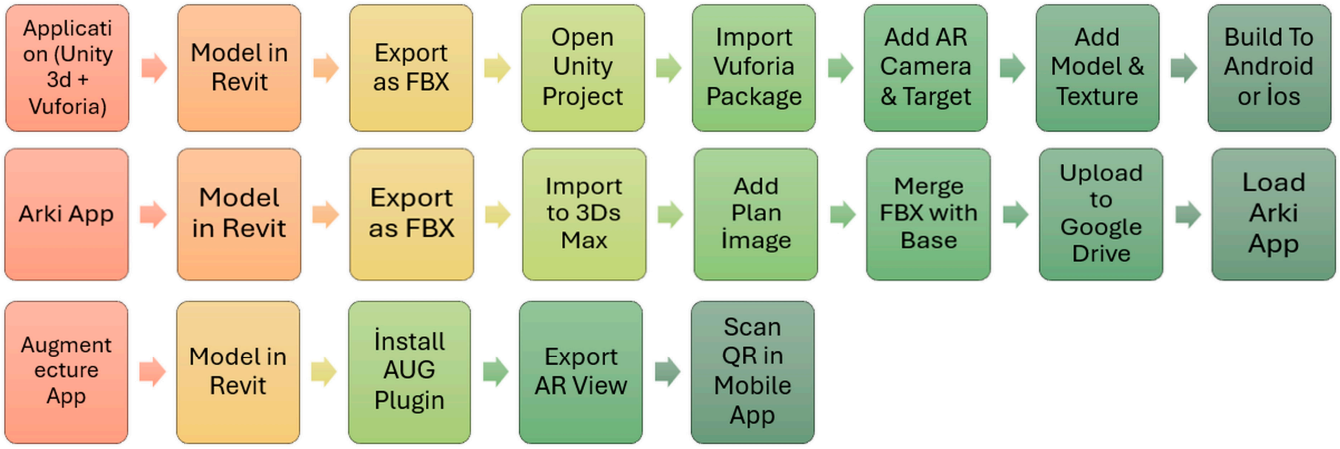

Figure 17. Comparative schematic representation of the setup processes for the tested AR applications.

Previous research has highlighted the potential of AR in reconstructing lost architectural heritage [5–13,40]. Building on this body of work, the present study extends the discussion by demonstrating how AR can be applied in the case of the Konya People's House.

Recent bibliometric reviews also underline that AR in cultural heritage is predominantly applied in areas such as 3D reconstruction, digital heritage, virtual museums, tourism, and gamification, confirming the relevance of our case study within broader research trends [41].

Consistent with our findings on the superiority of synchronization in mixed-content overlays, it was demonstrated that multi-user MR systems must maintain real-time positional correspondence among participants to ensure immersive and collaborative heritage exploration [42]. Similarly, our Unity + Vuforia prototype's stable, synchronous tracking represents a critical advantage over marker-dependent tools in fostering synchronized AR experiences.

Our approach's layered integration of visual and textual annotations echoes the multidimensional design of location-based AR applications that combine GPS-triggered content with immersive virtual tours to enrich cultural heritage education [43]. The similarity underscores the importance of multi-layered data in promoting heritage comprehension and engagement. It was highlighted that AR-GIS hybrid systems can articulate detailed construction features in a heritage context—specifically, bridging on-site artifacts with georeferenced overlays to reveal engineering techniques [44]. In a complementary manner, our case of digitally reviving the Konya People's House through AR also emphasizes AR's role in reconstructing lost architectural identity, even in absence of original documentation. In line with previous AR application evaluations, Augmentecture and ARki were comparatively tested within this study. Augmentecture, integrated with Revit, is notable for its easy setup and basic visualization, whereas ARki, despite broader compatibility, poses installation complexity and occasional performance limitations. These findings highlight the added value of the Unity + Vuforia-based application, which provides static and dynamic content placement directly on the plan base, thereby offering a more advanced environment for digital presentation and interaction.

Studies exploring AR integrated with wearable hardware (e.g., HoloLens) for preserving and transmitting historical street layouts found that immersive wearable environments markedly enhance user interaction and heritage perception [45]. While our prototype operates on mobile devices, the shared benefit lies in fostering intuitive heritage engagement beyond traditional visualizations. Similar wearable AR implementations, such as the Kapanca Street project in Türkiye, demonstrated how immersive devices can strengthen both documentation and user engagement, suggesting a strong parallel with our mobile-based

approach [46]. Consistent with prior findings that emphasize the role of mobile AR in cultural heritage dissemination [40], our results demonstrate the feasibility of applying such tools in the case of the Konya People's House.

Moreover, recent studies revealed that AR attributes such as interactivity, vividness, and novelty significantly foster perceived usefulness and enjoyment, which in turn encourage heritage-responsibility behaviors among visitors [47].

However, the performance differences observed among the applications are currently limited to qualitative evaluations. Future studies should support technical parameters such as processing time, device resource usage, render quality, and user interaction duration with quantitative data [20]. Such metrics will enable the developed method to be compared with similar platforms more objectively. A review of Table 4 indicates that the custom Unity + Vuforia solution particularly excels in "Visual/Data Integration", "Plan Base Alignment", "Speed/Stability", and its ability to function without any additional physical objects or markers. This demonstrates that the developed system is not only capable of presenting 3D models but can also synchronize multiple layers of data—such as text, images, and videos—within the AR environment. Furthermore, its capacity to operate fully aligned with the physical plan base, without requiring external markers, is considered a significant advantage for the documentation and public presentation of lost architectural heritage.

The Augmentecture platform performs well in criteria such as "Ease of Use", "Simple Setup", and "Mobile Compatibility", offering a practical solution for basic AR experiences based on plan overlays. However, its limited data integration and reliance on marker-based operation suggest that this platform is more suitable for rapid prototyping scenarios and projects with lower content complexity. The radar chart further highlights that, despite its user-friendly structure, it may fall short for projects requiring high data density.

On the other hand, ARki offers clear advantages in "File Compatibility" and "Multi-Software Support", allowing integration with a wide range of modeling tools. Nonetheless, its multi-layered setup process and user-dependent steps introduce certain challenges during use. The radar analysis clearly reflects this situation in areas where high user interaction is needed but functionality remains relatively limited.

Overall, the comparative evaluation of the three applications illustrates that they differ not only in functionality but also in terms of sustainability, data integration capacity, and user accessibility. The findings demonstrate that the Unity + Vuforia-based system provides a more comprehensive and flexible solution for the documentation and digital dissemination of architectural heritage. This finding resonates with the broader discourse on heritage smart cities, where digital twins, AI, and immersive technologies are increasingly seen as critical tools for balancing preservation, accessibility, and sustainable cultural tourism [48]. Moreover, comparable museum-based AR initiatives have also shown that interactive digital layers not only enhance visitor engagement but also facilitate the understanding of abstract cultural or scientific concepts, underscoring the pedagogical potential of AR in heritage contexts [49].

7. Discussion and Limitations

Within the scope of this study, the Augmentecture and ARki applications were tested and found to have parallels with various examples in the existing literature focusing on the documentation of cultural heritage through augmented reality (e.g., [5–13]). However, it was observed that both applications have certain limitations in terms of model elevation on plan bases and data integration processes. In particular, although Augmentecture proves effective for rapid prototyping thanks to its simple Revit-compatible installation, it remains insufficient for large-scale projects due to its limited content integration capacity and dependence on marker-based alignment. Meanwhile, the ARki application offers

advantages in terms of file format compatibility, yet its multi-layered setup process and occasional delays in plan alignment may lead to performance issues that negatively affect the user experience.

In this context, the Unity + Vuforia-based custom AR application, similar to the virtual reconstructions of lost buildings demonstrated by Günay (2022) [5] and Dewitz et al. (2019) [13], provides visualization possibilities based on limited archival data. Its distinctive contribution, however, lies in minimizing the need for technical support from other disciplines, thereby enabling local stakeholders to actively participate in the process. Consequently, the findings reveal that AR technology can evolve beyond being merely a visualization tool into a user-friendly approach for documentation and digital preservation [28].

The original contribution of this study is that, while aligned with the examples of virtual reconstructions of lost architectural heritage in the literature, it proposes an open-source, easily applicable AR prototype that does not require advanced software skills. This makes it accessible to local authorities, collectors, and independent users from different fields, adaptable across diverse cultural and spatial contexts. In this way, the study suggests a more inclusive framework for sustainable digital preservation and cultural transmission.

The primary limitation of this study is that the testing phase was conducted with a limited number of devices and user profiles. Furthermore, the performance assessments were restricted to qualitative observations; parameters such as processing time, render quality, and user interaction time were not supported by quantitative data. Future research should include comprehensive experimental studies with various hardware and software combinations to objectively demonstrate the broader applicability of the proposed method. Accordingly, it is recommended that upcoming studies conduct user tests, measure processing times, and analyze interaction data statistically.

As no original architectural drawings or precise measurements of the Konya People's House have survived, certain aspects of the reconstruction (e.g., façade proportions, interior arrangements) inevitably involved interpretative decisions based on available photographs and written descriptions. This subjectivity represents a limitation of the study.

Future research should prioritize experimental designs that incorporate quantitative measures such as processing time, rendering quality, and user interaction metrics, tested across diverse hardware and software environments. Conducting usability studies with both expert and non-expert participants would provide a more representative understanding of the applicability of AR in heritage documentation. Beyond methodological development, the findings of this study also carry long-term policy and educational implications. Integrating accessible AR tools into heritage conservation strategies can promote sustainable digital preservation practices, while embedding AR-based documentation methods into architectural and art history curricula can strengthen the training of future professionals. These directions highlight the dual role of AR technologies as both practical tools and transformative instruments for cultural heritage management.

8. Conclusions

The primary aim of this study is to evaluate user-friendly augmented reality (AR) applications that can contribute to the documentation and archiving of architectural heritage. Considering that researchers and practitioners in fields such as architecture and art history often lack direct integration with technology or advanced software skills, the need for accessible digital tools in this context becomes increasingly evident. Accordingly, this study investigates whether the AR applications examined can support the digital documentation of architectural heritage without requiring programming knowledge or advanced technical assistance.

The applications evaluated were selected with the technical proficiency levels of potential users in mind—particularly collectors, architects, and art historians who are engaged in the production of documentation for the preservation of cultural heritage. This approach aims to enable users with access to technological tools, but with limited capacity for advanced customization, to actively participate in digital documentation processes.

Within the scope of this study, two accessible AR applications were tested for the reconstruction and interactive experience of architectural heritage. Based on identified challenges, a new Unity + Vuforia-based prototype was developed and demonstrated to offer a more advanced environment for digital presentation and interaction.

These applications were technically compared based on aspects such as model elevation on plan drawings, data integration, installation complexity, user-friendliness, and mobile device performance. The findings indicate that the Unity + Vuforia system offers a more holistic and inclusive tool for documenting cultural heritage structures and communicating them to wider audiences through new-generation presentation techniques. In this context, the study demonstrates that mobile AR technologies can serve not only as visualization tools but also as versatile platforms for digital preservation, education, and cultural transmission.

The findings suggest that the proposed method holds potential applicability not only for lost buildings with limited archival data such as the Konya Halkevi but also for cultural heritage sites of different scales and typologies. Moreover, local authorities, museums, and independent collectors can use such accessible AR solutions to conduct documentation processes without the need for technical support from other disciplines, thus contributing to the intergenerational transmission of these structures.

In conclusion, this study aligns with the literature on the virtual reconstruction of lost architectural heritage. Its distinctive contribution lies in reducing the need for cross-disciplinary expertise, thereby enabling local actors to participate more actively in digital documentation processes.

Nonetheless, conducting the study on a single case structure with a limited user profile presents a constraint regarding the generalizability of the findings. Furthermore, since testing was carried out only on specific mobile devices and environments, variations in performance may arise on different hardware and software infrastructures. Therefore, the adaptability of the proposed model to architectural heritage sites of various scales should be validated in future studies with broader examples.

While this study primarily relied on qualitative observations, it is recommended that future research include quantitative measurements of metrics such as processing times, data integration speed, and processor/mobile device resource usage. Such measurements will help demonstrate the performance advantages of the developed AR infrastructure more concretely.

Future studies should design test scenarios involving structures of varying scales and typologies, including wider user groups, to assess the effectiveness of the proposed methods in sustainable preservation and cultural transmission processes more comprehensively. Accordingly, the proposed model can serve not only as a reference point for academic research but also as a practical resource for local government projects and museum applications.

This study contributes to the field not only by demonstrating the feasibility of AR for architectural heritage documentation, but also by introducing a simplified and more accessible workflow. Unlike existing approaches that often require advanced coding or specialized technical expertise, the proposed Unity + Vuforia-based prototype was designed to be adaptable for non-technical researchers and cultural heritage practitioners. This novelty ensures that digital preservation and communication of lost or endangered buildings can be achieved more inclusively and sustainably. Practically, the workflow

enables scholars, educators, and institutions to integrate AR into documentation and educational practices with minimal barriers, offering a replicable model that can support both academic research and long-term heritage conservation strategies.

Analysis of Modernization Movements in Housing During the Early Republican Period: Karabük, Türkiye

Ayşe Merve Saraçoğlu Gezer * and Ayşen Esra Bölükbaşı Ertürk

Faculty of Architecture, Karabuk University, 78050 Karabük, Türkiye; esrabolukbasi@karabuk.edu.tr
* Correspondence: mervesaracoglu@karabuk.edu.tr

Abstract: As a unit, housing is one of the most important elements affected by social, economic, and cultural changes in every period of human history. In all ages, from ancient times to the present, housing has not only met the need for shelter, but also reflected people's lifestyles and values and the technological developments of the period. Housing architecture emerges as a type of structure that has been continuously evolving in every period and is affected by the changes experienced by societies. In this study, the idea that houses are not only structural products, but the structures that have become homes for humans, is approached and discussed through concepts such as spatial organization, relationality, accessibility, visibility, density of use, depth, privacy, and belonging. The Yenişehir district in Karabük province, which is thought to have been transformed into design by considering these concepts, also constitutes the focus area of the study idea in this sense. The houses located in the Yenişehir district, which was selected because it contains concrete examples of the modernization efforts of the Early Republican Period of Türkiye and is an example of industrial housing production, have been numerically evaluated within the scope of this study with the data obtained from the space syntax analysis and the depthMapX program (v0.8.0). In this way, it raises the question of whether it is possible to create housing settlements for people in the transition from agricultural society to industrial society without disrupting the socio-cultural structure of society. As a result, it has been seen that the houses in Yenişehir are designed functionally and human-oriented, and they also consider the dynamics of society.

1. Introduction

Karabük is a province located in the western part of Türkiye's Black Sea Region, notable for its establishment and development within the context of architectural history (Figure 1). Administratively, it comprises a total of 6 districts, 80 neighborhoods, and 277 villages (Table 1) [1]. In the 1930s, Karabük emerged as one of the significant centers of Türkiye's industrialization efforts. During the Early Republican Period, as part of national goals to expand industrial enterprises, the foundations of the Demir Çelik İşletmeleri (DÇİ, Iron and Steel Enterprises) were laid, accelerating the city's development. At that time, Karabük was a small village named Öğlebeli, subordinate to the Safranbolu district. The establishment of DÇİ brought about population growth and economic vitality, transforming the region's status. Karabük became a township of Safranbolu in 1941 and gained district status on 3 March 1953, through Law No. 6068, with 53 villages annexed to it [2]. On 6 June 1995, Karabük was declared Türkiye's 78th province under Law No. 22305 [3].

Eflani	6	54
Eskipazar	7	50
Ovacık	1	42
Safranbolu	21	60
Yenice	17	34
Total	80	277

In the Early Republican Period (the first 25 years of the Republic), importance was given to industrialization in Türkiye, and important milestones for industrial initiatives were immediately implemented. As the first step in this context, the Economic Congress (İzmir, 1923) was organized, and the First Five-Year Industrial Plan was implemented. In order to support initiatives to be carried out by the state or individually, the Industrial and Mining Bank was established in 1925, and the rights of entrepreneurs were further strengthened with the Industrial Encouragement Law (Teşvik-i Sanayi Kanunu) in 1927 [4]. However, as a result of the Great Depression in 1929, the Industrial and Mining Bank had to be dissolved, and as a result, two separate banks were established in 1933, Sümerbank to support industry and Etibank to support mining [5]. In order to implement the industrial initiatives that needed to be made on behalf of the state, Sümerbank determined seven separate regions that were not yet urbanized but were open to development and started to implement industrial initiatives. (Among the factories of Sümerbank that became the symbolic buildings of the republic are Kayseri Cloth Factory (1935), İzmit Paper Factory (1936), Ereğli Cloth Factory (1937), Nazilli Cloth Factory (1937), Bursa Merinos Factory (1938), Gemlik Artificial Silk Factory (1938), Karabük Iron and Steel Factory (1939), and Malatya Cloth Factory (1939).) The study area, Karabük, is the region determined for heavy industry development among these seven regions, and the housing modernization movements of the newly established state were examined within this scope.

With the Republic's industrialization drive, Karabük embarked on an urban planning process in which Sümerbank's urbanization policies played a significant role [6]. Yenişehir Neighborhood became a turning point in Karabük's and Türkiye's history of modern urbanization. The city, shaped by the presence of DÇİ, remains a notable example of planned urbanization, preserving its original planning features to this day (Figure 2a). The Republic's modern urban planning vision included the construction of housing for workers during the establishment of DÇİ. In 1938, housing became a pressing issue

for approximately 400 brick workers from Artvin and Erzurum as well as for British engineers involved in the factory construction. Temporary solutions were devised, such as accommodating workers in nearby villages and lodging engineers in newly built hotels in Safranbolu's Kıranköy area. However, this highlighted the need for a long-term settlement policy [7].

(**a**) (**b**) (**c**)

Figure 2. (**a**) Aerial photograph of the Yenişehir district. (**b**) View of workers' houses in 1940. (**c**) Yenişehir cinema in 1964.

To address the housing need, renowned urban planner and architect Henri Prost was commissioned, and in 1938, plans for the Yenişehir neighborhood were prepared. (Due to disasters such as fire and flooding in the archives, there is no original plan prepared by Henri Prost today. There is an official letter about the money paid to him by the prime minister of the time for the plan's drawing.) With the development of this planned settlement, Yenişehir marked the beginning of Karabük's modern urbanization journey (Figure 2b). Sümerbank not only focused on housing but also addressed the social and cultural needs of workers and their families through comprehensive planning [8]. Various facilities and services were established to improve workers' living standards, enhance productivity, and foster loyalty to the institution (Figure 2c). These included healthcare and educational, cultural, and religious facilities such as hospitals, nurseries, schools, a public house, a cinema, clubs, a guesthouse, a hotel, and a mosque. Additionally, the neighborhood featured sports fields, playgrounds, parks, a garden with a pool, public baths, and marketplaces.

In addition to these amenities, the residential structures in Yenişehir embraced the modern architectural style of the time. Sümerbank organized housing according to social

class, creating a hierarchy from workers' pavilions to managers' residences. The houses were planned to meet the needs of their occupants and provide a comfortable living environment. At the neighborhood entrance were houses designated for the general manager and guests, followed by residences for managers, engineers, and skilled workers. Dormitories for single workers were built near social facilities but away from family housing. The homes' design aimed to enhance workers' comfort and social lives, with gardens allowing families to engage in agricultural activities and adapt to urban life [6,9–11].

The construction activities in Karabük began in 1936 with 6 cubic-style apartment buildings and a 150-bed dormitory for single workers. These efforts accelerated between 1939 and 1948 with the construction of 920 residences. Sümerbank's urban planning extended beyond housing to include infrastructure, green spaces, sewage systems, and water facilities. For example, Yenişehir adopted a central heating system, a significant innovation for the period.

Today, Yenişehir neighborhood retains its importance as a modern residential area. In 1996, the High Council of Monuments designated it as a protected urban and natural site. (Karabük province, Central district, Yenişehir Neighborhood Natural Protected Area was registered as a "Natural Protected Area—Sustainable Protection and Controlled Use Area" with the Approval of the Ministry dated 21 October 2019 and numbered 246753). Located north of the factory area and at the foothills of Karabük Urban Forest, Yenişehir continues to serve as a social, cultural, and economic center. It also has the distinction of being the region that still exists and has been used for years with its original function among the seven regions determined by Sümerbank.

Despite wars and economic crises, the Early Republican Period prioritized decisions valuing society and individuals. Through industrialization efforts, modern residential plans were implemented in various regions of the country, with settlements that surpassed contemporary standards. This study focuses on Karabük Yenişehir's housing production, emphasizing the principles that guided its development. By analyzing and quantifying these historical, architectural, sociological, and cultural values, the study aims to encourage further research into Yenişehir. Meanwhile, the study analyzes whether the residential settlements produced in the transition from agricultural society to industrial society were planned in accordance with the socio-cultural structure of the society. Finally, unlike previous studies, it also includes archive studies for plan types and presents study findings with numerical values.

2. The Concept of Housing and Its Development in Türkiye

Examples of vernacular architecture hold significant value, as they illuminate both the design principles and the way of life of their respective periods. The concept of housing is an interdisciplinary subject that continues to be explored across various fields. Understanding and improving the quality of life in urban areas necessitates considering user demands, which, in turn, sheds light on the underlying reasons for ongoing transformations. Through this approach, it becomes possible to examine how factors such as the demand for change, adaptation to transformation, or being forced into change evolve at both the city-wide and regional scales.

For humans, the primary source of motivation is the fulfillment of the physiological needs essential for survival. According to Maslow's hierarchy of needs, the group of basic necessities—including eating, drinking, and resting—is followed by the need for safety, which encompasses the requirement for shelter [12]. Since the earliest periods, humans, inherently vulnerable to natural conditions, have sought to address this need by constructing shelters. However, in contemporary society, the production of housing—broadly categorized as shelter—is no longer solely aimed at fulfilling this basic necessity.

While shelter remains a fundamental need, a dysfunctional dwelling fails to contribute to the well-being and happiness of its inhabitants.

The theme of the fourth meeting of the International Congress of Modern Architecture (CIAM), held in Athens in 1933 [13], was designated as "The Functional City". As a result of the determinations made regarding residential areas in urban planning, several principles influencing housing design were outlined. Among the suggested principles, which were mainly related to physical factors, a technological dimension was also emphasized. The importance of land conditions such as topography, climate, and sunlight were emphasized when planning residential areas.

As an architectural historian, Sibel Bozdoğan [14] defines architecture as a "carrier of civilization" when evaluating it in the context of housing and life. In making this definition, Bozdoğan includes not only public buildings but also private homes, which are described as the "most intimate family space". This perspective suggests that all changes in family life can be interpreted as internal cultural transformations. Preferences in rooms, furniture, colors, and patterns within homes continuously evolve over time.

Professor Nazan Kırcı [15] defines architecture as the "art of compromise" and emphasizes that the contradictions resulting from changing human demands stem from the differences between the past and the present. He argues that the resolution to this contradiction lies in architectural history. However, this does not imply a mere repetition of the past; rather, it underscores the importance of acknowledging experiences, identity, and collective memory. Understanding these factors provides insights into how individuals shape their living environments based on their chosen lifestyles.

Philosopher–writer Yörükan [16] also adds the concept of "natural conditions" to urban development discussions. He argues that with the growth of urbanization, nature has increasingly been disregarded. As a result of uncontrolled expansion, cities experience not only physical deterioration but also psychological strain on their inhabitants. Urban dwellers, having severed their connection with nature, experience alienation from their authentic selves, lose sensitivity to the allure of the city, and may begin to view their private living spaces—originally intended as shelters—as status symbols.

Throughout history, the selection of settlement sites has been influenced by factors such as proximity to water resources, food availability, suitability for settlement, and security. Prehistoric settlements and housing developments identified in Anatolia reflect these basic factors. The first known settlement structure in Anatolia is found in Çayönü (Diyarbakır), while the oldest known settlement is Çatalhöyük (Konya), and the oldest known religious center is Göbeklitepe (Şanlıurfa). Before settling in Anatolia, Turkish tribes adopted a nomadic and semi-nomadic lifestyle, which led to significant advances in woodworking. When they migrated from Central Asia, they combined their accumulated knowledge and experience with the architectural traditions they encountered in Anatolia and became familiar with stone as a material. The Kubadabad Palace (Figure 3) in Beyşehir, Konya, an example of civil architecture, has an important place in the architectural literature. The name "Kubadabad" means "the place revived and developed by Keykubad", and its complex structure reflects the architectural advances of the period [17].

Numerous examples of civil architecture from this period have survived to the present day, and the "Turkish House" plan type was implemented not only in the Anatolian region but also in various locations across Asia and Europe, where the empire extended its borders. The first systematic study on the Turkish house, which is also referenced in contemporary research, is Sedad Hakkı Eldem's book titled *Türk Evi Plan Tipleri* (*Turkish House Plan Types*), published in 1954 [18]. In this book, Eldem discusses the general characteristics, distinctive features, production processes, and deterioration causes of the Turkish house. Based on approximately 1500 measured drawings, he categorizes Turkish houses into four plan

types (Figure 4) according to their spatial organization. He notes that the Turkish house is typically a single-story structure, while in multi-story examples, each floor is allocated based on its functional role within the dwelling (Figure 5). Accordingly, the ground floor is in direct connection with the garden and accommodates service units. This level does not serve as a living space, and the facades facing public areas remain solid and windowless. Between the ground floor and the main living floor, there is an intermediate level, which is lower in height than the primary floor and is also referred to as the "winter floor". The main floor, where the rooms are located, serves as the primary living area and defines the house's plan type.

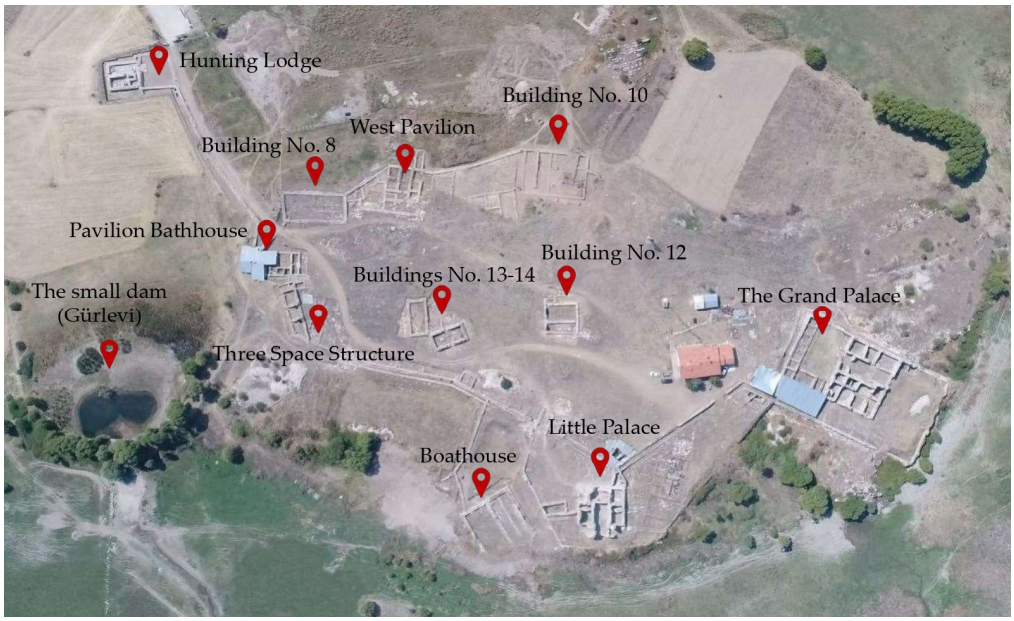

Figure 3. Kubadabad palace complex (The author has placed bookmarks on the existing image), Konya/Türkiye [17].

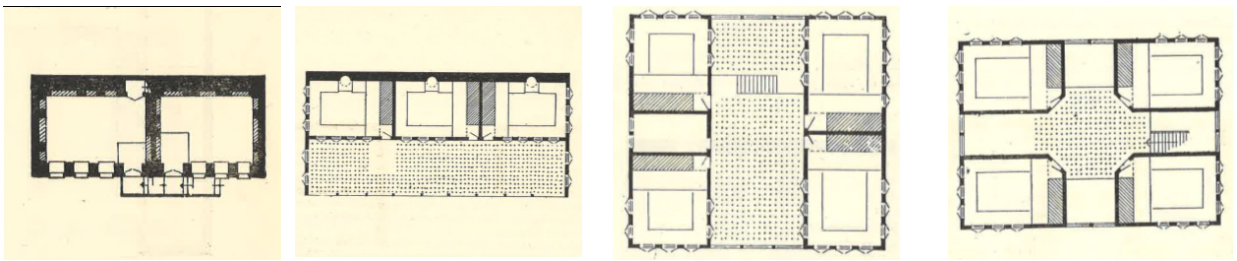

Figure 4. Sedad Hakkı Eldem's Turkish house plan type examples (Reprinted from Ref. [18]). (**a**) Plan type without sofa. (**b**) Plan type with outer sofa. (**c**) Plan type with inner sofa. (**d**) Plan type with middle sofa.

Until this period, individual efforts and employer–master relations were seen in housing production as architecture without architects. In the Republican Era, various housing policies were introduced to regulate residential production. This period emphasized the stylistic features inherent to Turkish architecture. However, as this movement did not have a long-lasting impact, modernization efforts emerged in various aspects of society alongside industrialization. During the modernist architectural period, geometric forms were predominantly preferred, functionality became a key design principle, and the technological advancements of the era were effectively utilized [19].

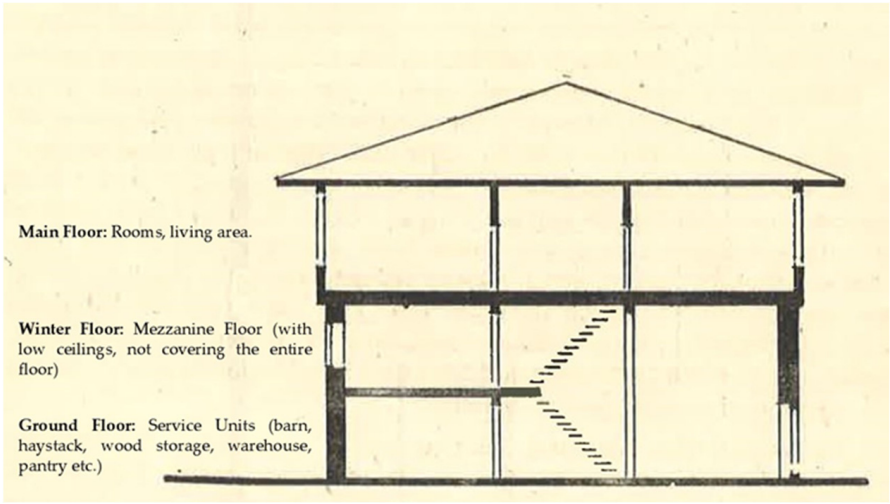

Figure 5. Sedad Hakkı Eldem's Turkish house section (Adapted with Ref. [18]).

The rapid population growth of the 1960s led to an urgent need for housing solutions, prompting the development of mass housing projects. These projects, initially carried out by the state or through housing cooperatives, later evolved into large residential complexes. Particularly from the 2000s onward, gated communities have become increasingly prevalent. These settlements, protected by security measures and restricting access to outsiders, function as self-contained urban environments, often incorporating education, healthcare, sports, business, and shopping facilities, as seen in the so-called "space city" developments [20].

After briefly reviewing the history of housing in Anatolia, this section of the study focuses on the Yenişehir district in Karabük, an area of significant importance in the city's housing production history during the Early Republican Period. Yenişehir serves as an exemplary case of modernization through industrial housing production. This evaluation of Yenişehir is expected to provide insights into the changes introduced in housing during the Republican Era and the evolving perspective on human living conditions. By considering the notion that living spaces reflect the socio-cultural characteristics of their respective periods, this study aims to analyze the housing movements of the era from a contemporary perspective.

3. Analysis of Residences in Yenişehir District Using the Space Syntax Method

Within the scope of the research method (Figure 6), the plans of the houses in the Yenişehir district in the archive were obtained, and fifteen existing plans were identified. Since it was seen that some plans were derived from each other, three main headings were determined in order to scan the plans with similar features: the number of floors of the building, the number of flats, and the number of entrances to the flat. The number of floors and flats of the building can be used to understand whether it is a detached or an apartment building, and the number of entrances to the flat can give an idea about the interaction between the exterior and interior spaces of the flat. In this context, nine typologies emerged. There are also differences in the number of rooms and square meters among these types, and these details are presented in Table 2. Four of the typified structures are detached houses and five are apartments. Two of the detached houses are single-story, and two are duplex structures.

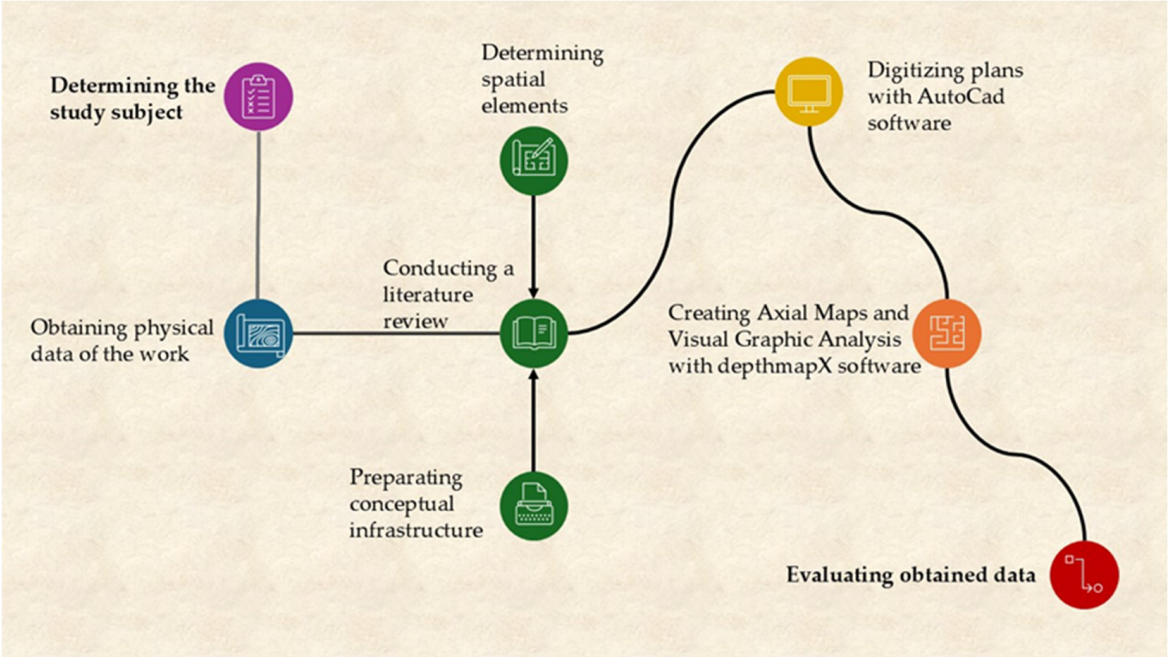

Figure 6. Flow chart for the implementation of the research method.

Table 2. Features of selected buildings from Yenişehir.

Type	Area (m^2)	Number of Rooms	Number of Floors	Number of Flats	Number of Entrances
A	140 m^2	4	2	1	3
B	89 m^2	2	2	4	1
C	106 m^2	3	2	4	1
D	57 m^2	2	2	4	1
E	70 m^2	2	1	1	2
F	42 m^2	1	1	1	2
G	50 m^2	2	2	1	2
H	82 m^2	2	4	8	1
I	88 m^2	2	4	8	1

In this study, it was decided to use the space syntax method for analysis. The determined study area has been the subject of many studies, but no study has conducted a study on space analysis. This selected method analyzes how spaces are organized, their effects on people, and how they direct social interaction. While functions such as living, eating, and sleeping were carried out in the same room with portable changes before the Republic, specialization (such as living area, bedroom, dining room, study room) is seen in rooms with the Republic. This allows for the analysis of houses not only in terms of structure but also by including the human factor, which is the main purpose of the study.

This method was first developed and used by Bill Hillier and Julienne Hanson in the 1970s based on human movement and visual perception [21]. This method attracts the attention of architects because it can be used both at urban and building scales [22–24]. As did Saraçoğlu Gezer and Sultan Qurraie, we had previously chosen to use this method in our study of the square experience in Karabük province [25]. This method, which has been preferred for many urban studies in a similar form, is preferred in all studies requiring graphical network analysis because it can be worked on an urban scale and because it is a virtual brain that can test the relationships between each of the elements in the city [26–28]. It is a method that can be used at the residential scale [29–31], public building scale [32–34], and even landscape planning [35–37], in addition to the urban scale.

Space syntax is a method used to analyze spatial configurations and how they affect human movement, social interactions, and accessibility. Two key measures in space syntax analysis are connectivity and integration, both of which provide insight into the spatial properties of a given environment [38]. In this study, space syntax analysis was utilized to examine the spatial configuration of residential buildings. This analysis allows for the mapping of spatial transitions and depth while also enabling the calculation of integration values [39]. Furthermore, as a continuation of the space syntax analysis, connectivity and visual graph analyses were conducted using the depthMapX software (Table 3).

Connectivity analysis, which is used to measure how many connections an area has to adjacent areas, is used to calculate the number of neighboring areas that can be accessed from a given location. The resulting values are evaluated to determine the local accessibility of an area [40,41]. Here, high connectivity indicates that an area is easily accessible and has multiple entry points, while low connectivity values indicate that an area is more isolated or closed. In the case of housing, spaces with a high level of connectivity can be said to have multiple doors opening to different rooms and a central gathering area, while spaces with a low level of connectivity can be said to have only one entrance and have limited access.

The integration value is a general measure that shows the degree to which a space in a system can be reached from all other spaces. It calculates the spatial hierarchy as a whole by the average number of steps required to reach a certain space from all other spaces in the system [42,43]. Here, high integration values indicate that an area is frequently accessible and more central, while low integration values indicate that an area is rarely accessible and isolated. In the case of housing, it can be said that spaces with a high level of integration value are centrally located and efficiently connected to more than one room, while spaces with a low level of integration value are more private and less accessible.

In all these housing units built in Yenişehir as part of industrial-based residential production, engineers, civil servants, and workers employed at various levels in the factory reside. Although some housing groups have been demolished due to structural safety concerns, many of them continue to function as residences. The data obtained through digitization and analysis reveal that these housing units feature timeless and modern

layouts capable of adapting to changing living conditions (Table 4). It has been observed that in all housing types—including single-story detached houses, two-story detached houses, two-story apartment buildings, and four-story apartment buildings—garden use is prioritized, parking spaces are allocated for vehicle owners, basement storage areas are included in apartment-type structures, and while individual housing arrangements are generally preferred, examples of row houses and twin houses can also be found.

Table 4. Connectivity and integration data related to the identified structures.

Type	Connectivity Analysis Values					Integration Value Calculations

4. Results

Within the scope of architectural history, civil architecture holds as much significance as public buildings, as it provides insights into both the design approach of a given period and the lifestyle it reflects. Just as human history extends far into the past, the history of housing follows a similarly long trajectory. Throughout historical processes, every social transformation has led to changes in societal thought and ways of living, which have, in turn, directly influenced the design and organization of private residential spaces.

Although the primary function of housing is to provide shelter, in contemporary society, it has also become a symbol of social status. Understanding how this transformation is perceived by users and measuring their level of participation in urbanization processes should be planned by local governments. Neighborhoods that differentiate themselves through housing production should be identified as key elements shaping urbanization. Rather than introducing new concepts in housing studies, it is essential to prioritize the accurate use of existing terminologies. Since concepts serve as tools of communication, their correct application is directly linked to a proper understanding of society.

Based on this perspective, the Yenişehir district in the central province of Karabük was selected as the study area due to its construction in line with the industrialization policies of the Early Republican Period, its role as a pioneer in the modernization movements of the Republic, and its significance in housing production related to industrial development. All necessary plans for the analysis of the area were digitized using archival resources from Karabük Iron and Steel Industry and Trade Inc. (KARDEMİR). In addition, the houses identified and included in the study were observed on site, and the use of the houses was examined with the permission of the people living in the houses.

An examination of these housing types reveals that living spaces are more prominently positioned, while bedrooms are located in more secluded areas. In Type A and Type B, a separate night corridor provides access to the bedrooms. During the initial design phase, the separation of living rooms and sitting rooms was a deliberate choice, but in contemporary usage, these two functions have merged into a single living area, eliminating the need for an additional sitting room. The spatial organization of houses varies according to different

user needs. In cases where an additional bedroom is required, a room originally designated as a sitting room may be converted into a child's bedroom, while spaces originally intended for work or guest accommodations may be repurposed as additional sleeping areas. In Type C, bedrooms have been moved entirely to the upper floor, ensuring maximum privacy, while shared spaces such as the living room, kitchen, and bathroom are concentrated on the ground floor.

The conducted analyses demonstrate that the highest connectivity and visibility values in residential floor plans are found in living spaces, confirming that these areas have been strategically positioned for optimal functionality and spatial relationships. The placement of bedrooms in single-floor residences accessible through a separate corridor, and their relocation to upper floors in two-story residences, aligns with privacy needs while also enhancing security within the home.

5. Conclusions and Discussion

This study examines residential buildings in one of the seven regions where industrial housing production was carried out in the Early Republican Period of Türkiye. This region, located in Karabük province and called Yenişehir (Turkish meaning 'new city'), is the only surviving residential area that continues to be used with the same function as the day it was built. Sümerbank, which carried out the construction process, determined criteria such as suitability for climate, topography, and easy access to building materials for all regions. The aim of the housing settlements planned in the seven different regions was to integrate a society that made a living from agriculture into industry and to have modern living standards. While doing this, no one was suddenly separated from the land. It planned houses with gardens in accordance with horizontal architecture suitable for human scale.

The changing social structure with the declaration of the Republic brought modernization in housing. With the advancement of technology, sanitary and heating installations can also be seen in these structures built in the 1930s. The examination of these structures, which were pioneers in their time, is important for understanding the development of housing history. The study examines the residential structures in the area and shows how changing residential demands are reflected spatially and how users respond to these transformations.

Research also reveals that despite the changes experienced with modernization, attention is paid to the importance given to living spaces culturally. In analyses based on human movements, the spaces most intensively used and most related to all other units are always in living spaces. Living spaces are a socializing space for family members returning from work and school to get together in the evenings and spend time with relatives and friends on weekends. It is an important notion for individuals and families in socio-cultural terms.

In this context, it is very important to integrate user perspectives into urban planning decisions. Therefore, user demands should be taken seriously. It is recommended to conduct survey studies to evaluate the extent to which residential areas fulfill their goals in line with the developing urbanization dynamics.

Graphical/Tabular Abstract

The study area was determined as the Ankara Station Building in Ankara, Turkey. After literature review and case study, 35 questions were prepared, and a survey was conducted with 521 people. The data was analyzed with IBM SPSS Statistics program and 7 factors were found. The factors are determined as service, historical value, museum, activity, shopping, transportation, and occasion shown in Figure A.

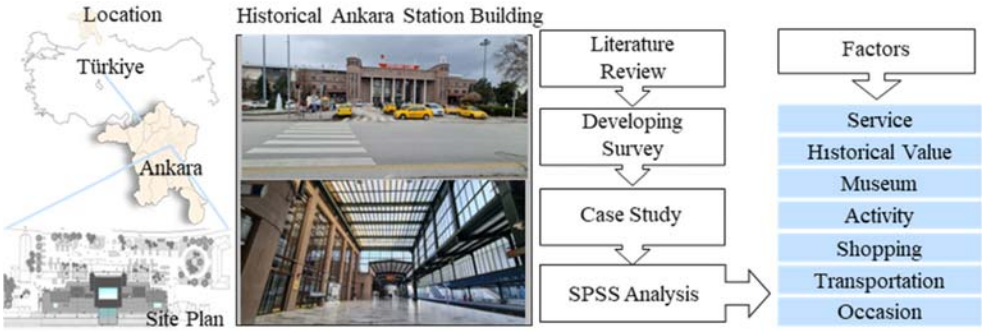

Figure A. Case study

Purpose: It is important for the sustainability of the historical station buildings, which have an important place in emphasizing the identity of a city, to keep their historical identity at the forefront while continuing their original functions. In this context, it is aimed to develop the timeless museum and model that will make a new contribution to the literature to ensure the sustainability of the station structures. To adapt the model, the opinions of the users of the Ankara Station Building, which was chosen as a case study area, were taken about the building and its adaptation to the timeless museum.

Theory and Methods: Creating survey questions with experts in the field, analyzing and interpreting the survey data conducted with 521 people with the IBM SPSS Statistics program. Survey questions were created on a five-point Likert scale. Frequency and percentage distribution information of the demographic characteristics of the survey participants were obtained, dimensions were created by factor analysis, and the factors were subjected to difference tests with one-way ANOVA and t-test according to demographic characteristics.

Results: The overall scale reliability coefficient was calculated as Cronbach's Alpa $\alpha = 0.897$. Seven factors were obtained in the study. As a result of the tests, differences of opinion were revealed according to different ages, status, education, marital status, and location.

Conclusion: The survey participants' knowledge about the building and their opinions about the adaptation of the building to the timeless museum were evaluated. The data obtained in the study revealed that the users' knowledge about the history and importance of the building was insufficient. In addition, users stated that the building was inadequate in terms of service, social areas, opportunities, and activities to spend quality time. In this context, it is believed that with the timeless museum model that will be adapted to the building, all the deficiencies stated by the users will be eliminated and add value to the building. On the other hand, the adaptability of this innovative, timeless museum model to different historical station buildings will ensure that the cultural heritage is known to the users and the sustainability of the buildings.

Anahtar Kelimeler:
Tarihi gar binası, zamansız müze, kullanıcı tercihleri, Ankara Gar Binası

ÖZ

Bir kentin sahip olduğu mimari formlar ve özelliklerinin yanı sıra, şehre ait gar binaları kentin kimliğini oluşturan önemli unsurlar arasındadır. Tarihi gar yapıları, kenti ziyaret etmek ve deneyimlemek isteyen kişilerin, kent ile ilk karşılaştıkları anı simgeledikleri için insanların hafızalarında önemli bir yer edinir. Bu kapsamda, Türkiye Cumhuriyeti'nin kuruluş döneminde yapılmış ve tarihsel olarak önemli olaylara şahitlik etmiş, hala aktif olarak kullanılan Ankara Gar Binası'nı deneyimleyen kişilerin görüşleri alınarak, kullanıcı tercihleri tespit edilmiş ve yapının zamansız müzeye dönüşümü ile ilgili düşünceleri alınmıştır. Araştırmada nicel araştırma yöntemi kapsamında anket tekniği kullanılmıştır. Örneklem alanını Ankara Gar Binası kullanıcıları oluşturmuş ve kolayda örneklem yöntemi ile anket soruları beşli Likert ölçeğinde hazırlanmıştır. 521 kişinin anket verileri IBM SPSS Statistics programına işlenmiş ve yanıtlar analiz edilerek yorumlanmıştır. Sonuç olarak, bazı faktörler için farklı yaş grupları, meslek grupları, eğitim durumları, medeni durum ve ikamet yeri arasında belirgin farklılıklar ortaya çıkmıştır.

ABSTRACT

Station buildings stand among the significant elements shaping the identity of a city, alongside its architectural form and characteristics. The historical station buildings hold a significant place in people's memories, as they symbolize the initial encounter of individuals who wish to visit and experience the city. In this context, to take the opinions of people who experienced the Ankara Station Building, which was built during the founding of the Republic of Turkey and witnessed historically important events and is still actively used, a survey was conducted to identify user preferences. The aim is to explore the adaptation of the building into the timeless museum. During the study, the survey technique was used within the scope of the quantitative research method. The sampling area consisted of Ankara Station Building users and the survey questions were prepared on a five-point Likert scale with the convenience sampling method. The survey data of 521 people were processed into the IBM SPSS Statistics program and the responses were analyzed and interpreted. As a result, significant differences emerged in some factors between different age groups, employment groups, educational groups, marital status, and location status.

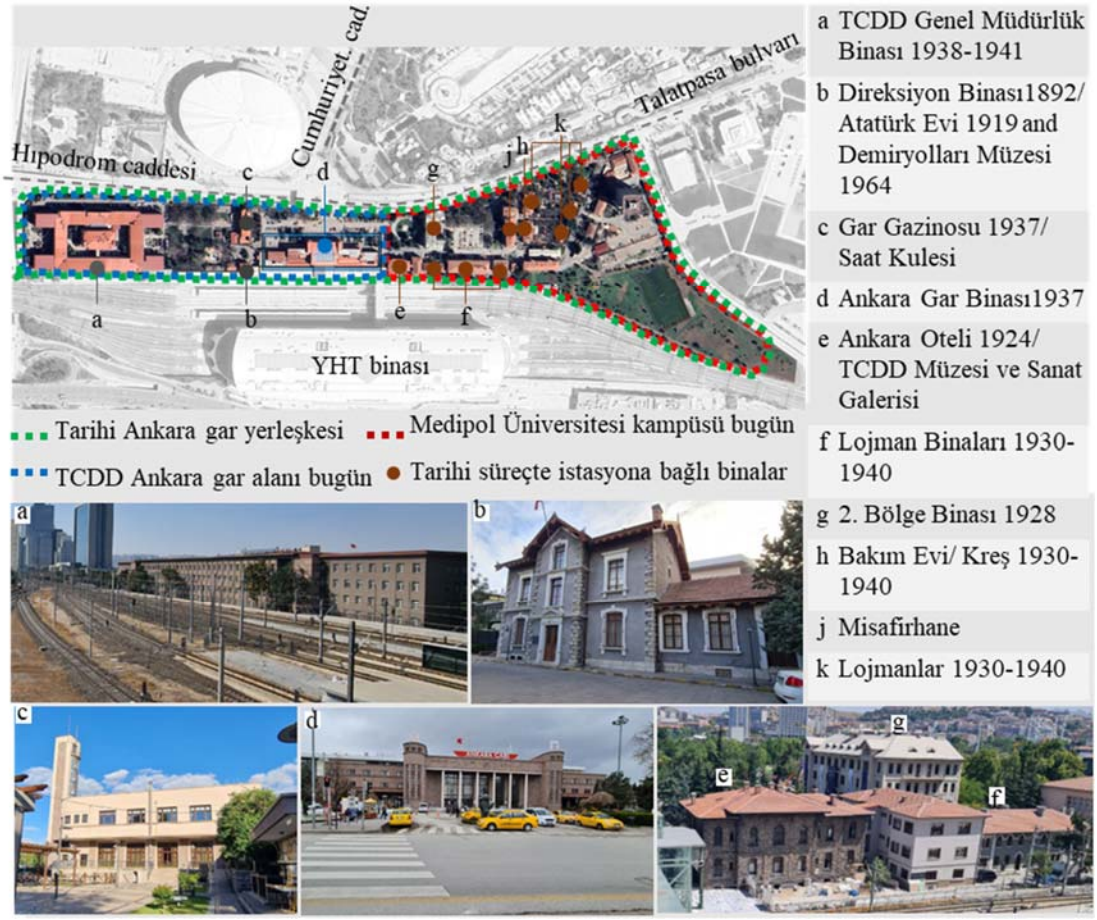
1. Giriş (Introduction)

Tarihi yapıların sürekliliğinin sağlanması, kültürel mirasın korunması ve gelecek nesillere aktarılması açısından son derece önemlidir [1]. Zamanla özgün işlevini yitiren ve atıl durumda kalan tarihi yapılar, mimari karakterlerine uygun şekilde yeniden kullanıma uyarlanarak korunmakta ve sürekliliği sağlanmaktadır [2, 3]. Tarihi yapıların farklı işlevlere uyarlanması [4], bu yapıların yaşayan ve kullanılan mekânlara dönüşmesini sağlayarak geçmişle günümüz arasında köprü kurmaktadır. Eğitim yapıları, sağlık yapıları ve sanayi yapıları gibi birçok farklı türden tarihi yapının günümüzde çeşitli işlevleri yerine getirmek üzere uyarlanması ile hizmetine devam ettiği bilinmektedir [5-8]. Bu yapı türlerinden birisi de tarihi gar binalarıdır [9]. Tarihi gar binaları, modern taşımacılık sistemlerine uygun şekilde restore edilerek müzeler, kültürel merkezler, kafeler ve ofisler gibi farklı amaçlar için kullanılabilmektedir [10-12]. Bu adaptasyon, geçmişin izlerini korurken yapıların toplumsal yaşama yeniden entegre olmasını sağlamaktadır.

Gar binaları, tarih boyunca kentlerin gelişimine katkıda bulunarak [13] kritik bir rol oynamıştır [14]. Garlar, sadece tarihsel ve kültürel kimliğin birer yansıması olarak kabul edilmemiş aynı zamanda şehirlerin giriş kapıları olarak [15] rollerini sürdürmüşlerdir. Kentlerin ulaşım merkezleri olan tarihi gar binaları, gün içerisinde şehir içinden ve dışından yapıya gelen birçok insan için ulaşım hizmetinin yanı sıra [16] alışveriş imkanları, bekleme alanları ve sosyal aktivite imkanları gibi farklı hizmet alanları da sunmaktadır [17, 18]. Yapıyı ulaşım amacı ile kullanan yolcuların veya geçiş amaçlı kullanan diğer bireylerin gar binalarının tarihi değerinin farkına varmaları, yapının simgelediği kültürel mirası ön plana çıkarmak adına önemlidir. Bu sebeple, insanların yapı kullanımına dair beklentilerini anlamak ve hizmet kalitesini geliştirmek için kullanıcı görüşleri alınarak değerlendirilmelidir. Kullanıcıların yapıya dair bilgi ve düşüncelerini öğrenmek için yapılan anket çalışmaları [19, 21], gar binalarının modern topluma nasıl entegre edileceğini anlamak ve bu önemli yapıların tarihi ve kültürel mirasını gelecek kuşaklara aktarmada uygulanacak yöntemler için önemli bir rol oynamaktadır.

Ankara'nın giriş kapısı olarak nitelendirilen ve Cumhuriyet Dönemi yapılarından biri olan Ankara Gar Binası, sahip olduğu tarihi değer ve mimari özellikleri ile simge bir yapıdır [22-24]. Ankara Gar Binası, araştırmacı tarafından yapılan alan çalışması ve arşivden elde edilen rölöve çizimleri doğrultusunda, mimari olarak Talatpaşa Bulvarı'na paralel olarak 150 metre boyunca uzanan, simetrik ve yatay bir yapıdır. Yapının mimari hacim düzenlemesi simetridir ve bodrum katından itibaren dört kattan oluşmaktadır. Giriş kütlesinin her iki yanında dairesel merdiven blokları bulunmaktadır ve şu an lojman daireleri olarak kullanılan katlara çıkmaktadır. Bina ana giriş kapılarının bulunduğu cephenin yüksekliği 14,27 metredir ve girişi tanımlayan 9,68 metre yüksekliğinde beş adet cam blok ile giriş kapıları bulunmaktadır. Bu alanı oluşturan hacim, bekleme salonu olarak kullanılmaktadır ve 33x24 metre genişliğe, 12,56 metre yüksekliğe sahiptir (Şekil 1). Bekleme holünün tavanı metal konstrüksiyon üzerine opak lamine camdan oluşmakta ve gün ışığını sönümlenmiş şekilde içeri almaktadır. Bina, merkezde ana kütle ve iki yanda simetrik şekilde küçülen birer hacim olmak üzere toplamda üç adet kütleden meydana gelmektedir. Ana kütle altında bir bodrum kat olmak üzere, toplamda 4 kat, diğer bitişik yan kütlesi ise bodrum kat ile birlikte 3 kattan oluşmaktadır. Betonarme yapı, Ankara taşı ile kaplanmış ve aşırı dekoratif unsurlardan kaçınılarak yapının geometrisi vurgulanmıştır. Bekleme salonunu ile bağlantılı olan yan alanların üst katları lojman olarak kullanılırken, zemin kat giriş



Şekil 1. Ankara Gar Binası bekleme salonu (a), bavul alanı (b), zemin kat ve vaziyet planı (TCDD arşivi) (c), bilet gişeleri (d)
(Ankara Station Building waiting area (a), suitcase area (b), ground floor and site plan (c), ticket offices (d))

holünde büfeler, bilet satış gişeleri, bavul alanı, personel ofisleri, berber ve şeref salonu gibi çeşitli birimler bulunmaktadır. Yapıya; ulaşım, ziyaret ve geçiş amaçlı gelen kullanıcılar, yapının zemin kat bekleme holü, bagaj bölümü, ıslak hacim alanı ve iç mekanla bağlantısı olmayan dış cepheye bağlı girişlerden berber dükkânı ve mescit alanlarını kullanabilmektedirler. Bu sebeple gün içindeki sirkülasyon yoğunluğunun büyük bir çoğunluğu bekleme holünde gerçekleşmektedir.

Ankara Gar Binası, mimar Şekip Akalın tarafından tasarlanarak 1937 yılında faaliyetine başlamıştır [25]. Günümüze kadar mimari özgünlüğünü koruyan bina, hala işlevine devam etmektedir. Ankara Gar Binası; yapıldığı dönemde kendisine bağlı TCDD Genel Müdürlük binası (1938-1941), Lojman Binaları (1930-1940), Direksiyon Binası (1892), Gar Gazinosu (1937), Ankara Oteli (1924), 2. Bölge Binası (1928), Bakım Evi (1930-1940) ve Misafirhane gibi diğer binalarla bir kompleks oluştururken, süreç içerisinde bu binaların bir kısmının farklı kurum ve kuruluşlara verilmesi ile yalnızlaşmaya başlamıştır. Şekil 2'de Ankara gar binasının tarihi yerleşkesinde bulunan yapılar ve günümüzde gar yerleşkesinin durumu uydu görüntüsü üzerinden ifade edilmiştir. Ayrıca kütle ve ölçeği ile tarihi binanın görünürlüğünü gölgeleyecek şekilde inşa edilen yüksek hızlı tren (YHT) garının (2016) [25, 26] Ankara Gar Binası'nı geri planda bırakması sebebi ile yapı, tarihi değerini ön plana çıkaramamaktadır (Şekil 3). Belli başlı sebepler ile sahip oldukları mimari ve kültürel değerleri unutulmaya yüz tutmuş veya tarihi kimliğini yeterince yansıtamayan yapıları koruma kapsamında çeşitli çalışmalar yapılmaktadır. Bu kapsamda çalışmaların önemli bir kısmı tarihi yapıların yeniden işlev verilerek günümüze kazandırılması yöntemiyle yapılmaktadır [27]. Bu yapıların birçoğunun, yapının özgünlüğüne müdahale etmemesi ve koruma açısından uygunluğu sebebiyle müzeye dönüşümü tercih edilmektedir.

Tarihi yapılardan dönüştürülen mekanlarda yapının özgün sirkülasyon hatları korunarak, sergi alanları için organizasyon ve plan şemalarının içeriğe uygun bir şekilde oluşturulması veya tasarlanması mümkündür. Planlama aşamasında, sergilemenin nitelik ve ihtiyaçlarının yanı sıra [28] binanın hizmet kalitesi; aktivite, alışveriş imkanları, ziyaretçi yönetimi, bilgilendirme, ulaşım kolaylığı ve zamanın nitelikli bir şekilde geçirileceği ortamların sağlanması ile artmaktadır. Yapılan araştırmalar ile özgün işlevini yitirdikten sonra müzeye dönüştürülmüş tarihi gar binalarından bahsetmek mümkündür. Fakat kurulduğu günden bu yana özgün işlevine devam eden tarihi bir gar binasının işleyişi sırasında kullanıcıları için müze algısı oluşturacak bir dönüşüme rastlanamamıştır. Müze tanımları konusunda literatürde yaşayan müze [29], tarih müzesi [30], interaktif müze [31], sanal müze [32], ekomüze gibi çok fazla çalışma ve tanım bulunmaktadır. Zamansız müze kavramı araştırıldığında, "timeless museum" olarak Aiello vd. 'nin sanal gerçeklik ortamında önerdiği sanal müze betimlemesi olarak karşımıza çıkmaktadır [33]. Ayrıca White ve Wesleyan "timeless museum" kavramını Paris'i anlatan şiirsel bir yaklaşımda "zamanın ötesinde" anlamında kullanmıştır [34]. Negassi ise bu kavramı etnik sağlığa sahip bir ülkeyi tasvir etmek için kullanmıştır [35]. Çalışma için ortaya konulan "zamansız müze" kavramı her ne kadar bu kaynaklarda anılmış olsa da tarihi gar

Şekil 2. Ankara Gar kompleksi (Ankara Station Complex)

Şekil 3. Saat kulesinden bakış (a), Cumhuriyet Caddesi'nden bakış (b), Gençlik Parkı'ndan YHT binası, Gar Binası ve Ankara Garı eski yerleşkesi (c). (View from the clock tower (a), view from Cumhuriyet Street (b), YHT building, Station Building and old campus of the Ankara Station from Gençlik Park (c).)

binaları için ortaya koyduğumuz ve literatüre katkı sağlayacak yeni bir kavramdır. Zamansız müze, tarihi bir gar binasının özgün işlevine devam ederken, aynı zamanda kullanıcı için müze algısı oluşturularak tarihi yapının sürdürülebilirliğinin ve "yapı dokunulmazlığının" sağlanmasına katkı sunacaktır. Bu model, geleneksel müze tanımının ötesinde, zamansız bir şekilde özgün hizmetine devam ederek geçmişin anlamını günümüze taşıyan gar yapılarının, tarihi ve kültürel değerlerini vurgulamayı amaçlamaktadır. Bu yaklaşım, kültürel mirasın canlı ve dinamik bir şekilde korunmasını ve paylaşılmasını hedeflemektedir. Özellikle gar binaları gibi tarihi ve sembolik öneme sahip yapılar, zamansız müze kavramıyla daha geniş bir kitleye açılacak, ziyaretçilere geçmişle bağ kurma ve tarihi, derinlemesine anlama fırsatı sunacaktır. Bu sayede, tarihi gar binalarının sadece bir ulaşım merkezi olmalarının ötesinde, kültürel ve tarihi bir mekân haline gelmesi de hedeflenmektedir.

Zamansız müze modeli ile; günün her saatinde işleyen ve 7/24 kullanıcılara açık olan tarihi gar binalarının, özgün işlevine devam ederken yapının bulunduğu konum itibariyle tarihi önemini, mimari ve dönemsel özelliklerini çeşitli sergileme yöntemleriyle kullanıcıya sunması düşünülmektedir. Bu sayede yolcuların yapıda beklemeleri ve geçişleri sırasında güzergahları üzerinde oluşturulacak çeşitli sergileme yöntemleri ile yapının tarihi farkındalığı yaşatılacak ve yolcuların gar binasını nitelikli bir şekilde deneyimlemeleri sağlanacaktır. Zamansız müze modeli ile şehir içinden ve dışından gelen kullanıcıların yapıyı keşfedebileceği ve beklemeleri sırasında ziyaretçiye çeşitli sanatsal ve sosyal aktivitelere katılabilecekleri olanaklar sunularak tarihi yapı ile ilgili farkındalıkları artırılacaktır. Bu dönüşümün oluşması için öncelikle kullanıcı görüşleri alınarak bina hizmet alanlarındaki eksiklikler tespit edilmelidir.

Bu çalışma ile Ankara Gar Binası'nın zamansız müzeye dönüştürülmesi sürecinde yapı kullanıcılarından; tercihleri, yapı ile ilgili farkındalık düzeyleri ve yapının müzeye dönüştürülmesi konularında görüşlerinin alınması amaçlanmıştır. Bu sebeple çalışma, Ankara Gar Binası kullanıcılarının (yolcular, personel, ziyaretçiler vb.) görüşlerinin alınmasına yönelik olmasıyla daha önce böyle bir çalışmanın yapılmaması çalışmayı özgün kılmaktadır. Dolayısıyla çalışma, sonuçlarını alana yeni bir bakış açısı getirmesi yönünden önemlidir. Bu nedenle araştırmanın amacına bağlı olarak aşağıdaki temel hipotez ve alt hipotezler geliştirilmiştir. Anket tekniği kullanılan çalışmanın verileri IBM SPSS Statistics programıyla analiz edilmiş ve analizler sonucunda hizmet, tarihi değer, müze, etkinlik, alışveriş, ulaşım ve zaman olmak üzere yedi faktöre ulaşılmıştır. Ortaya çıkan bu faktörler demografik özelliklere göre kıyaslanarak değerlendirilmiştir.

H1: Ankara Gar Binası'nı kullananların tarihi yapıya ilişkin farkındalık düzeyleri arasında demografik yapılarına göre anlamlı farklılık vardır.

H1-1: Ankara Gar Binasını kullananların tarihi yapıya ilişkin farkındalık düzeyleri cinsiyetlerine göre anlamlı farklılık göstermektedir.
H1-2: Ankara Gar Binasını kullananların tarihi yapıya ilişkin farkındalık düzeyleri yaşlarına göre anlamlı farklılık göstermektedir.
H1-3: Ankara Gar Binasını kullananların tarihi yapıya ilişkin farkındalık düzeyleri medeni duruma göre anlamlı farklılık göstermektedir.
H1-4: Ankara Gar Binasını kullananların tarihi yapıya ilişkin farkındalık düzeyleri statülerine göre anlamlı farklılık göstermektedir.
H1-5: Ankara Gar Binasını kullananların tarihi yapıya ilişkin farkındalık düzeyleri ikamet yerlerine göre anlamlı farklılık göstermektedir.
H1-6: Ankara Gar Binasını kullananların tarihi yapıya ilişkin farkındalık düzeyleri eğitim durumuna göre anlamlı farklılık göstermektedir.

2. Araştırma Yöntemi (Research method)

Bu araştırmada, karma araştırma yönetimi kullanılmıştır. Dolayısıyla hem nitel hem de nicel veriler amacına uygun olarak analiz edilerek değerlendirilmiştir. Araştırmanın nitel tarafında literatür taraması ve uzman görüşlerinin incelenmesi söz konusu iken nicel araştırma kısmında araştırmacı tarafından geliştirilen anket tekniği uygulanmıştır. Anket sorularının hazırlanmasında Ankara Gar Binası ile ilgili detaylı literatür araştırması yapıldıktan sonra [36-38] çalışma alanında yerinde incelemelerde bulunulmuş ve gar binası personelleri ile görüşmeler yapılarak yapı hakkında bilgiler alınmıştır. Elde edilen bilgiler ve literatür doğrultusunda araştırmacı tarafından özgün bir

şekilde oluşturulan anket ifadeleri 15 uzman (7 Mimar, 2 Mimari Restoratör, 1 Sanat Tarihçisi, 1 Arkeolog, 2 Peyzaj Mimarı, 1 İç Mimar ve 1 Çevre Mühendisi) görüşü alınarak geliştirilmiştir. Araştırmanın amacına uygun olarak iki bölümlü bir anket oluşturulmuştur. Anketin birinci bölümü katılımcıların demografik özelliklerini belirlemektedir. İkinci bölüm ise katılımcıların Ankara Gar Binası kullanımı ile ilgili görüşlerini, tarihi değeri hakkındaki bilgilerini ve farkındalıklarını ölçmenin yanı sıra binanın zamansız müze modeline dönüşümü ile ilgili düşüncelerini ölçmek için oluşturulmuştur.

Anket ifadeleri pilot uygulama ile 100 kişiye kolayda örneklem yöntemi kapsamında uygulanmıştır. Sonrasında açımlayıcı faktör analizi yapılarak anket ifadeleri boyutlandırılmış ve saha uygulamasına başlanmıştır. Örneklem sayısının belirlenmesinde sınırsız evrenler ve nicel araştırmalar için geçerli olan $n = \sigma^2 . Z_\alpha^2 / H^2$ formülünden istifade edilmiş olup (N>10.000), standart sapma değeri σ=0,05, anlamlılık düzeyi $Z_{0,05}$=1,96, etki büyüklüğü H=0,05 olarak alındığında örneklem sayısının ez az n=384 olduğu tespit edilmiştir [39]. Hedef katılımcılar, Ankara Gar Binası'nı kullanıp deneyimleyen bireyler arasından seçilmiştir. Ankara Gar Binası ve çevresinde, araştırmacı tarafından kolayda örnekleme yöntemi kullanılarak ankete görüş bildirmeyi kabul eden gönüllü 563 kişi ile yüz yüze uygulama gerçekleştirilmiş, bunlardan 521 katılımcının anketleri geçerli sayılmış ve değerlendirmeler bu sonuçlar üzerinden yapılmıştır.

Anket ifadelerine katılımcıların katılım düzeylerini belirlemek amacıyla Likert ölçeği kullanılmış ve 1 (hiç katılmıyorum), 2 (az katılıyorum), 3 (orta derecede katılıyorum), 4 (çok katılıyorum), 5 (tamamen katılıyorum) şeklinde kategorize edilmiştir. Veriler, IBM SPSS Statistics paket programı kullanılarak analiz edilmiştir. Örneklem grubuna dahil edilen Ankara Gar Binası kullanıcılarının demografik bilgileri ve bina kullanımına dair bilgiler frekans ve yüzde dağılım tablosu oluşturulmuştur. Parametrik test koşullarının sağlanıp, sağlanmadığını belirleyebilmek, uygulanabilirlik ve örneklem yeterlilik tespiti için varyansların homojenliği testi ile normal dağılım testi (Kolmogorov-Smirnov), faktör analizinin yapılabilirliğini ölçmek için de Bartlett testi ile örneklem yeterliliği için Kaiser-Meyer-Olkin (KMO) sonuçları belirlenmiştir. Cronbach-Alpha testi de yapılarak çalışmanın güvenilirliği saptanmıştır. Ayrıca döndürme işlemi uygulanarak faktör analizi yapılmış, ölçek boyutlandırılması gerçekleştirilerek ölçekler araştırmacı tarafından ifadeler çerçevesinde isimlendirilmiştir. Sonuçlar katılımcıların demografik özellikleri açısından farklılık testlerine (T-testi ve ANOVA testi) tabi tutulmuştur. Bu bağlamda elde edilen katsayılar ve p değerleri incelenmiş ve çalışma kapsamında yorumlanmıştır.

3. Bulgular (Findings)

Bu kısımda araştırmanın amacına uygun olarak iki bölümden oluşan anket formuna yönelik bulgulara yer verilmiştir.

3.1. Demografik Analizler (Demographic analysis)

Ankara Gar Binası kullanıcılarının tarihi yapı hakkındaki görüşlerinin belirlenmesinin hedeflendiği çalışmada, araştırmaya katılan kullanıcıların demografik özellikleri (cinsiyet, yaş, medeni durum, eğitim durumu, statü, ikamet yeri) ile ilgili bilgilerin yer aldığı değişkenlere dair frekans ve yüzdelik dağılımlar hesaplanarak Tablo 1'de verilmiştir. Çalışmaya katılanların alt yaş sınırı 15 olarak belirlenmiş olup, 15-18 yaş aralığında olan kişilerin görüşleri ailelerinin izni alınarak çalışmaya dahil edilmiştir.

Tablo 1 kapsamında katılımcıların %51,6'sı erkek, %48,4'ü kadındır. Katılımcıların çoğunluğunu %58,6 ile 18-37 yaş aralığında bireyler, %59,5 ile bekar bireyler, %67,6 ile Ankara içinde ikamet edenler, %54,9 ile lisans ve lisansüstü eğitim durumuna sahip bireyler oluşturmaktadır. Ayrıca katılımcıların statülerinin çoğunluğu sırası ile %26,3 devlet memuru, %25,3 öğrenci, %24,2 özel sektör çalışanı, %10,6 serbest çalışan, %8,3 çalışmayan ve %5,4 emekli olarak tespit edilmiştir.

Tablo 1. Araştırmaya dahil edilen Ankara Gar Binası kullanıcılarının demografik özelliklerine dair frekans ve yüzde dağılımları (n=521) (Frequency and percentage distributions regarding the demographic characteristics of the users of the Ankara Station Building included in the research)

Değişkenler	Gruplar	f	%
Cinsiyet	Kadın	252	48,4

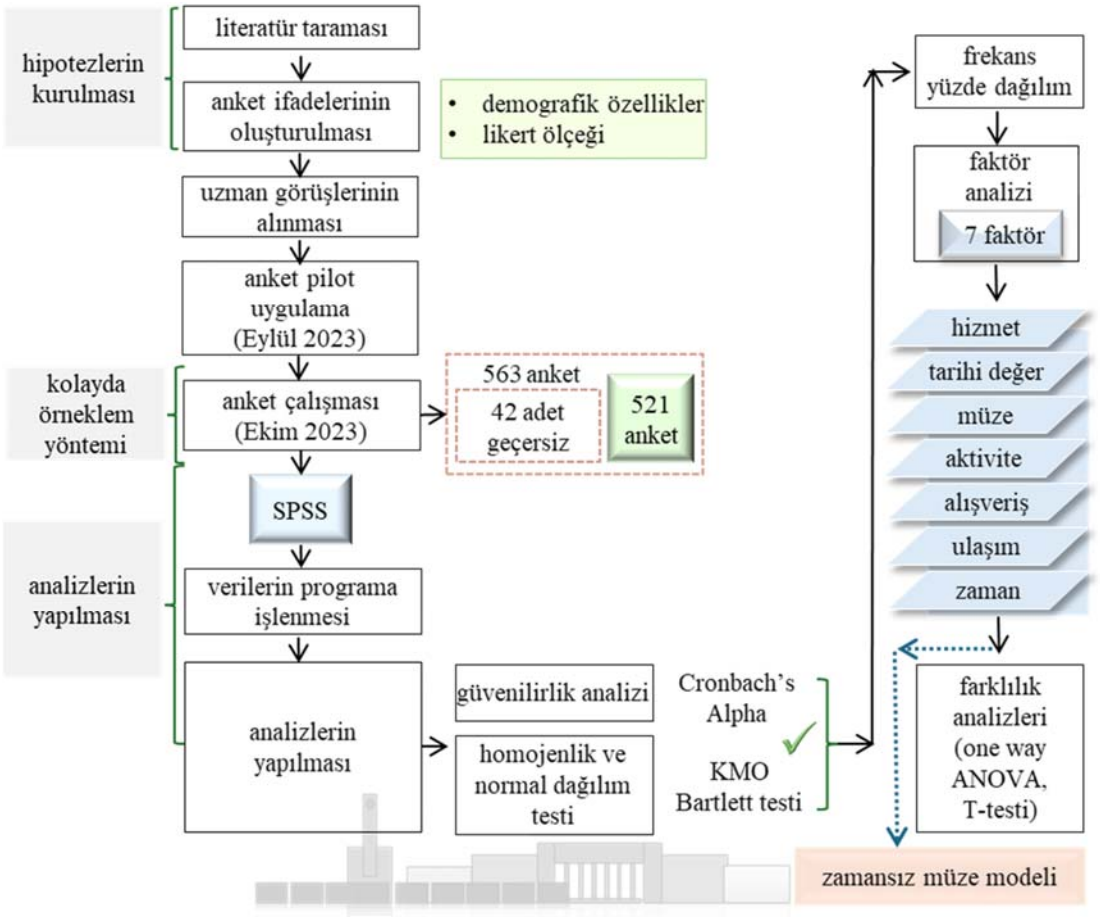
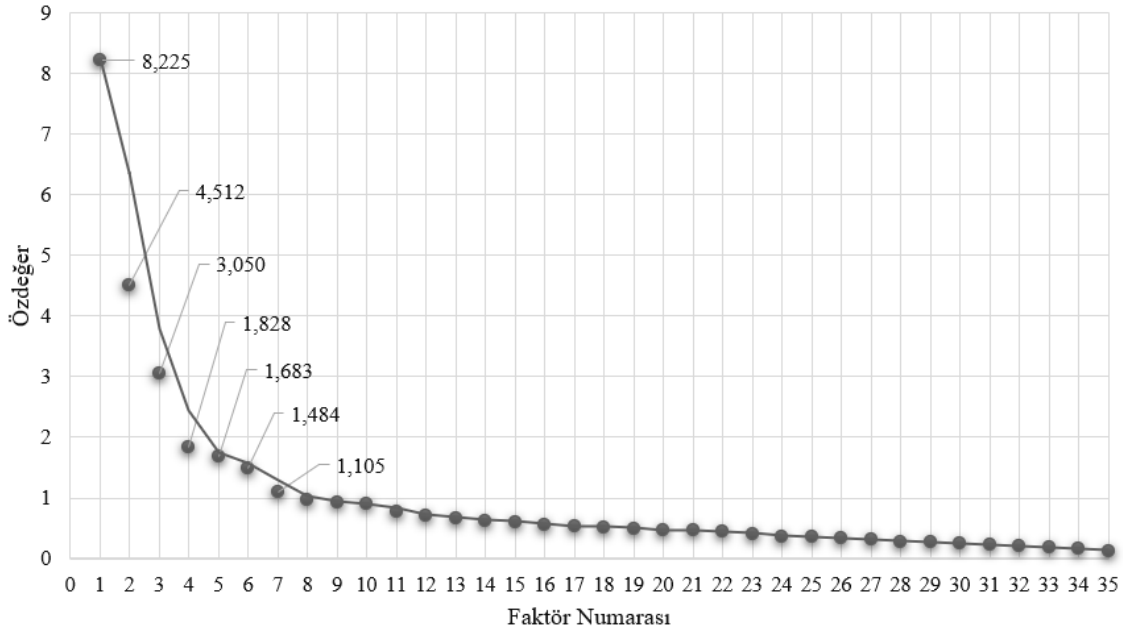
	Serbest Çalışan	55	10,6
	Çalışmayan	43	8,3
İkamet Yeriniz	Ankara	352	67,6
	Ankara Dışı	169	32,4

3.2. Güvenilirlik ve Geçerlilik Analizleri (Reliability and Validity Analysis)



Veri setinin geçerliliği ve uygunluğunu görmek için testler yapılarak değerlere bakılmıştır. Verilerin normalliğin iki bileşeni çarpıklık (skewness) ve basıklıktır (kurtosis). Dağılımın normal olduğunu gösteren değerler ise -1.5 ile +1.5 arlığındadır [40]. Kolmogorov-Smirnov testi neticesinde çarpıklık değeri (skewness)=-0,665 ve basıklık değeri (kurtosis)=+1,117 çıkarak dağılımın normal olduğu görülmüştür. Ayrıca, anket verilerinin analiz sonuçlarının güvenirliğini değerlendirmek için Cronbach's Alfa değeri, güvenilirlik analizinin ölçüsü olarak kullanılmaktadır. Cronbach's Alpha, yani güvenirlik katsayısının bulunabileceği aralıklar $0,60 \leq \alpha < 0,80$ ise ölçek oldukça güvenilir, $0,80 \leq \alpha < 1,00$ ise ölçek yüksek derecede güvenilir olarak kabul edilmektedir [41] Tablo 2'de verilen bütün alt boyutların Cronbach's Alpha değerleri 0,60 değerinin üzerinde olduğu için güvenilirdir. Ayrıca çalışmanın genel ölçek güvenilirliği katsayısı (Cronbach's Alpa) α=0,897 olarak hesaplanarak yüksek derecede güvenirlik sağlamıştır. Kaiser-Meyer - Olkin (KMO) testi verilerin faktör analizine uygunluğunu ölçmeye yönelik bir ölçümdür. Bir başka deyişle örneklem büyüklüğünün yeterliliğini test etmektedir. KMO değerlerinin 0,8 ile 1,0 arasında olması örneklemenin yeterli olduğunu göstermektedir [42]. Tablo 2 'de yer alan Kaiser-Meyer-Olkin (KMO)=0,873 değeri ve Bartlett testi= $\chi 2$ =9410,775; p=0,000 değeri ile örneklemin yeterli olduğunu ve faktör analizi yapılabileceğini ifade etmektedir. Yapılan tüm bu analizler neticesinde, verilerin normal dağılıma uygun ve homojen olduğu, örneklem sayısının yeterli olduğu ve güvenilir olduğu, dolayısıyla parametrik test koşullarının sağlandığı ortaya çıkmıştır.

3.3. Faktör Analizi (Factor Analysis)



Faktör analizi boyutluluk azaltma analizi olarak isimlendirilmektedir. Bunun önemi, aynı içeriğe yanıt veren birden fazla göstergenin, çok benzer yanıtlara sahip göstergelerle aynı kategoride sınıflandırılması, farklı içeriği yansıtan göstergelerin ise başka kategorilerde sınıflandırılmasıdır [43]. Faktör analizi yaparken rotasyon tekniği olan Varimax ile "Dönüştürülmüş Bileşenler Matrisi" (Rotated Component Matrix) elde edilmiştir. Döndürülmemiş faktörler belirsiz olduğundan, daha iyi yorumlama için faktörler döndürülmektedir. Döndürmenin amacı, her değişken yükün mümkün olduğu kadar az faktöre dayanmasını sağlayan, ancak her değişken üzerindeki yüksek yüklerin sayısını maksimuma çıkaran optimal basit bir yapıya ulaşmaktır [44]. Şekil 4'te, çalışma kapsamında ortaya çıkan her bir özdeğerin ilişkili olduğu faktöre karşı grafiği görülmektedir. Burada özdeğerler, bir faktör tarafından açıklanan varyasyon miktarını temsil etmektedir [45].

Tablo 2'deki sonuçlar incelendiğinde 35 soruya ilişkin ölçeğin 7 faktör (hizmet, tarihi değer, müze, etkinlik, alışveriş, ulaşım ve zaman) altında toplandığı görülmektedir. 7 faktör toplam varyansın %62,534'ünü (Kümülatif Varyans) açıklamaktadır. Her bir soruya ilişkin faktör yükleri Tablo 2'de verilmiştir.

Anket verileri değerlendirildiğinde, yapıya dair iç ve dış mekân temizliği, iklimlendirme koşullarının yeterliliği, engelli erişimine uygunluğu, güvenlik hizmetlerinin yeterliliği, ziyaretçi yönetimi ve bilgilendirme gibi özellikler birinci boyut olan hizmet faktörünü açıklamaktadır. Kullanıcıların gar binasının tarihi ve inşa edildiği dönem, gar binasına bağlı diğer yapılar, yapının mimarı ve mimari

Şekil 4. Çalışmaya ait akış şeması (Flow chart of the study)

Şekil 5. Özdeğer grafiği (scree plot of the eigenvalues)

özellikleri, gar binasının tarihi kimliği ve yapıya bağlı olan müze ile ilgili farkındalıkları ikinci boyut olan tarihi değer faktörünü açıklamaktadır. Kullanıcıların gar binasının müzeye dönüşümü ve bu durumun yapıya katacağı değer hakkındaki görüşleri ile dönüşüm sonrası yapıya olan ilgileri ve ziyaret sıklığının nasıl değişeceği gibi durumlar üçüncü boyut olan müze faktörünü açıklamaktadır. Kullanıcıların yolculuk öncesi ve sonrası beklemeleri sırasında vaktini nitelikli geçirecek aktivite imkanlarının yeterliliği, bekleme alanlarının konforu, mevcut sosyal hizmet alanları ile ilgili yeterli bilgiye sahip olup olmadıkları gibi özellikler dördüncü boyut olan etkinlik faktörünü açıklamaktadır. Yapının hem mevcut durumda hem de zamansız müzeye dönüşümü söz konusu olduğu durumda alışveriş imkanlarının iyileştirilmesi ile ilgili görüşleri gibi unsurlar beşinci boyut olan alışveriş faktörünü açıklamaktadır. Kullanıcıların yapıya bireysel araç ve toplu taşıma ile ulaşımın rahatlığı ve gar binasının konumunun önemi hakkında görüşleri gibi özellikler altıncı boyut olan ulaşım faktörünü açıklamaktadır. Son olarak, kullanıcıların yapıda zamansız müze modeli kapsamında düzenlenebilecek aktivitelere katılabilecek uygun zamanları ve ilgileri gibi özellikler yedinci boyut olan zaman faktörünü açıklamaktadır.

3.4. Farklılık analizleri (Differentiation Analyses)

Araştırma kapsamında yer alan Ankara Gar Binası'na dair kullanıcı görüşlerinin bireysel özellikler üzerinden karşılaştırılmasında; iki değişkenli bağımsız örneklem grupları olan cinsiyet, medeni durum ve ikamet yeri için T-testi (Independent Samples), yaş, eğitim durumu, çalışma durumu olan ikiden fazla değişken gruplarında tek yönlü varyans analizi (One Way Anova) yöntemlerinden yararlanılmıştır. Testler yapılırken, faktör analizi sonucunda çıkan yedi boyutun her biri demografik özellikler ile parametrik testlere tabi tutularak farklılık bulunan değerler incelenmiştir. T-testi sonucunda arasında anlamlı farklılık bulunan gruplar Tablo 3'te verilmiştir (*P<0,05)*.

Tablo 3 incelendiğinde:

- Cinsiyete göre tarihi değer faktöründe farklılık tespit edilmiş olup (P<0,05), erkek (f=269) kullanıcıların ($\bar{X}$=2,9665), kadın (f=252) kullanıcılara göre ($\bar{X}$=2,7557) yapının tarihi önemi ve mimari özellikleri ile ilgili bilgilerinin daha çok olduğu görülmektedir.
- Cinsiyete göre etkinlik faktöründe farklılık tespit edilmiş olup (P<0,05), erkek (f=269) kullanıcıların ($\bar{X}$=2,7928), kadın (f=252) kullanıcılara göre ($\bar{X}$=2,6280) yapıda beklemeleri sırasında nitelikli vakit geçirebilecek aktivite alanları, sosyal hizmet alanları ve bekleme alanlarının konforu hakkında daha olumlu düşündükleri görülmektedir.
- Medeni duruma göre tarihi değer faktöründe farklılık tespit edilmiş olup (P<0,05), evli (f=211) kullanıcıların ($\bar{X}$=3,0339), bekar (f=310) kullanıcılara ($\bar{X}$=2,7493) göre yapının tarihi değeri hakkındaki farkındalıklarının daha olumlu olduğu görülmektedir.
- İkamet yerine göre hizmet faktöründe farklılık tespit edilmiş olup (P<0,05), ikamet yeri Ankara (f=352) olan kullanıcıların ($\bar{X}$=3,7639), ikamet yeri Ankara dışı (f=169) olanlara göre ($\bar{X}$=3,6089) tarihi değer farkındalıklarının daha olumlu olduğu görülmektedir.
- İkamet yerine göre tarihi değer faktöründe farklılık tespit edilmiş olup (P<0,05), ikamet yeri Ankara (f=352) olan kullanıcıların ($\bar{X}$=2,9736) yapının tarihi değeri ve mimari özellikleri ile ilgili farkındalıklarının ikamet yeri Ankara dışı (f=169) olanlara göre ($\bar{X}$=2,6374) daha olumlu olduğu görülmektedir.
- İkamet yerine göre etkinlik faktöründe farklılık tespit edilmiş olup (P<0,05), ikamet yeri Ankara (f=352) olan kullanıcıların ($\bar{X}$=2,7734) yapıda beklemeleri sırasında nitelikli vakit geçirecek imkanlar, bekleme alanlarının konforu ve gar binasının sosyal hizmet alanları ile ilgili bilgilerinin ikamet yeri Ankara dışı (f=169) olanlara göre ($\bar{X}$=2,5873) daha olumlu olduğu görülmektedir.
- İkamet yerine göre alışveriş faktöründe farklılık tespit edilmiş olup (P<0,05), ikamet yeri Ankara (f=352) olan kullanıcıların ($\bar{X}$=4,0156) alışveriş imkanlarından ikamet yeri Ankara dışı (f=169) olanlara göre ($\bar{X}$=3,7840) daha memnun oldukları görülmektedir.
- İkamet yerine göre zaman faktöründe farklılık tespit edilmiş olup (P<0,05), ikamet yeri Ankara dışı (f=162) olan kullanıcıların yapıda düzenlenebilecek aktivite, sanatsal, sosyal etkinliklere katılma, çocuklar ve gençler için aktivite alanlarının olması konusunda ($\bar{X}$=3,4201), ikamet yeri Ankara olan (f=352) kullanıcılara göre ($\bar{X}$=3,0587) daha olumlu düşündüğü görülmektedir.

Tablo 2. Anket ifadelerine ilişkin faktör analizi ve güvenilirlik analizi sonuçları. H: Hizmet; TD: Tarihi Değer; M: Müze; E: Etkinlik; A: Alışveriş; U: Ulaşım; Z: Zaman, A.S.:Anket sırası, F.S.:Faktör sırası.

Sonuç itibari ile araştırmanın alt hipotezlerinden;

H1-1: Ankara Gar Binasını kullananların tarihi yapıya ilişkin farkındalık düzeyleri cinsiyetlerine göre anlamlı farklılık göstermektedir.
H1-3: Ankara Gar Binasını kullananların tarihi yapıya ilişkin farkındalık düzeyleri medeni duruma göre anlamlı farklılık göstermektedir.
H1-5: Ankara Gar Binasını kullananların tarihi yapıya ilişkin farkındalık düzeyleri ikamet yerlerine göre anlamlı farklılık göstermektedir.
Hipotezleri kabul edilmiştir. Arasında anlamlı farklılık bulunan gruplar Tablo 4'te verilmiştir (*P<0,05)*.

Tablo 4 incelendiğinde:

- Yaşa göre tarihi değer faktöründe farklılık tespit edilmiş olup (P<0,05); 17 ve altı yaş ($\bar{X}$=2,3915) grubundakilerin 48-57 yaş ($\bar{X}$=3,2616) grubundakilere göre; 18-27 yaş ($\bar{X}$=2,6364) grubundakilerin 28-37 ($\bar{X}$=3,0191) yaş grubundakilere göre ve 18-27 yaş ($\bar{X}$=2,6364) grubundakilerin 48-57 ($\bar{X}$=3,2616) yaş gruplarındakilere göre tarihi yapı hakkındaki bilgileri ve farkındalıklarının daha düşük olduğu görülmüştür.
- Yaşa göre ulaşım faktöründe farklılık tespit edilmiş olup (P<0,05); 18-27 yaş ($\bar{X}$=4,3333) grubunun 17 ve altı yaş ($\bar{X}$=3,8395) grubuna göre; 28-37 yaş ($\bar{X}$=4,4068) grubunun 17 ve altı yaş ($\bar{X}$=3,8395) grubuna göre yapının konumu ve ulaşım kolaylığı konusunda daha olumlu düşündüğü görülmektedir.
- Statüye göre hizmet faktöründe farklılık tespit edilmiş olup (P<0,05); öğrenci ($\bar{X}$=3,8000) grubundakilerin emekli ($\bar{X}$=3,3214) grubundakilere göre ve serbest çalışanlar ($\bar{X}$=3,9018) grubundakilerin emekli ($\bar{X}$=3,3214) grubundakilere göre binayı temizlik, iklimlendirme koşulları, engelli erişimi, güvenlik ve ıslak hacim imkanları açısından daha olumlu düşündükleri görülmektedir.
- Statüye göre tarihi değer faktöründe farklılık tespit edilmiş olup (P<0,05); devlet memuru ($\bar{X}$=3,3222) grubundakilerin özel sektör ($\bar{X}$=2,8220) grubundakilere göre; devlet memuru ($\bar{X}$=3,3222) grubundakilerin öğrenci ($\bar{X}$=2,5422) grubuna göre; devlet memuru ($\bar{X}$=3,3222) grubundakilerin serbest çalışan ($\bar{X}$=2,5688) grubuna göre tarihi değer farkındalıkları ve yapı hakkındaki bilgilerinin daha fazla olduğu görülmektedir.
- Statüye göre zamansız müze faktöründe farklılık tespit edilmiş olup (P<0,05); devlet memuru ($\bar{X}$=3,9367) grubunun gar binasının müzeye dönüşmesi için uygunluğu ve dönüşümün yapının değerini ortaya çıkaracağı ile ilgili görüşleri öğrenci ($\bar{X}$=3,5947) grubundan daha olumludur.
- Statüye göre ulaşım faktöründe farklılık tespit edilmiş olup (P<0,05); serbest çalışanlar ($\bar{X}$=4,4727) grubunun yapının konumu ve yapıya ulaşımın rahatlığı için görüşleri çalışmayan ($\bar{X}$=4,3411) grubuna göre daha olumludur.
- Statüye göre zaman faktöründe farklılık tespit edilmiş olup (P<0,05); devlet memuru ($\bar{X}$=3,3212) grubundakilerin gar binasında düzenlenebilecek aktivitelere, sanatsal ve sosyal faaliyetlere katılmak için görüşlerinin öğrencilere ($\bar{X}$=2,9722) göre daha olumlu olduğu görülmektedir.
- Eğitim durumuna göre hizmet faktöründe farklılık tespit edilmiş olup (P<0,05); lisans grubunun ($\bar{X}$=3,6657) ilköğretim ($\bar{X}$=4,0727) grubuna göre, lisansüstü grubunun ($\bar{X}$=3,5532) ilköğretim ($\bar{X}$=4,0727) grubuna göre binanın temizlik, engelli erişimi, ıslak hacim imkanları ve iklimlendirme gibi hizmet alanları hakkında daha olumsuz düşündüğü görülmektedir.
- Eğitim durumuna göre zaman faktöründe farklılık tespit edilmiş olup (P<0,05); lisansüstü grubunun ($\bar{X}$=3,4810), lise grubuna göre ($\bar{X}$=2,9544) gar binasında düzenlenebilecek aktivitelere, sanatsal ve sosyal faaliyetlere katılmak için daha olumlu düşündüğü görülmektedir.

Bu durumda;

H1-2: Ankara Gar Binasını kullananların tarihi yapıya ilişkin farkındalık düzeyleri yaşlarına göre anlamlı farklılık göstermektedir.
H1-4: Ankara Gar Binasını kullananların tarihi yapıya ilişkin farkındalık düzeyleri statülerine göre anlamlı farklılık göstermektedir.
H1-6: Ankara Gar Binasını kullananların tarihi yapıya ilişkin farkındalık düzeyleri eğitim durumuna göre anlamlı farklılık göstermektedir.

Hipotezleri kabul edilmiştir.

Tablo 4. Yaşlarına, statülerine ve eğitim durumlarına göre katılımcıların hizmet, tarihi değer, müze, ulaşım ve zaman faktörlerine ilişkin bulunan anlamlı farklılıklar (one way ANOVA testi) (n=521) (Significant differences were found regarding the service, historical value, museum, transportation and occasion factors of the participants according to their age, status and education level.)

4. Sonuç (Conclusion)

Tarihi yapılar sahip oldukları mimari fiziksel dokuların yanında, mekânın kültürel yansıması ve hafızası ile kentlere bir kimlik kazandırmaktadır. Böylelikle kullanım farklılıklarına bağlı olarak tarihi yapıların fonksiyonel ve biçimsel özellikleri yapıldığı döneme ilişkin fikir edinilmesini sağlamaktadır. Bu kapsamda, bir kentteki kamusal yapılar arasında yer alan tarihi gar binaları da yapıldığı dönemden günümüze kadarki süreçte kent kimliğini yansıtan önemli yapılardır. Yolculukların başlangıç ve bitişine şahitlik eden gar binaları, insanların zihin ve duygularında bıraktığı etki ile de ayrı bir öneme sahiptir. Hizmetine devam eden tarihi yapıların kullanıcılar tarafından fark edilmesi, koruma kapsamında yapıyla ilgili gerekli hassasiyetin gösterilmesi ve kullanıcı isteklerine cevap verilmesi yapının sürdürülebilirliği açısından önemlidir. Bu bağlamda kullanıcı görüşleri, taleplerinin karşılanabilmesi için planlamadan tasarım aşamasına kadar çok önemlidir.

Son dönemde kentlerde sıkça görülmeye başlayan ve farklı konseptlerde müze mekânı olarak dönüştürülen tarihi yapıların sayıları artmaktadır. Hayatı boyunca müze ziyareti gerçekleştirmemiş veya gerçekleştirmeyi düşünmeyen birçok insan, çağdaş müzecilik anlayışı ile düzenlenmiş farklı içerikteki bu müzelere ilgi göstermeye başlamıştır [46]. Bu durum kenti ziyaret edenlerin sayısında da önemli artışlar yaşanmasına neden olmaktadır. Ülkemizde belli bir tasarım konsepti ile inşa edilen müzelere Çanakkale Troya ve Eskişehir Odunpazarı Modern Müzesi [47] gibi müzelerin yanı sıra Bursa Anadolu Arabaları Müzesi, İstanbul Müze Gazhane, Ankara Ulucanlar Cezaevi Müzesi, İstanbul Modern gibi tarihi yapılardan dönüştürülen müzeler örnek verilebilir. Ayrıca, askeri müzeler, sanat müzeleri, jeoloji müzeleri, tarih müzeleri, doğa tarihi müzeleri, arkeoloji müzeleri, etnografya müzeleri ve bilim müzeleri gibi müzeler ise belirli türde eserleri sergileyerek, daha çok eğitim amacıyla veya o alana ilgi duyan kişilerin ziyaret ettiği yerler olarak kullanılmaktadır.

Çalışma kapsamında ele alınan ve literatüre yeni bir bakış açısı kazandıracak olan zamansız müze modeli ile özgün işlevine devam eden tarihi gar binalarının, işleyişine devam ederken kullanıcılara tarihi farkındalık oluşturmanın yanı sıra müzeye dönüştürülerek yapının yaşanabilirliğinin artırılması düşünülmüştür. Oluşturulan bu kuramsal temelin en önemli kısmı, tarihi yapı atıl kalmadan veya tarihi kimliğini tamamen kaybetmeden, özgün işlevi ile müzeye dönüştürülerek yapı dokunulmazlığının sağlanmasıdır.

Araştırmanın temel hipotezi olan "H1: Ankara Gar Binası'nı kullananların tarihi yapıya ilişkin farkındalık düzeyleri arasında demografik yapılarına göre anlamlı farklılık vardır." kısmen kabul edilmiştir. Bu bağlamda yapılan çalışma ile elde edilen sonuçlardan, yapının müzeye dönüşmesi ile ilgili görüşlerin olumlu yönde olduğu görülmüştür. Tüm katılımcıların tarihi değer ile ilgili verdiği cevaplardan katılımcıların yapının Ankara için önemi, yapının inşa edildiği dönem ve mimarisi ile ilgili yeterli bilgiye sahip olmadığı tespit edilmiştir. Özellikle gar binası için ortaya koyduğumuz "zamansız"lık kavramı, yapının bir geçiş alanı olmasının ötesinde tarihi kimliği ile var olmasını sağlamaktır.

Tarihi yapı ile ilgili, kadın katılımcıların binada etkinlik imkanlarını yetersiz gördüklerinin tespit edilmesi, kadın kullanıcılara yönelik etkinlik alanlarının iyileştirilmesi ile yapıyı kullanmaya ilişkin görüşlerini olumlu yönde teşvik edeceği görülmüştür. Zamansız müze modeli ile, sanatsal ve sosyal etkinlik alanlarının oluşturulması ve alışveriş imkanlarının artırılmasıyla bu eksikliğin giderileceği beklenilmektedir. Tarihi değer algısının özellikle öğrenciler ve bekarlar tarafından düşük olduğu sonucuna ulaşılması, genç gruplar, öğrenciler ve bekarlar için tarihi yapı hakkında bilgilerinin ve ilgilerinin yetersiz olduğu şeklinde yorumlanabilir. Dolayısıyla, bu grupların ilgisini çekecek aktivitelerin ve etkinlik alanlarının iyileştirilmesi, yapıda zaman geçirmelerini sağlayarak yapı ile ilgili farkındalıklarını artıracağı düşünülmektedir.

Ankara dışında ikamet eden kullanıcıların Ankara'da ikamet edenlere göre yapının tarihi değeri ile ilgili farkındalıklarının düşük olduğu, etkinlik, hizmet ve alışveriş imkanlarını yetersiz buldukları saptanmıştır. Ayrıca ikamet yeri Ankara dışı olan kullanıcılar, Ankara'da ikamet edenlere göre yapıda düzenlenebilecek aktivitelere, sanatsal ve sosyal etkinliklere katılmak için daha olumlu yaklaşmıştır. Bu noktada şehrin sembol yapılarından biri olan gar binasının şehir dışından gelen ziyaretçilerin hafızasında daha olumlu bir şekilde kalması için gar binası ve kent tarihi hakkında bilgilendirici içeriklerin sunulduğu alanların oluşturulması, beklemeleri sırasında nitelikli vakit geçirebilecekleri etkinlik alanlarının ve alışveriş imkanlarının artırılması ve iyileştirilmesi önerilmektedir.

Ankara Gar Binası'nın zamansız müze olarak dönüştürülmesi ile kullanıcının tarihi farkındalığını artıracak sergiler ve bilgilendirici içeriklerin paylaşılması, yapının sürdürülebilirliğini destekleyecektir. Yapı bünyesinde zamansız müze modeli ile etkinlik, hizmet ve alışveriş imkanlarının da iyileşerek ziyaretçilerin beklemeleri sırasında nitelikli vakit geçirmelerini sağlayacaktır. Bu sayede alanların kullanıcı dostu olması, modern toplumun yaşam tarzına entegre olması ve zaman geçirilebilecek mekânlar haline gelmesi, yapıya olan memnuniyeti de artıracaktır

Bu tür geliştirmeler, tarihi gar binalarının sadece geçiş yerleri olmasının ötesinde, ziyaretçilere anlamlı ve keyifli deneyimler sunan kültürel merkezler haline gelmesi ile toplumun kolektif hafızasında yaşatılmasına katkı sağlayacaktır. Çalışma sonucunda hizmet kalitesinin artırılması ve zamansız müze modeli ile tarihi dokuyu yansıtan düzenlemelerin yapılması, şehir içinden ve dışından gelen kullanıcıların yapıyı keşfetmeleri için önemli bir adım olacaktır.

Hızla değişen ve gelişen dünyada, yaşam koşulları, istekler ve buna bağlı olarak ortaya çıkan gereksinimler, her alanda olduğu gibi mimari alanda da kendini göstermektedir. Tarihi yapıların kullanımlarının özgün işlevlerinden uzaklaşmadan ve mevcut koşullarıyla geleceğe aktarılması konusunda tarihi gar binalarının 'zamansız müze' konsepti ile kullanılması ele alınmıştır. Böylece söz konusu yapıların çevresel, mimari ve yapısal koşullarına uygun ikincil işlevlerle değerlendirilmesi açısından bir farkındalık oluşturulmaya çalışılmıştır.

Highlights

- This paper focuses on the bi-directional data exchange methods, IFC and API, within BIM technology.
- A case study is conducted to find a reliable data exchange method for structural engineering.
- The API is better than IFC; however, it isn't extremely smooth to enable bidirectional data flow.

Building Information Modelling (BIM,) Interoperability Industry Foundation Classes (IFC), Application Programming Interface (API)

Abstract

Building Information Modelling (BIM) is a technology that allows data generated by different disciplines using different software to be shared and used in a digital environment. By promising bi-directional data integration between all stakeholders, BIM encourages interoperability in the industry. This study aims to assess the operability and reliability of bidirectional data exchange methods within BIM technology, specifically Industry Foundation Classes (IFC) and Application Programming Interface (API). The study tests these methods between the architecture and structural engineering disciplines using Autodesk Revit along with the structural software packages: ETABS, Robot Structural Analysis, SAP2000, and Tekla Structures. The results show that the IFC file extension causes data losses in information sharing between software, while the API method can provide reliable data integration between different tools. However, the API only works smoothly between the tools developed by the same company. Nevertheless, API may be a promising way to achieve the interoperability goal of BIM technology.

1. INTRODUCTION

Architectural design and structural analysis are two distinct yet interrelated domains within a construction project. Each field follows unique procedures and pursues specific objectives in the building design process. The architectural design focuses on determining the configurations of various architectural elements, including their dimensions and materials, while the structural analysis examines the structural and mechanical properties of building components, such as stress, strain, and stability [1]. Both architectural and structural design are crucial for the successful completion of a building's design [2].

Structural design encompasses several tasks, including defining the structure, conducting structural analyses, and creating drawings and technical documentation. To develop a comprehensive project involving multiple disciplines, a series of phases is undertaken by various technical teams, each employing different tools. The information needed for each stage is primarily derived from technical drawings, which often result in omissions and inaccuracies, leading to inconsistencies in the final product. Throughout these processes, it is crucial to have trust in the data exchanged between the different systems. To ensure this trust and facilitate seamless collaboration, a high level of interoperability is essential [3]. At this point, the Building Information Modelling (BIM) concept is promising to centralize and transfer all the information generated throughout the development of the project. BIM serves as a collaborative working platform that

*Corresponding author, e-mail: damlanurilipinar@karabuk.edu.tr

embodies the physical, analytical, digital, and functional characteristics of a building. It is a smart, object-oriented, and information-rich digital representation of the project, encompassing all necessary details [4]. The essence of BIM is enabling a database for all disciplines of the project to improve collaboration and communication [5]. Therefore, BIM has been embraced to address issues of fragmented workflow, insufficient communication, and ineffective coordination within the Architecture/Engineering/Construction (AEC) industry [6]. BIM provides synchronized data and interoperability of the project from the beginning of the design phase [7], and so, essential information for design, calculation, simulation, execution, operation, maintenance, renovation, and demolition has been automatically acquired. Thus, the crucial aspect is to possess building models that can be easily accessed, modified, and shared within a unified data environment [8]. According to the BIM's undertaking in the literature, importing and exporting data from one BIM software to another is trustworthily achieved [9]. There are different methods for sharing and transferring data contingent upon the extent of interoperability [10], such as Application Programming Interface (API) supplements [11] and Industry Foundation Classes (IFC) based data [12]. With all promises and advantages, the actual implementation of BIM interoperability is still a challenge [13].

This research examines the interoperability between architectural design and structural analysis. The aim is to investigate the BIM interoperability through data transfer processes among various software platforms using two types of pathways: (i) Application Programming Interface (API) or "immediate connection," which refers to the direct link between software programs from the same provider; and (ii) indirect connection Industry Foundation Classes (IFC), which involves transferring information through third-party software or methods/algorithms. The methodology of the research includes a simple case study involving an analysis of data exchange abilities between common architectural and structural software. The main building model in the case is created in Autodesk Revit. For the structural analysis part, ETABS 21, Autodesk Robot Structural Analysis Professional (RSA), SAP2000, and Tekla Structures tools are chosen as the main authorized tools.

2. INTEROPERABILITY FOR BI-DIRECTIONAL DATA EXCHANGE

In a standard construction project, multiple entities such as architects, engineers, clients, contractors, subcontractors, specialists, etc., are involved. Each stakeholder employs a range of software tools tailored to their specific needs, supporting large and complex projects. When collaborating with other users, ensuring seamless data exchange between these tools becomes a critical issue for interoperability. The direct one-on-one data format transitions between each participant are excessive and not necessary for the actual exchange of data. Moreover, with the growing complexity of projects, the conventional approach scarcely fulfills the escalating demand for sharing and exchanging data [14]. Achieving interoperability among these software packages is a significant challenge, but essential for ensuring seamless sharing of information models. This is where data-sharing techniques come into play, enabling the analysis of data that needs to be shared and determining the data-sharing requirements for improved collaboration. Seamless interoperability can help minimize delays and cost overruns by eliminating the need for re-modeling in construction projects [1]. At this point, BIM technology has been introduced based on the concept of creating, storing, and managing a large amount of information throughout the building life cycle in an integrated way [15].

The central concept of BIM is interoperability, which means that the data contained within the building model should be shared seamlessly and utilized effectively [16]. As per Sacks et al. [17], interoperability denotes the ability to effortlessly share and utilize information generated by various vendors and software within a team, free from any complications. This reduces the risk of errors, delays, and miscommunications, leading to more efficient and effective project delivery. Especially, in complex building projects, owing to multiple stakeholders, data sharing and exchange between different software tools is inevitable so a common data format is necessary for data interoperability [14]. Arayici and colleagues [18] highlighted the significance of interoperability in facilitating an integrated design approach. Effective collaboration, interaction, and information exchange among team members require interoperability through open standards. The use of open standards is crucial for facilitating a smooth interchange of information, irrespective of the nature of the data or the software employed. Laakso and Kiviniemi [19] emphasized that

interoperability relies on open data standards, enabling the development of universally compatible file formats usable across different applications.

Rammant [10] explains that there are different levels of interoperability depending on the data sharing and exchanging requirements. The basic level is the first level, where team members can export and import data from one software to another. This method requires manual intervention to ensure the data's correct coordinates, and it becomes impractical for complex projects due to the need to redo the import/export process for every revision. Moreover, each discipline employs different software applications, which further complicates the process. Rammant [10] also presented the second tier of interoperability, which encompasses an openly accessible standard format enabling users to retrieve all data. The Industry Foundation Classes (IFC) format is a widely accepted schema in the AEC industry at this level. Ultimately, as outlined by Rammant [10], the highest level involves establishing a direct connection between diverse software, linking two distinct application interfaces through the Application Programming Interface (API). Over recent years, the predominant facilitators of project data exchange have been the API [11] and the open format known as IFC [12].

2.1. The Industry Foundation Classes (IFC)

The Architecture, Engineering, Construction & Facility Management (AEC/FM) industry has a need for BIM interoperability, which has led to the development of Industry Foundation Classes (IFC). IFC is a neutral and open standard building data model created and maintained by buildingSMART to facilitate data sharing among all stakeholders throughout the entire lifecycle of a project [20]. In other words, it is an ISO-registered, open, and neutral data exchange standard for BIM [2]. The development of IFC can be traced back to 1994 when Autodesk formed a consortium, the International Alliance for Interoperability (IAI), to promote integrated application development. The IAI was later renamed buildingSMART to reflect its ultimate goal [17]. Sacks et al. [17] described the Industry Foundation Classes (IFC) as an object-oriented data representation schema used for exchanging data between various applications employed by different disciplines. According to buildingSMART International's (2023) data [21], the latest version of IFC is 4.3. ADD 2 specification, but this is under Final Draft International Standard (FDIS) Voting and expected to be published by the International Organization for Standardization (ISO) in early 2024. Therefore, IFC4 and IFC 2x3 versions are available for the exchange file format structure.

The Industry Foundation Classes have two main components: a data schema and an exchange file format structure. The data schema is described using two languages - EXPRESS data specification language and XML Schema definition language (XSD), with the former being the source and the latter being generated from it according to mapping rules defined in ISO 10303-28. To facilitate the exchange and sharing of data, two exchange file formats are specified: a clear text encoding of the exchange structure defined in ISO 10303-21 and Extensible Markup Language (XML) defined in the XML W3C Recommendation. Other exchange file formats may also be used as long as they comply with the data schemas. This IFC release includes both the data schemas (in EXPRESS and XML schema representations) and reference data, which includes definitions of property and quantity names, as well as formal and informative descriptions [21].

According to Khemlani [22], the IFC model covers a wide range of building information, including elements such as walls, columns, and doors, as well as schedule, construction cost, and organization, in the form of data objects throughout all phases of a building's lifecycle, from conceptual planning to occupation and operation. The IFC model is organized around building entities, which makes it an object-based data model. Unlike the conventional geometric data model based on computer-aided design (CAD), a data model provides information that can be shared and utilized for a variety of purposes such as analysis, documentation, visualization, and calculation.

Laakso and Kiviniemi [19] have identified four layers within the architectural IFC data model, which progress from the lowest to the highest. These layers are the resource layer, core layer, interoperability layer, and domain layer. The BIM utilizes the data model to depict geometric data, material properties, and interoperability. Positioned above other layers, the resource layer contains commonly used elements in the AEC industry, categorizing entities based on generic properties like geometry, material, cost, date, and

time. The core layer, the second layer, delineates entities in the upper layers and comprises two schemas: the kernel and extension. The kernel imparts fundamental concepts about elements, relationships, procedures, attributes, and actors, while the extension encompasses control, product, and process extensions. The interoperability layer, the third layer, furnishes a shared platform for the upper domain layer to seamlessly exchange data. Finally, the domain layer, the highest layer in the IFC structure, is tailored to specific AEC domains such as architecture, structural engineering, HVAC, construction management, and others, according to Laakso and Kiviniemi [19]. Official model view definitions (MVDs) are released by buildingSMART International [21] as related specifications. These MVDs are designed to work with IFC 4.3.0 and currently have three levels of implementation: Reference View, Alignment Based Reference View, and Design Transfer view. These levels can be thought of as incremental stages that progressively add more advanced features to the implementations. The data schema architecture of IFC is structured into four conceptual layers, and each schema is allocated to one of these layers.

The IFC model, a versatile compilation of building model data, plays a vital role in facilitating bidirectional data interchange across diverse software platforms. This model incorporates a broad spectrum of entities about building elements (such as windows, doors, and slabs) and business tasks (like construction schedules, costs, and organizational aspects). The organization of objects in the IFC schema is structured according to their relationships, and the IFC "framework model" encompasses various elements like object types, classifications, attributes, materials, geometry, and properties to represent the building model comprehensively. All physical elements are nested within the IFC structure using different entities [19]. The IFC platform encompasses data related to architectural, structural, mechanical, electrical, and plumbing aspects. As a result, the IFC model incorporates multiple dictionaries to facilitate data interpretation. Consequently, when transferring data via an IFC file, the exchanged information needs to be understood in terms of its data category. Subsequently, the model can be converted into compatible data using relevant dictionaries [16].

2.2. Application Programming Interface (API)

Application programming interface (API) is a set of subroutine definitions, protocols, and tools for building application software [2]. In BIM technology API is a file transfer method also known as a direct link or direct native link. This link automatically establishes a connection between two different applications. The link operates in both directions, ensuring the seamless exchange of data without loss, as stated by Fleming [23]. As outlined by Sacks et al. [19], direct connections relying on programming-level interfaces represent the oldest but enduringly vital method for data transfer. These interfaces empower software to construct models and perform actions such as exporting, checking, or deleting data. Application interfaces, on the other hand, facilitate the import and adjustment of data to acquire information from other applications. The establishment of direct links occurs between a minimum of two distinct software programs, aiming to streamline data exchange as companies strive for a compatible interface and enhanced support for data export and import. According to Yousefzadeh et al. [24], direct links are delineated as extensions or add-ons designed exclusively for a specific software program, in contrast to IFC files which can be used across multiple software programs. Consequently, data interchange through direct links is characterized by superior quality, yielding more satisfactory final results compared to other file transfer methods. Rammant [10] illustrated that the API has the capability to connect Revit Structure software with Computer-Aided Engineering (CAE) software, enabling the seamless transfer of intelligent models to ETABS, RSA, and Scia Engineer, eliminating the necessity for redundant data entry.

To enhance the functionality of BIM platforms, developers create plug-ins that allow the integration of different external applications. Plug-ins play a crucial role in improving the design stage by increasing productivity, performing calculations, running analysis, and enhancing interoperability. In particular, the development of plug-ins is essential for creating reliable solutions for simulations, and the BIM community needs to collaborate to develop these plug-ins. Developing bi-directional plug-ins with the Revit API and framework is crucial for streamlining the design process and mitigating data loss during cross-platform interactions. This approach promotes interoperability through files, as exemplified by the CSiXRevit plug-ins within Revit, facilitating seamless data exchange between Revit and ETABS/SAP2000 [11, 17]. In

conclusion, the advancement of technology in achieving interoperability enhances the maturity of BIM, leading to the optimization of projects, better building performance, and increased focus on sustainability.

API is utilized to create customized software extensions and add-ons that enhance the functionality of BIM methods. As noted by Yousefzadeh et al. [24], the use of API extensions enables the exchange of high-quality data, contributing to a successful and integrated project lifecycle. However, it is important to recognize that direct links are specific to particular target applications, meaning that a developed direct link is designed to operate exclusively with specific software platforms and their corresponding versions. Consequently, extensions serve as limited transitional pathways between specified programs. Software production firms and their partners develop API-based extensions and plug-ins to facilitate information exchange between target applications such as Revit and its designated application [20]. Plug-ins are utilized primarily to streamline the construction process, enhance interoperability, and boost productivity. They enable team members from different disciplines to perform calculations and execute commands within building tasks. BIM users actively encourage the development of plug-ins as they facilitate the sharing of project data, improving synchronization with external applications. Additionally, plug-ins are leveraged in various areas such as cost estimation, project scheduling, energy efficiency, sustainability analysis, and the utilization of diverse computational tools [11]. According to Ignatova, Zotkin, and Zotkina [25], utilizing the API permits internal analysis by extracting data directly from native building information models. This ensures that the results of the analysis stay within the primary building model. Subsequent sections will assess the effectiveness of this method between Revit and different structural analysis tools.

3. CRITICAL REVIEW OF THE LITERATURE

BIM has transformed the construction industry and is increasingly becoming a focal point of discussion in Engineering, Architecture, and Construction firms due to the advantages it offers when implemented [26]. BIM brings various benefits to the industry, such as linking design to detailing, reducing errors, enhancing collaboration, and enhancing structural quality. Construction projects, whether medium or large-scale, involve multiple structural consultants who utilize various structural analysis applications. These technologies and applications suffer from insufficient interoperability, and there remains a lack of research addressing interoperability issues within the field of structural engineering [2].

Despite advancements in the data exchange methods of BIM technology, the literature consistently points to significant challenges in achieving seamless data transfer and interoperability. One major issue is the lack of standardization in data exchange formats, which leads to inconsistencies and loss of information during transfers [27]. Furthermore, the integration of different software platforms often requires extensive manual intervention, which is time-consuming and prone to human error [28], the developments in open data standards such as IFC, practical challenges are due to varying interpretations of these standards by different software platforms, leading to data loss and inconsistencies [27]. The use of APIs and direct links between software from the same provider offers promising solutions for seamless data exchange; however, they are often hindered by the complexity of implementation and the need for extensive customization [29]. Indirect links through third-party tools, while providing broader compatibility, frequently result in data fragmentation and increased error risks [30]. These challenges highlight a critical gap in the standardization and robustness of data exchange formats within the BIM. Furthermore, the disparity in data handling across different BIM tools exacerbates these issues, necessitating manual interventions that are both time-consuming and prone to human error [28]. Addressing these interoperability and data transfer problems is essential for harnessing the full potential of BIM technology in the architecture, engineering, and construction (AEC) industry. For these reasons, this research's case study is selected simply with 3 bays in both directions, including basic structural elements such as concrete columns, beams, shear walls, and slabs. The bi-directional data transfer methods among various software, Revit and RSA, ETABS21, SAP2000, and Tekla Structure, were checked on this simple model.

4. MATERIAL AND METHOD

In this study, the effectiveness and reliability of two data transfer approaches, API and IFC, were evaluated using a simple case study with various BIM tools. A building model was created in Autodesk Revit 2023

and transferred to four different structural analysis tools, ETABS, RSA, SAP2000, and Tekla Structures to assess the validity of these data transfer methods. The goal of the case study was to explore how BIM models from architectural designs can be utilized in structural analysis tools and to determine if the analysis results can be accurately transferred back to the main building model. This bi-directional data transfer was tested using both API and IFC methods to evaluate their effectiveness in preserving data integrity.

Revit was chosen as the authoring tool due to its widely used and its ability to support various data exchange methods, as well as its compatibility with various BIM applications. Revit is extensively employed in information modeling technology due to its provision of functional templates for diverse disciplines and its ability to streamline data interchange among various applications within the BIM framework [25]. Revit offers a comprehensive suite of software applications tailored for the construction industry. Its capabilities include everything from creating 3D animations with an emphasis on visual effects to handling simple CAD drawings. Revit products are specifically designed for BIM projects and play a significant role in the planning stages of construction projects [2]. Revit consists of Revit Structural, Architecture and MEP templates. The key feature that makes Revit Structure easy and flexible to use is also what makes it essential. Autodesk Revit is well-suited for structural design in 3D and supports interoperability. The Revit Structure software combines a physical model made of various materials with a separate analytical model, which can be modified and utilized for efficient structural analysis, design, and description [31].

Robot Structural Analysis Professional is specialized software for analyzing structural loads. Revit and RSA tools are software products developed by the same company, Autodesk. It ensures compliance with building codes and facilitates data exchange with Revit through integrated BIM workflows. Utilizing this software allows for the creation of designs that exhibit resilience and constructability, while also delivering precision, effective coordination, and seamless integration within the BIM environment [32].

ETABS and SAP2000 are software for structural and earthquake engineering developed by Computer & Structures, Inc. (CSI). ETABS and SAP2000 are a widely used industry software for finite element analysis. It offers various capabilities including structure modeling, analysis, design processes, and reporting outputs. With the aim of enhancing productivity in the industry, ETABS and SAP2000 have been positioned as an integrated software package, providing improvements in data exchange with Revit [33].

Tekla Structures is a powerful structural BIM software developed by Trimble. Tekla Structures is a specialized structural engineering software designed for construction industry professionals, especially structural engineers. This software allows users to create information-rich 3D Building Information Modeling (BIM) models, allowing them to design and model structures of varying sizes and complexity. Tekla Structures excels at handling materials such as steel, concrete, brick, timber, aluminum, insulation, and composite structures with exceptional precision and detail [34].

4.1. Aim and Objectives

The main purpose of the study is to examine the availability of exchange methods for bidirectional data exchange. The objectives of the research are (i) to evaluate the shortcomings and capabilities of distinct transfer strategies: API and IFC, (ii) to test and compare data exchange methods for various structural analysis software, and (iii) to assess the level of interoperability. In light of the objectives, four different structural software packages RSA, ETABS, SAP2000, and Tekla Structures are utilized.

As part of the methodology, a building model developed in Autodesk Revit was exported to BIM-compatible structural analysis software. To ensure the accuracy and completeness of data transfer, the imported models were thoroughly examined for any loss of information. This included the verification of structural grids, axes, columns, beams, slabs, their connections, geometrical configurations, cross-sectional and material properties, and dead loads. Upon confirming the integrity of the transferred data, dead load analyses were conducted to complete the process. The results were then integrated back into the original Revit model to facilitate coordinated information sharing among all project stakeholders. The overall workflow of the study is illustrated in Figure 1.

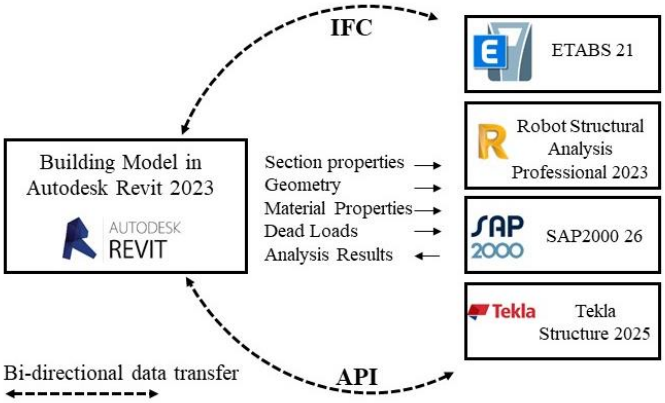

Figure 1. *Research process to examine IFC and API methods for bi-directional data exchange among Revit and various structural analysis tools*

4.2. Case Study

The concept of BIM allows for the creation of intelligent objects in a building model. These objects contain more than just geometric information like size, volume, and orientation. They encompass non-geometric factors like material, cost, manufacturer, and specification. In an object-oriented model, each element's physical and functional attributes, material properties, and design parameters are precisely outlined. It is imperative to ensure the accurate exchange of all attributes for each element between software systems. Annotation elements like grids and levels are also part of the building model, and it's important to export and import them into target applications as well.

To test the proposed flow work, a case study is performed. The building model utilized is a symmetrical, small office building designed for this research. It has an eight-story with a 4-meter story height and no basement. The building has three bays in each direction and reinforced concrete frame elements in the perimeter, along with shear walls in the core. The case study is a concrete building, with dead loads that are uniformly distributed on the beams. The major structural components include the external columns, beams, shear walls in the core of the buildings [35]. The physical and analytical models developed using the Revit 2023 Structural Template are seen in Figure 2. Only structural elements; columns, beams, slabs, and shear walls are included in this study. Interior walls and other building elements are excluded. Utilizing this template enables the automatic generation of an analytical model that mirrors the physical model. This analytical model simplifies data interchange with other structural analysis tools, allowing for the verification of connections among all Revit elements and nodes before deploying the model in various analysis platforms. Furthermore, the analytical model is adaptable, permitting manual adjustments and edits by overseeing nodes that connect frame and panel elements [33,36].

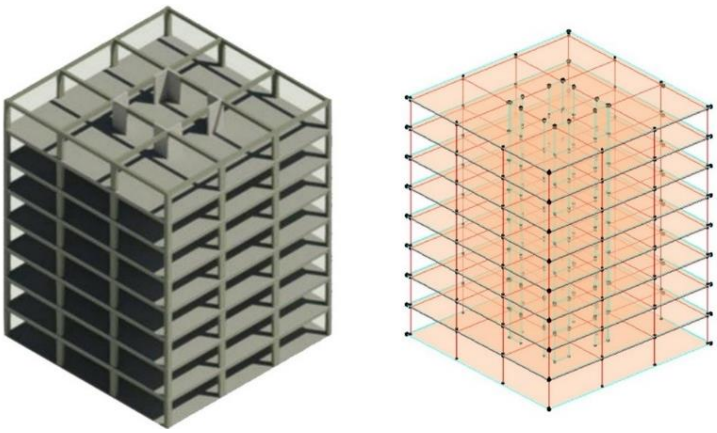

Figure 2. *Physical (architectural) and Analytical (structural) models produced in Revit interface [35]*

5. THE RESEARCH FINDINGS

In the exchange process between Revit and structural analysis software tools, two main data transfer paths are compared. In the exchange process between Revit and structural analysis software, two main data transfer paths are compared. The building model is first sent to structural analysis tools with an indirect link through IFC. Then, the same model is exported to structural analysis tools via a direct link API method. Afterward, the structural models in the analysis tools are checked in terms of the achievement of the transfer. If structural models are proper for the analysis, a dead load analysis was carried out with the self-weight of the elements. Lastly, the analysis results return to the main building model in Revit. The findings are illustrated in the following section.

During the data transfer process from Revit to structural analysis tools, building objects, their geometric representations such as size, width, height, orientation, volume, and shape, non-geometric attributes like material, cost, manufacturer, specification, and more should be reliably transferred. Additionally, the building model should include annotation elements like grids and levels, which need to be exported and imported into the intended applications.

5.1. Data Exchange with IFC File Format

In this section, the exchange of data between Autodesk Revit and structural analysis tools through the utilization of the IFC file format. The initial step involves exporting the analytical structural model from Revit to an IFC file model, utilizing the IFC 2x3 Coordination View 2.0 version, which represents the most current coordination view. The latest versions of IFC, IFC4x3, and IFC4 structural are also used throughout the trials. However, imported these files into structural analysis tools, many missing structural elements are observed in the analysis tools. Therefore, IFC 2x3 can be accepted as a better data exchange version among IFC versions. In Revit, specific IfcObjects (IfcColumns, IfcBeams, IfcWalls, and IfcSlabs) are selected for export, along with obtaining the quantity, dimensions, and material specification of each type. Then, the IFC extension file is imported into Robot Structural Analysis, ETABS, SAP2000, and Tekla Structures interfaces as seen in Figure 3.

When the IFC file extension is imported to Robot Structural Analysis, no warnings or errors are encountered during the import process. However, it is observed that certain elements are not successfully transferred to the Robot interface. In the imported structural model, some panel elements like the concrete shear walls are transferred deficiently on some floors. Also, some frame elements like beams are missing in the structural model. There is frame instability because of no connection between elements. Therefore, the transferred model cannot be effectively used for analysis purposes. The inability to read elements in the Robot tool may be attributed to issues with the formulation of IFC and the lack of data readability in Robot.

The same IFC file is imported into ETABS. However, upon transferring the model and conducting a thorough examination, several inaccuracies were identified. Some elements lack dimensions and material properties in the structural model, and the connections of frame elements pose issues in the imported model. The unconnected frame elements in the imported structural model show that the existing IFC versions that have been developed and integrated into the current BIM software tools targeted at structural engineers remain highly restrictive. Running analysis through this imported model encounters various warnings like checking the structure carefully for: - inadequate support conditions, or - one or more internal mechanisms, or - zero or negative stiffness properties, or - extremely large stiffness properties, or - buckling due to p-delta or geometric nonlinearity, or - a frequency shift (if any) onto a natural frequency. Likewise, the IFC file is imported into SAP2000, then the software gives a warning. When the imported model is examined, some beam elements are absent. Some elements in the structural model lack dimensions and material attributes, and the imported model has difficulties with frame element connections.

Lastly, IFC file is imported to Tekla Structures. The model is opened in Tekla Structure interface as reference model. Although the imported model arrived in the Tekla interface without errors, the IFC elements are not in a usable version in Tekla. The Convert IFC objects command was used to convert the elements into reusable Tekla objects under the Manage tab in the Tekla interface. However, this processing

did not convert the elements into structural elements such as beams and columns. Therefore, the imported model via IFC in the Tekla interface looks like an image instead of a 3D structural model.

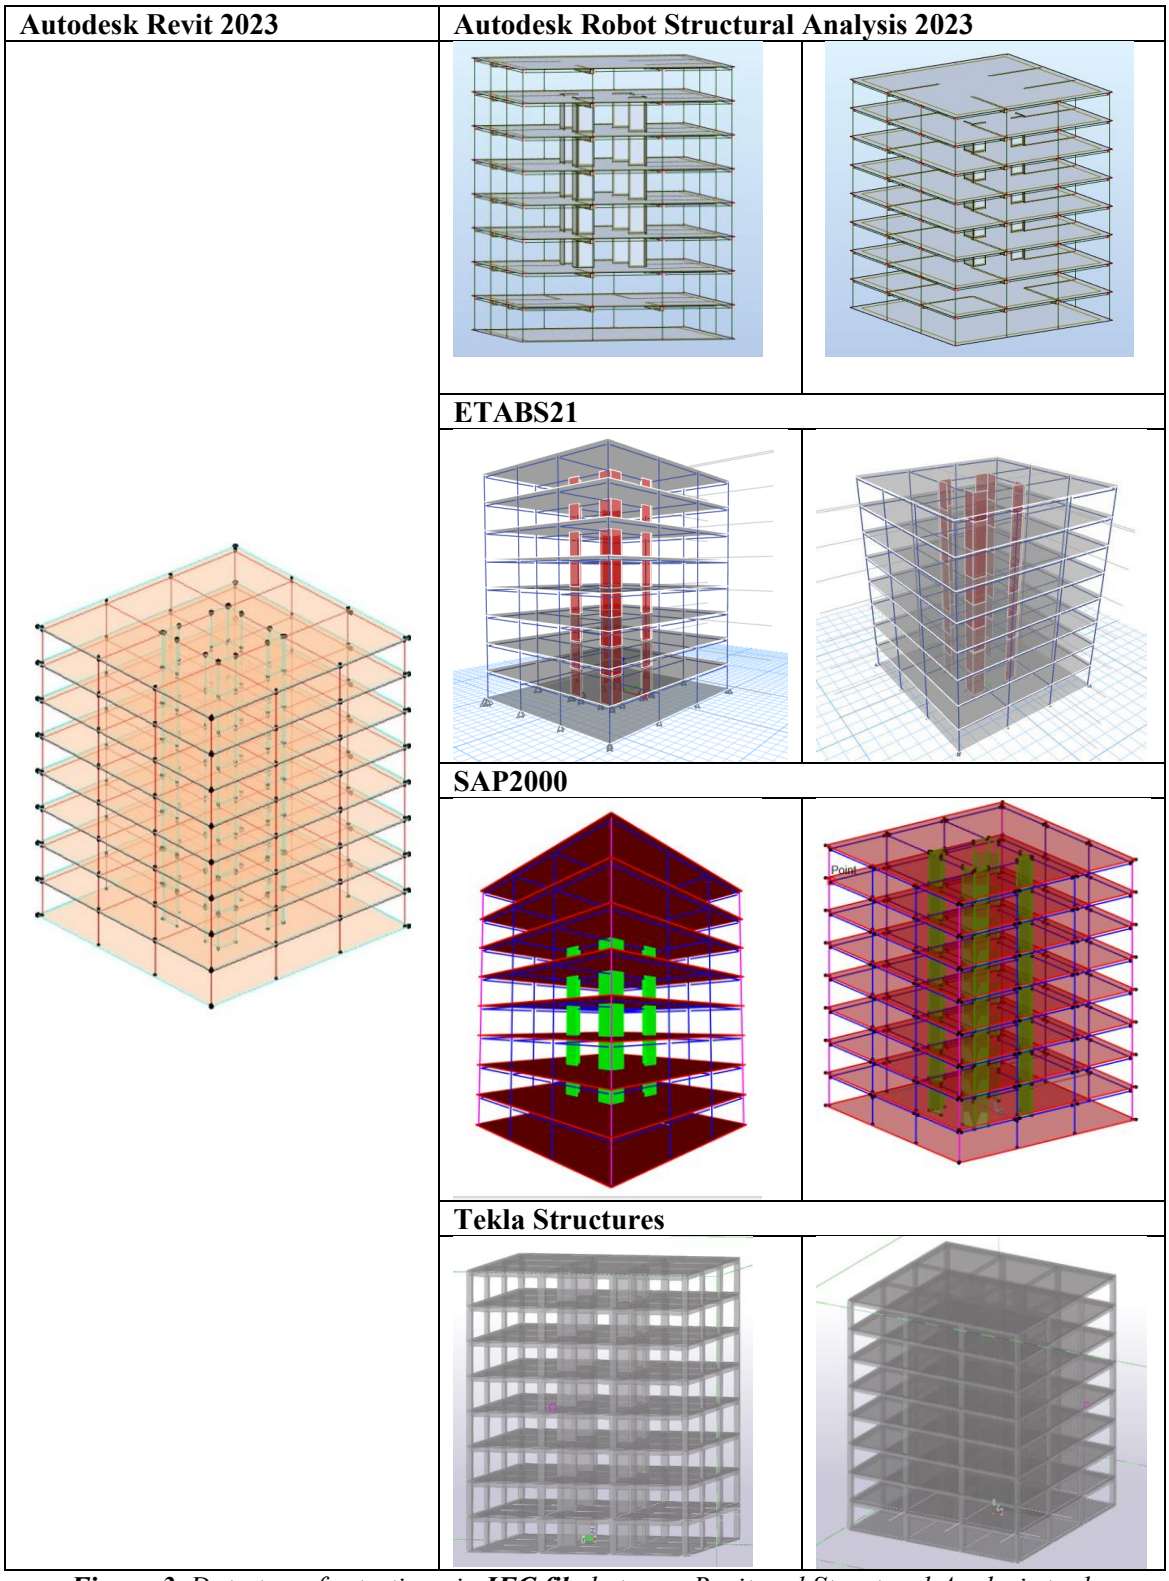

Figure 3. *Data transfer testing via* ***IFC file*** *between Revit and Structural Analysis tools*

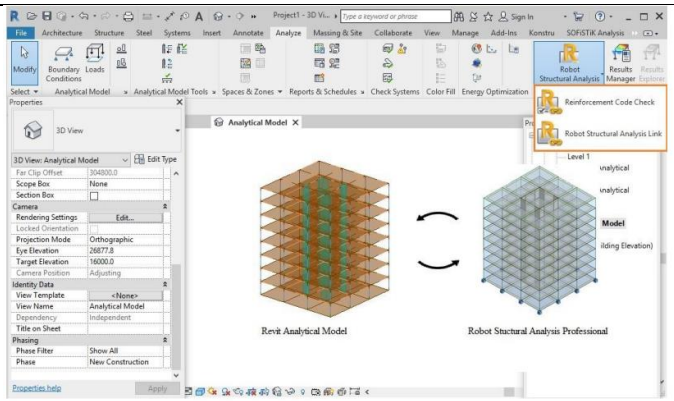
5.2. Data Exchange with API Extensions and Supplements

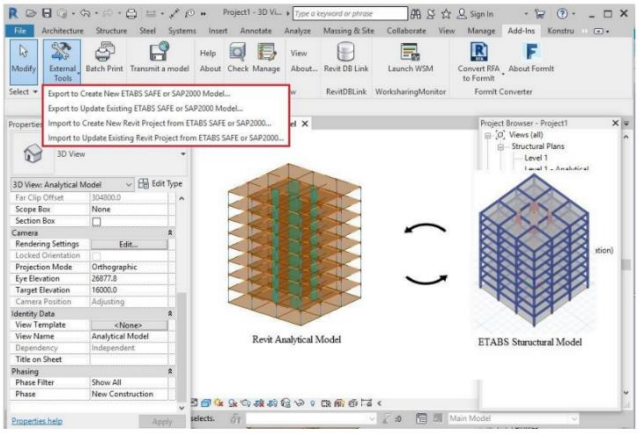
This portion concentrates on the transfer of the model through a direct link native file and API between Revit Structure, Robot Structural Analysis Professional, ETABS, SAP2000, and Tekla Structures. First of all, the data exchange process by API between Revit and Robot Structural Analysis was examined. As both Revit and Robot Structural Analysis software are products of the same developer, Autodesk, they provide a direct connection link for a smooth data transfer. When Robot Structural Analysis software is downloaded, it seamlessly integrates with the Revit platform. The Robot Structural Analysis Professional tool is easily accessible within the Revit structural analysis interface, situated under the 'Analyze' tab. Activation of this tool opens the integration link through the Robot Structural Analysis dialog box. Within this dialog box, the user can opt for the direction of data flow. For the initial data exchange, the "Send model" option is selected to facilitate the transfer of data. Through the direct integration link between Revit and Robot Structural Analysis Professional, data can be transferred rapidly in either direction. Revit generates a structural model that corresponds to the analytical model needed for the analysis process, including all essential properties such as material properties, section profiles, loads, load combinations, and boundary conditions. Once in the Robot Structural Analysis interface, which is a software for finite element analysis, it is important to verify if any data loss has occurred in the model. The architectural model in Revit encompasses components such as grids, levels, structural columns and beams, shear walls, floors, material specifications, designated loads and load cases, and member end releases. Through the direct link integration, all these elements and their characteristics are conveyed to Robot. Within the Robot Structural Analysis platform, the model is capable of receiving additional updates by specifying final load cases and combinations, and by incorporating advanced analysis parameters.

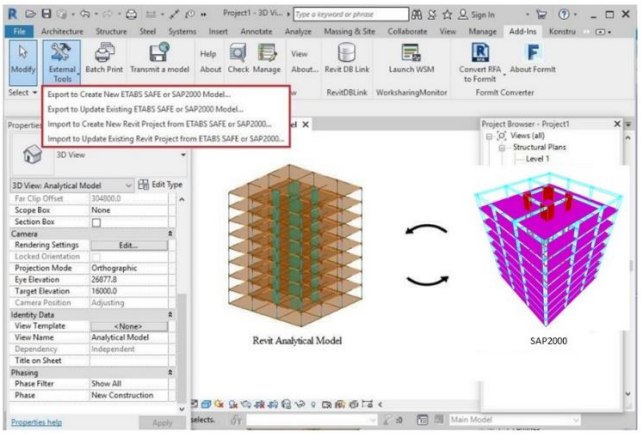
From the ETABS and SAP2000 perspective within the BIM concept, CSI has developed an API, a widely used programming language. In the collaboration between ETABS-SAP2000 and Revit, a plug-in named "CSiXRevit" has been developed. This plug-in facilitates bidirectional data exchange between ETABS-SAP2000 and Autodesk Revit Structure. Throughout the data transition, specific elements such as grid lines, story levels, materials, structural frame elements, walls, and flat or non-sloped floors, along with defined loads and load cases (excluding area loads), are transferred from Revit Structure to ETABS and SAP2000, as detailed in the CSI Documentation [33]. Upon installation, CSiXRevit is incorporated into the Revit interface as an external tool in the Add-ins tab. This tool establishes a shared file format, ".exr," for intermediary data exchange. The resulting .exr file can then be imported into ETABS and SAP2000 for further processing.

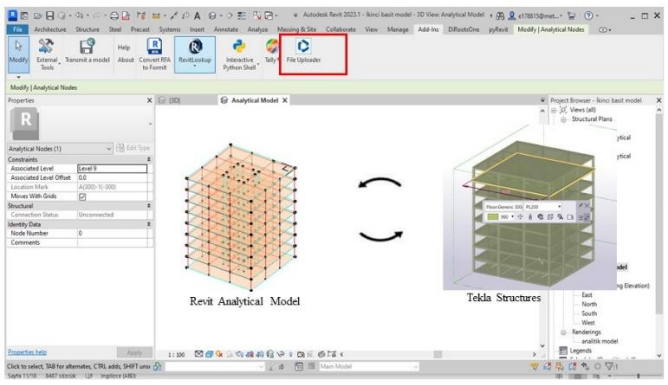
For the Tekla Structures interoperability concept, Trimble, the Tekla manufacturer, has created a Trimble connection for the live connectivity between tools to provide smooth data interchange between Revit and Tekla Structures. This is a 'File Uploader' plug-in that works with the Revit interface. The structural model in Revit is uploaded to Trimble Connect using this plugin. The uploaded file is then imported into the Tekla Structures interface via the web browser.

Before conducting the structural analysis, the models sent to the RSA, ETABS, SAP2000, and Tekla Structures platforms, as seen in Figure 4, undergo a thorough verification and approval. This includes the successful data exchange of crucial information such as grids, levels, dimensions, and properties of structural components, including their section properties, nodes, dimensions, and material definitions, and the connectivity of frame elements. Finally, the structural models are subjected to rapid analysis for dead load cases, and if the models are proper for the analysis, as the primary objective of this research is to examine the data exchange capabilities of the API method. Accordingly, the goal of this section is to assess the data exchange functionalities of the API method. Efforts are made to transmit the analysis outputs back to Revit to update the building model following the analysis results. In the study, only the structural model in RSA is ready for the analysis. Therefore, analysis results are obtained from RSA, and then the results are transferred again to the Revit interface. The models in ETABS, SAP2000, and Tekla Structures are not proper for the dead load analysis due to the deficiencies of the data transfer.









Robot Structural Analysis	 (Direct Link for Bi-directional Data Exchange)
ETABS	 (CSiXRevit, Bi-directional Data Flow Plug-in)
SAP2000	 (CSiXRevit, Bi-directional Data Flow Plug-in)
Tekla Structures	 (Trimble Connect Live Link)

Figure 4. *Data transfer testing via* ***API*** *between Revit and Structural Analysis tools*

Initial findings may seem promising, as the direct link integration between Revit and structural analysis tools is smoother and faster. However, there are still some problems with API method data transfer, such as missing data, unstable links, undefined materials or dimensions, except for Robot Structural Analysis, which is the product of Revit's manufacturer. Therefore, the dead load analysis was carried out only in RSA. In other tools, the imported models were still not proper for any analysis.

Revit and RSA emphasize their support for interoperability and their capacity to consolidate all revised data within a building model. The dead load analysis results are seamlessly transmitted to the Revit interface. Following the analysis in RSA, to update the Revit model, the integration direction needs to be set as ''update model and results'' in the Revit interface. Consequently, all modifications and results can be incorporated into the Revit building model. In Revit, the 'result manager' and 'result explorer' add-in tools facilitate the preservation of the updating process, allowing the visualization of structural analysis results, as depicted in Figure 5. In this figure, the deformation and displacement results on slabs under the dead load pressure are sent to the Revit interface, and it is still readable and reliable in the Revit interface. A key advantage of this link between Revit and RSA, highlighting the significance of BIM tools in design and analysis, is its bidirectional functionality, allowing the RSA model to also send data back to Revit. This feature is particularly important as structural designers often need to update and modify designs based on structural specifications.

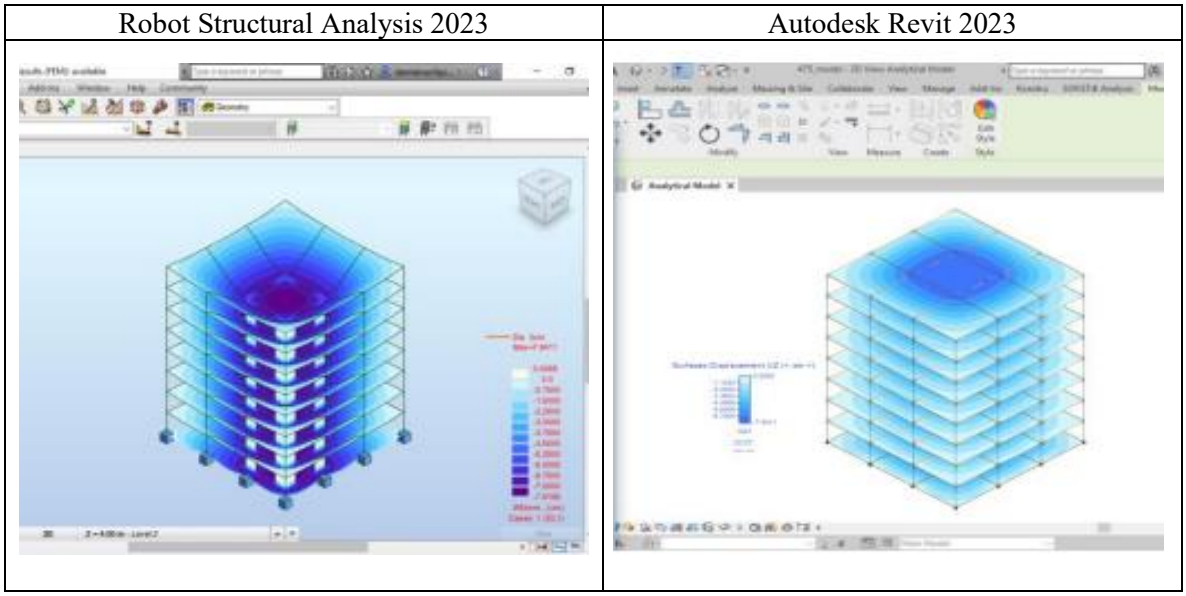


Figure 5. *The analysis results are transferred back from Robot Structural Analysis to the Revit interface via API [35]*

This bidirectional data compatibility is crucial as structural engineers may need to modify the Revit model based on the structural analysis results of their designs. The information transferred is identical to that in the direct link using the native file. Consequently, the results demonstrated that the design modifications and analysis outcomes for the foundation, frame elements, and surfaces can seamlessly transfer to the Revit interface with the output data. The physical model in Revit was updated based on these design changes and analysis results.

6. CONCLUSION

6.1. Summary of the Research and Discussions

This study focuses on exploring the use of BIM in structural analysis and architectural design by examining interoperability, identifying the more effective data transfer method between architectural and structural software, and determining the viability of these integrated design pathways in structural engineering practice. The research aimed to answer the following questions:

1. How does BIM facilitate interoperability between architectural design and structural analysis?
2. Which data transfer pathway is the most capable among architectural and structural disciplines?
3. What are the outcomes of a bidirectional data transfer process between Autodesk Revit and various structural analysis tools?

At the beginning of the research, the issue of interoperability within the construction sector using BIM technology is reviewed. BIM is a modern approach and process for the AEC industry, which replaces traditional practices with digital construction delivery processes. Establishing two-way data exchange between two separate applications holds great promise for the industry. Thus, this research explores data-sharing methods, namely IFC and API, within BIM technology to evaluate their capabilities and reliability. IFC and API methods are investigated through architecture and structural engineering disciplines. To verify these methods, the five most preferred tools are chosen; Autodesk Revit, Robot Structural Analysis, and ETABS, SAP2000 and Tekla Structures. Then, a case study is carried out.

As a case study, a simple structural system for a building was modeled in Revit. The model consisted of several crucial elements, including axes and concrete frame components such as columns, beams, shear walls, and slabs. Subsequently, the model was exported from Revit to Robot Structural Analysis, ETABS, SAP2000, and Tekla Structures' interfaces to conduct a comprehensive structural analysis using IFC and API methods. Bi-directional data transfer from Revit to structural analysis tools, and vice versa, was tested thoroughly using IFC and API methods. The results of the data transfer were meticulously analyzed, and the findings are presented in Table 1.

Table 1. *The summary of bi-directional data transfer results via IFC and API among selected BIM tools*

Transferred Data	**IFC** (indirect link)				**API** (direct link & native file)

RSA(Robot Structural Analysis)
(+) The data exchange is achieved.
(-) The data exchange is not achieved.

Studies in this research have indicated that there are challenges in exchanging data between different applications when using the IFC file format. During this research, the IFC 2x3 file version is used. Because the latest versions IFC4x3 and IFC4structural do not work during the data exchange processes. The structural analysis tools give errors when trying to open one of these versions. As reviewed from the literature, when importing and exporting an IFC file across various BIM software, there is a risk of data loss and unintentional modifications due to differences in how each software handles modeling properties [12]. The representation of object geometry, properties, and relationships can vary, resulting in inconsistent models when exchanging data between different tools. Additionally, software tools may struggle to recognize certain objects from other disciplines due to their specialized domains [14]. Likewise, in the course of this investigation, within the Revit interface, the building model was converted to the IFC format and then brought into RSA, ETABS, SAP2000, and Tekla Structures. The imported structural models in the analysis tools, deficiencies of elements, and data were observed, and it was not possible to run the analysis. However, the idea of interoperability, reliable data, open and neutral standards, collaboration, flexibility, and sustainability in the building industry based on the openBIM is defined by buildingSMART International. OpenBIM encompasses the creation and maintenance of open and neutral standards, the high-quality implementation of these standards, and the establishment of recognized independent benchmarks to ensure quality and thoroughness. IFC is one of the neutral and open standard data file formats, and IFC provides a foundation for openBIM data exchanges. Therefore, buildingSMART is responsible for developing IFC schemas [37]. With the improvements in the IFC neutral data exchange format, more straightforward platform-to-platform communication can be achieved without any data loss. Thus, data exchange can be smoothly provided among different software developed by different companies without the need for any plug-in.

Considering the different versions of the tools used in the data exchange process, the API does not work between different versions of the tools. In other words, for a direct connection between Revit and Robot Structural Analysis tools, both Revit and Robot must be the same version. Similarly, for data transfer with the API, Revit, ETABS, SAP2000, and also the CSiXRevit plugin must be the same version. At this point, IFC, which is an open file format, does not require the same version for data exchange between programs. In other words, a model produced in Revit 2023 version can be opened with an IFC file in SAP2000 v26 version. However, the SAP2000 v23 version is required for the link received from the Revit model using the CSiXRevit plugin to work correctly.

Employing the API method for data exchange within the BIM framework allows for bidirectional data flow. This approach functions seamlessly in Revit-Robot Structural Analysis connections. However, the other structural analysis tools have some problems with the data exchange process. The data exchange between Revit and Robot Structural Analysis is more seamless compared to the Revit-ETABS, SAP2000, and Tekla Structures link because both Revit and Robot Structural Analysis tools are developed by the same company. The direct integration between Robot and Revit software promotes coordinated working principles. The utilization of the API method enhances the speed and efficiency of project processes while effectively mitigating errors and issues. Essentially, the sophisticated API functions as a state-of-the-art method for data exchange, facilitating bidirectional data flow and enhancing collaboration between Revit software and Robot Structural Analysis Professional. CSI, the developer of ETABS and SAP2000, has created a well-functioning plug-in, CSiXRevit, to encourage the interoperability between Revit and ETABS- SAP2000. CSiXRevit claims to provide a seamless bi-directional data exchange between Revit and ETABS-SAP2000. Yet, during the exchange process, missing elements, dimensions, and specifications are observed. For the smooth data exchange between Tekla Structures, the producer of Tekla, Trimble has developed a Trimble connection for the live link between tools. This is a type of plug-in, 'File Uploader', that works in the Revit Interface. The structural model in Revit is uploaded to the Trimble Connect by using this plugin. Then, this uploaded file is imported into the Tekla Structures interface from the browser. But the imported model is inapplicable for performing a structural analysis.

Consequently, through the conducted research, it becomes possible to identify the optimal approach for structural engineers to adopt, considering the observed limitations in interoperability. The direct link API seems a highly efficient and user-friendly method for data exchange, only between the products of the same

company. Therefore, it is highly likely that the API method will emerge as the optimal pathway for advancing BIM maturity levels in the foreseeable future.

6.2. Limitations of the Research

The study has some limitations. The following items address them;

- The experiment was limited to a single project model, which, while useful for identifying issues related to missing information, may not accurately reflect scenarios involving different types of structural models.
- The effectiveness of the API method in dealing with complex and large-scale projects,
- The capability of the API method in the curvilinear and sloped elements,
- The measures taken by the API to guarantee data security and integrity are not examined in this study.

Key words:
Energy retrofitting; modern heritage; passive building; Yenişehir Cinema.

ABSTRACT

Improving the energy performance of existing buildings is crucial for reducing energy demand and transitioning towards renewable energy sources in the building sector. The **Passive Building Standard** serves as a valuable guide by providing a set of strategies for achieving high energy efficiency. **Yenişehir Cinema**, an important modern heritage building, has remained vacant for nearly 12 years. Given its cultural and historical significance, integrating it back into urban life through energy-efficient retrofitting can contribute to urban sustainability.
This study aims to enhance the energy performance of Yenişehir Cinema by transforming it into a **passive building**. The proposed retrofitting strategy involves implementing a **heat recovery ventilation system, improving the building envelope, and mitigating overheating**. The energy performance of both the baseline and retrofitted scenarios was assessed using **energy models developed in Design Builder**.
The results indicate a **92% reduction in annual heating demand** and a **41.3% decrease in total carbon emissions** compared to the baseline scenario. Furthermore, the additional investment costs required for the proposed improvements can be recouped within **seven years**. However, while the overheating in the building was reduced by **40%,** this improvement remains insufficient to fully ensure **thermal comfort**.

INTRODUCTION

The construction sector accounts for 36% of global energy consumption and 39% of carbon emissions resulting from energy use (Global Alliance for Buildings and Construction, 2020). Given this impact, the widespread adoption of passive and hybrid systems and their climate-specific optimization are among the key long-term global objectives (Global Alliance for Buildings and Construction, 2020). To reduce the dependence on fossil fuels and minimize carbon emissions, both existing and newly constructed buildings must be designed with high energy efficiency (Sharma et al., 2022). In Europe, 48% of existing buildings were constructed between 1961 and 1990 (Volf et al., 2018), highlighting the urgency of retrofitting older buildings to align with current climate conditions and the growing scarcity of resources.

Reducing the energy demands of existing buildings should be achieved while maintaining occupant health and comfort (Ruparathna et al., 2016). Passive buildings are designed to have minimal energy demand for heating, yet they still provide high indoor comfort levels (Mihai et al., 2017). The EnerPHit certification system, which allows existing buildings to be upgraded to Passive Building Standard, significantly reduces their heating and cooling loads (Passive House Institute, 2023).

Extensive research has been conducted on the energy retrofitting of existing buildings. A study conducted in China applied Passive Building Standard principles by insulating the building envelope, ensuring airtightness, and integrating a high-efficiency heat recovery mechanical ventilation system. As a result, heating demand was reduced by 90% and cooling demand by 70% compared to the baseline scenario (Liu et al., 2021). Similarly, a study in Sweden demonstrated that carbon emissions could be reduced by 50% to 82% through the use of various insulation materials, facade enhancements, and window improvements (Piccardo et al., 2020). In the UK, a year-long study comparing a conventional house and a passive house found a 62.2% reduction in energy consumption and a 24% improvement in indoor temperatures. Numerical modeling further indicated that heating demand could be reduced by 80% in existing buildings through energy-efficient renovations (Liang et al., 2017).

Retrofitting historical buildings in accordance with Passive Building Standard is also critical for preserving cultural heritage while ensuring energy efficiency. A study on a historic building in Egypt found that thermal comfort levels could be increased to 66% through the implementation of hybrid passive strategies (Ibrahim et al., 2021). Similarly, a 19th-century historic building retrofitted using three passive building strategies achieved a 51.8% reduction in primary energy demand. The payback period for the implemented interventions was estimated at 18 years (Qu et al., 2021).

Türkiye, which remains heavily dependent on foreign energy resources, aims to reduce its primary energy consumption by 14% between 2017 and 2023 in accordance with the National Energy Efficiency Action Plan (Republic of Turkey Ministry of Energy and Natural Resources, 2023). The average energy consumption for heating in buildings across Türkiye is 110 kWh/m² (Allplan GmbH, 2013), whereas maximum permissible heating demand values in other countries are significantly lower: 35 kWh/m² in the UK, 34 kWh/m² in the Netherlands, and 23 kWh/m² in Denmark (Allplan GmbH, 2013). This substantial difference highlights the urgent need for stricter energy efficiency regulations and more effective enforcement mechanisms in Türkiye.

Despite the increasing emphasis on energy efficiency, a lack of legal coordination and institutional collaboration between organizations responsible for heritage protection and energy efficiency poses a significant challenge (Jahed et al., 2020).

Several studies have explored energy retrofitting strategies for historic buildings in Türkiye. Ulu & Arsan (2020) examined 22 buildings in the historic urban fabric of İzmir, demonstrating that proposed retrofit strategies could achieve up to 48% energy savings. Similarly, Timur et al. (2022) analyzed two traditional houses in Muğla, evaluating interventions such as HVAC system optimization, thermal insulation, buffer zone integration, double-glazed windows, and airtightness improvements. Their findings indicated that these measures, when applied together, could reduce annual energy consumption by up to 30%.

Since historical buildings require careful intervention to preserve their architectural integrity and cultural value, energy retrofitting must be approached with sensitivity. Ozbalta et al. (2021) assessed multiple active and passive energy efficiency scenarios for a historic building in İzmir. Their results showed that the optimal energy retrofit combination required 34% less energy compared to other alternatives.

Previous research has demonstrated that implementing Passive Building Standard in existing buildings leads to substantial reductions in energy consumption and carbon emissions, particularly in heating and cooling loads (Liu et al., 2021; Liang et al., 2017; Piccardo et al., 2020). The benefits of Passive Building Standard have also been observed in historic buildings, particularly in terms of energy savings and thermal comfort improvements (Ibrahim et al., 2021; Qu et al., 2021). Most energy retrofitting studies have focused on historical buildings in the Aegean region, primarily examining annual energy savings when passive and hybrid systems are integrated (Ulu & Arsan, 2020; Timur et al., 2022; Ozbalta et al., 2021). However, the complex interrelated parameters that influence overall energy performance are often overlooked.

The novelty of this study lies in its comprehensive approach, which simultaneously considers energy efficiency, carbon emissions, thermal comfort, and cost-effectiveness. The primary objective of this research is to retrofit Yenişehir Cinema—an example of modern cultural heritage—following Passive Building Standard. The target audience includes industry stakeholders, passive building practitioners, Kardemir Steel Industry Inc. (the entity holding the building's usage rights), and academics interested in energy-efficient retrofitting strategies.

MATERIAL AND METHODOLOGY

This section outlines the case study, and details the methodology applied in this research. The validation of the 3D model, software, and climate data is conducted. Following this validation, decisions regarding the energy model for the operational phase are presented. Finally, the databases and methodologies used for thermal comfort, cost analysis, and environmental impact assessment are described.

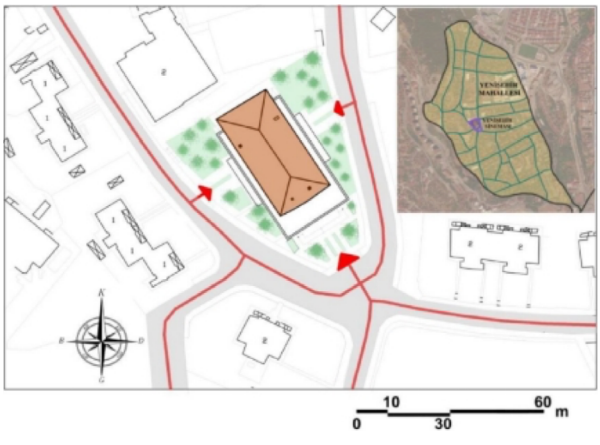

Figure 1. Master plan of Yenişehir Cinema Building (Güneş, 2017).

Case Study

The primary subject of this study is Yenişehir Cinema, located in Karabük Province, Türkiye. The building is situated in the Yenişehir Neighborhood, within an urban conservation area and a third-degree natural conservation zone. Although it was actively used as a cultural center for a period, the building itself is not officially registered as a heritage structure.

The cinema building covers a total area of 1,500 m², with three open facades and additional facilities at the rear. The net area of the building is 1,350 m², and it has a seating capacity of 750. Additionally, registered pine trees are present in the garden surrounding the cinema.

Architecturally, Yenişehir Cinema was designed by Supreme Architect Münci Tangör, a prominent figure of the Early Republican Period in Türkiye. The construction of the building took place between 1954 and 1958 (Güneş, 2017; Ulusoy, 2022).

Historically, the cinema was among the most popular and well-attended theaters in Türkiye between 1958 and 1990. Between 2008 and 2013, it continued functioning as a cultural center. However, since 2013, the building has remained closed and out of use. In 2017, restoration drawings were initiated, but the project was never implemented (Güneş, 2017). The site plan of the building is presented in Figure 1.

The historic Yenişehir Cinema, which once attracted significant public interest, has remained vacant for nearly twelve years. Yalçınkaya & Bal (2019) highlight the importance of reintegrating Yenişehir Cinema into urban life while preserving its cultural and historical significance to support urban sustainability. Similarly, Güneş (2017) emphasizes that maintaining the building's original function is essential for ensuring both social and spatial sustainability. The exterior and interior views of the building are presented in Figure 2.

Figure 2. **(a)** South facade, **(b)** East facade, **(c)** Registered trees, **(d)** Cement-based material (Authors' Archive), **(e, f)** Interiors (Güneş, 2017).

The outer walls of the building are constructed using concrete blocks. The roof structure consists of both hipped and flat sections, covered with tiles and ceramic tiles, respectively. The building system is reinforced concrete. For flooring, vinyl material is used, while most of the windows in their current state feature double glazing. The main exterior door is made of wood, contributing to the building's architectural character. The thermal properties of the existing materials are detailed in Table 1.

Methodology

The Passive Building Standard is based on five fundamental principles, which include:

1. High-level insulation (Ud<0.15 W/m²K)
2. High-performance, insulated window and door systems (Up<0.8 W/m²K)
3. Airtight building envelope (<0.6 /h @50 Pa)
4. Architectural detailing to eliminate thermal bridges
5. High-efficiency, heat recovery mechanical ventilation system (Sustainable Energy Association, n.d.).

Additionally, to comply with the Passive Building Standard, a building's annual heating and cooling demand must not exceed 15 kWh/m², and its primary energy demand should remain below 120 kWh/m². From a thermal comfort perspective, indoor temperatures must not exceed 25°C for more than 10% of the total annual hours (International Passive House Association, 2018). However, existing buildings may not fully meet these strict criteria, necessitating the development of the EnerPHit certification system, which provides two alternative compliance pathways. Meeting either of these criteria is sufficient for certification.

The first pathway focuses on building component performance, ensuring that all structural elements adhere to Passive Building Standard. The second pathway is based on energy demand, where the maximum heating load is set at 25 kWh/m² for cool-temperate climates, while the cooling demand limit remains at 15 kWh/m².

The energy demand-based approach further categorizes buildings into three classes: Classic, Plus, and Premium, based on their energy performance (Passive House Institute, 2023). In this study, the EnerPHit Standard was applied using energy demand-based criteria.

Following the Passive Building Standard, the energy retrofit process included:

- Installation of a heat recovery mechanical ventilation and heating-cooling system
- Insulation and airtight sealing of the building envelope
- Upgrading window and door systems.

Firstly, the existing building model was generated and validated. Once the climate data and building model is checked, baseline energy model is adjusted with decisions made in advance. Thereafter, energy retrofits were applied in sequence. According to the simulation results, the overheating was determined and the thermal comfort requirements were evaluated according to the (American Society of Heating, Refrigerating and Air-Conditioning Engineers) ASHRAE-14 Standard. At the conclusion of the study, economic and environmental analyses were conducted. Finally, the results were discussed on the axis of sustainable architecture (Figure 3).

As for the limitations of the study, the side and rear facades of the building are covered with rough plaster, while the entrance facade features mosaic coatings, which enhance

Table 1. Material properties of the existing structure

Building component	Material	Thickness (m)	Thermal conductivity (W/mK)	Specific heat (J/kg-K)	Density (kg/m³)	U value (W/m²K)
Wall	Plaster	0.02	0.4	1000	1000	1.88

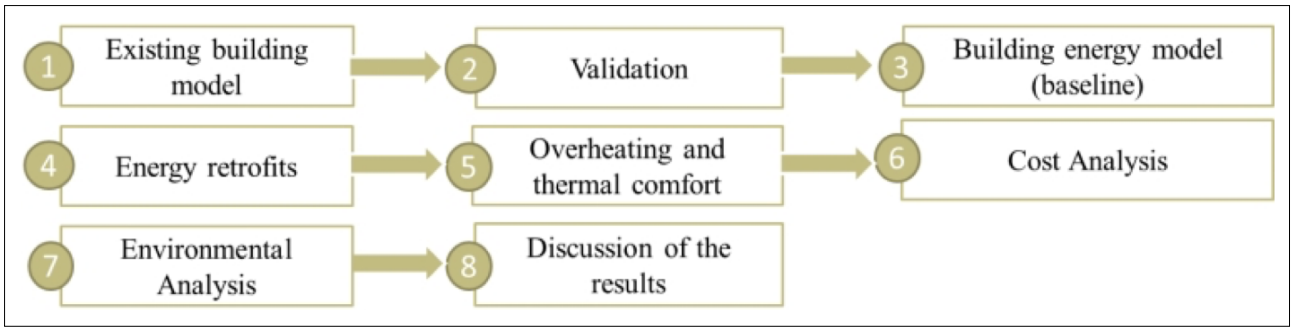

Figure 3. Methodology of the study.

its aesthetic quality. Consequently, any proposed external insulation measures would primarily impact the entrance (south) facade. However, this adjustment is beyond the scope of this study. Nonetheless, it is anticipated that the overall exterior appearance of the building will remain unaffected by the other proposed energy efficiency improvements.

Databases and Methodologies for Validation

Based on the collected data—including architectural plans, photographs, and information on building materials—a digital model of the structure was developed, and energy simulations were conducted using Design Builder v6.1 software. To ensure accurate climatic inputs, annual climate data for Karabük province was obtained from NASA's Prediction of Worldwide Energy Resources (POWER) Data Access Viewer (DAV) v.2.4.9 (NASA, n.d.).

To validate the accuracy of the simulations, real-time temperature measurements were collected using an RC-51H device, recording data at 1-hour intervals from January 3 to January 7, 2023. Due to the deteriorated state of the building, where windows are broken, measurements were limited to a single room that was as isolated as possible from external environmental influences. The selected room has no direct windows facing the outside, ensuring that the recorded indoor climate data closely represents the building's actual indoor conditions.

The ASHRAE Guideline 14 was utilized to validate the energy model, ensuring its accuracy in representing the building's actual thermal performance. Two widely used statistical methods, Mean Bias Error (MBE) and Coefficient of Variation of the Root Mean Square Error (CV(RMSE)), were employed to minimize discrepancies between the energy model predictions and the real indoor environment (Yılmaz & Oral, 2019; Guo et al., 2021; Li et al., 2021).

To validate the model, temperature measurements obtained from the indoor space were compared with corresponding simulated data generated by the energy model. Based on this comparative analysis, error margins were determined using the following equations:

$$MBE(\%) = \frac{\sum_{i=1}^{n}(Mi-Si)}{\sum_{i=1}^{n}(Mi)} \times 100 \quad (1)$$

where MBE represents "Mean Bias Error", n denotes the number of the data, Mi stands for the measured data, and Si indicates simulation results.

$$\mathrm{CV(RMSE)}(\%) = \frac{\sqrt{\sum_{i=1}^{n}\left(\frac{(Mi-Si)^2}{n}\right)}}{M} \times 100 \quad (2)$$

where CV(RMSE) stands for "Coefficient of Variation of the Root Mean Square Error", M denotes the mean value of the collected data in the field.

According to ASHRAE Guideline 14, for an energy model calibrated with hourly data, the margin of error between real-time measurements and energy simulations should not exceed 10% for Mean Bias Error (MBE) and 30% for Coefficient of Variation of the Root Mean Square Error (CV(RMSE)). In this study, the number of data points (n) was set to 24, corresponding to the number of hours in a day, with measurements recorded hourly.

Baseline and Retrofitted Energy Models

In the energy simulations, the baseline case was evaluated under the assumption that the building is still in use. However, since the building has been vacant for an extended period, the occupancy rate, as well as the heating and cooling setback temperatures, were determined based on assumptions.

The basement floor was excluded from the energy simulations, as such areas are typically unheated spaces (Dascalaki et al., 2011). The building's operational hours were assumed to be 08.00 am–10.00 pm, every day. The window-to-wall ratio was calculated as 5%, and some of the trees on the southwest side of the building, which are officially registered, were modeled as shading elements, as they are located along the sun-exposed facade.

Primary energy demand accounts for the total energy consumption associated with room electricity, lighting, heating, cooling, ventilation, and hot water. Historical records indicate that the building was previously heated with solid fuel and naturally ventilated during its period of use.

The baseline energy model represents the closest approximation of the building's original state when it was operational. The assumptions for both the baseline and retrofitted energy models are provided in Table 2. The building is heated and cooled with a variable refrigerant flow system with heat recovery (VRF-HR) in the retrofitted case. A VRF-HR system recovers heat from cooling zones and transfers it to heating zones, enabling simultaneous heating and cooling (Zhang et al., 2018). Additionally, a 3D model image generated in Design Builder is presented in Figure 4.

Thermal Comfort Criteria

In addition to the Passive Building Standard, the thermal conditions of the building after energy retrofits were assessed using the Predicted Mean Vote (PMV) and Predicted Percentage of Dissatisfied (PPD) methods. These methods are designed to predict thermal comfort under steady conditions and are based on a 7-point Likert scale (Cheung et al., 2019).

For the calculations, the thermal comfort tool developed by Berkeley University, which is based on ASHRAE 55 Standard, was used (Center for the Built Environment, n.d.). According to this methodology:

Table 2. Baseline and retrofitted energy model decisions

Parameters	Baseline	Retrofitted
Heating period	October-March	October-March
Heating temperature - set back	20 ºC-12 ºC	20 ºC-12 ºC
Heating system	Boiler and radiators	VRF-HR
Total efficiency	-	70%
Cooling period	-	June-August
Cooling temperature - set back	-	23ºC-28ºC
Cooling system	-	VRF-HR
Ventilation system	Natural	Mechanical with HR
Occupancy rate	08.00 am-10.00 pm	08.00 am-10.00 pm
Infiltration rate (ac/h)	0.7	0.59

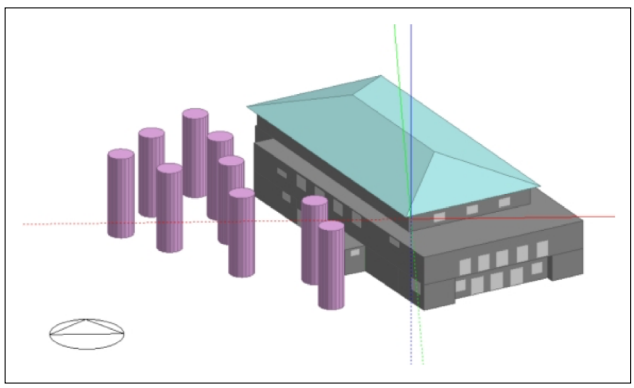

Figure 4. 3D model of the building from Design Builder.

- The clothing insulation value (clo) was set to 1.0 clo for typical winter indoor clothing and 0.5 clo for summer indoor clothing, based on operative temperatures. The metabolic rate was taken as 1 met, assuming occupants are seated quietly while watching a movie. Operative temperature and relative humidity values were determined using standard deviation and mean values, ensuring that two-thirds of the data falls within one standard deviation of the mean. Air speed was assumed to be 0.1 m/s.

Calculation of Economic Savings

At the conclusion of the study, the total costs of all energy improvement measures were calculated to evaluate the economic feasibility of the proposed interventions. This analysis aimed to determine whether the costs associated with the retrofits could be recouped within the building's remaining service life.

The unit prices for key energy efficiency components—including the VRF-HR, rockwool insulation, and low-emissivity (low-E) triple glazing system with argon filling—are detailed in Table 3. Notably, for the VRF-HR system, pricing was obtained on a per-project basis. The cost of insulating the exterior door was excluded from the calculations, as it was considered negligible in comparison to other retrofit measures. The post-retrofit service life of the building was estimated at 30 years, and the electricity tariff (kWh/₺) used in the economic analysis was sourced from the Energy Agency (n.d.). To estimate the payback period of the initial investment costs, the annual energy savings and cumulative cost recovery over time were analyzed, taking into account that electricity tariffs for the public sector in Türkiye increase by 30% annually as indicated by Energy Market Regulatory Authority (*Enerji Piyasası Düzenleme Kurumu, EPDK*) in 2024 (Dünya, 2023).

Database for Environmental Analysis

A comprehensive environmental analysis requires the assessment of both operational and embodied carbon emissions. The energy retrofits considered in this study include mechanical systems with heat recovery, insulation, and argon-filled triple-glazing window systems.

Table 3. Unit costs of proposed applications

Senarios	Unit	Unit price	Source
VRF	Per project	€200,000	Personal communication, July 24, 2024
Insulation	1 m² 1 cm	€0.6 + %18 VAT	Koca, 2023
Window	1 m²	1459.15 ₺ + 18% VAT	Yaşasan, 2024
Argon gas	1 m²	45 ₺ + 18% VAT	Yaşasan, 2024

VAT: Value added tax.

The embodied carbon of conventional buildings typically accounts for less than 20% of the total life cycle carbon (LCC). However, in low-energy buildings, embodied carbon can constitute up to 80% of the LCC (Akbarnezhad & Xiao, 2017). Given this disparity, it is crucial to evaluate both operational and embodied carbon emissions simultaneously to obtain a holistic understanding of environmental impact.

The system boundary for this study is defined as the production stage (A1–A3), while the impact category under investigation is total global warming potential (GWP-total) for embodied carbon calculations. GWP quantifies the amount of heat trapped in the atmosphere by a greenhouse gas relative to CO_2, meaning that a higher GWP indicates a stronger warming effect (U.S. Environmental Protection Agency, n.d.). GWP-total is also recognized as one of the seven key environmental impact categories outlined in the EN 15804+A2 Standard (Hill et al., 2018).

To obtain accurate embodied carbon data, this study utilizes the Environmental Product Declaration (EPD) of the selected materials, as detailed in Table 4.

The energy consumed during the operation phase of traditional buildings accounts for approximately 90% of their total energy consumption (Koç et al., 2022). To calculate operational carbon emissions, the electricity consumption point emission factors specified by the Ministry of Energy and Natural Resources were used (Republic of Turkey Ministry of Energy and Natural Resources, n.d.).

According to official data, 1 MWh of electricity consumption corresponds to approximately 0.445 tons of CO_2e. Since electrical energy is used for heating, cooling, ventilation, and all other operational activities within the building after energy retrofits, carbon emission calculations were conducted and compared for both the initial (pre-retrofit) and final (post-retrofit) states. For the environmental analysis, the service life of the building was assumed to be 30 years.

FINDINGS AND DISCUSSION

This section covers the validation and analyzes the material properties and operational energy consumption of the baseline case, followed by the energy simulation of the reference model. Energy savings are calculated based on the reference model, assessing the feasibility of retrofitting the existing building.

Additionally, a comprehensive evaluation is conducted covering energy savings, overheating and thermal comfort, environmental impact, and cost analysis of the proposed interventions. The results are subsequently discussed in detail.

Validation of the Energy Model

The error margins obtained from the measured and simulated indoor temperature data were compared with the acceptable limit values defined in ASHRAE Guideline 14-2002.

For the climate and building energy model validation, the Mean Bias Error (MBE) was found to be in the range of -6.95% to -10.01%, while the Coefficient of Variation of the Root Mean Square Error (CV(RMSE)) ranged from 11.85% to 23.80% (Figure 5).

Since these values remained within the acceptable thresholds specified by ASHRAE Guideline 14, the building energy model was deemed reliable. Consequently, a comparative analysis of annual energy consumption, carbon emissions,

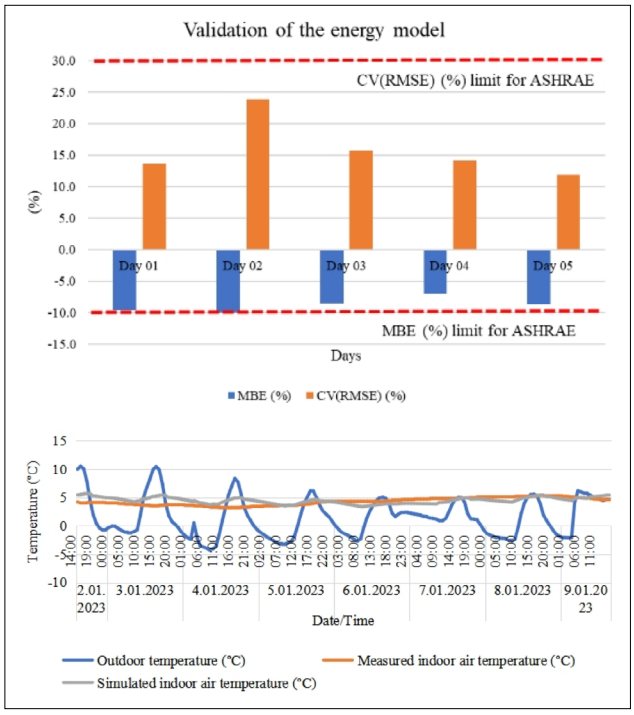

Figure 5. Validation of the building energy model (above), real-time measurements and simulation results for the indoor temperatures (below).

Table 4. Unit embodied carbon values (A1-A3) of the energy retrofits

Material/System	Unit	Embodied Carbon (kg CO_2-e)	Source
VRF-HR units	1 product	5.43E+02	Daikin, 2024
Rock wool (0.037W/mK, 60 mm, 33 kg/m^3)	1 m^2	2.62E+00	Knauf, 2021
Triple glass unit (4-12-4-12-4)	1 m^2	4.80E+01	Environdec, 2023

costs, and thermal comfort criteria was conducted for both the baseline and retrofitted scenarios, considering the in-use condition of the building.

Energy Simulations

Energy simulations were conducted based on the assumptions used to generate the building energy models. The results indicate that the heating load of the baseline energy model is 90.7 kWh/m²/year. To achieve Passive Building Standard compliance, an 83.4% reduction in heating load is required. Additionally, the primary energy demand is 163.1 kWh/m²/year, necessitating a 26.4% reduction to meet passive building criteria.

Thermal comfort analysis shows that the average indoor temperature exceeds 25°C for 17.6% of the year, while operative temperatures surpass 25°C for 16.4% of the year. According to the Passive Building Standard, these values should be reduced to below 10% to mitigate overheating risks.

The first stage of energy retrofitting involved the integration of energy-efficient HVAC units. Heating and cooling were provided using a heat recovery air conditioning unit, specifically a VRF-HR system.

As a result of this HVAC intervention:

- The heating load decreased to 58.3 kWh/m²/year, representing a 35.7% reduction.
- The primary energy demand dropped to 145.4 kWh/m²/year, achieving a 10.8% reduction.

In the second stage, rock wool insulation panels were applied to the building envelope, increasing its thermal inertia (Table 5). The thicknesses of the insulation layers were determined to ensure that the thermal transmittance of building components remains below 15 W/m²K, as required by the Passive Building Standard.

Furthermore, it was assumed that the airtightness of the structure improved, with air leakage decreasing to 0.59 air changes per hour (ac/h) following the addition of insulation layers.

As a result of the energy simulation, the heating load decreased by 87%, reaching 7.2 kWh/m²/year. Additionally, the primary energy demand was reduced by 36.1%, falling to 94.3 kWh/m²/year. These improvements successfully met the Passive Building Standard requirements for heating and primary energy demand. However, the addition of the insulation layer resulted in a 10.8% increase in cooling load.

In the third stage of the energy retrofit, windows and doors were upgraded to enhance thermal performance. The thermal transmittance (U-value) of the windows was reduced from 2.71 W/m²K to 0.78 W/m²K by installing argon-filled triple glazing. Additionally, insulation was applied to the doors, which are made of painted oak wood, reducing their U-value to 0.56 W/m²K. In addition to enhancing the window glazing, 1-meter-long shading elements made of moderately reflective metal slats were installed inside the windows. In-glass blinds were programmed to remain open during summer (June–August) to optimize thermal performance.

According to the simulation results, the heating load remained unchanged compared to the baseline case, while the cooling load decreased by 13.4%, reaching 14.1 kWh/m²/year. A 2.3% reduction in primary energy demand was achieved, resulting in an energy consumption of 92.1 kWh/m²/year.

Table 5. Improving the thermal performance of the building envelope with insulation

	Material	Thickness (m)	Thermal conductivity (W/mK)	Specific heat (J/kg-K)	Density (kg/m³)	U value (W/m²K)
Wall	Plaster	0.02	0.4	1000	1000	0.143
	Rock wool	0.24	0.037	840	33	
	Concrete block	0.30	1.15	1000	1800	
	Plaster	0.02	0.4	1000	1000	
Hipped roof	Roof tile	0.025	1	800	2000	0.148
	Rock wool	0.24	0.037	840	33	
	RC	0.12	1.15	1000	1800	
Flat roof	Ceramic tile	0.018	0.85	840	1900	0.148
	Rock wool	0.24	0.037	840	33	
	RC	0.12	1.15	1000	1800	
Floor	Screed	0.05	1.4	650	2100	0.146
	Rock wool	0.24	0.037	840	33	
	RC	0.12	1.15	1000	1800	

After implementing all energy retrofits, the study determined that a 92% reduction in heating load was achieved, while cooling load and primary energy demand fully complied with Passive Building Standard requirements. VRF-HR system contributed to a 35.7% reduction in heating load, while insulation and airtightness accounted for 88.3% of the total heating reduction. However, window retrofits had no significant impact on heating demand due to the low window-to-wall ratio.

Regarding cooling load, the impact of the VRF-HR system could not be determined, as the building did not previously have a cooling system. Floor, wall, and roof insulation, along with airtightness improvements, caused a 10.8% increase in cooling demand, while window retrofits played a 13.5% role in cooling demand reduction.

Regarding total energy savings, the contributions of individual retrofit measures were as follows: the VRF-HR provided a 10.8% reduction in primary energy demand, insulation and airtightness contributed to a 35.1% reduction, and window improvements resulted in a 2.3% reduction. These combined efforts led to a total energy saving of 43.5% (Figure 6).

Overheating and Thermal Comfort

After the energy improvements, the operative temperature, which serves as an indicator of thermal comfort and is calculated as the arithmetic average of the radiation temperature and indoor dry-bulb temperature, was analyzed to assess overheating, a key criterion of the Passive Building Standard. According to the passive building requirements, the operative temperature should not exceed 25°C for more than 10% of the hours in a year. The results indicate that the operative temperature exceeds this threshold for 9.8% of the annual hours, demonstrating compliance with the standard. The implemented measures resulted in a 40.2% reduction in overheating hours per year (Figure 7).

Additionally, the average indoor temperature range between 19.4°C and 27.8°C, which falls within the comfort range specified by ASHRAE Standard 55-2017. The average indoor humidity remains between 40% and 60%, meeting the required comfort conditions. These findings confirm that the retrofitting measures not only improved energy efficiency but also prevented the building's overheating (Table 6).

The thermal comfort conditions were also evaluated using the Predicted Mean Vote (PMV) and Predicted Percentage of Dissatisfied (PPD) methods, in accordance with ASHRAE 55-2023 (Center for the Built Environment, n.d.). The results confirmed that overheating alone is not a sufficient criterion for ensuring user thermal comfort. Instead, a comprehensive assessment of is necessary.

The PMV-PPD analysis revealed that only two of the datasets met the thermal comfort criteria. During the summer period, up to 87% of users are likely to experience discomfort (cool) when the operative temperature is below average (Table 7). This suggests that the current conditions may not be optimal for occupant comfort.

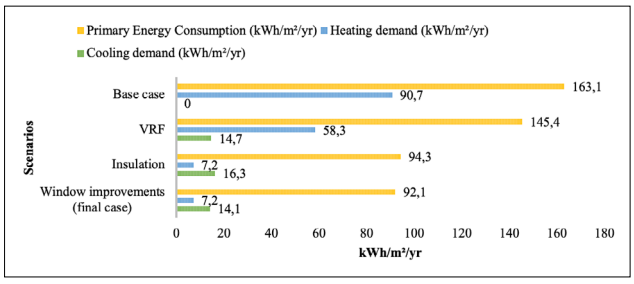

Figure 6. The effects of the improvements on the energy performance of the building.

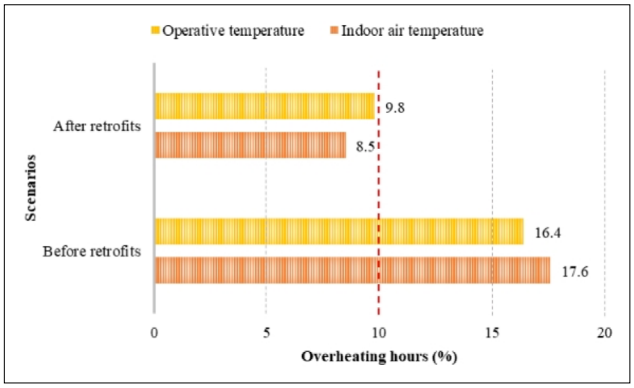

Figure 7. Overheating before and after the retrofits.

Table 6. Overheating hours of the building during the year after improvements

Overheating status	Average indoor air temperature	Operative temperature	Relative humidity	Outside dry-bulb temperature
Minimum	15.1	17.1	10.2	-9.7
Maximum	31.5	29.9	78.7	38.6
Mean	21.9±2.1	22.4±2	43.8±12.5	13±9
Hours above 25°C (uncomfortable)	741	860		
Total hours in a year	8760			
Uncomfortable hours (%)	8.5	9.8		

Table 7. Thermal comfort based on PMV/PPD method

Operative temperature (°C)	Relative humidity	Clothing level (clo)	PMV	PPD (%)	Sensation
20.4	31.1	0.5	-2.25	87	Cool
20.4	56.3	0.5	-2.09	81	Cool
20.4	31.1	1.0	-0.89	22	Slightly cool
20.4	56.3	1.0	-0.73	16	Slightly cool
24.4	31.1	0.5	-0.77	18	Slightly cool
24.4	56.3	0.5	-0.57	12	Slightly cool
24.4	31.1	1.0	0.16	6	Neutral
24.4	56.3	1.0	0.36	8	Neutral

However, adjusting the operative temperature to above average during winter conditions significantly improves thermal comfort. Under these conditions, the percentage of users experiencing discomfort is reduced to only 6-8%, ensuring that the thermal comfort threshold is met (Figure 8). These findings indicate that careful temperature regulation is necessary to maintain an optimal indoor environment throughout the year.

Cost Analysis

Following the completion of the energy retrofits, the initial investment costs and payback periods of the applied measures were calculated to evaluate their feasibility within the scope of the project. In addition, the total costs were determined by incorporating both initial investment costs and 30-year operating expenses.

For accurate cost assessment, foreign exchange transactions for Euro (€) to Turkish Lira (₺) were based on the Indicative Exchange Rates of the Central Bank of the Republic of Türkiye as of 24.07.2024 at 15:30 (Table 8). This ensures that cost evaluations reflect real-time currency values, enhancing the reliability of the economic analysis.

After calculating the costs, the annual energy savings were determined by comparing the baseline annual energy consumption with the total annual energy consumption of retrofitted case. This corresponds to a total energy saving of 142,000 kWh per year.

As a result of the calculations, it was determined that:

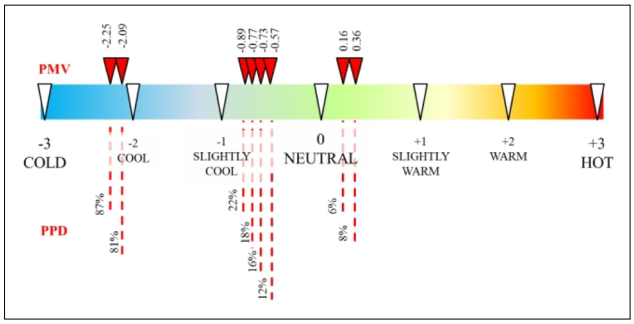

Figure 8. PMV/PPD results and thermal comfort assessment.

Table 8. Total quantity and price calculation of the applications proposed for the project

Scenarios	Total amount	Total cost
VRF-HR	20 high static pressure concealed ceiling type indoor units (ducting, copper piping and installation)	200,000 €+18% VAT =8,413,400 ₺
Insulation	3310 m^2 24 cm	47,664 €+18% VAT =2,005,062 ₺
Window (with argon gas)	50.26 m^2	73,336 ₺+18% VAT =86,536 ₺
		2,261 ₺+18% VAT =2,668 ₺
Total		10,507,666 ₺

- Window replacement costs (86,536₺) can be fully recovered within the first year.
- Insulation costs (2,005,062₺) can be covered within the first three years.
- VRF-HR costs (8,413,400₺) will be recouped within seven years.

The findings indicate that the proposed energy retrofitting measures are financially viable, with relatively short payback periods, making them a cost-effective solution for improving building energy efficiency.

Finally, the additional investment costs and 30-year operating costs were evaluated together to determine the overall economic feasibility of the proposed retrofitting measures. The annual primary energy demand in the final scenario was calculated by accounting for inflation-driven increases in energy costs and compared with the operating costs of the baseline case.

According to the results, the total initial investment and 30-year operating costs of the proposed passive building were found to be 43.4% more economical compared to the operating costs of the baseline case alone (Table 9).

Table 9. Calculation of operating and investment costs

Years (2024-2053)	Baseline	Passive building
Operational cost (₺)	12,957,131,748	7,316,688,130
Additional cost (₺)	-	10,507,666
Total cost (₺)	12,957,131,748	7,327,195,796
Saving (%)	-	43.45

These findings highlight that, despite the initial capital investment, transitioning to a Passive Building Standard yields significant long-term financial benefits, making it a cost-effective and energy-efficient solution.

Environmental Impact

Both embodied carbon emissions and operational carbon emissions were assessed to evaluate the overall environmental impact of the proposed energy retrofits. The total embodied carbon emissions resulting from the retrofits were calculated based on Environmental Product Declaration (EPD) data sheets. According to these calculations:

- VRF-HR system contributed 10,860 kg CO_2-e,
- Insulation accounted for 34,689 kg CO_2-e,
- Windows contributed 2,412 kg CO_2-e,
- Leading to a total embodied carbon footprint of 47,961 kg CO_2-e.

The total annual operational carbon emissions were calculated based on annual energy consumption. The energy-to-carbon conversion factor from the Ministry of Energy and Natural Resources (n.d.) was used, where 1 MWh of energy consumption corresponds to 0.445 tons of CO_2-e.

In the baseline case, with an annual energy consumption of 163.1 kWh/m²/year, the corresponding operational carbon emissions were 72.6 tons CO_2-e per square meter per year. After implementing the retrofits, with an annual energy consumption of 92.1 kWh/m²/year, the operational carbon emissions were reduced to 41 tons CO_2-e per square meter per year. As in the cost analysis, the operational period for environmental analysis was considered as 30 years. Over this period, the total operational greenhouse gas (GHG) emissions would have been 2,177 tons per square meter in the baseline case. After the retrofits, this value decreased to 1,230 tons per square meter. When embodied carbon emissions from the production stage (A1-A3) were included, the total emissions after retrofits amounted to 1,277 tons per square meter.

As a result, the GHG emissions from operational energy consumption were reduced by 43.5%, while the total carbon emissions decreased by 41.3% compared to the baseline scenario, demonstrating the significant environmental benefits of the energy-efficient retrofits (Figure 9).

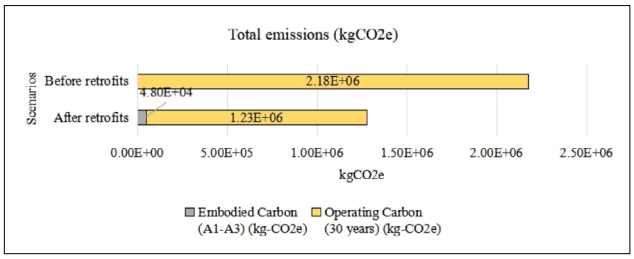

Figure 9. Environmental impact of the energy retrofits.

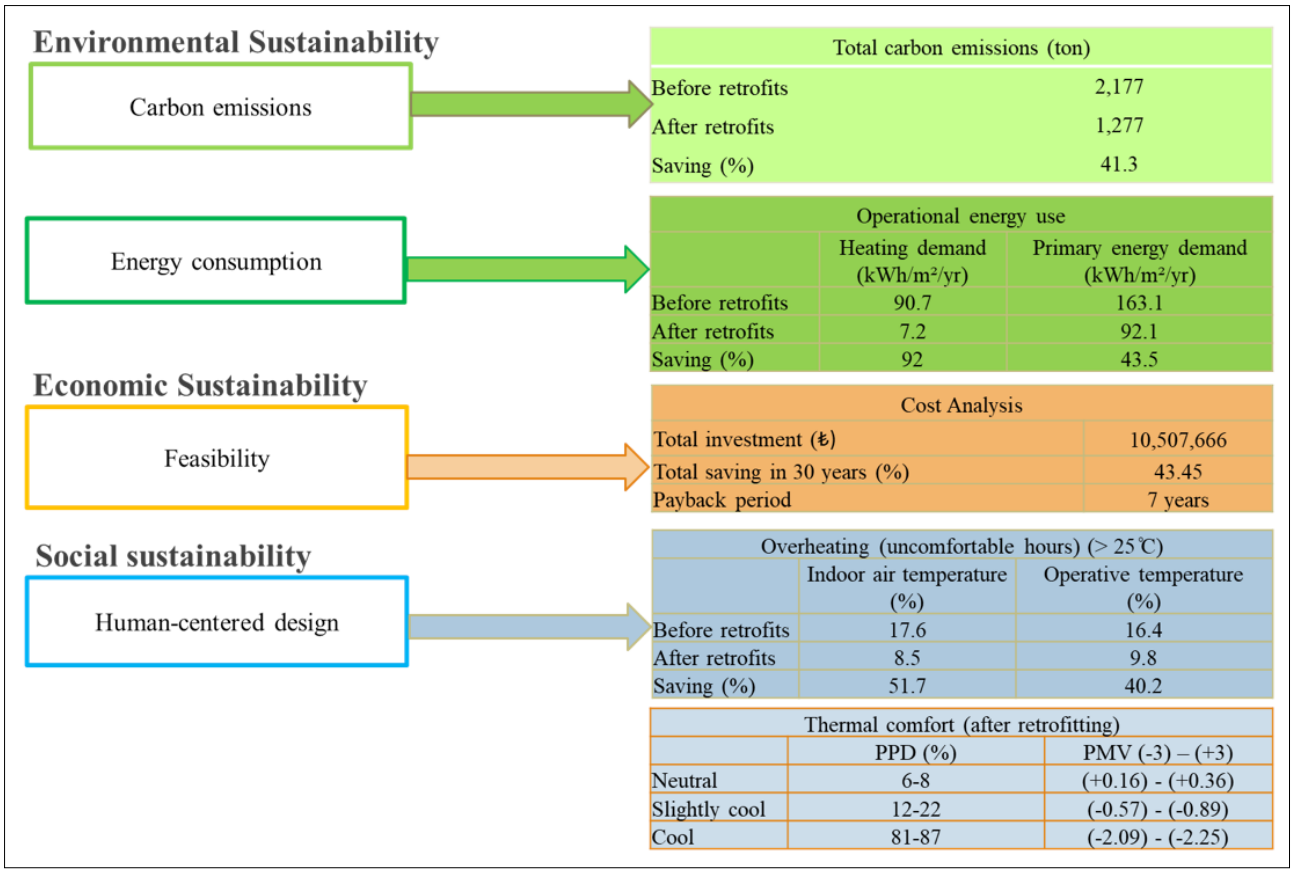
Assessment of the Results

This study aimed to promote sustainability in the architectural domain by retrofitting Yenişehir Cinema in accordance with Passive Building Standard requirements. Additionally, the project envisions reintegrating Yenişehir Cinema into urban life as a passive building, ensuring both economic and environmental sustainability. Economic sustainability is achieved through applicable energy-efficient solutions, while environmental sustainability is targeted by reducing the building's carbon footprint. To accomplish these goals, passive building strategies were systematically implemented, fulfilling all required conditions.



The desired thermal transmittance values for walls, doors, and windows were successfully achieved, and a heat recovery ventilation unit was integrated into the building. As a result, the heating, cooling, and primary energy demands were reduced to below threshold values, and the overheating level of the building was significantly minimized.

Comparing the baseline case with the retrofitted case, the results indicate a 43.5% reduction in annual primary energy demand, while heating demand decreased by 92%. Although the overheating issue was reduced by 40%, further improvements are required to ensure optimal thermal comfort for users.

The proposed retrofits are financially feasible, with a total payback period of 7 years. Furthermore, the total carbon emissions of the building were reduced by 41.3%, demonstrating the environmental benefits of energy-efficient interventions. Consequently, the study has successfully achieved ecological, economic, and social improvements, paving the way for Yenişehir Cinema to be reintroduced into urban life as a retrofitted passive building (Figure 10).

CONCLUSION AND RECOMMENDATIONS

The depletion of non-renewable resources and the ongoing challenges posed by climate change present significant obstacles to the sustainability of existing buildings. As a result, it is crucial to enhance the energy performance of such buildings to ensure their continued viability. The Passive Building Standard provides a comprehensive range of solutions to address this challenge. According to the

Total carbon emissions (ton)	
Before retrofits	2,177
After retrofits	1,277
Saving (%)	41.3

Operational energy use		
	Heating demand (kWh/m²/yr)	Primary energy demand (kWh/m²/yr)
Before retrofits	90.7	163.1
After retrofits	7.2	92.1
Saving (%)	92	43.5

Cost Analysis	
Total investment (₺)	10,507,666
Total saving in 30 years (%)	43.45
Payback period	7 years

Overheating (uncomfortable hours) (> 25℃)		
	Indoor air temperature (%)	Operative temperature (%)
Before retrofits	17.6	16.4
After retrofits	8.5	9.8
Saving (%)	51.7	40.2

Thermal comfort (after retrofitting)		
	PPD (%)	PMV (-3) – (+3)
Neutral	6-8	(+0.16) - (+0.36)
Slightly cool	12-22	(-0.57) - (-0.89)
Cool	81-87	(-2.09) - (-2.25)

Figure 10. Interpretation of the results in the perspective of sustainable architecture.

standard, energy demands should be balanced to maintain user comfort throughout the year, and the integration of hybrid systems is recommended to optimize performance.

Yenişehir Cinema, a notable modern architectural building, holds significant value in the collective memory of the community. Currently, the building is vacant, but it is believed that the structure can be successfully retrofitted using the principles of the Passive Building Standard and reintegrated into urban life. In alignment with the EnerPHit certification system, the thermal performance of the building envelope was enhanced by incorporating active air conditioning systems, adding insulation, and improving transparent surfaces. One of the major barriers to energy efficiency and comfort was the lack of insulation in the building envelope. Consequently, 35.1% of energy savings in primary energy consumption were achieved solely through improvements to insulation and airtightness. Additionally, the installation of a heat recovery ventilation system prevented heat losses, resulting in a 10.8% reduction in energy consumption. However, due to the building's low transparency, the improvements to windows and doors contributed the least to energy performance, accounting for only 2.3% of the total energy savings. As a result, all requirements to achieve the EnerPHit certification system have been completed.

From an economic standpoint, the window improvements can be covered within the first year, insulation applications within three years, and the VRF-HR system within seven years.

By ensuring thermal comfort, it is possible to create a user-oriented interior space, fostering an environment where social interactions can thrive. The study found that while overheating can be prevented according to the Passive Building Standard, this alone is insufficient to ensure the required thermal comfort. The PMV/PPD method demonstrated that additional measures are necessary to achieve and maintain optimal thermal comfort. While implementing these measures, passive approaches, such as Trombe walls and innovative insulation materials, should be considered to prevent the building from consuming excessive energy during the use phase while ensuring thermal comfort.

Although the proposed improvements led to an increase of 48 tons in the embodied carbon of the building, the overall total carbon emissions decreased by approximately 41% due to the reduction in carbon emissions during the operational phase. This indicates that the retrofitting measures yield positive environmental sustainability outcomes.

Increasing legal regulations and financial support mechanisms that encourage passive building conversions in Türkiye will contribute to the sustainable transformation of the existing building stock. Projects promoted through public-private partnerships would help similar practices to become widespread and YES-TR certificates to be obtained.

Future research can focus on advanced technologies and innovative materials that can be applied to heritage buildings. A comprehensive approach that addresses the energy-carbon-cost triangle is essential for achieving long-term sustainability. Similar passive building transitions can be tested in different climate zones to assess the applicability of passive building strategies in various climatic conditions in Türkiye. Further research can be conducted on how to optimize energy efficiency strategies in different geographical regions. Furthermore, in addition to thermal comfort, visual comfort, acoustic comfort, and the indoor air quality should be considered to ensure the creation of a truly sustainable built environment.

OVACIK (KARABÜK) İLÇESİNDEKİ GELENEKSEL KONUTLARIN KIRSAL MİMARİ BAĞLAMINDA İNCELENMESİ

EXAMINATION OF TRADITIONAL HOUSES IN OVACIK (KARABÜK) DISTRICT IN THE CONTEXT OF RURAL ARCHITECTURE

Elif ÇETİN*

Mehmet MUTLU**

ÖZ

Kırsal yerleşimler, içinde bulunduğu coğrafyanın iklimsel ve topografik özellikleri ile sosyal ve kültürel yaşam biçimlerinin etkisiyle şekillenmiştir. Çok sayıda mimari miras değer barındıran kırsal yerleşimler, değişen yaşam koşullarının etkisiyle terk edilmektedir. Terk edilen kırsal yerleşimlerde sosyokültürel ve ekonomik yapı değişmekte buna bağlı olarak da kırsal mimari doku da değişime uğramaktadır. Bu çalışma kapsamında çalışma alanı olarak seçilen Ovacık kırsal yerleşimleri, verilen göçlerin etkisiyle yok olma tehlikesiyle karşı karşıyadır. Ovacık kırsalında bulunan 137 yerleşimden dokuzu tamamen terk edilmiş durumdadır. Çoğu yerleşimde devamlı olarak ikamet eden hane oldukça az sayıdadır. Terk edilen yerleşimlerdeki geleneksel yapılar yok olma sürecine girmiştir. Bu çalışmada Ovacık kırsalında bulunan geleneksel yapım teknikleri ve malzemeler kullanılarak inşa edilen konutların plan özellikleri, cephe biçimlenişleri, yapım tekniği, malzeme ve süsleme özellikleri irdelenmiştir. Çalışma yöntemi olarak literatür çalışması yapılmış ardından alan çalışması yapılarak 137 yerleşimin tamamı yerinde incelenmiştir. İçerisine girme imkânı bulunan konutların içine girilerek plan şemaları çıkartılmış ve detaylı fotoğrafları çekilmiştir. Köy halkıyla sözlü görüşmeler yapılarak yerleşim ve yapılar hakkında bilgiler edinilmiştir. Ayrıca Ovacık ilçesinin komşu olduğu altı ilçede bulunan gelenek konutların özellikleri incelenmiş ve Ovacık kırsalındaki konutlarla benzer ve farklı özellikleri saptanmıştır. Bu çalışma ile Ovacık kırsal mimarisinin temelini oluşturan geleneksel konutların literatüre kazandırılması ve kırsal mimari dokusunun kaybolmadan belgelendirilmesi amaçlanmıştır.

ABSTRACT

Rural settlements have been shaped by the climatic and topographical features of their geographical context, as well as by the social and cultural lifestyles of their inhabitants. Containing numerous architectural heritage assets, these settlements are increasingly being abandoned due to changing living conditions. In abandoned rural areas, socio-cultural and economic structures undergo transformation, and consequently, the rural architectural fabric also experiences significant alteration. The rural settlements of Ovacık, selected as the study area, have been subjected to a rapid migration process since the 1980s, leading to the gradual disappearance of many of these settlements. Today, out of the 137 rural settlements in Ovacık, 9 have been completely abandoned. In most of the remaining villages, the number of permanently inhabited households is very limited. Traditional buildings in the abandoned settlements are in the process of decay. The structures that continue to be used are often repaired in an unplanned manner or replaced with new constructions employing modern materials and techniques, as they no longer meet contemporary needs. This situation damages the authenticity of the buildings and contributes to the deterioration of the rural architectural texture. This study examines the plan typologies, façade compositions, construction techniques, materials, and ornamental features of traditional houses constructed with local materials and vernacular building methods in rural Ovacık. The research methodology consisted of a literature review followed by extensive fieldwork. All 137 settlements were visited and documented in situ. For the accessible houses, interior plans were drawn and detailed photographs were taken. Oral interviews were conducted with local residents to gather information about the settlements and their buildings. Traditional houses in the Ovacık countryside generally consist of two stories: the ground floor serves as service areas, while the upper floor accommodates living spaces. Similar to the traditional Turkish house, each room in Ovacık houses is designed to meet the needs of an individual family unit, with particular attention paid to privacy. The plan typologies observed in Ovacık houses include external sofa, corner sofa, internal sofa, and central sofa plans, with the internal sofa type being the most prevalent. The sofa, locally referred to as the çardak, serves as the central hall from which rooms are accessed. Typically, the ground floors of the houses are built of rubble stone masonry, while the upper floors are constructed with a timber-frame infill (hımış) system. In some examples, çantı (a log construction technique) and hımış systems are used together. Functionality was prioritized in these dwellings, resulting in simple façades and interior elements. In the comparative analysis section, the architectural characteristics of traditional houses in six neighboring districts were examined to identify the similarities and differences with those of Ovacık. The aim of this study is to contribute to the architectural literature by documenting the traditional houses that form the basis of Ovacık's rural architecture and to preserve the rural architectural heritage before it disappears.

Key Words: *Karabük, Ovacık, Rural Architecture, Traditional Architecture, Traditional House*

Giriş

Kırsal yerleşimler bulundukları çevrenin iklim ve coğrafik özelliklerine göre şekillenmektedir. Ayrıca kırsal yerleşimler, o bölgede yaşayanların somut ve somut olmayan kültürel değerlerini yansıtmaktadır. Bölgeden bölgeye köyden köye farklılık gösteren kültürel değerlerin etkisiyle kırsal mimari de zenginleşmektedir. Kırsal yerleşimlerin sosyal, ekonomik ve kültürel değerlerinde zaman içinde meydana gelen değişimler, her yörenin kendine özgü bir mimari kimliğe sahip olmasına neden olmaktadır[1].

Kırsal yerleşimler, zamanla değişen yaşam koşulları, teknolojik gelişmeler, sanayileşme ve aile yapılarında meydana gelen değişimler gibi nedenlerin de etkisiyle nüfuslarını hızla kaybetmektedir. TÜİK verilerine göre kent-kır nüfus istatistiklerine bakıldığında 1950'li yıllarda kent nüfusu %25, kır nüfusu %75 oranındadır. Yıllar geçtikçe kent nüfusu sürekli artmakla beraber 1990'lı yıllarda kentte yaşayan nüfus oranı %60 olmuştur. Günümüzde ise kentte yaşayan nüfus toplam nüfusun %93,4'ünü oluşturmaktadır. Kırsal alanlarda yaşayan nüfus, toplam nüfusun sadece %6.6'sını meydana getirmektedir[2].

Kırdan kente göçün etkisiyle kırsal alanlar, kendilerine özgü mimari dokularını zamanla kaybetmektedir[3]. Kendi kaderine bırakılan geleneksel konutlar da gerekli bakım ve onarımları yapılamadığından yıkılmakta ya da yıkılma tehlikesiyle karşı karşıya kalmaktadır. Kırsal yaşamın devam ettiği bazı yerleşimlerde ise geleneksel konutlar yetersiz gelmekte ve onarıma ihtiyaç duyulmaktadır. Yapı sahipleri onarım yaparken yapıların özgünlüğüne dikkat etmemekte, uzman restoratör ve mimardan destek almadan gelişigüzel onarım yapmaktadır. Ayrıca geleneksel konutların yıkılıp yerine yeni yapı inşa edildiği de sıklıkla görülmektedir. Yeni yapılar inşa edilirken kırsal mimari doku arka plana atılmakta, yeni yapım sistemleriyle yerel malzeme kullanımından uzak yapılar üretilmektedir. Köy ölçeği dikkate alınmadan, şehir merkezinde yer alan yapılara benzer örnekler inşa edilmektedir. Bu durum da kırsal mimari dokunun yok olmasına sebep olmaktadır.

Bu çalışmada, kırsal yaşamın giderek yok olduğu ancak özgün mimariye sahip yerleşimlerin varlığını halen daha koruduğu Ovacık kırsal mimarisinin en önemli unsurlarının başında gelen geleneksel konutların tespiti ve belgelendirilmesi yapılarak bu konutlar kırsal mimari disiplini içerisinde değerlendirmeye tabi tutulmuştur. Ayrıca, Ovacık kırsal mimarisinin oluşmasında etkili olan yerleşim bölgesinin tarihi, coğrafi yapısı, iklimsel özellikleri ve nüfus özellikleri de çalışma kapsamında irdelenmiştir. Son beş yıldır yapılan arazi çalışmalarında elde edilen veriler kullanılarak Ovacık kırsal mimarisinin genel özelliklerinin ortaya konulması amaçlanmıştır. Arazi çalışmaları sırasında içerisine girilebilen konutların rölöveleri alınmış ve plan şemaları çıkartılmıştır. Çalışma kapsamında geleneksel yapım teknikleri ve malzemeler kullanılarak inşa edilen ve özgünlüğünü koruyan konutlar incelenmiştir.

1 Akgün, 2013, 7.

2 Bu veriler TUİK internet sayfasından alınmıştır. (Bk. TÜİK, 2025)

3 Eres, 2016, 9.

Yapı sahipleriyle ve geleneksel yapı ustalarıyla görüşmeler yapılarak bölgede kullanılan özgün yapı terimleri hakkında bilgilere ulaşılmıştır. Elde edilen veriler, fotoğraflar ve çizimlerle desteklenerek geleneksel konutların mimari özellikleri belirlenmiştir. Ayrıca Ovacık çevresindeki geleneksel konutlarla Ovacık kırsalındaki konutlar karşılaştırılarak benzerlikleri ve farklılıkları ortaya konmuştur.

1. Ovacık ve Ovacık Kırsal Mimarisinin Genel Özellikleri

1.1. Ovacık

Batı Karadeniz bölgesinin iç kesimlerinde bulunan Ovacık, Karabük ilinin doğusunda yer alan, Karabük iline bağlı küçük bir ilçedir. Batısında Karabük il merkezi ve Eskipazar ilçesi, doğusunda Kastamonu ilinin Araç ilçesi, güneyinde Çankırı ilinin Bayramören ve Çerkeş ilçeleri, kuzeyinde ise Karabük ilinin Safranbolu ilçesi bulunmaktadır (Şek. 1).

Ovacık ilçesinin tarihiyle ilgili yapılan araştırmalar ilk yerleşimlerin M.Ö. 3000-2000 yıllarında başladığını göstermektedir. Ovacık'ın yer aldığı Kuzeybatı Karadeniz bölgesine tarihsel süreç içerisinde Paphlagonialılar yerleşmiş olup, bölge Paflagonya olarak isimlendirilmiştir. Paflagonya sınırları günümüzde Karabük, Kastamonu, Sinop, Çankırı, Bartın illerini kapsamaktadır[4]. 1071 Malazgirt Zaferi'nden sonra Anadolu'ya yayılmaya başlayan Türkler, Paflagonya bölgesinde de varlık göstermiştir. 1082 yılında Çankırı, Eflani, Ulus, Bartın, Kastamonu ve Safranbolu'yu fetheden Emir Karatekin bölgede bir Türk Emirliği kurmuştur[5]. Daha sonraki dönemlerde ise bölgede; Danişmentliler, Çobanoğulları Beyliği, Umuroğulları ve Candaroğlu Beyliği hâkimiyet göstermiştir. 1389 yılında ise bölge toprakları Osmanlı hâkimiyetine geçmiştir. Osmanlı döneminde Karabük, Bolu sancağına bağlı olup, bugünkü il sınırlarında, Taraklı-Borlu (Safranbolu), Viran-Şehir (Eskipazar-Ovacık çevresi)

Şek. 1: Ovacık ilçesinin konumu (Karabük İl Özel İdaresi Arşivinden işlenmiştir)

4 Gökoğlu, 1952, 33.

5 Sakaoğlu, 1987, 57.

ve Yenice kazaları bulunmaktaydı. 17. yüzyılda Bolu Sancağının kaza sayısı artırılarak 36 kazaya sahip bir sancak durumuna getirilmiştir. Bu düzenlemede Ovacık bölgesinde Viran-Şehir, Şehabeddin ve Ulakderesi (Avlak) kazaları yer almıştır. Bu kazalar 19. yüzyıla kadar varlığını devam ettirmiştir[6]. 1869'da yapılan düzenlemelerle Ovacık; Ulak, Şehabeddin ve Oğlakdere kazalarından oluşan bir nahiye haline getirilmiştir. Ovacık nahiyesi, Çankırı (Kengiri) Sancağının Çerkeş kazasına bağlanmıştır. 1869 yılında Ovacık nahiyesinde 25 köy ve bu köylerde yaşayan 2145 hane bulunmaktadır[7].

Çankırı ilinin Çerkeş kazasına bağlı nahiye olan Ovacık, 1959 yılında ilçe olarak Çankırı'ya bağlanmıştır. 1995 yılında Karabük'ün il olmasıyla Ovacık, Karabük iline bağlı bir ilçe olmuştur[8]. Günümüzde Ovacık'a bağlı 42 köy ve bir Merkez mahalle bulunmaktadır. 42 köy, 137 mahalleden oluşmaktadır[9].

Ovacık ilçesinin nüfusu 1960'lı yıllarda köyleriyle birlikte yaklaşık 10.000'den fazla iken, yıllar içerisinde giderek azalarak 5000'nin altına inmiştir[10]. İlçe merkezinin nüfusu 600 civarındadır[11]. Nüfusun hızla azalmasında iş imkânlarının kısıtlı olması, gelişen teknolojilerle birlikte tarımda insan gücüne duyulan ihtiyacın azalması, hayvancılığa gerekli önemin verilmemesi ve sosyal imkânların yetersizliği etkili olmuştur.

İlçe merkezinde ve köylerinde yaşanan göçle birlikte yerleşim yerleri sahipsiz kalmıştır. Kırsal alanlarda tamamen terkedilen yerleşimlerin sayısı hızla artmaktadır. Pek çok yerleşim yerinde kış aylarında kimse yaşamazken, yaz aylarında nüfus kısmen artmaktadır. Kırsal alanlarda yerleşimin devamlı olarak sürdürüldüğü köy sayısı oldukça sınırlıdır.

1.2. Ovacık Kırsal Mimarisi

Ovacık kırsal mimarisi; çok sayıda konutun yanı sıra, 71 köy odası, 67 cami, 22 okul ile konutların bağımsız müştemilatları olarak inşa edilmiş samanlıklar, ahırlar, ambarlar ve çeşme yapılarından meydana gelmektedir. İlçe merkezinde geleneksel mimari doku çok fazla korunamamıştır. Merkezde bulunan geleneksel yapılar kendi kaderlerine terk edilmiştir ve bu yapıları kullanmak yerine betonarme teknikte geleneksel dokuyu bozacak yapılar inşa edilmiştir. Köylerinde ise geleneksel mimari dokunun korunmuşluğu daha iyi durumdadır. Tamamen özgün dokusunu koruyan köyler bulunsa da bazı yerleşimlerde dokuya zarar verecek nitelikte yapılar inşa edilmiştir. Bu çalışma kapsamında Ovacık kırsal mimarisinin temelini oluşturan geleneksel konutların plan şemaları, yapım teknikleri, kullanılan malzemeler ve iç mekân düzenlemeleri kapsamlı bir şekilde ele alınmıştır.

10 Yiğit, 2011, 527.

11 Bu veriler TÜİK internet sayfasından alınmıştır (Bk. TÜİK,2025)

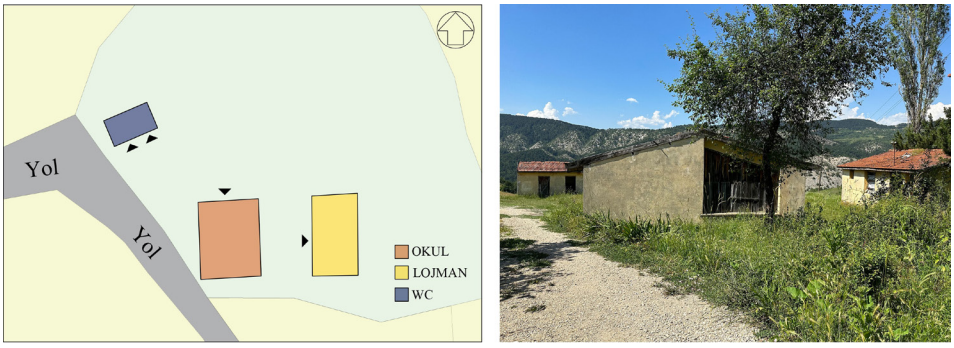
Geleneksel konutların bazılarında samanlık, ahır ve ambar gibi eklentiler yapıyla aynı parselde olabiliyorken, bazı konutlarda bu tamamlayıcı yapılar bulunmamaktadır. Ahır genellikle konutun giriş katında yer almaktadır. Konutun içerisinde olmayıp konutla aynı parsel içerisinde bağımsız olarak kullanılan ahırlar da görülmektedir. Samanlıklar, köyün ekin yapılabilen "harman" olarak bilinen düzlük alanlarda yer almaktadır. Samanlık yapıları genellikle yığma taş olarak inşa edilmiş olup üst örtüleri beşik çatı biçimindedir (Fot. 1).

Fot. 1: Samanlık örneği (Sarılarsonya köyü, Sarılar mahallesi)

Ambarlar ise bazı köylerde yapıdan bağımsız bazı köylerde ise yapıya bitişik şekilde bulunmaktadır. Yapıya bitişik şekilde ve yapı yüksekliği ile aynı yükseklikte yapılan ambarlar, yörede "boy ambarı" olarak isimlendirilmektedir. Boy ambarları, çantı yapım tekniği sayesinde dışarıdan algılanabilmektedir (Fot. 2a). Koltuk ve Anbarözü köyünde ise ambarlar ayrı bir yapı şeklinde çantı tekniği kullanılarak inşa edilmiştir (Fot. 2b). Birçok evde ise ambarlar sandık şeklinde konutun çardak mekânında bulunmaktadır. Bu tür ambarlar yörede "herkil" olarak isimlendirilmektedir.

Fot. 2: Yapıdan bağımsız ve yapıya bitişik ambar örnekleri; **a)** Avlağıkaya köyü Karşı mahalle; **b)** Anbarözü köyü Merkez mahalle

Fot. 3. Ovacık kırsalında bulunan tarihi cami örnekleri (Çukur köyü ve Boyalı köyü)



Ovacık kırsal mimarisini oluşturan bir diğer yapı türü, köy odalarıdır. Ovacık kırsalında, hemen hemen bütün yerleşimlerde köy odası bulunmaktadır. Bu köy odalarının tamamı geleneksel yapım teknikleri ve malzemeler kullanılarak inşa edilmekle beraber zaman içerisinde yıpranan köy odalarının bazılarının yıkılıp yeniden inşa edildiği, bazılarının ise kapsamlı bir onarımdan geçirilerek özgünlüğünü kaybettiği görülmektedir. Köy odaları da konutlarla benzer mimari tipolojiye sahip olup genellikle iki katlı inşa edilmiştir. Köylerde yaşamın aktif olduğu yıllarda köy odaları köy halkının günlük yaşamında önemli bir role sahip olmuştur[12]. Akşamları köyün erkekleri bir araya toplanarak sohbetlerini köy odalarında gerçekleştirmiştir. Ramazan ayında toplu iftarlar köy odalarında verilmektedir. Bayramdan önce arife günü ziyrat[13] için köy odasında toplanılmaktadır. Bayramlaşmalar köy odalarında yapılmaktadır. Ayrıca köy odalarında cenaze işlemleri ve taziyeler gerçekleştirilmektedir. Ovacık'ta camisi olmayan yerleşim yerlerinde köy odaları aynı zamanda ibadet amacıyla da kullanılmaktadır. Bazı yerleşimlerde ise cami ve caminin içerisinde bulunan bir bölüm köy odası olarak işlevlendirilmiştir[14].

Ovacık köylerinin neredeyse tamamında cami bulunmaktadır. Bazı camiler Cuma camisi niteliğinde olup birkaç köye hizmet vermektedir. Özgün cami yapıları yığma taş olarak inşa edilmiştir. Özgün minareleri ise ahşap malzemeden yapılmıştır. Taşoğlu, Anbarözü, Başboyunduruk, Çatak ve Boyalı köylerindeki camiler tescillenerek koruma altına alınmış ve restore edilmiştir (Fot. 3). Bazı köylerde ise zamanla yıpranan cami yapıları yıkılarak yerine modern teknikler kullanılarak yenisi inşa edilmiştir.

12 Çetin, 2019, 16.

13 Ziyrat: Ovacık kırsalında arife günleri yapılan mezarlık ziyaretine ziyrat denilmektedir. Ziyrat için köy odasında toplanılır ve köy halkı evlerinden helva ve ekmek getirir. Getirilen yiyecekler birleştirilip köy halkına ikram edilir ardından da mezarlığa gidilir ve dualar okunurdu.

14 Mutlu, 2024, 12.

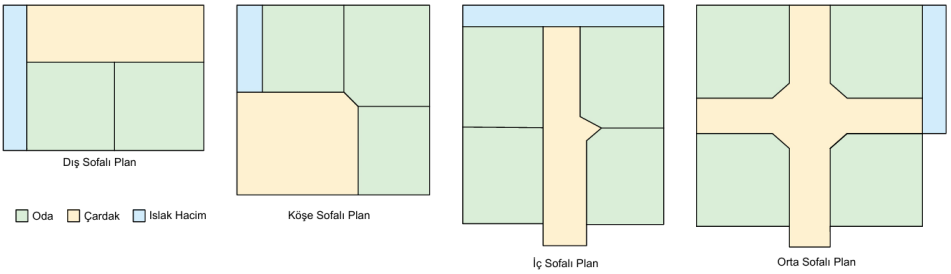
Şek. 2: Sülük köyü Göcek mahallesinde bulunan okul ve lojmanı

Ovacık köylerinin çoğuna 1960'lı yıllarda okul inşa edilmeye başlanmıştır. 1990'lı yıllardan sonra köylerde nüfusun azalmasıyla okullar da işlevini sürdürememiştir. Lojman, tek katlı ve yığma teknikte inşa edilen okul yapılarının yanına inşa edilmiştir. Tuvaletler de okul bahçesinde ayrı bir yapı olarak bulunmaktadır. Günümüzde Ovacık köylerinin hiçbirinde aktif olarak kullanılan okul bulunmamaktadır.

2. Ovacık Geleneksel Konutları

Ovacık kırsalında konutlar bir, iki veya üç kattan meydana gelmekte olup, en yaygın görüleni zemin+1 kat şeklindedir. Genellikle eğimli arazi yapısına sahip Ovacık kırsalında, konutlar da eğimli araziye konumlanmıştır. Konutların yer aldığı parsel sınırları genellikle bahçe duvarlarıyla ayrılmamıştır. Çoğu geleneksel konuta giriş, doğrudan sokak üzerinden sağlanmaktadır (Şek. 3a). Bazı örneklerde ise bahçenin yola komşu duvarına yapılan ahşap kapıyla önce bahçeye, sonra konuta girilmektedir (Şek. 3b). Eğimli araziye oturan konutlarda, farklı kottan ulaşılan birden fazla giriş bulunmaktadır.

Konutların zemin katında genellikle ahır bulunup, ahırla konut girişi ayrılmıştır. Zemin katlarda biri tek kanatlı biri çift iki ayrı kapı bulunmaktadır. Çift kanatlı kapı hayvanlar için olup doğrudan ahıra açılmaktadır. Tek kanatlı kapıyla "avlu" olarak isimlendirilen alana girildikten sonra burada yer alan merdivenle üst kattaki yaşama birimlerine çıkılmaktadır (Fot. 4a). Zemin katın ahır olarak kullanıldığı bazı konutlarda, zemin katla üst kat arasında bağlantı olmayıp katların girişleri tamamen ayrılmıştır. Eğimli arazi üzerine inşa edilen konutlarda eğimin yukarı kotundan üst katta bulunan yaşama birimlerine girilirken, alt kotta bulunan bahçeden doğrudan ahıra giriş sağlanmaktadır (Fot. 4c). Bazı konutlarda ise yapının dışında bulunan merdivenle üst kata ulaşılırken, aynı cephede zemin katta bulunan kapıyla ise ahıra giriş sağlanmaktadır (Fot. 4b). Ayrıca iki farklı cepheden ve farklı kotlardan birden çok girişin olduğu örnekler de görülmektedir (Fot. 4d).



Şek. 3: Konutların giriş düzenleri. **a)** Doğrudan sokaktan giriş sağlanan konut örneği (Koltuk köyü); **b)** Bahçeden giriş sağlanan konut örneği (Kavaklar köyü)

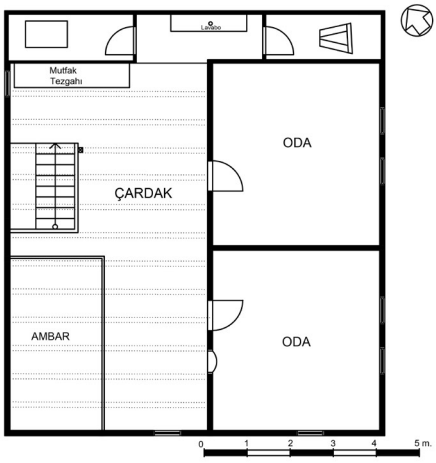
2.1. Plan Özellikleri

Geleneksel Türk evinin temel özelliklerini barındıran Ovacık kırsalındaki konutlarda farklı plan şemaları görülmektedir. Geleneksel Türk evinde gördüğümüz sofa etrafında sıralanan odalar Ovacık'taki geleneksel konutlarda da görülmektedir. Ovacık yöresinde sofa, "çardak" olarak bilinmektedir. Geleneksel Türk evlerinde plan şeması sofasız, dış sofalı, iç sofalı ve orta sofalı olarak gruplandırılmaktadır[15]. Bu plan tiplerinden dış sofalı, iç sofalı ve orta sofalı plan tipleri Ovacık kırsalındaki konutlarda da görülmektedir (Şek. 4). Ayrıca bölgede köşe sofalı plan şemasına sahip konutlar da bulunmaktadır. İncelenen konutlarda iç sofalı plan şemasının daha yaygın olduğu tespit edilmiştir.

Şek. 4: Ovacık kırsal mimarisinde konutlarında yaşam katı olan 1. kat plan şemaları

Ovacık kırsalındaki evler iki, üç veya dört odalıdır. Dış sofalı plan tipine sahip konutlarda iki oda bulunmaktadır. Dış sofalı plan şemasına sahip konutlarda odalar yan yana dizilmekte ve sofanın sonunda ıslak hacim yer almaktadır (Şek. 5). Sofanın çevresi duvarlarla kapatılmış olup ışık alması için bir veya iki pencere açılmıştır.



Ovacık kırsalında görülen bir diğer sofa tipi köşe sofadır. İç ve orta sofalı plan tipine geçiş özelliği gösteren köşe sofalı plan tipi, üç odadan oluşmaktadır[16]. Köşe sofalı plan şemasında çardak köşede olup odalara buradan geçilmektedir. Merdiven de çardak mekânında bulunmaktadır. Dış sofalı plan şemasında da olduğu gibi uç kısımda ıslak hacim yer almaktadır (Şek. 6).

Ovacık kırsalındaki konutlarda en yaygın görülen plan şeması tipi iç sofalı plan tipidir (Şek. 7). İç sofalı konutlarda dikdörtgen şeklindeki çardak mekânı konutu simetrik olarak ikiye bölmektedir. Çardağın iki yanında genellikle ikişer oda yer almaktadır. Sofanın en ucunda ve arkaya bakan cephesinde ise "abdestlik" olarak tanımlanan bir lavabo bulunmakta ve buradaki koridorla helaya ulaşılmaktadır. Konutlara giriş genellikle çardaktan sağlanmaktadır. Konutun içerisinde zemin katla bağlantısını sağlayan bir merdiven varsa bu merdiven çardakta bulunmaktadır. Bazı örneklerde çardak mekânı genişletilerek buraya bir de boy ambarı yerleştirilmiştir (Şek. 7).

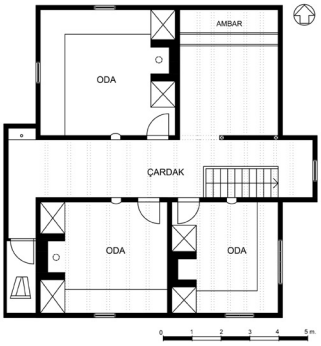
Hasan Kutluca Evi ve çardaktan iç mekân görünümü (Abdullar köyü)

Şek. 6: Köşe sofalı plan şemasına sahip örnek konutlar



Ovacık kırsalında görülen bir diğer plan tipi orta sofalı plan tipidir (Şek. 8). Orta sofalı plan şemasına sahip olan konutlar diğer plan şemasına sahip konutlara göre daha büyük ölçülerdedir. Orta bölümde bulunan çardağın köşelerine odalar yerleştirilmiştir. Odaların, çardağa bakan duvarları pahlanmıştır. Ayrıca oda duvarları birbirine bitişik değildir. Genellikle oda duvarları arasındaki boşlukta katlar arasında ulaşımı sağlayan merdiven, sütlük, depo veya ıslak hacim gibi birimler yerleştirilerek odaların birbirine temas etmesi engellenmiştir. Çardağın sokağa bakan ön cephesinde çıkma uygulaması yaygın bir şekilde görülmektedir. Genellikle buraya sedir yerleştirilmekte ve üç cephesinde bulunan pencereler sayesinde dışarıya açılmaktadır.

2.2. Konut Bölümleri

Odalar

Geleneksel Türk evinde odalar çekirdek bir ailenin ihtiyaçlarını karşılayacak şekilde donatılmıştır. Oda içerisinde yatma, oturma, yıkanma ve yemek yeme için gerekli her şey bulunmaktadır[17]. Ovacık kırsalındaki geleneksel konutlar da Türk evindeki oda düzenlemelerine benzer özellikler göstermektedir. Odalarda oturmak için sedir, ısınma ve

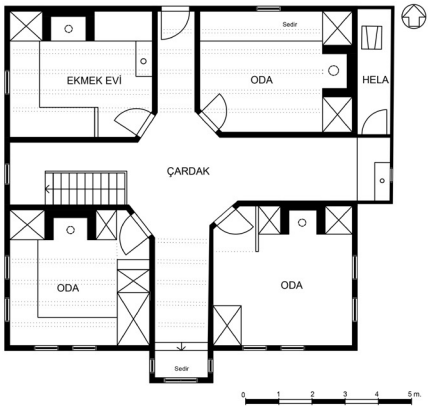
Şükrü Doğan Evi ve çardaktan iç mekân görünümü (Yeniören köyü)

Şek. 7: İç sofalı plan şemasına örnek konutlar



yemek pişirme işlevini yerine getirebilmek için ocak, uyumak için kullanılan yorgan ve yastıkların muhafaza edilebilmesi için yüklük, eşyaların depolanması için dolap, yıkanma işlevini yerine getirmek için gusülhane, tabak ve çanakları koymak için raf veya sergen ve gaz lambası koymak için "gözgöre" adı verilen raflar yer almaktadır[18]. Odalar kare ya da kareye yakın dikdörtgen planlıdır.

Odaya giriş 70-80 cm genişliğinde ahşap eşikli kapılarla sağlanmaktadır. Oda kapıları, içeri girildiğinde içerinin tamamının görülmesini engelleyecek şekilde pahlı köşelere yerleştirilmiştir (Fot. 5a). Ayrıca kapının yanında bulunan dolap ve ocakta görüş açısını daraltmaktadır. Genellikle orta sofalı plan şemasına sahip olan konutlarda bu durum görülmektedir. Bu şekilde pahlı köşelere yapılan kapılara yörede "farsa kapı" denilmektedir[19]. Bazı konutlarda mahremiyeti sağlamak için kapının açıldığı doğrultuda bulunan dolap uzatılarak paravan görevi görmektedir. Mahremiyet, geleneksel Türk evinin plan şemasının oluşmasında etkili olduğu gibi Ovacık kırsal mimarisinin şekillenmesinde de önemli bir rol oynamıştır. Çardakla doğrudan bağlantılı olan odalarda kullanılan dolap ve raflar, oda içinin çardaktan doğrudan görünmesini engellemektedir (Fot. 5b).

18 Çetin ve Mutlu, 2021a,28.

Şek. 8: Orta sofalı plan şemasına örnek konutlar

Fot. 5: Odalara giriş. **a)** Pahlı köşeden giriş **b)** Oda girişinde paravan

Odalarda yüklük, gusülhane ve ocak aynı duvarda yer almaktadır. Ocak, gusülhane ve yüklük dolaplarının ortasına konumlandırılmıştır (Fot. 6). Ocak ve gusülhanenin yan yana olması sayesinde gusülhanenin ocak yandığı sürece sıcak kalması sağlanmıştır. Genellikle gusülhane önünde sedir yer almaktadır bu sayede gusülhane dolabına daha rahat ulaşılmaktadır (Fot. 6).

Fot. 6: Yüklük, ocak ve gusülhane dolabı

Odalarda bulunan sedir hem oturma hem de yatma eylemini yerine getirmek için kullanılmaktadır. Sedir genişliği 80-100 cm arasındadır. Sedir genellikle odanın iki duvarını çevrelemektedir (Fot. 7). Bazı örneklerde ocağın bulunduğu duvar boyunca

da sedir devam etmektedir. Ancak ocak önünde sedirin genişliği 40-50 cm'ye kadar düşmektedir. Ayrıca sedir, konutun çardak mekânında dışarıya doğru çıkma yapan bölümünde de bulunmaktadır.

Fot. 7: Sedir örneği

Odalarda bulunan bir diğer eleman yörede "göz göre" olarak bilinen gaz lambası koymaya yarayan nişlerdir (Fot. 8). Göz göre genellikle odaların çardağa bakan duvarında ya da bitişiğindeki odaya komşu duvarda bulunmaktadır. Burada yanan gaz lambasıyla hem çardak hem de bitişiğindeki odanın aydınlatılması sağlanmaktadır. Ahşap malzemeden yapılan göz görelerin üst kısmı ışık geçirmesi için camdan yapılmıştır. Göz göreler tek ya da çok gözden oluşacak şekilde farklı biçimlerde tasarlanmıştır.

Fot. 8: Göz göre örnekleri

Mutfak

Ovacık geleneksel konutlarında genellikle mutfak işlevi gören ve "ekmek evi" olarak adlandırılan bir oda bulunmaktadır. Ekmek evinde mutlaka ocak bulunmaktadır (Fot. 9). Oda duvarlarında mutfak eşyalarını koymak için "terek" denilen raflar yer almaktadır. Ocağın iki yanında yüklük gibi ahşap kapaklı dolaplar bulunmaktadır. Konutlara su tesisatının gelmesiyle birlikte bu dolaplardan bir tanesi kaldırılarak bu bölüm evye şeklinde düzenlenmiştir.

Fot. 9: Mutfakta bulunan ocak ve tezgâh olarak kullanılan bölüm

Mutfak olarak düzenlenen bir odası bulunmayan bazı geleneksel konutlarda, mutfak sonradan çardak mekânına eklenen tezgâh ve dolaplarla oluşturulmuştur. Bu uygulama daha çok iç sofalı plan şemasına sahip konutlarda görülmektedir. Bazı örneklerde de ıslak hacim çıkmasının bir tarafına eklenen tezgahla mutfak ihtiyacı karşılanmıştır.

Hela-Abdestlik

Ovacık kırsalında bulunan geleneksel konutlarda helaların tamamı konutun içerisinde ve yaşama birimlerinin bulunduğu katta yer almaktadır. Çardak mekânının sonunda abdestlik bulunmakta olup, abdestliğin bitiminde konuta ek çıkma şeklinde hela yer almaktadır. Abdestlik ve helanın dış duvarları daraba tahtalarıyla kapatılmıştır. Genellikle konsol olarak inşa edilen hela, bazı konutlarda dikmelerle veya payandalarla desteklenerek taşıtılmıştır.

Abdestliğin olduğu bölümde, suyun uzaklaştırılmasını sağlamak için zemin tahtaları hafif eğimli olacak şekilde çakılmıştır. Işık girmesi için daraba tahtalarında küçük dikdörtgen veya üçgen şeklinde boşluklar açıldığı ya da daraba tahtaları arasında boşluk bırakılarak çakıldığı görülmektedir.

Abdestlik olarak tanımlanan yerde abdest almak ve el yıkamak için ahşap lavabo bulunmaktadır (Fot. 10). Genellikle lavabonun gideri dışarı verilmiştir. Abdestlikten ince tahta kapıyla ayrılmış helaya geçilmektedir. Ahşap tahtaların zeminden bir miktar yükseltilerek çakılmasıyla hela taşı oluşturulmuştur (Fot. 10). Tuvaletin gideri evin arka bahçesinde açılan kuyuya verilmiştir.

Fot. 10: Ahşap lavabo ve hela

Merdivenler

Geleneksel Ovacık konutlarında merdivenler genellikle ahşap malzemeden ve tek kollu olarak yapılmıştır. İki ya da üç kattan oluşan konutlarda üst kata ulaşım zemin katta bulunan ahşap merdivenle sağlanmaktadır (Fot. 11). Bazı konutlarda ise birinci kata ulaşım sağlayan merdiven konutun dışında bulunmaktadır. Arazi çalışmaları sırasında genellikle tek kollu merdiven görülmekle beraber L şeklinde ve çeyrek döner merdivene sahip örneklere de rastlanmıştır. Merdivenlerin genellikle bir tarafında duvar, bir tarafında korkuluk yer almaktadır. Merdiven korkulukları oldukça sade yapılmıştır. Korkuluk bulunmayan merdiven örnekleri de görülmüştür.

Ovacık kırsalında az sayıda da olsa taş malzemeyle yapılmış merdivenlere de rastlanmıştır. Bu merdivenler dış merdiven şeklinde konuta giriş sağlayan bölümlerde kullanılmış olup, genellikle 3-4 rıhttan meydana gelmektedir. Taş merdivenlerin basamak genişliği ve rıht yüksekliği ahşap merdivenlere göre daha fazladır.

Ambarlar

Tahıl ve kuru yiyecekleri depolamak için ambarlar kullanılmıştır. Geleneksel konutların içerisinde bulunan ambarlar, boy ambarı ya da herkil olmak üzere iki farklı şekilde görülmektedir. Boy ambarına yörede "taban hambarı" da denilmektedir. Boy ambarı çantı sisteminde inşa edilmiş olup iki kat boyunca devam eden yüksekliğe sahiptir. İçerisine hiçbir şekilde hava, nem ve böcek girmeyecek şekilde yapılan ambarlar, yiyeceklerin uzun bir süre depolanmasını sağlamaktadır. Boy ambarına kilitli bir kapıdan girilmektedir ve içerisi oda şeklinde düzenlenmiş çok sayıda herkilden oluşmaktadır (Fot. 12). Gemici merdivenine benzer bir merdivenle alt kota inilmektedir. Bu merdivene döşemede bulunan tahtalar kaldırılarak ulaşılmaktadır. Boy ambarına genellikle çardaktan ulaşılmaktadır.

Fot. 11: Ovacık geleneksel konutlarında görülen merdiven örnekleri

Fot. 12: Boy ambarı örneği, giriş kapısı ve merdiven

Herkil, genellikle çardakta ya da giriş katta bulunmaktadır. Herkil tek, iki ya da üç bölümden meydana gelmektedir (Fot. 13). İki bölümden meydana gelen herkiller büyük ve küçük bölümden oluşmaktadır. Büyük bölümü genellikle insan boyunda, küçük bölümü ise 60-70 cm yüksekliğindedir. Küçük bölüm önde, büyük bölüm arkada olacak şekilde yerleştirilmiştir. Küçük bölüme basılarak herkilin büyük bölümüne ulaşılmaktadır. Üç bölümlü herkiller ise üç kademeden oluşmaktadır.

Fot. 13: Herkil örnekleri

2.3. Cephe Özellikleri

Ovacık geleneksel konutlarının cephe düzenlemesi konutun konumuna ve büyüklüğüne göre değişiklik göstermektedir. Konutlar genellikle sade, süslemeden uzak cephe düzenine sahiptir[20]. Cephe karakterini belirleyen en önemli elemanlar açık ve kapalı çıkmalar, pencere ve kapı oranlarıdır. Çıkmalar, plan özelliklerini dış cepheye yansıtmaktadır. Odalarda yapılan çıkmalar odanın genişlemesini, daha iyi ışık almasını ve manzaraya açılmasını sağlamaktadır. Çardak mekânında yapılan çıkmalar, genellikle giriş kapısının üst hizasında olmakta ve böylelikle girişi tanımlamaktadır. Bu sayede giriş, yağmurdan korunmaktadır.

Giriş katın tamamı ahır veya depolama olarak kullanılan konutlarda zemin katta pencere bulunmamaktadır. Ahırın havalandırılması ve hayvan gübrelerinin dışarı atılmasını sağlamak için "temek" adı verilen camsız küçük pencereler bulunmaktadır. Temek, mazgal pencere şeklinde olup içeriye doğru genişlemektedir. Giriş katında oda bulunan konutlarda mahremiyet ve güvenliği sağlamak için giyotin pencerelere ahşap kapak ya da korkuluk yapılmıştır.

Birinci ve ikinci katta bulunan oda pencereleri genellikle ahşap giyotin ya da kanatlı pencere şeklindedir. Giyotin pencereler 65-75 cm genişliğinde, 125-140 cm yüksekliğindedir. Kanatlı pencereler iki, üç veya dört kanattan oluşmakta olup, en yaygın görülen türü dört kanatlıdır. Dört kanatlı pencerelerin ortadaki iki kanadı açılmaktadır. Pencerelerin çevresinde genellikle sade bir pervaz bulunurken, bazı pencerelerin alt pervazlarında farklı formlar görülmektedir. Odaların genellikle iki duvarında pencere bulunmaktadır. Çantı tekniğinde inşa edilen odaların genellikle bir cephesinde pencere

20 Çetin ve Mutlu, 2021b, 226.

Fot. 14: Ahşap pencere örnekleri

bulunur ve bu pencere diğer pencerelere göre daha küçük boyutlardadır. Yapım tarihi daha eski olan geleneksel konutlarda pencereler camsız olarak yapılmış olup, ahşap kapakla kapatılmıştır (Fot. 14).

Çardak mekânında da aydınlatma ve havalandırma için pencere bulunmaktadır. Çardakta çıkma yapılmışsa bu çıkmanın dışarı bakan üç yüzüne de pencere yerleştirilerek sokağa farklı açılardan bakma imkânı sağlanmıştır.

Konutların giriş kapıları bazı konutlarda çift kanatlı bazı konutlarda tek kanatlı bazılarında da hem çift hem de tek kanatlıdır. Arazi eğiminden dolayı birinci kata girişle zemin kata giriş farklı cepheden ya da kottan yapıldıysa, ahır olarak kullanılan zemin kata giriş genellikle çift kanatlı kapıdan sağlanmaktadır.

Ovacık kırsalında konutların özgün giriş kapılarının tamamı ahşap malzemeden yapılmıştır. Ahşap kapılar çakma veya tablalı olarak oluşturulmuştur. Ahşap çift kanatlı kapılarda kanat genişliği 75-80 cm, yüksekliği ise 180-220 cm arasındadır. Bazı konutlarda giriş kapılarının üzerine, farklı geometrik şekillerde küçük havalandırma boşlukları oluşturulmuştur. Bu sayede içeriye az da olsa ışık girmesi ve mekânın hava alması sağlanmıştır. Bazı giriş kapılarının üst kısmında ise, Safranbolu geleneksel mimarisinde "muşabak" olarak adlandırılan[21] ahşap kafeslerle içerinin havalandırılması ve aydınlatılması sağlanmıştır (Fot. 15). Boduroğlu köyünün Deveci mahallesinde ahşap kapılar farklı renklerde boyanarak üzerine desenler işlenmiştir. Bu yerleşim haricinde diğer yerleşimlerde kapılar, sade ve süslemeden uzaktır.

İç ve orta sofalı plan şemasına sahip konutlarda çardağın dışarı taşması ile cephelere hareketlilik kazandırılmıştır (Fot. 16a). Bu çıkmaların yan yüzlerine ve ön yüzüne pencereler açılarak konutun dışarıyla olan teması artırılmıştır. Çıkma miktarının arttığı durumlarda çıkmaların eliböğründeler ya da dikmeler ile desteklendiği görülmektedir. Sınırlı sayıdaki konutta çıkmanın cephe boyunca devam ettiği tespit edilmiştir (Fot. 16b).

Ovacık kırsalında görülen bir diğer çıkma ise balkonlardır (Fot. 16c). Balkonların üzeri çatıyla örtülmüştür. Bazı örneklerde balkonun dikmelerle ya da eliböğründeler ile desteklendiği görülmektedir (Fot. 16d). Balkon korkulukları oldukça sade yapılmıştır.

21 Günay, 1998, 359.

Fot. 15: Ahşap kapı örnekleri

Fot. 16: Açık ve kapalı çıkma türleri. **a)** Çardağın orta bölümünde kapalı çıkma **b)** Cephe boyunca çıkma **c)** Balkon şeklinde açık çıkma **d)** Dikmelerle desteklenen açık çıkma

Ovacık geleneksel konutlarında ıslak hacimler konutun arka ya da yan cephesinde yer almaktadır. Özgün ıslak hacimler konutun üst katında yer almakta olup, çıkma şeklindedir (Fot. 17). Bu bölüm, yörede "daraba" olarak isimlendirilen ahşap kaplama tahtalarıyla kapatılmıştır. Ahşap kaplamalar dikey olarak yapılmış ve bazılarının aralarında küçük açıklıklar bırakılmak suretiyle çakılmıştır. Bu sayede hem içeriye ışık girmekte hem de ıslak hacmin havalandırılması sağlanmaktadır. Birçok örnekte kaplama tahtalarının alt tarafı uzunlu kısalı bırakılmış olup, aynı hizada bitirilmemiştir (Fot. 17).

Fot. 17: Daraba tahtlarıyla kapatılan ıslak hacim çıkması

Ovacık kırsalında bulunan konutların çatıları kırma, beşik veya üç omuz şeklindedir. Özgün çatı örtü malzemesi alaturka kiremittir. Daha yakın tarihte inşa edilen geleneksel konutlarda Marsilya tipi kiremit kullanılmıştır. Günümüzde çatılarda yapılan onarımlarda alaturka ve Marsilya tipi kiremit kaldırılarak sac malzemelerle çatıların kaplandığı görülmektedir. Sac malzeme kullanımı yapının özgünlüğüne zarar vermektedir.

Çatıların hemen hemen hepsinde saçak bulunmaktadır. Saçaklar çıkmaların oluşturduğu girinti çıkıntılara göre kimi örnekte kademe yapmış, kimi örnekte ise düz bir biçimde cephe boyunca dolanmıştır. Saçakların altı genellikle kaplanmadan bırakılmıştır. Saçak altların kaplandığı durumda ise kaplama malzemesi olarak ahşap tercih edilmiştir.

2.4. Yapım Tekniği ve Malzeme

Ovacık kırsal mimarisinde geleneksel yapılar; yığma, karkas veya karma teknik kullanılarak inşa edilmiştir. Yığma sistemde inşa edilen yapı türleri genellikle samanlık, ahır ve ambar yapılarıdır. Ambarlar ahşap yığma teknikte çantı olarak inşa edilmiştir. Çantı olarak inşa edilen ambarlar, taş kullanılarak yerden bir miktar yükseltilmiştir. Samanlık ve ahır yapıları ise genellikle yığma taş tekniğinde olmakla beraber hem yığma taş hem de çantı tekniğinin beraber kullanıldığı örnekler de tespit edilmiştir (Fot. 18). Taş duvarlarda, belirli yüksekliklerde ahşap hatıllar kullanılmıştır.

Fot. 18:
Yığma sistemle inşa edilen ahır örneği

Ovacık kırsalındaki geleneksel konutların inşasında genellikle karma sistem kullanılmıştır. Konutların zemin katları yığma taş, üst katı ise ahşap karkas sistemde inşa edilmiştir (Fot. 19). Genellikle zemin kattaki yığma taş duvarlarda ahşap dikme ve payandalar kullanılmıştır. Zemin kattaki taş duvarın üzerine ahşap taban kirişi yerleştirilerek taban kirişinin üzerine konulan ana dikmelerle üst katın duvarları inşa edilmiştir. Ana dikmeler yörede "alay direği" olarak isimlendirilmektedir. Alay direklerinin arasına daha ince kesite sahip yörede "yeydane" olarak bilinen ara dikmeler 35-50 cm aralıklarla yerleştirilmiştir. Ana ve ara dikmelerin üstleri üst taban kirişi kullanılarak birleştirilmiştir. Alt ve üst taban kirişleri ise payandalar kullanılarak bağlanmış ve bu sayede yatay yüklere karşı koyabilmesi amaçlanmıştır. Pencere boşluklarında, dikme ve payandalar arasına hem yatayda hem de düşeyde kuşaklar yerleştirilmiştir. Bu kuşaklar yörede "başboyunduruk" olarak isimlendirilmektedir. Dikmelerin arasındaki boşluklar taş, kerpiç, ahşap ya da tuğla malzemelerle doldurulmuştur. Hımış sistemde inşa edilen duvarlar toprak esaslı sıva ile sıvanmıştır. Bazı örneklerde sıvanın duvar yüzeyine daha sağlam tutması için gazoz kapakları kullanıldığı görülmektedir.

Ovacık ilçesinin %67'si ormanlarla kaplı olduğundan en yaygın kullanılan yapı malzemesi de ahşaptır. Geleneksel yapıların karkas ya da yığma teknik kullanılarak inşa edilmesinde esas taşıyıcı eleman olarak ahşap kullanılmıştır. Yığma taş duvarlarda hatıl olarak ahşap malzeme kullanımı yaygındır. Geleneksel yapıların döşeme, tavan, çatı, kapı, pencere, merdiven, sedir, yüklük, gusülhane, raf ve dolap gibi çoğu elemanlarında ahşap malzeme karşımıza çıkmaktadır.

Ovacık kırsalında bir diğer yaygın kullanılan yapı malzemesi ise taştır. Yapıların temelleri taş malzemeyle inşa edilmiştir. Temelden başlayan taş örgü, subasman seviyesine kadar çıkmaktadır. Bazı yapılarda yapının kullanım amacına da bağlı olarak zemin kat duvarları da taş malzemeyle örülmüştür. Zemin katta kullanılan ahşap dikmelerin zeminle temas ettiği noktada büyük taşlar kullanılmıştır (Fot. 20).

Ayrıca taş malzeme, ahşap karkas sistemde inşa edilen dikmelerin aralarındaki boşlukların doldurulmasında kullanılmıştır. Dolgu malzemesi olarak kullanılan taşlar küçük boyutlu iken, temel ve zemin kat duvarlarının örülmesinde daha büyük boyutlu taşlar

Fot. 19: Hımış sistemde inşa edilen konut örnekleri

Fot. 20: Dikmelerin altında bulunan taş

tercih edilmiştir. Yapıların özellikle köşe noktalarında kullanılan taşlar daha büyük boyutlu ve düzgün biçimli seçilmiştir. Abdullar, Yeniören ve Boyalı köylerinde kesme taş kullanımı yaygınken diğer yerleşimlerde ise daha çok kaba yonu ve moloz taş kullanılmıştır.

Fot. 21: Ahşap karkas sistemde dolgu malzemesi olarak kullanılan ateş tuğlası

Ovacık kırsalında kerpiç, yardımcı yapı malzemesi olarak karşımıza çıkmaktadır. Tamamen kerpiç malzemeyle inşa edilen bir yapıyla karşılaşılmamıştır. Kerpiç genellikle hımış sistemde inşa edilen yapılarda ahşap dikmelerin arasında dolgu malzemesi olarak kullanılmıştır. Ocakların "çığlık" olarak isimlendirilen temel kısmının oluşturulmasında ve ocak duvarlarının örülmesinde kerpiç malzeme kullanılmıştır. Ayrıca kerpicin hammaddesi olan toprağın, hımış sistemde inşa edilen yapılarda sıva malzemesi olarak da kullanıldığı görülmektedir.

Ovacık kırsal yerleşimlerinde kullanılan bir diğer yapı malzemesi ise tuğladır. Ahşap karkas sistemde dolgu malzemesi olarak kullanılan tuğla malzeme yörede "Hanköy tuğlası", "ateş tuğlası" ya da "harman tuğlası" olarak bilinmektedir (Fot. 21). Ayrıca konutların baca duvarlarının örülmesinde de harman tuğlası kullanımı yaygın bir şekilde görülmektedir.

2.5. Süsleme Özellikleri

Ovacık kırsalında bulunan geleneksel konutlar genellikle süslemeden uzak, sade bir şekilde inşa edilmiştir. Konutlarda süslemeden çok işleve önem verilmiştir. Cephelerde, pencere alt pervazlarında ve giriş kapılarının üzerinde bulunan ışıklıklarda süsleme görülmektedir. Işıklıklar, genellikle kafes şeklinde yapılırken bazı konutlarda ay yıldız ya da farklı geometrik desenlerin işlendiği görülmektedir (Fot. 22). Giriş kapılarının üzerinde metal malzemeden yapılmış kapı tokmakları ve kilitleri dikkat çekmektedir. Ahşap kapı ve pencerelerin beyaz, yeşil ya da mavi renge boyandığı örnekler mevcuttur (Fot. 22).

Konutların cephelerinde olduğu gibi iç mekânlarında da işlev ön planda tutulmuştur. Pencerelerin alt ve üst pervazları oda duvarları boyunca devam etmiştir. Odalarda ocak, yüklük, gusülhane ve sedir bulunmaktadır. Bu elemanlara ek olarak odaların hemen hemen hepsinde niş veya dolap da yer almaktadır. Dolabın yanında şerbetlik veya lambalık olarak bilinen iki ya da üç sıralı ahşap raflar bulunmaktadır. Bu raflar kapaklı veya kapaksız olabilmektedir. Kapaksız raflarda nişler oymalı şekilde çeşitlilik göstermektedir. Kagir malzemeden inşa edilen ocakların, kemerlerinde de farklı formların kullanıldığı

Fot. 22: Bezeme detayları içeren kapı örnekleri

Fot. 23: Süsleme amacıyla boyanmış oda dolapları

görülmektedir. Ayrıca bazı konutlarda oda içerisinde bulunan ahşap elemanlar yeşil, mavi ya da beyaz renge boyanarak süsleme elemanına dönüşmüştür (Fot. 23).

Ovacık kırsalında bulunan konutların oda tavan ve döşemeleri, yapı sahibinin ekonomik durumuna göre değişkenlik göstermektedir. Zemin katta bulunan mekânlar genellikle ahır veya depolama olarak kullanıldığı için, bu bölümlerde tavanlar kaplamasız şekilde bırakılmıştır. Birinci katta bulunan oda tavanları ise ters kiriş şeklinde ya da düz kiriş şeklinde kaplanmıştır. Ters kiriş kaplamalı tavanlarda kirişler oda içerisinden görülüyorken, düz kiriş tavanlarda kaplama tahtası kirişlerin altını kapattığı için düz bir tavan görüntüsü elde edilmektedir. Ovacık kırsalında az sayıda konutta bezemeli tavan örneğine rastlanılmıştır (Fot. 24). Bazı konutlarda oda tavanlarında çıtalardan geometrik desenler oluşturulduğu görülmektedir.

Ovacık kırsalında bazı konutlarda yapının inşa tarihi, yapının zemin kat taş duvarı üzerine işlenmiştir (Fot. 25). Bu uygulama her yerleşimde görülmeyip en çok

Fot. 24: İşlemeli ahşap tavan örnekleri

Fot. 25: Taş duvar üzerine işlenilen yapım tarihi

Pürçükören köyünün Karakoyunlu mahallesinde ve Küçüksu köyünde karşımıza çıkmaktadır. Küçüksu köyündeki konutların duvarlarında 1944 depremine gönderme yapılarak, o dönemde yıkılıp yeniden yapıldığı belirtilmektedir (Fot. 25).

3. Karşılaştırma ve Değerlendirme

Çevre koşullarına göre şekillenen kırsal mimari; bitki örtüsü, iklim ve coğrafya olarak yakın olan yerleşimlerde birbirine benzer özellikler göstermektedir. Çalışma alanını oluşturan Ovacık ilçesi, idari olarak Karabük ili ve Karabük iline bağlı Eskipazar ile Safranbolu ilçeleri, Çankırı ili Çerkeş ve Bayramören ilçeleri ve Kastamonu ili Araç ilçeleriyle komşudur. Ovacık ilçesinin komşu olduğu yerleşimlerdeki geleneksel konutlarla ilgili yapılan çalışmalardan elde edilen veriler doğrultusunda Ovacık geleneksel konutlarıyla benzeyen ve farklılaşan özellikleri belirlenmiştir. Ovacık ve kırsalındaki konutların temel mimari özellikleri ile ilçe çevresindeki yerleşimlerde bulunan geleneksel konutların temel özellikleri ulaşılabilen yayınlardan elde edilen bilgiler Tablo 1'de gösterilmiştir.

Karabük iline bağlı Eskipazar kırsal yerleşimlerinde bulunan geleneksel konutlar tek veya iki kattan oluşmakta olup iki katlı konutların zemin katları genellikle ahır ola-

Tablo 1: Ovacık ve çevre yerleşimlerindeki konutların genel özellikleri

Yerleşim Yeri	Kat Sayısı	Yaygın Plan Tipi	Yapım Sistemi	Cephe Özelliği	Çatı Tipi
Ovacık	2	Dış ve İç Sofalı	Hımış, Çantı	Sade	Kırma, Beşik, Üç omuz
Eskipazar	2	İç ve Orta Sofalı	Hımış	Sade	Kırma ve Beşik
Çerkeş	2 ve 3	İç Sofalı	Hımış	Sade	Kırma ve Beşik
Bayramören	2	İç Sofalı	Hımış	Sade	Kırma ve Beşik
Araç	2	İç ve Orta Sofalı	Hımış, Çantı	Sade	Kırma ve Beşik
Safranbolu	2 ve 3	İç ve Orta Sofalı	Hımış, Çantı	Sade	Kırma, Beşik, Üç omuz
Karabük	2	İç Sofalı	Hımış	Sade	Kırma ve Beşik

rak kullanılmaktadır. Az sayıda örnekte ise zemin katta yaşama birimi olarak kullanılan oda bulunmaktadır[22]. Eğimli arazide bulunan konutlara farklı kotlarda giriş sağlanmaktadır. Sofaların konumlanışı plan şemasını şekillendirmiş olup, sofanın durumuna göre orta sofalı, iç sofalı, ön sofalı plan tipleri yer almaktadır. Orta sofalı plan şemasında simetri hakim olup dört cepheye uzanan eyvanlar oluşturulmuştur. Eskipazar konutlarında odalar bir ailenin ihtiyacını karşılayacak şekilde donatılmıştır. Lavabo ve hela bölümleri daraba tahtalarıyla kapatılmıştır[23]. Geleneksel konut mimarisinde ahşap yaygın bir şekilde kullanılmıştır. Yerel yapı malzemesi olan ve adını imal edildiği köyden alan Hanköy tuğlası ile bölgede bulunan sarı traverten ve kireç taşı kagir sistemde sıklıkla kullanılmıştır[24]. Geleneksel konutların zemin katları kagir yığma sistem ile üst katları ise hımış sistemde inşa edilmiştir. Bazı örneklerde antik dönemden kalan mimari ögeler devşirme olarak yapının çeşitli yerlerinde kullanılmıştır. Yapıların çatıları kırma ya da beşik çatı şeklinde örtülmüş olup özgün kiremit malzemesi olarak alaturka kiremit kullanılmıştır[25].

Çankırı iline bağlı Çerkeş ilçesinde bulunan geleneksel konutlar genellikle düz arazilere inşa edilmiştir. Bu bölgedeki konutlar iki veya üç kattan oluşmaktadır[26]. Zemin katları yığma taş, üst katları ise ahşap karkas sistem arası kerpiç dolgu şeklinde inşa edilmiştir. Genellikle konutların üst katlarında düz çıkma yapılmıştır ve bu çıkmaların alt kısımları kıvrımlı ahşap payandalar ile desteklenmiştir. Bazı geleneksel konutlarda cihannüma bulunmaktadır. Konutların giriş kapıları ahşap çift kanatlı kapılardan oluşmaktadır. Özgün pencereler ise giyotin şeklinde ve ahşap malzemedendir. Çatılar beşik veya kırma çatı biçimindedir. Konutlarda bezemeler iç mekânda yoğunlaşmış olup, daha çok ahşap tavanlarda bezemeler görülmektedir. Ayrıca bazı konutların giriş kapılarının çevrelerinde bitkisel bezemeler yer almaktadır[27].

Çankırı ili Bayramören ilçesi geleneksel konutları genellikle iç sofalı plan şemasına sahip olup iki kattan oluşmaktadır. Zemin katları yığma taş, üst katları ahşap karkas

22 Özyürek, 2024, 97.

23 Özyürek, 2024, 99.

24 Özyürek, 2024, 119.

25 Özyürek, 2024, 118.

26 Demirbağ, 2021, 481.

27 Demirbağ, 2021, 483.

arası kerpiç dolgu şeklinde inşa edilmiştir. Üst katlarda genellikle cephe ortasında düz çıkma yapılmıştır. Bazı örneklerde çıkmalar ahşap payandalarla desteklenmiştir. Giriş kapıları ahşap çift kanatlı, pencereler ise ahşap giyotin şeklindedir. Konutların çatıları beşik veya kırma çatı biçimindedir[28].

Kastamonu ili Araç ilçesi kırsalında bulunan konutlar genellikle iki kattan oluşmakta olup eğimli araziye yerleşmiştir. Konutların alt katları ahşap ve taş malzemenin birlikte kullanımıyla inşa edilmiştir. Üst kat ise ahşap çatkı sistem arası tuğla, taş, kerpiç veya ahşap ile doldurulmasıyla oluşturulmuştur. Bazı geleneksel konutlarda konutun bir bölümü çantı tekniğiyle inşa edilmiştir. Bu teknikte inşa edilen bölüm "taban oda" olarak isimlendirilmektedir[29]. Araç yayla evlerinde çantı sistem daha yaygın görülmektedir[30]. Konutlarda genellikle iç veya yörede çardaklı sofa olarak tanımlanan orta sofa plan şeması yaygın olarak kullanılmaktadır. Odalar bir ailenin yaşayabileceği şekilde düzenlenmiş olup en az bir odada yüklük, ocak ve gusülhane bulunmaktadır. Sofanın en ucunda abdestlik ve hela yer almaktadır. Bu bölümün duvarları daraba şeklindedir. Konutlara giriş ahşap çift kanatlı kapı ile sağlanmaktadır. Farklı kotlardan birden fazla girişin sağlandığı örneklerde tek kanatlı ahşap kapı da kullanılmıştır. Araç kırsalında bulunan konutların bazılarında ara kat uygulaması görülmektedir. Ara kata bölgede "kış odası" da denilmektedir. Bu bölüm genellikle kış aylarında kullanılmaktadır[31]. Yazın ise serme, kurutma veya depolama gibi ihtiyaçları karşılamaktadır Konutların üst örtüleri kırma çatı olup, alaturka veya Marsilya tipi kiremitle kaplanmıştır.

Karabük ili Safranbolu ilçesi kırsal yerleşimlerinde bulunan konutlar dış, iç veya orta sofalı plan şemasına sahiptir[32]. Genellikle iki kattan oluşan konutların zemin katları ahşap yığma sistemle veya yığma taş ile inşa edilmiştir. Birinci katlarda ise ahşap karkas ve ahşap yığma yapım sistemleri kullanılmıştır. Ahşap karkas sistemde dolgu malzemesi olarak taş, kerpiç, tuğla, ahşap veya karma malzeme kullanılmıştır[33]. Çantı sistemde inşa edilmiş konutlarda balkona benzeyen ve "günlük" olarak isimlendirilen açık çıkma bulunmaktadır. Yaklaşık 1 metre genişliğindeki bu çıkmada kışlık için hazırlanan yiyecekler kurutulmaktadır. Safranbolu kırsalındaki geleneksel evlerin odaları bir ailenin yaşamını sürdürebileceği gerekli donanıma sahiptir. Daraba tahtalarıyla kapatılan helalara çardağın bir köşesinden, bir aralıktan ya da abdestlikten geçilerek ulaşılmaktadır[34]. Konutlara giriş kapısı genellikle iki kanatlı olup, ahşap malzemeden yapılmıştır. Pencereler ise ahşap malzemeden kareye yakın biçimde çift kanatlı ya da giyotin şeklindedir. Konutların çatıları beşik, üç ya da dört yöne kırma biçimindedir. Çatı kaplama malzemesi eski evlerde pedavra tahtası şeklinde iken 1960-1970 sonrasında

28 Demirbağ, 2021, 480.

34 Karataş, 2019, 145.

yapılan evlerde ise Marsilya kiremittir[35].

Karabük kırsalında bulunan konutlar iki veya üç kattan oluşmaktadır. Zemin katları yığma taş, üst katlar ise hımış sistemde inşa edilmiştir. Hımış sistemde dolgu malzemesi olarak taş, tuğla ve kerpiç kullanılmıştır. Konutların üst katlarında genellikle çıkma yapılmıştır. Çoğu örnekte çıkmalar payandalarla desteklenmiştir. Balkon şeklinde açık çıkmalar da görülmektedir. Geleneksel konutların çatıları beşik ya da kırma çatı biçiminde olup, kaplama malzemesi olarak alaturka ve Marsilya tipi kiremit kullanılmıştır.

Ovacık kırsalındaki geleneksel konutlar genellikle iki katlıdır. Benzer şekilde, komşu yerleşimlerde de iki katlı konutlar yaygındır. Ancak, Çerkeş ve Safranbolu ilçelerinde üç katlı geleneksel konut örneklerine de rastlanmaktadır. Ovacık'taki geleneksel konutlar çoğunlukla eğimli araziler üzerine kurulmuştur. Bu yerleşim biçimi, Safranbolu, Eskipazar ve Araç ilçelerindeki geleneksel konutlarda da sıkça görülmektedir.

Ovacık kırsalındaki konutlarda görülen plan şemaları dış sofa, köşe sofa, iç sofa ve orta sofadır. Bayramören ve Çerkeş konutları genellikle iç sofalı plan şemasına göre inşa edilmiştir. Safranbolu ve Eskipazar konutlarında ise iç veya orta sofalı plan şeması görülmektedir. Ovacık ve komşu yerleşimlerinde odalar, sofanın etrafına konumlanmıştır. Odalar bir ailenin ihtiyaçlarını karşılayacak şekilde donatılmıştır. Odalarda; yüklük, ocak, gusülhane ve sedir bulunmaktadır. Islak hacimler, sofanın en ucunda ve genellikle arka cephede yer almaktadır. Ovacık ve çevre yerleşimlerinde cephe düzeni birbirine benzemektedir. Geleneksel konutlar, süsleme özellikleri bakımından da oldukça sade yapılar olup, işlev ön plana çıkmıştır.

Yapım tekniği ve malzeme özellikleri komşu yerleşimlerle kıyaslandığında benzer ve farklılıklar bulunmaktadır. Ovacık konutlarının büyük bir çoğunluğunda zemin kat yığma, üst kat ise hımış sistemle inşa edilmiştir. Bayramören, Çerkeş ve Karabük kırsalındaki konutlarda benzer şekilde inşa edilmiştir. Ovacık kırsalında az sayıda konutta çantı tekniği görülmektedir. Safranbolu ve Araç kırsalında çantı tekniği daha yoğun kullanılmıştır. Ovacık ve komşu yerleşimlerindeki geleneksel konutların inşasında taş, ahşap ve kerpiç ortak kullanılan malzemelerdir. Hanköy tuğlası olarak bilinen tuğla türü Eskipazar, Ovacık ve Safranbolu evlerinde de görülmektedir. Ayrıca Eskipazar'da bulunan Hadrianapolis antik kentinden dolayı devşirme malzeme kullanımı Eskipazar kırsalında yaygındır.

Ovacık ve çevre yerleşimlerindeki konutların çatıları genellikle kırma çatı biçimindedir. Kırma çatı tipine ek olarak beşik ve üç omuz çatı tipi Ovacık ve Safranbolu kırsalında yaygındır. Yerleşimlerde özgün çatı örtü malzemesi alaturka kiremittir. Safranbolu kırsalında diğer yerleşimlerden farklı olarak pedavra adı verilen tahtalarla çatının örtüldüğü örnekler görülmektedir.

Sonuç

Ovacık ilçesine bağlı kırsal yerleşimlerdeki geleneksel konutlar, yerleşim biçimi, plan şemaları, yapı malzemeleri ve inşa teknikleri açısından, yakın çevredeki diğer kırsal

35 Karataş, 2019, 150.

yerleşimlerle önemli benzerlikler taşımaktadır. Bu benzerlikler, coğrafi konum, iklim koşulları ve yerel yapı kültürünün ortaklığıyla şekillenmiş olup, geleneksel Ovacık konutlarının bölgesel kırsal mimari içindeki yerine dair önemli ipuçları sunmaktadır.

Ovacık kırsalındaki konutlar genellikle iki katlı olup zemin katları ahır veya depolama amacıyla kullanılırken, yaşam mekânlarını oluşturan odalar birinci katta yer almaktadır. Birinci katlarda dış sofalı, iç sofalı ve orta sofalı plan şeması görülmektedir. Geleneksel konutlarda yapı malzemesi olarak Anadolu'nun çoğu bölgesinde kullanılan ahşap ve taş, Ovacık kırsalında da temel yapı malzemesi olmuştur. Ovacık kırsal konutlarının zemin katı genellikle yığma taş olarak inşa edilmiştir. Birinci katın inşasında ise hımış sistem kullanılmıştır. Hımış ve çantı sistemin bir arada kullanıldığı örneklerde görülmektedir.

Konutların giriş kapıları tek veya çift kanatlı ahşap kapılardan oluşmaktadır. Bazı giriş kapılarının üzerinde ışıklık görevi gören ahşap kafesler bulunmaktadır. Konutların özgün pencereleri giyotin veya ahşap kanatlı pencere türündedir. Bazı konutların giyotin pencerelerinde ahşap kapak uygulaması görülmektedir. Konutların çatılarında özgün örtü malzemesi olarak alaturka kiremit kullanılmıştır. Ancak bazı konutların çatılarında yapılan tadilatlarda, alaturka kiremitler kaldırılarak Marsilya tipi kiremit veya sac malzemeyle örtülmektedir.

Ovacık kırsal konutlarında da geleneksel Türk evinin en önemli unsuru olarak karşımıza çıkan bir özellik olarak her bir oda, bir ailenin yaşamını sürdürebileceği şekilde gerekli elemanlarla donatılmıştır. Odaların hemen hemen tamamında yüklük, ocak, gusülhane, dolap ve sedir bulunmaktadır. Bu elemanlara ek olarak gözgöre ve nişler de odalarda yer almaktadır. Odaların girişi, kapı açıldığında içerinin doğrudan görülmesini engelleyecek şekilde düzenlenmiştir.

Ovacık kırsalındaki geleneksel konutların çoğu terkedildiği için her geçen gün yok olma tehlikesiyle karşı karşıyadır. Kullanılan konutlarda ise bilinçsiz müdahaleler söz konusudur. Konutlarda yapılan tadilatlarda ahşap kapı ve pencereler kaldırılarak pvc ya da metal malzemeli kapı ve pencereler takılmaktadır. Yapı duvarları, çimento esaslı malzemeyle sıvanıp boyanmaktadır. Çatılar sac malzemeyle kaplanmaktadır. Odalarda yapılan onarımlarda ocak, yüklük, sedir gibi elemanlar kaldırılarak yeni mobilyalar kullanılmaktadır. Bu müdahaleler konutların özgünlüğüne zarar vermektedir. Ayrıca betonarme olarak inşa edilen yeni konutlar da geleneksel dokunun bozulmasına sebep olmaktadır.

Ovacık kırsalındaki geleneksel konutların birçoğu 19. yüzyıl sonu ile 20. yüzyıl ortaları arasında inşa edilmiştir. 1944 yılında yaşanan büyük depremin ardından konutlar zarar görmüş ve kapsamlı bir onarımdan geçirilmiştir. Deprem sonrası yapılan onarımlar yerel yapı ustaları tarafından gerçekleştirildiği için konutlar kırsal mimari özelliklerini kaybetmemiş ve özgünlüğünü korumuştur. Bölge halkından edinilen bilgilere göre, geleneksel yöntemlerle konut inşası 1980'li yılların başından itibaren sona ermiştir.

Sonuç olarak, Ovacık kırsalındaki geleneksel konutlar; plan tipolojileri, malzeme kullanımı, yapım teknikleri ve iç mekân donatılarıyla Anadolu kırsal

mimarisinin temel özelliklerini yansıtmaktadır. Aynı zamanda komşu yerleşimlerle olan benzerlik ve farklılıklarıyla, kırsal mimarinin kendine özgü özelliklerini ortaya koyması açısından önemli bir örnek niteliği taşımaktadır. Çalışma, Ovacık kırsalındaki geleneksel konutların bölgesel mimari içindeki konumunu belirlemeye ve yerel mimari karakterin tanımlanmasına katkı sağlamaktadır.

Öz

19. yüzyılda, günümüzdeki Karabük il sınırlarının da büyük bir bölümünü kapsayan Viranşehir sancağı, ekonomik açıdan parlak bir dönem yaşamıştır. Bölgedeki ticaret ve üretim faaliyetleri sonucunda çeşitli kişi ve aileler varlık sahibi olmuştur. Aynı dönemde, iltizam sisteminin yaygınlaştırılmasıyla, Osmanlı merkezi otoritesi, yetkilerinin bir bölümünü sancaklara devretmiş, bu sayede bazı zengin kişi ve aileler siyasi ve askerî güç elde etmiştir. O dönem, bu kişilerden bazıları *"derebey"* olarak da anılmıştır.

Bu çalışma kapsamında, 19. yüzyılın başlarında, Osmanlı Devleti'nde, Viranşehir sancağı mütesellimi olarak görev yaparken, siyasi, askerî ve ekonomik açıdan güç kazanan ve sonunda Sultan II. Mahmud ile çatışma yaşayan, Derebey Hasan Çavuşzade Hüseyin Ağa ve ailesinin Viranşehir sancağında inşa veya tamir ettirdikleri yapılar araştırılmıştır. Araştırmada konak, han, hamam, camii, değirmen, çeşme, ahır, ambar, samanlık, fabrika ve askerî tahkimat gibi çeşitli işlevlere sahip, bir kısmı günümüze ulaşmış, toplam yirmi beş adet yapı tespit edilmiştir. Makale, bu yapılar içerisinden, Karabük'ün Eskipazar ilçesine bağlı iki kırsal yerleşimde, özgünlüğünü muhafaza etmiş üç konağa odaklanmaktadır. Arşiv ve kaynak taramaları, kişisel görüşmeler, soyağacı ve alan araştırmaları yapılmış, rölöve ve fotoğraflarla eserler belgelenmiştir. Hasan Çavuşzadeler siyasi ve askerî güçlerini kaybettikten sonra inşa ettirilen bu üç yapıda, ailenin kimliğine uygun olarak Batı ve İstanbul etkisiyle şekillenmiş şehirli bir tarzın kullanıldığı görülmektedir. Bölgede, öncelikli olarak, incelenen yapılara benzer, tarihî belge niteliği olan kültürel mirasın sürdürülebilirliği için bilimsel araştırmaların, bilinçlendirme faaliyetlerinin ve uygulanabilir projelerin geliştirilmesi önerilmektedir.

Abstract

Despite the decline of the Ottoman Empire during the 19th century, the Viranşehir Sanjak, which encompassed a large portion of the present-day Karabük province in Türkiye, experienced a period of economic prosperity. Because of trade and production activities in the region, various individuals and families accumulated wealth and power. During the same period, with the expansion of the iltizam system, the Ottoman central authority transferred some of its powers to the sanjaks, allowing some wealthy individuals and families to gain political and military power. At that time, some of these individuals were also called *"derebeys"* (feudal lords). Derebey Hasan Çavuşzade Hüseyin Ağa served as the mütesellim of the sanjak in the early 19th century, gained political, military and economic power, and ultimately came into conflict with Sultan Mahmud II.

This study investigates the structures built or restored by Hasan Çavuşzade Hüseyin Ağa and his family in the Viranşehir Sanjak. The research identified 25 structures with various functions -for instance, mansion, khan, Turkish bath, mosque, water mill, fountain, barn, granary, hayloft, factory, and fortification- some of which have survived to the present day. This study focuses on three mansions that have preserved their authenticity in two rural

settlements in the Eskipazar district. Archival and literature reviews, genealogical research, personal interviews, and field studies were conducted, and the structures were documented and evaluated through measured drawings and photographs. We have determined that in these three structures commissioned by the Hasan Çavuşzades after losing their political and military power, they used an urban style shaped by Western and Istanbul influences in accordance with the family's identity. In the region, we recommend that scientific research, awareness-raising activities, and feasible projects be developed for the sustainability of cultural heritage with historical document value, similar to the structures being studied.

Ethics committee approval was obtained from Karabük University (meeting no: 2023/04-32, date: 18.05.2023).

Extended Summary

During the final years of the Ottoman Empire, the state expanded the Iltizam System in agriculturally productive lands to solve the cash shortage of the central treasury. This system was based on the principle of the government leasing the right to collect taxes on individuals for a specific time. In this manner, the state received cash payments from the lessee, referred to as the mültezim. On the other hand, mültezims appointed mütesellims to represent them. This system led to the emergence of many derebeys (feudal lords) who attempted to collect excessive taxes by exerting pressure on the people. Especially in the late 18th century and the first half of the 19th century, these derebeys played an important role in domestic politics with the weakening of central authority in the Ottoman Empire. Sultan Mahmud II, in order to reestablish central authority, struggled in politics and the military against threatening derebeys.

The Viranşehir Sanjak, which included Eskipazar and Safranbolu, covered a large part of today's Karabük province in Türkiye in the 19th century. Viranşehir Sanjak experienced its most prosperous period economically in the 18th and 19th centuries. The source of this wealth was trade and production activities. Because of these activities, various individuals and families became excessively rich and gained power in the region. With the central authority transferring its political and military powers to the provinces, some of these lords and families claimed to be *"derebeys"*. During that time, Ottoman derebeys and their families built various structures in the region.

By the order of Sultan Mahmud II, Viranşehir Mutesellim Derebey Hasan Çavuşzade Hüseyin Ağa and his son Musa Bey played significant roles in suppressing the Tahmisçioğlu rebellion in Kastamonu, which was part of the wave of uprisings that started in Anatolia under the influence of Ibrahim Pasha, the commander of the Egyptian army. It is alleged that Hasan Çavuşzade Hüseyin Ağa and his son Musa Bey, taking advantage of the trust they gained from this situation, exerted various forms of pressure on the people and built armories and fortifications against the Sultan. Complaints were made to Istanbul with these claims. In 1835, because of these complaints, Hüseyin Ağa and Musa Bey were dismissed from their positions and arrested by the Istanbul government. During that period, the Ottoman army destroyed some buildings belonging to the Hasan Çavuşzade family.

Field studies have revealed that family-owned structures or traces of structures from the 19th century are located in various areas of Viranşehir Sanjak. The regions where these structures are found include the Safranbolu city center, the valleys formed by the Eskipazar (Viranşehir) Stream, and the village of Tamışlar. The city of Safranbolu served as the administrative center of the Viranşehir district, and Hasan Çavuşzade Hüseyin Ağa commissioned the construction of a large mansion featuring a pool in its selamlık (men's reception hall). The valleys shaped by the Eskipazar Stream were used both as a military center along caravan routes and for agricultural production by Hasan Çavuşzade Hüseyin Ağa and his son, Musa Bey. In this region, which includes the Eskipazar district center (Viranşehir),

Kıranköy neighborhood, and Çakmakoğlu Valley, we determined that mansions, Turkish baths, khans, mosques, and military fortifications, as well as production facilities such as a lumber mill and a watermill, were either constructed or repaired. The village of Tamışlar, on the other hand, is a high-altitude forest settlement. In addition to serving as the family's summer residence, it was used for agricultural production. In Tamışlar, mansions, stables, and granaries commissioned by Hasan Çavuşzade Hüseyin Ağa's two sons, İsmail and Halil Bey, have been identified. Within this scope, 25 structures have been documented.

This study focuses on three mansions that have preserved their authenticity in two rural settlements in the Eskipazar district (Karabük). The Halim Bey Mansion in the Kıranköy neighborhood and the İsmail Bey and Halil Bey Mansions in the village of Tamışlar. Archival and source research, genealogical studies, personal interviews, and field surveys have been conducted. Additionally, the structures were documented through measured drawings and photographs, and their architectural features were analyzed.

The Halim Bey Mansion, located in the Kıranköy neighborhood, is estimated to have been built in the second half of the 19th century by Hasan Bey (born in 1855), the father of Halim Bey and the grandson of Musa Bey. The mansion has three floors: a basement, a lower floor, and an upper floor. The basement is made of rubble stone, while the lower and upper floors are constructed using a timber frame and a stone-filling construction system. The interior design solutions for the basement and lower floor, which serve as the living spaces for the servants, were designed using different elevations by the slope of the land. The upper floor, which is the main living space of the owners, is arranged on a single level and has a plan with an octagonal central sofa (hall). Most of the rooms reflect the traditional room layout of Ottoman-Turkish houses. The façade and interior design of the mansion are well-crafted and modest. Overall, the mansion maintains its structural integrity both externally and internally. However, due to a lack of maintenance, the building faces threats from water and moisture from the ground and roof.

The İsmail Bey Mansion is located in the village of Tamışlar. Ismail Bey, the son of Hasan Çavuşzade Hüseyin Ağa, had this structure built in 1871-1872 as a guesthouse and an annex. The mansion consists of three floors. The basement and lower floor walls are made of rubble stone, while the upper floor is constructed with a timber frame system and stone filling. The basement contains storage, the lower floor includes a taşlık (entrance) and servant section, while the upper floor houses the guest rooms and the main room. The upper floor is designed on a single level, while the other floors are designed at different elevations based on the slope of the land. The upper floor, built with careful craftsmanship and design, comprises an octagonal central sofa and the surrounding spaces. All rooms on this floor reflect the classical room layout of Ottoman-Turkish houses. The walls and wooden ceilings of the sofa and the two rooms on the upper floor feature unique decorative elements and embellishments. Structural cracks are present in the corner regions of the building's rubble stone walls. Additionally, there are losses in the bonding material, particularly in areas close to the ground.

The Halil Bey Mansion is located in Tamışlar village, near İsmail Bey Mansion. We estimate that this three-story mansion was built by Hasan Çavuşzade Hüseyin Ağa's another son, Halil Bey, in the late 19th century. The basement walls, along with the northern façade walls of the lower floor and specific interior partitions, were built using stone masonry, while the remaining walls of the lower floor and the entire upper floor were constructed with a timber-frame system. The structure was designed in accordance with the sloped topography, featuring an exposed southern façade at the basement level. The basement floor includes a stable, whereas the lower floor accommodates both service and storage areas, as well as living spaces such as rooms and a sofa. The upper floor, designed as the residential level for the mansion's owners, features an octagonal central sofa surrounded by various rooms, consistent with other examined examples. This floor includes rooms at each of its four corners, with iwans and other spaces situated in between. The spatial organization follows the traditional layout of Ottoman-Turkish houses. The mansion, which exhibits a simple architectural style both on its façade and interior design, does not have any major structural problems.

The three mansions under study, in terms of form, plan scheme, façade arrangement, ornamentation and details, exhibit significant similarities with the architectural style of wealthy families in Ottoman cities during the 19th century, influenced by Europe and Istanbul. The mansions, designed in accordance with the geographical and climatic characteristics of the region, reference the social, economic, and political power once held by the Hasan Çavuşzade Family. These structures enrich the local values in terms of their cultural and architectural aspects. Notably, the Hasan Çavuşzade Family reflected their identity in the details of these buildings (such as ornamentation, façade arrangement, plan scheme, and floor heights).

The family, seeking a safe place away from the chaos of the city, chose to settle in rural areas along riverbanks and on caravan routes, which geographically justified the use of the term "derebey" for Hüseyin Ağa and his son Musa Bey. Thanks to their choice of location, the family benefited from fertile lands and gained control over trade. There is also evidence indicating that they established and managed strategic structures, such as khans, for intelligence gathering. While the Hasan Çavuşzade Family held political power, they commissioned the construction of large-scale public buildings. However, after losing political power, the three mansions that were built had more modest dimensions and architectural styles.

Because of the architectural heritage preservation activities in Safranbolu that began in the 1970s, the city's architectural heritage gained prominence with its inclusion in the UNESCO World Heritage List in 1994. However, the measures taken to preserve the cultural heritage in the areas surrounding the city have proven insufficient, especially in rural regions. The lack of sufficient interest from property owners, residents, and authorities and the scarcity of resources have led to the destruction of the cultural heritage. In the region, we recommend promoting scientific research and awareness-raising activities focused on making such historical document-like cultural heritage sustainable and increasing the feasibility of related projects through public participation.

Giriş

Osmanlı Devleti'nin son dönemlerinde, coğrafi keşiflerle değişen ticaret yolları, uzun süren savaşlar, kapitülasyonlar, yönetim sorunları ve toprak sisteminin bozulması gibi çeşitli sebeplerden dolayı devlet, ekonomik sorunlarla karşı karşıya kalmıştır. Merkezî hazinenin nakit bulma sorununu çözmek amacıyla, tarımsal açıdan verimli devlet topraklarında iltizam sistemi yaygınlaştırılmıştır. Bu sistem, *devletin belirli bir süre için vergi toplama hakkını kiraya vermesi* prensibine dayanmaktaydı. Bu şekilde, devlet, *mültezim* olarak adlandırılan kiracıdan nakit para almıştır. Diğer taraftan, mültezimler kendilerini temsil etmek için *mütesellim* adı verilen vekiller atamışlardır. Bu sistem, halk üzerinde baskı uygulayarak ağır vergiler toplamaya çalışan derebeylerin[1] ortaya çıkmasına yol açmıştır[2]. Özellikle 18. yüzyılın ikinci yarısı ve 19. yüzyılın ilk yarısında, bu derebeyler, Osmanlı Devleti'ndeki merkezî otoritenin zayıflamasıyla birlikte, iç siyasette önemli rol oynamışlardır. Sultan II. Mahmud, devlet yönetiminde merkezî otoriteyi yeniden tesis etmek için, tehdit oluşturan derebeyler ile siyasi ve askerî olarak mücadele etmiştir. II. Mahmud döneminde, bu mücadeleye karşı çıkan birçok derebeyi tutuklanmış, idam edilmiş, kaleleri ve konakları yıkılmış ve mallarına el konulmuştur[3].

İçerisinde Eskipazar'ın da yer aldığı Viranşehir sancağı, 19. yüzyılda bugünkü Karabük ve Bartın illerinin büyük bölümünü, Zonguldak, Bolu ve Çankırı illerinin ise bir kısmını kapsamaktaydı. Sancağın merkez kazası Safranbolu şehriydi[4]. Viranşehir sancağı ve Safranbolu'da ekonominin en parlak olduğu dönem 18. ve 19. yüzyıllardır. Bu zenginleşmenin kaynağı ticaret ile kereste, deri ve tarım ürünlerinin üretim faaliyetleridir. Bu dönem aynı zamanda Osmanlı Devleti'nde, iltizam sisteminin genişletilerek taşradaki etkili kişi ve ailelere siyasi ve askerî güç vermek zorunda kaldığı bir döneme denk gelmektedir. Bu sebeple bölgedeki bazı kişiler ve çeşitli aileler aşırı zenginleşmiş ve güç kazanmıştır[5]. Bu beylerden bir kısmı *"derebeylik"* iddiasında bulunmuştur[6].

Bölgede bu tür kişiler ve aileler tarafından çeşitli yapılar inşa ettirilmiştir. 1836 yılında, Hamamlı (Eskipazar), Konak (Afşar/Eflani), Esencik (Eflani) ve Dursanlı (Nebioğlu/Safranbolu) köylerinden geçen Seyyah Ainsworth, bu köylerde âyanların ve derebeylerin konaklarının bulunduğundan bahsetmektedir[7]. Safranbolu'da bulunan Kazdağlıoğlu Camii ve Hamamlı köyünde (Eskipazar) bulunan hamamlar, zindan ve kiler yapıları bu tür yapıların günümüze ulaşan bazı örnekleridir[8] (Görsel 1). Bir zamanlar taşrada oldukça etkili olan bu ailelerin yaşadıkları dönem ve yapıları hakkında yeterli düzeyde araştırma bulunmamaktadır.

---

[1] "Derebey" sıfatı Osmanlı Devleti'nde resmî bir ünvan olmayıp 17. yüzyıl sonlarından itibaren, o dönemde devletin yetki ve toprak verdiği kişiler veya onların vekilleri için yaygın olarak kullanılan bir ifadedir. Bu kişiler ve aileleri daha sonra devlet gücüne karşı gelen güç odakları hâlini almıştır. "Derebey" tabiri genellikle halkın gözünde despot bir imaja sahip beyler için kullanılmıştır. Dolayısıyla bu tanımlama makaleye konu olan ailenin ve aile bireylerinin halkın gözündeki yerini göstermek açısından önem arz etmektedir. "Derebey" Türkçe literatürde kısıtlı kullanılmasına rağmen İngilizce literatürde "Ottoman derebey" ifadesi daha sık görülmektedir. Bu çalışmanın "kendi döneminde derebey olarak bilinen" bireylere sahip bir aileyi ve yapılarını ele alması bakımından, literatürde özgün bir yere sahip olacağı düşünülmektedir. "Derebey" ifadesi, Hasan Çavuşzade Hüseyin Ağa ve Musa Bey için günümüzde halk arasında kullanılmaktadır. Bunun yanı sıra bu ifadenin bu kişiler için kendi dönemlerinde de kullanıldığı, bu çalışmada kullanılan arşiv belgelerinden ve dönemin kaynaklarından anlaşılmaktadır. Bk. Derebey Hasan Çavuşzade Hüseyin Ağa'nın mensubu olduğu aşiretin, Viranşehir sancağına Kemah'tan (Erzincan) geldiği belirtilmektedir[9]. Bir aşirete mensubiyeti sebebiyle, ailenin Osmanlı Devleti'nde resmî pozisyonunu almadan önce de varlıklı ve yaşadığı bölgede etkili olması muhtemeldir. Ancak, Hasan Çavuşzade Ailesi'nin zenginliğinin kaynağı veya Viranşehir sancağındaki mülklerini başlangıçta nasıl edindiği konusunda kesin bir bilgi bulunmamaktadır.

Hasan Çavuşzade Ailesi hakkında geniş bilgi veren kaynaklardan birisi İtalyan Prenses Cristina Trivulzio Belgiojoso'nun yazılarıdır[10]. Daha önce Hasan Çavuşzade Ailesi hakkında yapılan az sayıdaki araştırmada[11] pek dikkate alınmayan bu kaynaklar bu makale kapsamında incelenmiştir.

1848'deki İtalyan ayaklanmaları sırasında Prenses Belgiojoso'nun Avusturya yönetimine karşı çıkması, Avusturya Hükümeti'ni rahatsız etmiştir. Prenses, hükümetin baskısından rahatsız olarak 1850'de Osmanlı Devleti'ne sığınmıştır. Prenses aynı sene, kızı ve maiyetiyle birlikte, Hasan Çavuşzadeler'den devraldığı, Viranşehir sancağında bulunan bir çiftliğe yerleşmiştir[12]. Prenses, çiftliği satın aldığı kişilerin babalarını şu şekilde anlatmaktadır:

> "(...) Artık iki-üç vilayet arasında bölünmüş olan Viranşehir'in iyi surları vardı. Burası güçlü bir paşanın gözdesi idi. Bolu, Ankara, Çerkeş, Heraklee (Ereğli) gibi şehirler bu paşanın idaresindeydi. Ancak bu büyük şehirlerin hükümdarı, dinlenmek için Viranşehir'i çevreleyen yemyeşil vadiyi, güzel bahçeleri sulayan nehir kıyısını bu şehirlere tercih etti. Bu paşanın adı Osman idi. Ne yazık ki Viranşehir kısa ömürlü refahını bu tercihe borçluydu."[13]

Prenses'e göre Osman Paşa'nın (Hasan Çavuşzade Hüseyin) oğlu Musa, babasının idaresi altındaki topraklarda vergi toplayarak ve asker yetiştirerek babasına ve Osmanlı Padişahı II. Mahmud'a karşı isyan etmiş ve İstanbul'dan gönderilen askerlerle savaşmıştır[13]. Prenses Belgiojoso bu savaştan da bahsetmektedir:

[9] Yazıcıoğlu, *Küçük Osmanlı'nın Öyküsü Safranbolu Tarihi,* 111, 249; Hamdi Özkök ile kişisel görüşme, Karabük, 12 Haziran 2023.

[10] Prenses Belgiojoso, seyahatnamesinin başlangıcında aileden bahsetmiş ve *"Scenes de la vie Turque"* isimli kitabında Hasan Çavuşzade Hüseyin Ağa'nın oğlu İsmail Bey hakkında *"Les Deux Femmes D'Ismail-Bey"* (İsmail Bey'in İki Karısı) başlıklı bir yazı kaleme almıştır. Princesse Belgiojoso, *Asie Mineure et Syrie Souvenirs de Voyages* (Paris: Michel Levy Freres, 1858), 1-13; Princesse Belgiojoso, *Scenes de la vie Turque* (Paris: Michel Levy Freres, 1858), 277-377.

[11] Bilgi için bk. İsmail Hakkı Uzunçarşılıoğlu, "Kastamonu'da Tahmiscioğlu Vak'ası," *Tarih Semineri Dergisi* 1/2 (1937), 138-152; Yazıcıoğlu, *Küçük Osmanlı'nın Öyküsü Safranbolu Tarihi*, 246-252.

[12] Cumhurbaşkanlığı Devlet Arşivleri Başkanlığı Osmanlı Arşivi (BOA), Hariciye Nezareti Mektubi Kalemi (HR. MKT.) 38/9, 19 Cemazeyilahir 1267 [21 Nisan 1851].

[13] Birçok kaynakta Musa Bey'in babasının adı Hasan Çavuşzade Hüseyin olarak geçse de prenses, Musa Bey'in babasının adının Osman olduğunu belirtmiştir. Bu isim, Osmanlı arşivinde bulunan ve prensese satılan Çakmakoğlu Çiftliği ile ilgili bir belgede de *"Ceyavuzoğlu Osman"* olarak yer almaktadır. Cumhurbaşkanlığı Devlet Arşivleri Başkanlığı Osmanlı Arşivi (BOA), Sadaret Divan Kalemi Evrakı (A. DVN.) 103/39, 29 Recep 1271 [17 Nisan 1855]. Princesse Belgiojoso, Asie Mineure et Syrie Souvenirs de Voyages, 7-8.

> "(...) Genç bey kararlılıkla Mahmud'a karşı uzun ve korkunç bir savaşa girişti. Musa'nın askerleri kendi yurtlarında savaştıkları için iyi savaştı. Küçük Asya'nın bu taşralıları, kendilerini yabancı bir orduya karşı ulusal bağımsızlık davasını savunuyormuş gibi gördüler. Zaten bu Konstantinopolis Türkleri Avrupai üniformaları ve silahlarıyla onlar için yabancı değil miydi!"[14]

Aynı kaynağa göre daha sonra topçu birliklerinin kuşatması sebebiyle Musa Bey teslim olmak zorunda kalmıştır. Sonunda İstanbul'da hapsedilmiş ve idam edilmiştir[14].

Mısır ordusu komutanı İbrahim Paşa'nın etkisiyle Anadolu'da başlayan isyan dalgasının bir parçası olan Kastamonu'daki Tahmisçioğlu isyanının Sultan II. Mahmud'un emriyle bastırılmasında, Viranşehir Müteselimi Hasan Çavuşzade Hüseyin Ağa ile onun oğlu ve vekili Musa Bey önemli bir rol üstlenmişlerdir[15]. Bu durumdan kazandıkları güveni kullanarak halka çeşitli şekillerde baskı uyguladıkları ve sultanın aleyhine cephaneler ve istihkâmlar yaptıkları gerekçesiyle İstanbul'a şikâyet edilmişlerdir[16]. 1835 yılında, bu şikâyetler sebebiyle Hüseyin Ağa ve Musa Bey görevden alınmış ve tutuklanmıştır[17]. O dönemde Hasan Çavuşzade Ailesi'ne ait birçok binanın Osmanlı ordusu tarafından tahrip edildiği anlaşılmaktadır[18].

Viranşehir sancağının çeşitli bölgelerinde Hasan Çavuşzade Hüseyin Ağa ve oğullarına ait çok sayıda yapının ve geniş arazilerin bulunduğu tespit edilmiştir. Bu yapıların birçoğu günümüze ulaşmamıştır. Günümüze ulaşan kalıntıların ve yapıların boyutları, işlevi, mimarisi, süslemeleri ve detayları, o dönemde Anadolu'daki aristokrasinin kültürel arka planı ve yaşam tarzı hakkında bilgiler vermektedir.

Çalışma kapsamında arşiv, kaynak ve soyağacı araştırmaları, kişisel görüşmeler ve alan çalışmaları, rölöve ve fotoğraflarla Hasan Çavuşzade Ailesi ve 19. yüzyılda yaptırdıkları mimari eserler hakkında detaylı olarak bilgi toplanmıştır. Makale, bu mimari eserler arasından, özgünlüğünü koruyan, Karabük ilinin Eskipazar ilçesine bağlı iki kırsal yerleşimdeki üç yapı olan Kıranköy mahallesindeki Halim Bey, Tamışlar köyündeki İsmail Bey ve Halil Bey konaklarına odaklanarak yapıların mimari özelliklerini incelemektedir.

1. Hasan Çavuşzade Ailesi'nin İzleri ve Mimari Eserleri

19. yüzyılda Hasan Çavuşzadeler tarafından yaptırıldığı ya da tamir ettirildiği tespit edilen yapıların bulunduğu bölgeler: Safranbolu şehir merkezi, Eskipazar Çayı'nın oluşturduğu vadiler ve Tamışlar köyüdür. Safranbolu şehri, Viranşehir sancağının idari merkezi olarak kullanılmış ve Hasan Çavuşzade Hüseyin Ağa burada havuzlu, büyük bir konak inşa ettirmiştir[19]. Eskipazar Çayı'nın oluşturduğu vadiler hem kervan yolları üzerinde yer alan askerî bir merkez olarak hem de tarımsal üretim için Hasan Çavuşzade Hüseyin Ağa ve oğulları tarafından kullanılmıştır. Bu bölgede yer alan Eskipazar ilçe merkezi, Kıranköy Mahallesi ve Çakmakoğlu Vadisi'nde konaklar, hamamlar, hanlar, camiler ve askerî tahkimatların yanı sıra kereste fabrikası ve değirmen gibi üretim yapılarının da inşa ya da tamir ettirildiği anlaşılmıştır. Tamışlar köyü, diğer yerleşimlerden daha yüksek rakımda yer alan bir orman köyüdür. Burası, ailenin yazlık yerleşimi olmasının yanı sıra tarımsal üretim için de kullanılmıştır. Burada konaklar, ahırlar ve bir ambar bulunmaktadır.

[14] Princesse Belgiojoso, *Asie Mineure et Syrie Souvenirs de Voyages,* 7-8.

[15] Tahmisçioğlu isyanı, Mısır valisi Kavalalı Mehmet Ali Paşa'nın oğlu İbrahim Paşa'nın Anadolu'yu işgali sırasında, onun kışkırtmasıyla başlayan iç isyanlardan biridir. Bu isyan, Tahmiscioğlu Hacı Mustafa ve Hacı Ahmed tarafından çıkartılmış, Kastamonu ve çevresinde etkili olmuştur. Sultan II. Mahmud'un emriyle, Viranşehir Müteselimi Hasan Çavuşzade Hüseyin Ağa'nın oğlu Musa Bey'in emrindeki askerler tarafından 1833 yılında bastırılmıştır. Uzunçarşılıoğlu, "Kastamonu'da Tahmiscioğlu Vak'ası," 149-150.

Görsel 2: *Hasan Çavuşzadeler tarafından yaptırılan veya onarılan yapılar ve konumları.*

1.1. Safranbolu'daki Yapılar

Hasan Çavuşzade Hüseyin Ağa, mütesellim olarak sancağın mali ve askerî işlerinin yanı sıra idari işlerden

de sorumluydu. Bu sebeple o dönem, sancağın idari merkezi olan Safranbolu şehrinde görevliydi[20].

Safranbolu tarihî şehir merkezinde (Çukur) bulunan Havuzlu Asmazlar Konağı'nın 1830 yılında, eskiden yakınında bulunan ahır ve samanlık yapılarının ise 1830-1835 yılları arasında, Hasan Çavuşzade Hüseyin Ağa tarafından yaptırıldığı belirtilmektedir[21]. Samanlık ve ahır günümüze ulaşmamıştır. Konak ise Hasan Çavuşzade Ailesi'nin gücünü kaybetmesiyle birlikte Asmazlar Ailesi'nin mülkiyetine geçmiştir. Bu konakla birlikte, konağın da içerisinde bulunduğu "Beybağı" olarak bilinen geniş bir araziye de Asmazlar Ailesi sahip olmuştur. "Beybağı" ifadesi halk arasında, bu mevkinin Hasan Çavuşzade Hüseyin Ağa'nın mülkü olmasına atfen kullanılmıştır[22].

Beybağı'nın Safranbolu'da "Paşa Suyu" olarak bilinen tarihî su kaynağının, camilere, çeşmelere ve hamamlara dağıtıldığı taksim yerinin hemen yakınında bulunması dikkat çekmektedir. Seçilen konumun Hasan Çavuşzade Ailesi'nin diğer yerleşim tercihleri gibi bilinçli ve stratejik olduğu anlaşılmaktadır. Buna karşılık Safranbolu halkı arasında yaygın olarak bilinen bir deyiş, Beybağı'nın ve Havuzlu Asmazlar Konağı'nın halk arasında nasıl bir imaja sahip olduğunu ve dönemin "beylik" algısını gözler önüne sermektedir: "Beybağı'ndan aşma, Asmazlar'a yanaşma, akşamdan kalan aş ile, canını çıkartırlar iş ile."[23]

Osmanlı sivil mimarisinin en önemli örneklerinden birisi olan Havuzlu Asmazlar Konağı, orta sofalı plan şemasında, bodrum, alt ve üst kat olmak üzere 3 katlı olarak inşa edilmiştir. Konakta odalar, havuz başı selamlık köşkü, geniş sofalar ve eyvanlar yer almaktadır. Yapının güneydoğu ve güneybatı bölümü, II. Mahmud dönemi kışla yapılarında sıkça rastlanan köşe kulelerini anımsatacak bir şekilde, cephe hizasından dışarı taşırılarak tasarlanmıştır. Bina, 1976 yılında bir kurum tarafından Asmazlar Ailesi'nden satın alınmış ve daha sonra restorasyonu yapılmıştır[24]. Günümüzde butik otel olarak kullanılmaktadır (Görsel 3).

Görsel 3: *Havuzlu Asmazlar Konağı'nın güneydoğu perspektifi (solda) ve havuzlu selamlık köşkü (sağda).*

1.2. Kıranköy Mahallesindeki Yapılar

Kıranköy, Eskipazar Çayı'nın hemen kenarında yer almaktadır ve günümüzde Karabük ilinin Eskipazar ilçesine bağlı kırsal bir mahalledir. Kıranköy'de bulunan caminin kitabesinde bu yapının tamiratının Hasan Çavuşzade Hüseyin Ağa tarafından yaptırıldığı yazmaktadır. Yapılan incelemelerde cami haricinde Hasan Çavuşzade Hüseyin Ağa veya torunu Hüseyin Bey (Musa Bey'in oğlu) tarafından yaptırıldığı düşünülen bir adet hamamlı konak, Hasan Çavuşzade Hüseyin Ağa'nın oğlu Musa Bey tarafından yaptırıldığı düşünülen bir

adet hamamlı konak, bir adet hamam, duvar (tahkimat) izleri ve Musa Bey'in torununun oğlu Halim Bey'in adıyla anılan bir adet konak ve müştemilat bulunduğu anlaşılmıştır[25] (Görsel 4).

Kaynak: E. Karataş, 2023.

Görsel 4: *Kıranköy'e kuzeyden bakış ve Hasan Çavuşza Ailesi'nin yapıları.*

Kıranköy Camii'nin kitabesinden yapının 1783-1784 (Hicri 1198) yılında Mehmet Hayri Efendi tarafından yaptırıldığı ve Viranşehir Mütesellimi Hasan Çavuşzade Hüseyin Ağa tarafından 1813-1814 (Hicri 1229) yılında tamir ettirildiği anlaşılmaktadır. Taş yığma sistemle yapılmış caminin son dönemde gördüğü bir tadilatta dış cephedeki muhdes sıvalar temizlenmiş, çatısı yenilenmiş, yakınına şadırvan yapılmış, metal malzemeden yapılmış bir minare ve son cemaat mahallinin üzerini kapatan bir sundurma eklenmiştir (Görsel 5). İç duvarlardaki özgün kalem işi süslemelerin boya ile kapatıldığı tespit edilmiştir.

a) b)

Kaynak: A. Özköse, 2023.

Görsel 5: *Hasan Çavuşzade Hüseyin Ağa tarafından tamir ettirilen Kıranköy Camii.*
a) Kuzey perspektifi.
b) Rölöve çizimi.

Hasan Çavuşzade Hüseyin Ağa veya torunu Hüseyin Bey'in yaptırdığı tahmin edilen konak ise yerleşimin kuzeybatısında, Kıranköy Camii'ne yakın bir konumda bulunmaktadır. Konağın ilk yapıldığında 3 katlı olduğu ve 1944 yılında gerçekleşen Gerede-Çerkeş depreminde üst katının hasar aldığı için yıkıldığı belirtilmiştir[26].

[25] İhsan Özkök, Dursun Eken, Mithat Uyanık ve Hüseyin Eken, Kıranköy'de Hasan Çavuşzadeler'e ait olarak bilinen yapıların mirasçılarıdır. Kendilerinin Musa Bey'in torunları olduğunu belirtmektedirler. Soyağacı araştırmasında Musa Bey'in adına rastlanamamıştır. Bunun sebebinin kayıtların 1830'lu yıllara kadar ulaşmamasından kaynaklandığı düşünülmektedir. İhsan Özkök ile kişisel görüşme, Eskipazar, 31 Mayıs 2023; Dursun Eken ile kişisel görüşme, Eskipazar, 30 Mayıs 2023; Mithat Uyanık ile kişisel görüşme, Eskipazar, 31 Mayıs 2023; Hüseyin Eken ile kişisel görüşme, Karabük, 30 Mayıs 2023.

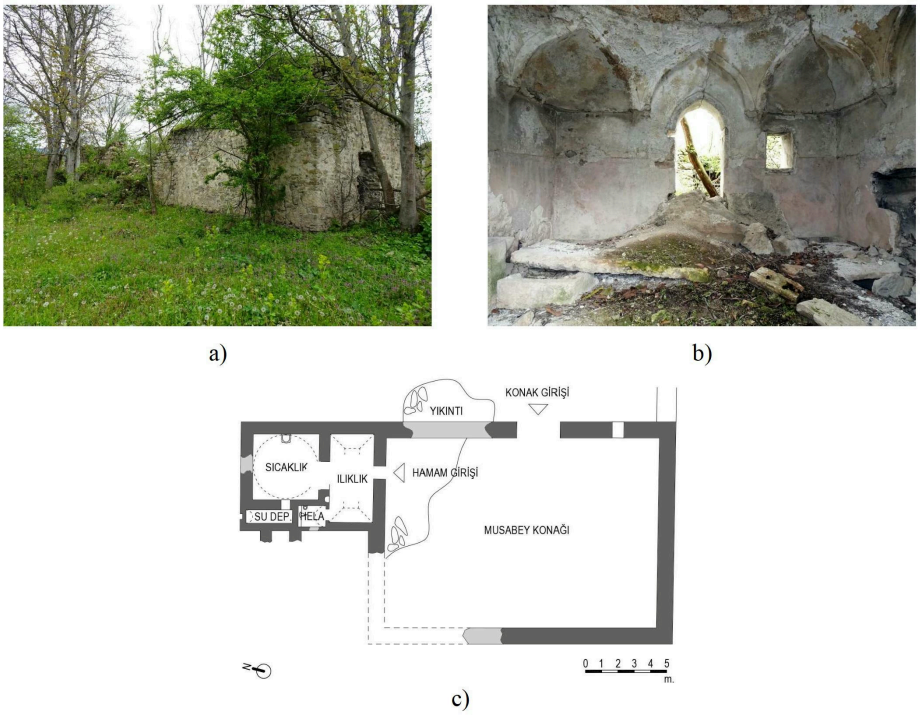
[26] İhsan Özkök ile kişisel görüşme, Eskipazar, 31 Mayıs 2023.

Hatalı uygulamalar sebebiyle, Hüseyin Bey Konağı'nın iç mekânı ve cepheleri büyük oranda özgünlüğünü yitirmiştir. Yapının ahır bölümünün yer aldığı bodrum kat yığma taş; üst kat ise ahşap iskelet arası taş ve kerpiç dolgu (yeğdane/hımış) yapım tekniği ile inşa edilmiştir. Ayrıca yapının güney cephesine bitişik olarak bulunan taş yığma sistemle yapılmış küçük ölçekli bir yapı izi bulunmaktadır. Diğer örnekler incelendiğinde bu yapının da bir hamam kalıntısı olduğu tahmin edilmektedir (Görsel 6).

Kaynak: E. Karataş, 2023.

Görsel 6: *Hüseyin Bey Konağı'nın güney cephesi (solda) ve doğu cephesi (sağda).*

Camii'nin batısında, tapu kayıtlarında *"Taş Kapı"* olarak geçen mevkiide hamamlı bir konak izi ve kalın çevre duvarı izleri bulunmaktadır[27]. Buradaki yapıların Hasan Çavuşzade Hüseyin Ağa'nın oğlu Musa Bey'e ait olduğu, buranın aynı zamanda askerî bir merkez olarak kullanıldığı belirtilmektedir[28]. Osmanlı Arşivinde bulunan 1835 tarihli bir belgeye göre Kastamonu Mütesellimi, Musa Bey'i konağının etrafına yaptırdığı büyük duvarlar, mazgallar (atış delikleri), kapının üzerindeki kule, mahzendeki silahlar ve diğer tahkimatlar sebebiyle İstanbul'a şikâyet etmiştir[29]. Arşiv belgesinde konum tam olarak verilmemiş olsa da bu yerin "Taş Kapı" olarak anılması ve askerî merkez olarak bilinmesi sebebiyle, belgedeki şikâyetlere konu olan konağın burası olabileceği düşünülmektedir.



Musa Bey'in adıyla anılan bu konağın da 1944 yılında gerçekleşen Gerede-Çerkeş depreminde yıkıldığı belirtilmektedir[30]. Günümüze konağın sadece yığma taş yapım sistemi ile yapılmış alt kat duvarlarından bir kısmı ulaşmıştır. Yıkıntılardan büyük boyutlara sahip olduğu anlaşılan bu konakla birlikte bir özel hamam yapısı da inşa edilmiştir. Hamamın sıcaklık mekânı büyük ölçüde korunmuş, ılıklık mekânının ise üst örtüsü yıkılmıştır. Yıkılan üst örtünün özgün hâlinde aynalı tonoz olduğu anlaşılmaktadır. Ilıklık mekânına konağın zemin katından girilmektedir. Ilıklıkta bulunan bir kapı sıcaklığa, diğer kapı ise helaya açılmaktadır. Helada bir adet hela kurnası ve hela taşı bulunmaktadır. Sıcaklık mekânının üstü, ince yonulu taş malzemeden yapılmış bir kubbe ile örtülmüştür. Kubbeye geçiş elemanı olarak sivri kemerli tromplar kullanılmıştır. Kubbenin en üst kısmında çiçek biçimini oluşturan 10 adet aydınlık açıklığı bulunmaktadır. Hamamın özgün hâlinde sıcaklığın batı ve doğu duvarlarında karşılıklı olarak 2 kurnanın bulunduğu anlaşılmaktadır. Günümüze sadece doğudaki kurna ulaşmıştır. Yapının batı cephesinde külhan bölümünün izleri görülmektedir. Yapının iç mekânı, define avcıları tarafından tahrip edilmiştir (Görsel 7).

Görsel 7: *Musa Bey Konağı (Taş Kapı mevkii).*
a) Kuzeydoğu perspektifi,
b) Sıcaklık mekânı,
c) Rölöve çizimi.

Kıranköy'de bulunan ve yine Musa Bey tarafından yaptırıldığı belirtilen diğer hamam yapısı ise köyün kuzeyindeki "Doruk" mevkiindedir[31]. Bu yapı küçük ölçekli özel hamam yapısıdır. Bu hamama bitişik başka herhangi bir yapı izine rastlanılmamıştır. Yapının sadece sıcaklık bölümü özgün hâliyle günümüze ulaşmıştır. Sıcaklık mekânının kuzeyinde bulunan bölüm ise özgünlüğünü yitirmiştir. Hamamın sıcaklık bölümünün *Taş Kapı* mevkiinde yer alan hamam yapısına benzer bir mimari üslupla inşa edildiği görülmektedir. Bu mekânda da ince yonulu taş kullanılarak yapılan kubbe, sivri kemerli tromplarla desteklenmiştir ve içerisi, kubbenin üst kısmında bulunan, çiçek biçimini oluşturan on adet açıklıkla aydınlatılmıştır. Yapı, günümüzde depo olarak kullanılmaktadır (Görsel 8).

Kaynak: E. Karataş, 2023.

Görsel 8: *Doruk mevkiindeki Musa Bey Hamamı'nın batı cephesi (solda) ve kubbesi (sağda).*

[31] İhsan Özkök ile kişisel görüşme, Eskipazar, 31 Mayıs 2023; Mithat Uyanık ile kişisel görüşme, Eskipazar, 31 Mayıs 2023.

Hüseyin Bey Konağı'nın kuzeybatısında Hasan Çavuşzade Ailesi'ne mensup olan Halim Bey'in ismiyle anılan bir konak daha bulunmaktadır (Bu konak 2. bölümde detaylı olarak incelenmiştir).

Halim Bey Konağı'nın kuzeyinde bulunan müştemilat ve misafir evinin üst kattaki başodasının duvarlarında bitkisel motifli kalem işi süslemeler bulunmaktadır. Yapının çatı örtüsü harap durumdadır ve özellikle üst katta su maruziyeti sebebiyle ciddi yapısal sorunlar mevcuttur (Görsel 9).

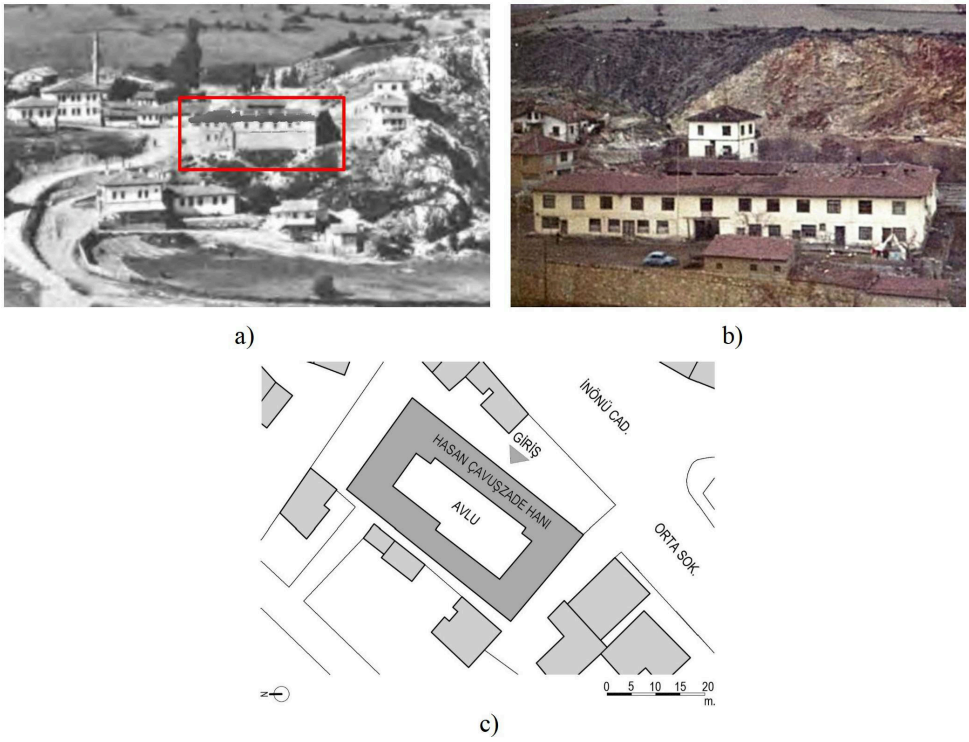
Görsel 9: *Halim Bey Müştemilatı'nın başodası.*

1.3. Eskipazar'daki (Viranşehir) Yapılar

Eskipazar yerleşiminin eski adı *Viranşehir* olarak bilinmektedir. Bu tabirin antik bir yerleşim yeri olan Hadrianapolis kentini (halk ağzında *Eski Viranşehir*) kastettiği düşünülmektedir. Bu isim Osmanlı döneminde hem Viranşehir sancağının hem de Viranşehir kazasının idari sınırlarını ifade etmek için kullanılmıştır[32]. Bu tabir halk arasında Eskipazar yerleşimini kasteden "Viranşehir Pazarı" hâlini almıştır. Özellikle Osmanlı Devleti'nin son döneminde Viranşehir'in (Eskipazar) küçük fakat kervan yolları üzerinde ticari olarak önem taşıyan bir yer olduğu anlaşılmaktadır[33].



Seyyah Mordtmann, 1856 yılında yöreden geçmiş ve Viranşehir'de Hasan Çavuşzade Ailesi'nin yaptırdığı bir çeşmenin ve bir hanın bulunduğunu yazmıştır. Mordtmann'a göre han, Hasan Çavuşzade Ailesi'ne ait olduğu için yakılmıştır. Seyyah bölgeye geldiğinde, han derme çatma bir şekilde onarılarak kullanılmaktaydı. Çeşme ise o dönemde hâlâ sağlam olup kitabesi 1829-1830 yılında yapıldığını göstermekteydi[34]. Hanın hissedarlarından olan Hüseyin Özkök, yapının yakınında tarihî bir çeşmenin bulunduğunu doğrulamıştır. Fakat çeşme hakkında daha fazla bilgiye ulaşılamamıştır.

[32] Ersoy, *Karabük'ün Köyden Kente Dönüş Öyküsü Karabük Tarihi*, 106-107.

[33] Franz Taeschner, *Osmanlı Kaynaklarına Göre Anadolu Yol Ağı*, çev. Nilüfer Epçeli (İstanbul: Bilge Kültür Sanat, 2010), 258; Mordtmann, *Anatolien: Skizzen und Reisebriefe aus Kleinasien (1850-1859)*, 260.

[34] Mordtmann, *Anatolien: Skizzen und Reisebriefe aus Kleinasien (1850-1859)*, 259.

Hanın 20. yüzyılın başlarında çekilmiş fotoğrafından yapının Mordtmann'ın ziyaretinden sonra onarıldığı ya da yeniden inşa edildiği anlaşılmaktadır. Hüseyin Özkök'e göre han, zemin katında ahırlar ve kahvehane; üst katında odaları bulunan iki katlı avlulu bir binaydı. Daha sonra bu yapı, hapishane ve kasabanın idari merkezi olarak kullanılmıştır. İşlev değişikliği sebebiyle handaki kapsamlı tadilatın cephede yol açtığı bozulmalar, yapının fotoğrafında gözlenmektedir. Yaklaşık 45 m x 23 m boyutlarındaki Hasan Çavuşzade Hanı, mirasçıları tarafından satılmış ve 1996 yılında yıkılarak yerine yeni binalar inşa edilmiştir[35] Ailenin varislerinden birine göre hanın güneydoğu görünüşünde, arkasında bulunan iki katlı konak da Hasan Çavuşzade Ailesi'ne ait bir yapıydı[36] (Görsel 10).

1.4. Tamışlar Köyündeki Yapılar

Tamışlar köyü, Eskipazar ilçe merkezinin yaklaşık 9,5 km doğusunda, 1050 m rakımında bulunmaktadır. Prenses Belgiojoso Viranşehir sancağındaki evinden Kudüs'e yaptığı seyahatin başlangıcında, kendi evinin bulunduğu yerden Bayındır köyüne kadar, Musa Bey'in en küçük kardeşinin kendisine eşlik ettiğini belirtmektedir. Prenses, Musa Bey'in kardeşinin yaşadığı yerden şu şekilde bahsetmiştir: *"(...) Genç arkadaşım*

[35]Hüseyin Özkök, Hasan Çavuşzade Hüseyin Ağa'nın oğlu Halil Bey'in 4. kuşaktan torunudur. Hüseyin Özkök ile kişisel görüşme, Eskipazar, 17 Haziran 2023; "Alt-Üst Soy Bilgisi Sorgulama," e-Devlet Kapısı Uygulaması, erişim 17 Haziran 2023, https://www.turkiye.gov.tr/nvi-alt-ust-soy-bilgisi-sorgulama.

[36]Dursun Küçükyılmaz ile kişisel görüşme, Eskipazar, 19 Haziran 2025.

bana veda ediyor. Yırtıcı bir kuş gibi, yüksek bir dağın eteğindeki küçük köyüne dönüyordu. Uzun bir süre, dövüş için doğmuş ancak vaktinden önce aylak bir hayata mahkûm olmuş bu genç adamı izledim."[37]

Prensesin İsmail Bey'in hayat hikayesini yazdığı eserden kendisinden bahsedilen kişinin Halil Bey olduğu anlaşılmaktadır[38]. Bahsedilen köyün ise Tamışlar köyü olduğu çıkarımı yapılabilir çünkü hem Tamışlar köyü prensesin tarifine uymakta hem de Hüseyin Özkök'e göre bu köy, Hasan Çavuşzade Hüseyin Ağa'nın yazlık (yaylak) yerleşimidir[39]. Köyde yapılan incelemede Hasan Çavuşzadeler'in yaptırdığı 3 adet konak, ahırlar ve bir ambar bulunduğu tespit edilmiştir (Görsel 11). Mirasçıların soyağacı kayıtlarına göre, bu konaklardan ikisi Hasan Çavuşzade Hüseyin Ağa'nın büyük oğlu İsmail Bey, diğeri ise kardeşi Halil Bey tarafından yaptırılmıştır[40].

Kaynak: E. Karataş, 2023.

Görsel 11: *Tamışlar'a güneybatıdan bakış ve Hasan Çavuşzadeler'in yapıları.*

İsmail Bey tarafından yaptırılan konaklar köyün güneybatısında birbirine yakın konumlarda bulunmaktadır. İsmail Bey Ağa Konağı'nda yapılan incelemede hatalı uygulamalar ve onarımlar sebebiyle konağın özgün mimarisinin tamamen bozulduğu tespit edilmiştir. İsmail Bey Konağı ve Halil Bey Konağı ise özgünlüklerini büyük oranda muhafaza etmektedir. Halil Bey Konağı'na hizmet eden ahırlar ve ambarın ise tabiat şartları sebebiyle büyük oranda bozulduğu gözlemlenmiştir (İsmail Bey Konağı ve Halil Bey Konağı Bölüm 2'de detaylı olarak incelenmiştir).

Diğer yapıların yanı sıra, Tamışlar köyünde bulunan taş yığma sistemle yapılmış bir cami ile Kıranköy Camii'nin mimarileri ve ahşap işçilikleri arasındaki benzerlik dikkat çekmektedir (Görsel 12). Bu sebeple, bu caminin de Hasan Çavuşzade Hüseyin Ağa tarafından Kıranköy Camii ile aynı dönemde tamir ettirildiği tahmin edilmektedir. Fakat yapının kitabesinin yerinde bulunmamasından dolayı konu hakkında kesin bir bilgi elde edilememiştir. Camide yarı açık olarak tasarlanmış son cemaat mahalli ve harim içerisinde kadınlar mahfili yer almaktadır. Caminin kesme taştan yapılmış minberi özgünlüğünü korumaktadır. Yapı bakıma muhtaç durumdadır ve hâlihazırda kullanılmamaktadır. page

Görsel 12: *Tamışlar Köyü Camii kuzey perspektifi (solda) ve harim bölümü (sağda).*

1.5. Çakmakoğlu Vadisi'ndeki Yapılar

Eskipazar ve Merkez (Karabük) ilçeleri arasında kalan ve kaynaklarda "Çakmakoğlu Çiftliği" olarak anılan bölgede, Hasan Çavuşzade Ailesi'ne ait geniş arazilerin ve çoğu günümüze ulaşamamış olan bazı yapıların varlığı tespit edilmiştir. 1853 yılında bu arazilerin büyük bir bölümü, İtalyan coğrafyasında Avusturya birlikleriyle özgürlükçüler arasında çıkan çatışmalar sebebiyle Osmanlı Devleti'ne sığınan Prenses Belgiojoso'nun kızı Maria Belgiojoso Torotti (1838-1913) tarafından satın alınmıştır[41]. Arazileri satan kişiler ise Hasan Çavuşzade Hüseyin Ağa'nın oğlu İsmail Bey ve kardeşleridir[42].

Çeşitli yayınlarda, uzun bir süre çiftliğin yeri tartışma konusu olmuştur[43]. Fakat belgelerde geçen yer isimleri çiftliğin "Kuz köyü" (Kuzyaka ünitesi/ Doğancılar/ Eskipazar), "Han nâm karye" (Hanköy/Eskipazar/ Karabük) ve "Büyük Tarla" (Büyük Tarla Mevkii/ Doğancılar/ Eskipazar/ Karabük) yakınlarında bulunduğunu göstermektedir[44]. Canbolat'ın çalışması da bu konumu doğrulamaktadır[45]. Prensesin anlatımına göre satın alınan arazi, yaklaşık 8 km uzunluğunda ve 1,33 km genişliğindedir. Prensesin açıklamaları ve coğrafya incelendiğinde arazinin Acıöz köyünde (Merkez/ Karabük) bulunan "Macar Çiftliği" mevkiinden başlayarak Cildıkısık geçidine kadar ulaştığı anlaşılmaktadır[46]. Prenses Belgiojoso, Çakmakoğlu Çiftliği'ndeki binalar hakkında şunları söylemektedir: "(...) Vadi bir nehir tarafından kesilir ve ormanlık alanlarla çevrilidir. Bir ev, bir değirmen ve bir kereste fabrikasını barındırır."[47] Belgiojoso, çiftlik arazisi üzerindeki konağını ise şu şekilde anlatmaktadır: "(...) Kulübem vadinin ortasında, doğuya eğimli bir yamaçta, güney ve kuzey arasında, ovayı, nehri çevreleyen alüvyonlu alandan ayıran arazide duruyor. Kulübeden başka bir adı hak etmeyecek kadar küçük ve mütevazi bir ev..."[48] Alman seyyah Mordtmann, 1856 yılında gördüğü konağın konumunu da

[41] 1848'de İtalyan coğrafyasında, Avusturya birlikleri ile özgürlükçüler arasında çatışmalar sırasında Osmanlı Devleti, Avusturya Hükümeti'nin baskısından kurtularak kendisine sığınmak isteyen mültecilerden birçoğunun iltica taleplerini kabul etmiştir. tarif etmiştir[49]. Tarife göre, bu yerin şu anda Merkez ilçesine bağlı olan Acıöz köyü sınırları içerisindeki Macar Çiftliği mevkii olduğu anlaşılmaktadır[50]. Bu alanda yer alan tarlanın hissedarlarından birine göre, 1975 yılına kadar burada, araziyi tarıma açmak için yıkılan bir konak vardı. Ayrıca bu konak ve çevresindeki arazinin "Macar Marya" isimli gayrimüslim bir kadın tarafından idare edildiği öğrenilmiştir[51]. Bu kadın, Osmanlı vatandaşı olduktan sonra çiftliği resmen satın alan Prenses Belgiojoso'nun kızı Maria Belgiojoso Torotti olmalıdır[52]. Yapılan araştırmalarda Macar Çiftliği mevkiinde bir ev ve bahçe duvarı kalıntısı tespit edilmiştir Görsel 13). Arazi sahibine göre konak "İki katlı, geniş bir alana sahip, etrafı yüksek duvarlarla çevrili, sütunlu girişine birkaç basamakla çıkılan, bodrum katında mahzeni olan taş bir yapı"dır[53].

Kaynak: A. Özköse, 2023.

Görsel 13: *Çakmakoğlu Çiftliği hava fotoğrafı.*

Konağın güneyinde, eski bir su değirmeni bulunmaktadır. Değirmen genel olarak, zamanın etkisiyle gördüğü hasarlar ve onarımlar sebebiyle mimari özgünlüğünü kaybetmiştir. Ancak günümüze kadar değişmeden kalan batı cephesinden yola çıkarak değirmenin 19. yüzyılın başlarında yapıldığı düşünülmektedir. Dolayısıyla, Prensesin arsa içerisinde yer aldığını belirttiği değirmenin bu yapı olduğu söylenebilir[54].

1893 yılında bölgeye gelen Seyyah Anton, haritasında "kaleh" (kale) adlı bir yeri işaretlemiştir. Burası Büyük Tarla mevkii ile doğuya doğru uzanan vadinin birleştiği bölgenin kuzeyinde yer almaktadır[55]. 1903 yılında aynı yerden geçen Leonhard, Anton'un haritasına atıfta bulunarak buranın daha önce yaşamış bir derebeye ait olduğundan bahsetmektedir[56]. Yöre halkı ise burayı "Macar Maria'nın çiftliğini gözetlediği yer" olarak tarif etmektedir. Bu sebeple, "kale" olarak adlandırılan bu yerin Hasan Çavuşzade Hüseyin Ağa ya da Musa Bey tarafından yaptırıldığı ve daha sonra bir kısmının çiftliği satın alanlar tarafından kullanıldığı tahmin edilmektedir. Burada son dönemde su deposu inşa edilmesi için kazı çalışması yapıldığı, bir mezar

[56] Richard Leonhard, *Paphlagonia Reisen und Forschungen im Nördlichen Kleinasien* (Berlin: Dietrich Reimer, 1915), 145.

ve bazı izlerin ise bu çalışma sırasında tahrip olduğu bildirilmiştir[57].

Alan araştırması sırasında Doğancılar köyü sakinleri tarafından çiftlik ambarlarının bulunduğu yer işaret edilmiştir. Bu ambarların yörede özellikle ambar mimarisinde sıklıkla kullanılan çantı (ahşap geçme) sistemiyle yapılmış olduğu belirtilmektedir. Bu yapılar bakıma muhtaç hâle gelince köylüler tarafından sökülmüştür[58]. Bu yer Tapu Kadastro Genel Müdürlüğü'nün kayıtlarında "Ambar Yeri" mevkii olarak geçmektedir[59]. Ancak burada bulunan yapıların prenses zamanında mı yoksa çiftlik Hasan Çavuşzadeler'e aitken mi inşa edildiğine dair bir bilgi bulunmamaktadır. Tespit edilebilen resmî yazışmalara göre, Hasan Çavuşzade İsmail Bey 1875 yılına kadar çiftliğin mülkiyeti üzerinde hak iddia etmeye devam etmiştir[60].

Çakmakoğlu Çiftliği yakınlarında Hasan Çavuşzade Ailesi'ne ait olmasına rağmen Prenses Belgiojoso tarafından satın alınmayan yapıların da olduğu düşünülmektedir. Seyyah Mordtmann'ın bahsettiği bu yapılar Hanköy köyünün batısında, Eskipazar Çayı kıyısında yer almaktadır. Mordtmann, bu yapılar hakkında şunları söylemiştir: *"Nehrin sağ kıyısında, eskiden büyük bir han ve camii olan ancak yaklaşık 30 yıl önce çıkan yangında kül olan yapıların sadece dış duvarları ve minaresi var."*[61]. Mordtmann, hanın sahibinden veya yangının sebebinden bahsetmemiştir. Ancak buranın hemen yakınında Hasan Çavuşzade Ailesi'ne ait Çakmakoğlu Çiftliği'nin bulunduğu ve Hasan Çavuşzade İsmail Bey'in eşi (Musa Bey'in eski eşi) Besime Hanım'ın Hanköy yakınlarında 60 dönümlük arazisi olduğu bilinmektedir[62]. Mordtmann, binaların 19. yüzyılın ikinci çeyreğinde yandığını vurgulamaktadır. Dolayısıyla bu yapıların da Hasan Çavuşzade Ailesi'ne ait olduğu ve Eskipazar'da bulunan han gibi tahrip edildiği düşünülmektedir.

2. Hasan Çavuşzade Ailesi'nin Eskipazar'da Bulunan Üç Konağının İncelenmesi

2.1. Halim Bey Konağı

Konumu ve tarihi: Konak, Karabük'ün Eskipazar ilçesinin Kıranköy mahallesinde, Doğa caddesinin kuzeyinde, Hüseyin Bey Konağı ve Kıranköy Camii'ne yakın bir konumda bulunmaktadır (Görsel 4, Görsel 14).

Kaynak: E. Karataş, 2023.

[62] Gür ve Canbolat, "Türkiye'de Cristina Trivulzio di Belgiojoso'nun Kızı Maria'ya Ait Arazi, Çiftlik ve Mülkler," 131.

Mimari üslubu ve malzeme yıpranmaları dikkate alınarak konağın 19. yüzyılın ikinci yarısında yapıldığı tahmin edilmektedir. Buna göre konağın Musa Bey'in torunu, Halim Bey'in babası, Hasan Bey (doğ. 1855) tarafından yaptırıldığı düşünülmektedir. Konağın hissedarlarından Hüseyin Eken, Musa Bey zamanından kalan 200 kadar tüfek ve silahın uzun süre bu konağın çatı arasında muhafaza edildiğini ve bu silahların daha sonra yetkililere teslim edildiğini belirtmiştir[63].

a. Mekân organizasyonu: Konak, bodrum, alt ve üst kat olmak üzere 3 kattan oluşmaktadır. Yapı, yaklaşık 158,50 m²'lik bir zemin oturumuna sahiptir. Konak, kuzey-güney doğrultusunda yaklaşık 20/100 eğimli bir arsa üzerinde yer almaktadır. Yapının bodrum ve alt katlarındaki iç mekân çözümleri, farklı kotlandırmalarla, arazi eğimine uygun bir biçimde yapılmıştır. Üst kat ise konak sahiplerinin yaşam katıdır ve tek bir kot düzenine sahiptir (Görsel 15).

Kaynak: A. Özköse, 2020.

Görsel 15: *Halim Bey Konağı rölöve çizimleri.*

Bodrum kat, yapının kuzey bölümünün alt kısmına, kısmi ve tek mekân olarak inşa edilmiştir. Bu bölümün girişi doğu cephesinden, –2,20 kotundan sağlanmaktadır. Mekânın içerisinde 1 adet su kuyusu mevcuttur. Kat yüksekliği (döşeme üstünden döşeme üstüne) yaklaşık 2,70 metredir.

Binanın ana girişi, alt kattan, doğrudan caddeye açılan ve güney cephede yer alan bir kapıyla sağlanmaktadır. Giriş mekânında (taşlık), üst kata çıkan, bir kolu dengelenmiş, L şeklinde bir merdiven bulunmaktadır. Taşlığın doğu ve batısında giriş ile aynı kotta yer alan depolar mevcuttur. Bu depoların kat yüksekliği yaklaşık 1,50 metredir.

Taşlığın kuzeyinde, merdiven sahanlığından ulaşılan, orta sofalı bir bölüm bulunmaktadır. Burası müstahdemlerin yaşadığı kat olarak bilinmektedir[64]. Orta sofanın dört köşesinde dört adet oda, kuzeyinde eyvan, doğusunda aralık ve batısında abdestlik ve hela mekânları mevcuttur. Güneybatıda yer alan odanın girişi, sofadan bağımsız olarak doğrudan merdiven sahanlığından (taşlıktan) sağlanmıştır. Kuzeydeki odalara sofanın pahlı köşelerinden (farsi) girilmektedir. Bu katta sadece bu iki odada ocak mevcuttur. Kazan ocağının bulunmasından ve oda düzeninden, kuzeybatıdaki odanın aşevi (mutfak) olarak tasarlandığı anlaşılmaktadır. Bu bölümün kat yüksekliği yaklaşık 3,05 metredir.

Üst kat, konak sahiplerinin yaşama katıdır. Sekiz köşeli bir plana sahip orta sofanın dört köşesinde dört adet oda, güneyinde merdiven ve merdiven aralığı, kuzeyinde ve doğusunda iki adet eyvan, batısında abdestlik ve hela mevcuttur. Odalara sofanın pahlı köşelerinden girilmektedir. İçerisinde kazan ocağı bulunan kuzeybatıdaki oda, alt katta olduğu gibi bu katta da aşevi olarak tasarlanmıştır. Aşevi haricindeki odaların girişlerinde içerinin görünmesini engelleyen ahşap paravanlar bulunmaktadır. Dört odada da ocak, gusülhane ve yüklükler mevcuttur. Süsleme ve oda düzenden, kuzeydoğuda yer alan mekânın başoda olarak

[63] Hüseyin Eken ile kişisel görüşme, Karabük, 30 Mayıs 2023.

[64] Hüseyin Eken ile kişisel görüşme, Karabük, 30 Mayıs 2023.

tasarlandığı anlaşılmaktadır. Odalarda kat yüksekliği yaklaşık 3,30 metreyken, sofada 4,30 metredir. Bu katta sofanın yüksekliği diğer mekânlara göre artırılarak daha ferah bir merkezî mekân elde edilmiştir (Görsel 15).

b. Yapım sistemi ve malzeme: Yapının bodrum katı yığma taş, alt ve üst katı ise ahşap iskelet arası taş dolgu (yeğdane/hımış) yapım sistemiyle inşa edilmiştir. Özellikle alt kat duvarlarında yapının köşeleri çift ahşap çaprazlarla güçlendirilmiştir (Görsel 14). Döşemelerin taşıyıcı malzemesi olarak çeşitli boyutlarda ahşap kirişler kullanılmıştır. Bodrum katta tavan tahtası bulunmazken, alt ve üst katlarda tavanların büyük bir bölümü tavan tahtaları ile kaplanmıştır. Yapının kapı-pencere doğramaları, dolap ve sedir gibi donatıları ahşap malzemeyle imal edilmiştir. Cephelerde özgün çamur sıva ve beyaz badana izleri bulunmaktadır.

Konak Kuzey Anadolu fay hattına oldukça yakın bir konumdadır. Bu fay üzerinde 1944 yılında, 7,3 büyüklüğünde, Gerede-Çerkeş depremi meydana gelmiştir[65]. Pek çok yapı bu deprem sırasında yıkıldığı ya da ağır hasar aldığı için Eskipazar çevresinde korunmuş geleneksel yapı sayısı oldukça azdır. Yapının depreme rağmen bütünlüğünü muhafaza etmiş olması, yapım sistemi ve malzeme kullanımları açısından akademik incelemelere konu olabilecek potansiyeli barındırmaktadır.

c. Cephe Özellikleri: Yapı kuzey-güney doğrultusunda yaklaşık 11,75 metre, doğu-batı doğrultusunda ise yaklaşık 13,50 metre cephe uzunluğuna sahiptir. Hiçbir cephede cumba ya da çıkma bulunmamaktadır. Bodrum ve alt kat cepheleri dışa daha kapalı olarak (az ve küçük açıklıklı), üst kat cepheleri ise daha fazla sayıda ve nispeten büyük açıklıklarla tasarlanmıştır.

Oda ve eyvanların pencereleri yaklaşık 1/2 oranında, ahşap kapaklı ve parmaklıklıdır. Giriş kapısının üzerinde, hela ve depo gibi mekanlardaki açıklıklarda muşabaklar kullanılırken, bodrum kat küçük penceresiz açıklıklarla (tömek) aydınlatılmıştır. Cephe üzerindeki izlerden, yapının ahşap çatkı ile yapılmış bölümlerinin (bodrum kat üst hizasından itibaren) daha önce çamur sıvalı ve beyaz badanalı olduğu anlaşılmaktadır (Görsel 14).

d. Detaylar: Konak genel olarak sade ve süslemesizdir. Fakat yapıdaki ahşap ve taş işçiliklerinin özenli olduğu görülmektedir. Aşevi olarak tasarlanmış mekânlar hariç olmak üzere, ocağı bulunan bütün odalarda klasik Osmanlı-Türk evi oda düzeninin uygulandığı görülmektedir.

Odalarda pencerelerin önlerinde sedirler, ocakların yanlarında ve giriş kapılarının karşısında yüklük ve gusülhaneler, pabuçluk (odanın giriş bölümü) duvarlarında kemerli çiçeklikler ve çeşitli yerlerde ahşap dolaplarla birlikte tasarlanmış kemerli oyma raflar (gözgöreler) bulunmaktadır. Oda kapıları çatkı; dış kapılar, servis ve depo mekânlarının kapıları ise çakma tekniğiyle yapılmıştır. Alt kattaki dolaplarda çakma; üst kattakilerde ise genellikle çatkı yapım tekniği kullanılmıştır.

Tavanlar, farklı biçimlerde yapılmış çıtakari detaylara sahiptir. Çıtalar, bazı tavanlarda düz, bazılarında ise 45 derece açılarla çakılmıştır. Başoda olarak kullanılan mekânda tavan süslemelidir. Tavanın merkezinde ise dairesel bir çerçevenin içerisinde yer alan yıldız motifli göbek mevcuttur. Bu odadaki çıtalar baklava dilimi deseni oluşturacak şekilde çakılmıştır. Tavanın bütün kenarlarında 40-70 cm'lik dışa çıkıntılı bir bordür bulunmaktadır (Görsel 16).

[65] Celal Şenol, "Türkiye'de Meydana Gelen Büyük Depremlerin Yerleşme ve Demografik Yapı Üzerindeki Etkileri (1927-2020)," *USBAD Uluslararası Sosyal Bilimler Akademi Dergisi* 2/2 (2020), 620-644, https://doi.org/10.47994/usbad.808881

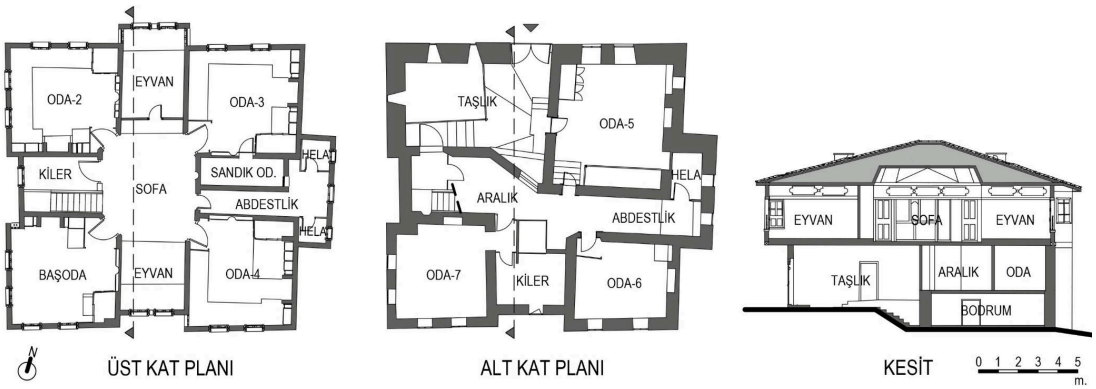
Kaynak: A. Özköse, 2020.

Görsel 16: *Halim Bey Konağı'nın başodasında ocak, giriş ve dolaplar (solda) ve çiçeklik, dolap ve oyma raflar (sağda).*

e. Korunmuşluk durumu: Konak genel olarak dış ve iç yapısal bütünlüğünü muhafaza etmektedir. Ancak özellikle yapının güney ve batı cephesinde tabiat şartları (termal etki ve yağış) sebebiyle yıpranma oranının yüksek olduğu tespit edilmiştir. Yapının çevresinde su ve nem maruziyetini engelleyecek herhangi bir tedbir bulunmamaktadır. Dolayısıyla yapı, zemininden sürekli suya ve neme (kapiler yükselme) maruz kalmaktadır. Zemine yakın olan duvarlarda parça kayıpları ve kısmi bozulmalar gözlemlenmiştir. Yapının özgün hâlinde bulunan cephe sıvalarının büyük ölçüde dökülmüş olması sebebiyle, ahşap çatkılar ve duvar harçları doğrudan açık hava şartlarına maruz kalmaktadır. Çatı örtüsü önceden gördüğü bir tadilatla özgünlüğünü yitirmiştir. Fakat hâlihazırda yapıyı açık hava şartlarına karşı muhafaza etmektedir. Konağın iç yapısı daha iyi korunmuştur ancak açık olan pencere vb. açıklıklar içerideki yıpranma oranını artırmaktadır. Bunun yanı sıra bacalarda gözlemlenen yıpranmalar ileride iç mekânda büyük bozulmalara sebebiyet verebilecek niteliktedir.

2.2. İsmail Bey Konağı

a. Konumu ve tarihi: Konak, Karabük'ün Eskipazar ilçesinin Tamışlar köyünde, köyün güneybatısında, İsmail Bey Ağa Konağı'nın güneydoğusunda bulunmaktadır (Görsel 11). Köy halkı tarafından Ömer Bey Konağı olarak bilinmektedir. Bu konağın İsmail Bey Ağa Konağı'ndan altı yıl sonra yapıldığı belirtilmektedir ve kapısının üzerinde hicri 1288 [miladi 1871-1872] tarihi yazılıdır. İsmail Bey zamanında, İsmail Bey Konağı'nın misafir evi ve müştemilat olarak kullanıldığı belirtilmiştir[66] (Görsel 17).



Kaynak: E. Karataş, 2023.

Görsel 17: *İsmail Bey Konağı'nın güney cephesi (solda) ve kuzey cephesi (sağda).*

b. Mekân organizasyonu: Bodrum, alt ve üst kattan oluşan yapı, yaklaşık 219 m² zemin oturumuna sahiptir. Konağın bodrum katında ardiye, alt katında taşlık ve müstahdem bölümü, üst katında ise misafir odaları

[66] Halil İbrahim Özkök ile kişisel görüşme, Eskipazar, 29 Mayıs 2023.

ve başoda bulunmaktadır. Üst kat bütünüyle tek bir kotta bulunurken, diğer katlar yaklaşık 20/100 (kuzey-güney) olan arsa eğimine uygun bir biçimde kotlandırılarak tasarlanmıştır (Görsel 18).

Kaynak: A. Özköse, 2021.

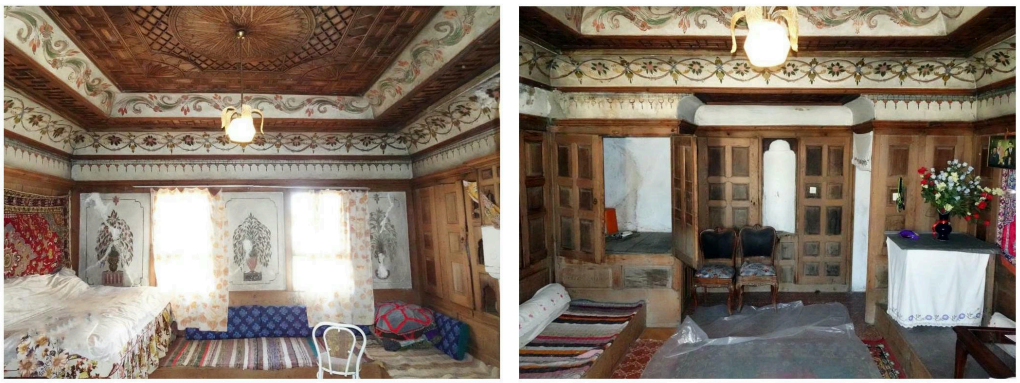
Görsel 18: *İsmail Bey Konağı rölöve çizimleri.*

Binanın giriş kapısı, alt katta bulunan taşlık mekânının kuzey duvarında yer almaktadır. Taşlıktan diğer mekânlara merdivenlerle geçiş yapılmaktadır. Taşlığın doğusunda ocağı da bulunan bir oda, batısında geç dönemde yapıldığı düşünülen büyük, ahşap bir ambar ve güneyinde ise müstahdem bölümü bulunmaktadır. Müstahdem bölümü, girişten yaklaşık 90 cm yüksek bir kotta yer almaktadır. Burada mekânlar arasında geçişi sağlayan bir aralık, güneyden cephe alan, ocaklı iki adet oda, odalar arasında kiler ve doğudan cephe alan hela ve abdestlik bölümleri mevcuttur. Bu bölümün kat yüksekliği yaklaşık olarak 2,45 metredir.

Bodrum kat, müstahdem bölümünün altındaki hacimden (kat yüksekliği yaklaşık 1,75 metre) oluşturulmuştur. Odunluk ve ardiye mekânlarına sahip olan bu kata taşlıktan inen 3 basamaklı bir merdiven ile ulaşılmaktadır.

Üst kat, sekiz köşeli plan şemasında tasarlanmış bir orta sofa ve etrafındaki mekânlardan oluşmaktadır. Sofanın dört köşesinde, pahlı köşelerden giriş yapılan odalar bulunmaktadır. Sofanın kuzeyinde ve güneyinde, iki adet eyvan yer almaktadır. Sofanın batısında, müstahdem bölümü girişinin hemen yanından bu kata ulaşan merdiven evi ve küçük bir oda bulunmaktadır. Sofanın doğusunda ise kuzeydoğudaki odayla bağlantılı bir sandık odası, sofa ile bağlantılı abdestlik ve abdestlikten girilen iki adet hela yer almaktadır. Bu kattaki dört odada ocak, gusülhane ve yüklükler mevcuttur. Manzara, süsleme-bezeme ve iç mekân düzeni, güneybatıda yer alan odanın başoda olarak kullanıldığını göstermektedir. Diğer mekânlarda kat yüksekliği yaklaşık 3,25 metreyken, sofada 4,10 metredir. Yapının üst katında, sofanın diğer mekânlara göre daha yüksek ve köşeleri pahlanmış tavanlı inşa edilmesi, ferah bir merkezî mekân sağlamıştır (Görsel 18).

c. Yapım sistemi ve malzeme: Yapının, bodrum ve alt kat duvarları yığma taş, üst kat ise ahşap iskelet sistem arası taş dolgu (yeğdane) olarak inşa edilmiştir (Görsel 17). Bodrum katın tavanını oluşturan ahşap kirişli döşemelerde tavan tahtası bulunmazken, diğer katlarda ahşap kirişler tavan tahtaları ile örtülmüştür. Kapı-pencere ve iç donatılar ahşap malzemeden imal edilmiştir.



d. Cephe Özellikleri: Konağın cephe uzunluğu kuzey-güney doğrultusunda yaklaşık 15,55 metre, doğu-batı doğrultusunda ise yaklaşık 16,40 metredir. Kuzeyde yer alan giriş kapısının önü, yapıdaki tek çıkma unsuru olan, üst katta eyvan bölümünün oluşturduğu cumba ile örtülmektedir. Doğu cephesinde abdestlik ve helaların yer aldığı bölüm, bina yüksekliği boyunca, bu cephede bulunan odaların cephe hizasından öne çıkmaktadır. Batı ve güney cephesinde ise odalar, cephe hizasından taşırılarak vurgulanmıştır. Yapıda taş yığma olan bölümlerin cepheleri (bodrum ve alt kat) dışa daha kapalı, az ve küçük açıklıklı olarak tasarlanırken ahşap çatkılı bölümler (üst kat) daha fazla sayıda ve nispeten büyük açıklıklara sahiptir.

Oda ve eyvanların pencereleri yaklaşık 1/2 (en/boy) oranına sahiptir. Yapının özgün hâlinde, pencerelerde ahşap kapaklar olduğu anlaşılmaktadır. Bazı açıklıklarda lokmalı parmaklık ve muşabaklar kullanıldığı görülmektedir. Bodrum kattaki mekânlar ve alt kattaki taşlık mazgallarla (tömek) aydınlatılmaktadır. Yapının cephesinde, özgün olarak, sadece üst kat duvarlarının sıvalı olduğu tahmin edilmektedir (Görsel 17).

İsmail Bey Konağı ve Hasan Çavuşzade Hüseyin Ağa tarafından yaptırılan Havuzlu Asmazlar Konağı'nın plan şemasının yanı sıra köşe kulesine benzer biçimdeki cephe elemanları arasındaki benzerlik dikkat çekmektedir. İsmail Bey, Havuzlu Asmazlar Konağı'ndaki tasarımın bir benzerinin bu yapıda uygulanmasını istemiş olabilir (Görsel 3, Görsel 17).

e. Detaylar: Konağın cepheleri ile bodrum ve alt katta bulunan iç mekânlar sade ve süslemesizdir. Alt katta bulunan üç odada ocaklar mevcuttur. Bu odalarda ahşap donatı daha az, işçilik ise daha basittir.

Üst kat, özenli işçilik ve tasarım ile inşa edilmiştir. Buradaki tüm odalarda klasik Osmanlı-Türk evi oda düzeni hâkimdir. Odalarda L biçiminde sedirler, ocakların yanlarında dolap ve yüklükler, çeşitli yerlerde ahşap oyma raflar (gözgöreler) bulunmaktadır. Bütün oda tavanlarında tekne tavan yapım tekniği uygulanmıştır. En üst kotta yer alan tavan ana zemini, kenarlarında bulunan iki kademeli C kıvrımlı, bağdadi tekniğiyle yapılmış pervazlarla, odanın duvarlarına doğru açılan bir görünüm almaktadır. Odalarda pabuçluk bölümleri bulunmaktadır. Bu bölümünün tavanı daha alçak olarak tasarlanmış, kapı önlerine içerinin sofadan görülmesini engelleyen ahşap paravanlar yerleştirilmiş, kapının karşısında konumlandırılan gusülhane ve yüklükler ile mekân ve görüş alanı sınırlandırılmış, pabuçluk duvarlarında yer alan kemerli çiçeklikler ile bu bölüm vurgulanmıştır. Bu kattaki özgün dolap, kapı ve donatılar ahşap çatkı tekniği ile yapılmıştır (Görsel 19).

Kaynak: E. Karataş, 2023.

Görsel 19: *İsmail Bey Konağı Oda-2'de tekne tavan ve kalem işi süslemeler (solda) ve kapı duvarı, paravan ve yüklük (sağda).*

Üst kattaki sofa ve odalarda eşsiz süsleme ve bezeme elemanları bulunmaktadır. Başoda, Oda-2 ve Oda-3'te bulunan tavanlarda kündekâri ve çıtakari teknikleri birlikte kullanılmıştır. Oda-4, sofa ve eyvanların tavanlarında sadece çıtakari tekniğinin kullanıldığı görülmektedir. Başoda, Oda-2 ve sofanın tavan pervazları ile oda duvarlarında özenle yapılmış bitkisel motifli kalem işi süslemelere yer verilmiştir. Başoda ve sofa tavanlarının ahşap yüzeyleri boyalıdır ve kalem işi süslemeler içermektedir (Görsel 19, Görsel 20).

Kaynak: E. Karataş, 2023.

Görsel 20: *İsmail Bey Konağı'nın başodasının tekne tavanı ve bezemeleri (solda) ve sofa tavanı ve bezemeleri (sağda).*

f. Korunmuşluk durumu: Konak özgünlüğünü ve yapısal bütünlüğünü genel olarak muhafaza etmektedir. Ancak yapının taş yığma olan alt ve bodrum kat duvarlarının köşe bölgelerinde tehlike arz eden yapısal çatlaklar bulunmaktadır. Yapının özellikle zemine yakın bölgelerinde nem, su maruziyeti (kapiler yükselme ve yağış) ve termal genleşme-büzülme sebebiyle bağlayıcı malzemede kayıp olduğu görülmektedir. Yapı cephelerinde pencerelerin büyütülmesi, küçültülmesi ve doğramaların değiştirilmesi gibi özgünlüğe zarar veren bazı işlemler uygulanmıştır. Ayrıca cephelerde özgün olmayan çimento esaslı sıva izleri görülmektedir (Görsel 17). Yapının üst kat tavanlarında, özellikle Oda-4 ve eyvanda, geçmişte su alması sebebiyle, ahşap malzemede ve sıvalarda ciddi bozulmaların olduğu gözlemlenmiştir. Çatı örtüsü gördüğü hatalı onarım sebebiyle özgünlüğünü yitirmiştir fakat hâlihazırda iç mekânı korumaktadır.

2.3. Halil Bey Konağı

a. Konumu ve tarihi: Konak, Karabük'ün Eskipazar ilçesinin Tamışlar köyünde, köyün güneybatısında, İsmail Bey Konağı'nın yakınında (güneydoğusunda), ondan daha alt kotta yer almaktadır (Görsel 11). Konağın günümüzdeki hissedarları, Hasan Çavuşzade Hüseyin Ağa'nın oğlu Halil Bey'in torunlarıdır. Hissedarlardan birinin soyağacı bilgilerine ve yapıdan elde edilen verilere dayanarak konağın Halil Bey tarafından, 19. yüzyılın ikinci yarısında yaptırılmış olduğu tahmin edilmektedir[67] (Görsel 21).

Kaynak: E. Karataş, 2023.

Görsel 21: *Halil Bey Konağı'nın kuzeydoğu perspektifi (solda) ve doğu cephesi (sağda).*

b. Mekân organizasyonu: Konak, bodrum, alt ve üst kat olmak üzere üç kattan oluşmaktadır. Yapının zemin oturumu yaklaşık 160 m²'dir. Bina, kuzey-güney doğrultusunda 23/100 olan arazi eğimine uygun olarak

[67] "Alt-Üst Soy Bilgisi Sorgulama," e-Devlet Kapısı Uygulaması, erişim 17 Haziran 2023, https://www.turkiye.gov.tr/nvi-alt-ust-soy-bilgisi-sorgulama.

arsanın kademeli şekilde kazılmasıyla inşa edilmiştir. Bodrum kat ahır olarak kullanılırken, alt kat hem servis ve depolama mekânlarını hem de yaşama mekânlarını içermektedir. Üst kat ise, incelenen diğer iki konakta olduğu gibi, konak sahiplerinin yaşama katı olarak tasarlanmıştır (Görsel 22).

Kaynak: A. Özköse, 2023.

Görsel 22: *Halil Bey Konağı rölöve çizimleri.*

Konağın ana girişi alt katta bulunan taşlık mekânının kuzeyinden sağlanmaktadır. Taşlıktan sadece ardiyeye ve sofaya doğrudan geçilebilmektedir. Bu katta taşlığın güneyindeki orta sofanın etrafını, ocağı olan bir oda ve aşevinin yanı sıra kiler, abdestlik, ardiye, ambar, aralık ve merdiven evi çevrelemektedir. Kiler bölümüne aşevinden, helaya abdestlikten, üst kata çıkan merdivenlere ise aralıktan geçiş yapılmaktadır. Bu katın kat yüksekliği yaklaşık 2,75 metre olarak ölçülmüştür.

Bodrum kat, kot farkından yararlanılarak yapının güney bölümünde bulunan yaklaşık 90 m² alana, güney cephesi açığa çıkacak şekilde konumlandırılmıştır. Bu katta, ahır ve ahırdan geçilerek ulaşılan daha küçük bir mekân (gümelik) bulunmaktadır. Kat yüksekliği 1,85-2,45 metre arasında değişkenlik arz etmektedir.

Üst kat, incelenen diğer iki yapıya benzer biçimde farsi köşeleri olan (sekizgen) bir orta sofa ve etrafındaki mekânlardan oluşmaktadır. Dört köşede odalar, sofanın kuzey ve güneyinde eyvanlar, batısında sandık odası ve abdestlik, doğusunda ise merdiven evi ve aralık bulunmaktadır. Bu katta bulunan sandık odasına doğrudan sofadan, helaya ise abdestlik mekânından ulaşılmaktadır. Odaların dördünde de ocaklar mevcuttur. Manzara, oda düzeni ve detaylardan güneydoğudaki odanın başoda olarak tasarlandığı anlaşılmaktadır. Sofanın tavanı, incelenen diğer konaklarda olduğu gibi odalar ve diğer mekânlara göre daha yüksek inşa edilmiştir (Görsel 22).

c. Yapım sistemi ve malzeme: Konağın duvarları, bodrum kat duvarlarının iç mekânlara bakan bölümü hariç olmak üzere, tamamen sıvalıdır. Ancak yapı tipolojisinden ve duvar kalınlıklarından bodrum kat ile alt katın kuzeyinde kalan cephe duvarları ve bazı iç duvarların taş yığma; alt katın diğer duvarları ile üst katın ise ahşap iskelet sistem ile inşa edildiği anlaşılmaktadır. Döşemeler ahşap malzemeden imal edilmiştir. Genellikle servis ve depo mekânları haricinde kalan mekânların tavanları tavan tahtaları ile kaplanmıştır. Kapı-pencere ve diğer iç donatılar ahşap malzemeden imal edilmiştir.

d. Cephe Özellikleri: Yapı kuzey-güney doğrultusunda yaklaşık 11,90 metre, doğu-batı doğrultusunda ise yaklaşık 14,25 metre cephe uzunluğuna sahiptir. Bu konakta, Halim Bey Konağı'na benzer bir biçimde, hiçbir cephede çıkma bulunmamaktadır. Batı cephesindeki hela ve abdestlik bölümü, bina yüksekliği boyunca dışarı taşırılmıştır. Taş yığma sistem ile yapılan duvarlar büyük ölçüde sağırdır. Buradaki mekânlar küçük açıklıklarla (tömek) aydınlatılmıştır. Üst kat daha fazla sayıda pencereye sahip ve daha aydınlıktır. Oda ve eyvanların pencereleri yaklaşık 1/2 oranında, ahşap kapaklı ve ahşap parmaklıklıdır. Servis ve geçiş mekânlarındaki küçük boyutlu açıklıklarda muşabaklar kullanılmıştır. Bütün cephe sıvalı ve beyaz badanalıdır (Görsel 21).

e. Detaylar: Konağa genel olarak sade ve süslemesiz bir tasarım hâkimdir. Yapıdaki ahşap işçiliklerin özenli olduğu görülmektedir. Odalarda klasik Osmanlı-Türk evi oda düzeni uygulanmıştır. Oda tasarımında ocaklar önemli bir öge olarak, çiçeklikler ise odaların pabuçluk duvarını öne çıkartan bir unsur olarak vurgulanmaktadır. Bunların yanı sıra iç donatı olarak ahşap malzemeden imal edilmiş sedirler, gusülhaneler, yüklükler, dolaplar, oyma raflar (gözgöreler) ve paravanlar kullanılmıştır.

Ahşap detaylarda çakma ve çatkı sisteminin kullanıldığı görülmektedir. Dış kapılar, taşlık-sofa kapısı ve hela kapıları çakma, diğer kapılar çatkı sistemle imal edilmiştir. Alt katta ve üst katta Oda-3'te bulunan dolapların yapımında ahşap çakma, diğer odalarda bulunan dolapların yapımında ise ahşap çatkı tekniği kullanılmıştır. Tavanlar düz ve çıtalı tavan olarak inşa edilmiştir. Üst katta bulunan sofa ve başodada çıtakâri teknikle yapılmış, dairesel tavan göbekleri mevcuttur (Görsel 23).

Kaynak: E. Karataş, 2023.

Görsel 23: *Halil Bey Konağı'nın üst katında bulunan başodanın ocak, dolap, sedir ve pencere düzeni (solda) ve sofadan kuzeydeki eyvana bakış (sağda).*

f. Korunmuşluk durumu: Yapının bütün duvarlarının sıvalı olması sebebiyle düşey taşıyıcılarda detaylı inceleme yapılamamakla birlikte, büyük bir yapısal sorun tespit edilmemiştir.

Yapı zemininde su ve nem için yeterli tedbirler bulunmamaktadır. Bu sebeple zemin-duvar birleşimleri sürekli olarak suya ve neme maruz kalmaktadır (Görsel 21). Ayrıca çatı örtüsünün bazı bölgelerinde görülen sorunlar sebebiyle üst kat iç mekânlarının yer yer su aldığı görülmektedir (Görsel 23). Bu durumun ahşap işçilikleri için ilerleyen süreçte daha büyük sorunlara yol açabileceği değerlendirilmektedir.

3. Karşılaştırma ve Değerlendirme

Anadolu Selçuklu Dönemi'nde, Anadolu'daki göçebe Türkler, boylar, oymaklar ve obalar hâlinde yaşıyorlardı. Birimlerin her birisinin başında bir bey bulunmakta ve bu beylik babadan oğula geçmekteydi[68]. Kırsal alanlardaki Türk yerleşimlerinin oluşumunun başlangıcındaki bu yapı ve Osmanlı'nın son dönemde uygulanan devlet politikası, toprak ve vergi sistemi (iltizam sistemi), Viranşehir sancağındaki kırsal alanlarda ekonomik gücün belirli kişi ve ailelerde toplanması sonucunu doğurmuştur. Bölgedeki ailelerin, Osmanlı Devleti'nin merkezi yönetimi ve saray ile olan ilişkileri sayesinde zenginleştikleri, güç sahibi oldukları ve bu ailelerin yaptırdıkları mimari eserlerin de aynı derecede zengin unsurlar içerdikleri gözlemlenmektedir. Kahvecizadeler, Hazinedaroğulları ve Hasan Çavuşzadeler, bölgedeki kırsal alanlarda yaşamayı tercih eden, bu zengin ve güçlü ailelere örnek olarak verilebilir[69]. Zenginleşen aileler yörenin kırsal alanlarında, şehirdekilerle yarışacak kadar zengin mimari unsurlara sahip, büyük konaklar yaptırmışlardır. Viranşehir sancağının kırsal alanları bu tarihî ve kültürel mirasın bir kısmını hâlâ barındırmaktadır. Safranbolu şehri yakınların-

daki bir Türkmen yerleşimi olan Yörük köyü, eskiden Rum halkın da yaşadığı Bulak ve Yazıköy köyleri ve günümüzde Karabük'ün Merkez ilçesine bağlı köylerden olan Güneşli ve Ödemiş bu zengin mimari örneklere sahiptir (Görsel 24).

Kaynak: E. Karataş, 2022.

Görsel 24: *Viranşehir sancağının kırsalında varlıklı ailelere ait Bulak köyündeki Âyanlar Konağı (solda), Güneşli köyündeki Bakıbeyoğlu Konağı (ortada) ve Ödemiş köyündeki Yusuf Ağa Konağı (sağda).*

Karabük ilinin Eskipazar ilçesi kırsalında yer alan ve Hasan Çavuşzadeler tarafından 19. yüzyılın ikinci yarısında yaptırılan Halim Bey, İsmail Bey ve Halil Bey konaklarının birbirlerine benzer mimari biçim ve üsluplara sahip olduğu görülmektedir. Üç katlı olarak inşa edilmiş olan yapılar, topografik verilere uygun olarak tasarlanmıştır. Yapım sistemleri, yığma taş üzerine ahşap iskelet sistemidir. Yapıların bodrum ve alt katları, arazi kotlarına uyumlu olacak şekilde, çevresel etkenler (yol, yön, giriş kotu vb.) göz önüne alınarak tasarlanmıştır. Esas yaşam katı olan üst kat ise, üç yapıda da benzer bir plan şemasına sahiptir. Üst katlar, sekiz köşeli haçvâri orta sofalı plan tipinin yapılara uyarlanması ile elde edilmiştir. Bu kat sofanın dört köşesinde bulunan odalar, odaların arasındaki eyvan, kiler, sandık odası, merdiven evi, aralık ve abdestlik gibi mekânlardan oluşmaktadır. Sofalar diğer mekânlardan yüksek olarak tasarlanmıştır. Sofaların tavan-duvar birleşimleri İsmail Bey ve Halil Bey konaklarında yuvarlatılarak pahlanmıştır. Odalarda, Osmanlı-Türk evi oda düzeninde kurgulanmış, mimari bir eleman olarak öne çıkartılmış ocaklar, pencerelerin önünde bulunan sedirler, ahşap detaylar içeren dolaplar ve oyma raflar (gözgöreler), odaların pabuçluk (giriş) bölümünde mahremiyeti sağlayacak şekilde konumlandırılmış paravan ve gusülhane-yüklükler ve pabuçluk duvarını vurgulayan çiçeklikler bulunmaktadır. Yapıların cepheleri sade, çıkmasız ya da tek cumbalıdır. Her üç konağın da kapı ve dolaplarında ahşap çakma ve çatkı; tavanlarında ise çıtakâri tekniğinin kullanıldığı görülmektedir. Diğer taraftan İsmail Bey Konağı, üst katta bulunan odalarında ve sofasındaki kündekâri tekne tavan detayları ve kalemişi süslemeleri bakımından diğer iki yapıdan ayrılmaktadır (Tablo 1).

Tablo 1: *Halim Bey, İsmail Bey ve Halil Bey konaklarının karşılaştırılması*

Özellikler	Halim Bey Konağı	İsmail Bey Konağı	Halil Bey Konağı
Konum	Kıranköy Mah. (Eskipazar)	Tamışlar köyü (Eskipazar)	Tamışlar köyü (Eskipazar)
Yapım tarihi	19. yüzyılın ikinci yarısı	1871-72 (miladi)	19. yüzyılın ikinci yarısı
İşlevi	Konut	Misafir evi ve müştemilat	Konut
Yaptıran	Hasan Bey (Hüseyin Ağa'nın torununun oğlu)	İsmail Bey (Hüseyin Ağa'nın oğlu)	Halil Bey (Hüseyin Ağa'nın oğlu)
Kat sayısı	3 kat (bodrum, alt ve üst)	3 kat (bodrum, alt ve üst)	3 kat (bodrum, alt ve üst)
Arsa eğimi	20 /100 (yüzde yirmi)	20 /100 (yüzde yirmi)	23 /100 (yüzde yirmi üç)
Zemin oturumu	158,50 m²	219 m²	160 m²
Toplam alanı	396,50 m²	559 m²	416,50 m²
Yapım sistemi	Yığma taş üzeri ahşap çatkı (yeğdane)	Yığma taş üzeri ahşap çatkı (yeğdane)	Yığma taş üzeri ahşap çatkı (yeğdane)
Plan şeması	Sekiz köşeli orta sofa	Sekiz köşeli orta sofa	Sekiz köşeli orta sofa

Özellikler	Halim Bey Konağı	İsmail Bey Konağı	Halil Bey Konağı
Bölümleri	Başoda, oda, aşevi, sofa, eyvan, abdestlik-hela, taşlık, depo	Başoda, oda, sandık odası, kiler, sofa, eyvan, abdestlik-hela, taşlık, depo	Başoda, oda, aşevi, sofa, eyvan, abdestlik-hela, taşlık, depo-ambar, ahır
Oda düzeni	Osmanlı-Türk evi oda düzeni	Osmanlı-Türk evi oda düzeni	Osmanlı-Türk evi oda düzeni
Cepheleri	Sade ve çıkmasız	Sade ve tek cumbalı	Sade ve çıkmasız
Detaylar	Sade tasarım, kapı ve dolaplarda çakma ve çatkı ahşap işçiliği, tavanlarda çıtakari detaylar	Sofa ve odalarda kalem işleri, kapı ve dolaplarda çakma ve çatkı işçilik, tekne tavanlarda kündekari ve çıtakari detaylar	Sade tasarım, kapı ve dolaplarda çakma ve çatkı ahşap işçiliği, sofa ve başodada çıtakari detaylar

Tehditler	Duvarlarda parça kayıpları, zemin kaynaklı su ve nem, tabiat şartları, bacalardaki yıpranmalar	Yapısal çatlaklar, zeminden kaynaklanan su ve nem, tabiat şartları (termal etki, yağış vb.)	Zeminden kaynaklanan su ve nem, çatı örtüsündeki yıpranmalar

Kaynak: E. Karataş ve A. Özköse, 2025.

Kuban'a göre Osmanlı-Türk evinin 19. yüzyılda inşa edilen örneklerinde, giriş kat servis mekânlarının bulunduğu yer olarak serbestçe tasarlanmıştır. Aynı dönemde üst katlarda uygulanan haç biçimli orta sofalı plan tipi, simgesel özelliklerinden dolayı şehirli ve zengin ailelerin konaklarında kullanılmıştır[70]. Bu tür örneklerin yaygınlığı İstanbul tarzının etkisiyle açıklanmaktadır[71]. Akın, Osmanlı-Türk evinde uygulanan yükseltilmiş ve köşeleri pahlanmış tavanlı, sekiz köşeli orta sofalı plan şemasının batı etkisiyle ortaya çıkan eliptik sofadan bir önceki aşama olduğunu belirtmektedir[72].

Günay'a göre, 19. yüzyılda, Osmanlı mimarisindeki batı etkisi sebebiyle ve ekonomik gerekçelerle, Osmanlı-Türk evinin cephe düzeni daha sade bir hâl almıştır. Bu dönemde çatkılar sıvalı, saçaklar küçük, çıkmalar daha azdır ve cephelerde kâgir (yığma) mimari taklit edilmiştir[73]. Aynı dönemde, konakların iç mekânında, tavan şekillerinde barok motifler ve odalarda bitkisel bezemeler ön plandadır. Batı etkisiyle yaygınlaşan vazolu panolar ve bitkisel motiflerin iç mekânda kullanılması, III. Ahmed'in Topkapı Sarayı'ndaki Yemiş Odası'na dayandırılmaktadır. Gültekin, Anadolu'nun batısında sıklıkla görülen bu tarz süslemelerin, İstanbul'daki hayata özenen taşradaki ayan ve eşraf tarafından yaygınlaştırıldığını belirtmektedir[74].

Eskipazar'ın iki farklı kırsal yerleşiminde incelenen üç konak, biçimleniş, mekân kurgusu, cephe düzeni, süsleme ve detaylar bakımından, 19. yüzyılda batı etkisiyle gelişmiş ve şehir mimarisinde varlıklı aileler tarafından uygulanan yapı tarzıyla büyük oranda benzerlik göstermektedir. Konaklar, bölgenin coğrafi ve iklimsel özelliklerine uygun bir tasarım içerisinde, Hasan Çavuşzade Ailesi'nin geçmişte elde ettiği sosyal, ekonomik ve siyasal güce atıf yapmaktadır. Bu yapıların kültürel ve mimari açıdan bölgedeki geleneği zenginleştirdiği ve ailenin yapılarda bulunan ayrıntılarda (süslemeler, cephe düzeni, plan şeması, kat yükseklikleri vb.) kendi şahsiyetlerini hissettirdikleri dikkate değerdir.

Aile siyasal gücünü kaybetmeden önce yaptırılan eserlerin, incelenen konaklara oranla daha görkemli ve kamusal nitelikte olduğu görülmektedir. Örneğin, Safranbolu'daki bazı konakların selamlıklarında rastlanan havuz ögesi, Hasan Çavuşzade Hüseyin Ağa'nın yaptırdığı Havuzlu Asmazlar Konağı'nda bir derebeyine yakışır boyutlardadır. Eskipazar Kıranköy'deki Musa Bey ve Hüseyin Bey konakları seçkin ve varlıklı ailelerin konaklarında olduğu gibi hamamlı olarak tasarlanmıştır. Eskipazar Merkez ve Hanköy köyünde bulunan hanlar ise yörede sadece şehir içi hanlarda görülen büyük bir orta avluya sahiptir.

Korumanın ilk aşamasında, Eskipazar'ın yakınında bulunan Safranbolu şehir merkezindeki geleneksel konutlar, Osmanlı-Türk evlerinin en iyi örnekleri olarak genelleştirilmiş, kasabalar ve kırsal alanlar daha az dikkate alınmıştır[75]. Safranbolu, 1994 yılında, UNESCO Dünya Miras Listesi'ne ise sadece tarihî şehir merkezi dikkate alınarak dahil edilmiştir. Ancak son yıllarda yapılan araştırmalar, bölgedeki tarihî ve kültürel bağlamı keşfetmeyi hedeflemektedir. Bu çalışmalarla Osmanlı Devleti'nin siyasal, sosyal ve kültürel yapısının fiziksel mekâna yansımaları daha detaylı olarak ortaya çıkarılmaya başlanmıştır. Yapılan araştırmalar, Osmanlı'nın gözde taşra kasabalarından olan Safranbolu kadar, Safranbolu'nun yakınlarındaki kırsal yerleşimler ve kasabaların da benzer zenginlikteki mimari değerlere sahip olduğunu göstermektedir. Bu eserlerin önemli bir bölümü Türk-Müslüman, bir bölümü de Rum-Hristiyan halkın sosyokültürel, ekonomik ve siyasal durumunu yansıtmaktadır[76].

Sonuç

1831 yılında İstanbul'da âyan ve kapucubaşı olarak görevler üstlenen Hasan Çavuşzade Hüseyin Ağa[77] ve ailesinin dönemin başkenti İstanbul ve saray ile köklü ilişkileri olduğu anlaşılmaktadır[78]. Kendilerine şehrin karmaşasından uzakta güvenli bir yer arayan ailenin yerleşmek için tercih ettiği yerlerin kırsal alanlardaki dere boylarında ve kervan yollarının üzerinde olması, Hüseyin Ağa ve oğlu Musa Bey için kullanılan "derebey" ifadesinin coğrafi olarak da haklılığını göstermektedir. Aile, konum tercihleri sayesinde verimli arazilerden yararlanmış ve ticareti kontrol altına almıştır. Ayrıca hanlar gibi stratejik yapılar inşa edip işleterek istihbarat elde etmiş oldukları da düşünülmektedir.

Hasan Çavuşzadeler siyasal güce sahipken, büyük ölçekli ve kamusal yapılar inşa ettirmiştir. Siyasal gücün kaybedilmesinden sonra inşa edilen ve bu çalışma kapsamında detaylı olarak incelenen üç konağın ise daha mütevazi boyutlara ve mimari tarza sahip olduğu görülmektedir. Fakat bu yapılarda ailenin karakterine uygun olarak dönemin varlıklı aileleri tarafından bölgede de benimsenen Batı ve İstanbul etkisiyle şekillenmiş şehirli bir tarzın kullanıldığı tespit edilmiştir.

Bu çalışma kapsamında araştırılan yapılardan Havuzlu Asmazlar Konağı (Tarih/No: 27.11.1990/1500), Musa Bey Konağı'nın sadece hamam kısmı (Tarih/No: 5.4.2013/823), Musa Bey Hamamı (Tarih/No: 7.6.2013/956), İsmail Bey Konağı (Tarih/No: 7.6.2013/954) ve Tamışlar köyündeki camii (Tarih/No: 7.6.2013/954), Karabük Kültür Varlıklarını Koruma Bölge Kurulu'nun kararlarıyla "Korunması Gerekli Taşınmaz Kültür Varlığı" olarak tescil edilmiştir. Ancak yapılan araştırmada Hasan Çavuşzadeler tarafından yaptırılan ya da onarılan diğer yapıların henüz yasal koruma altında olmadığı anlaşılmıştır.

1970'lerde başlayan, Safranbolu'daki mimari mirası koruma faaliyetleri sonucunda, 1994'te şehrin UNESCO Dünya Miras Listesi'ne dahil edilmesiyle, şehirdeki mimari miras öne çıkmıştır. Ancak şehrin çevresindeki dar alanda kültürel mirasın korunması için alınan önlemler kırsal alanlar için oldukça yetersizdir. Gerek mülk sahipleri, yerel halk ve yetkililerin bu değerlere yeterli ilgiyi göstermemesi gerekse kaynakların yetersizliği, kültürel mirasın hızla yok olmasına sebep olmaktadır. Bölgede, öncelikle bu tür tarihî belge niteliğindeki kültürel mirasın sürdürülebilir kılınmasına odaklanan bilimsel araştırmaların ve bilinçlendirme faaliyetlerinin teşvik edilmesi, buna yönelik geliştirilen projelerin uygulanabilirliğinin halkın da katılımıyla artırılması önerilmektedir.

Hakem Değerlendirmesi: Dış bağımsız.
Çıkar Çatışması: Yazarlar çıkar çatışması bildirmemiştir.
Finansal Destek: Yazarlar bu çalışma için finansal destek almadığını beyan etmiştir.
Teşekkür: Araştırma sırasındaki katkıları için Hasan Çavuşzade Ailesi'nin günümüzdeki varislerine ve Mimar Muhammet Enes Göktaş'a teşekkürlerimizi sunarız.

Peer Review: Externally peer-reviewed.
Conflict of Interest: The authors have no conflict of interest to declare.
Grant Support: The authors declared that this study has received no financial support.
Acknowledgement: We would like to express our gratitude to the current members of the Hasan Çavuşzade Family and to Architect Muhammet Enes Göktaş for their valuable contributions during the research.

Life cycle embodied energy

Abstract

Fit-out waste generated during building refurbishments has significant environmental consequences, accounting for substantial portions of construction and demolition waste. Over a 50-year lifespan, the total waste generated by a rentable office was found to be approximately four times higher than that of a standard office, while implementing open-plan layouts and movable partitions reduced embodied energy by up to 61.3% and embodied energy loss by 84.3%, respectively.This study investigates the effectiveness of flexible interior strategies—open-plan layouts and movable partition systems—in mitigating the environmental impacts associated with fit-out waste in rentable offices. The analysis, structured around three hypotheses and four office typologies, covers the production, replacement, and refurbishment stages of the building life cycle and evaluates total waste, life cycle embodied energy (LCEE), and embodied carbon (EC).The findings highlight that flexibility-oriented design strategies can significantly reduce material turnover and resource inefficiency in the building sector. However, strategies such as recycling, reuse, and the economic aspects of the interventions are excluded from the scope of this study.

1. Introduction

The emergence of high-rise office buildings can be traced back to the post-Industrial Revolution era, when the accumulation of capital and increasing urban employment created a demand for new typologies of office space. The earliest examples of high-rise offices appeared in the late 19th century, particularly in the urban centers of New York and Chicago, where land scarcity and population density necessitated vertical construction [1]. Throughout the 20th century, as high-rise buildings proliferated, design strategies prioritizing daylight access, open-plan layouts, high ceilings, and compact service cores were adopted to enhance rentability [2].

In the contemporary era, high-rise offices are widely categorized under terms such as ‘flexible office’ [3] and ‘rental office’ [4], reflecting changing work styles and user expectations. These buildings now dominate the skylines of metropolitan cities. According to a recent study of 54 high-rise buildings in Istanbul, Ankara, and Izmir, approximately 24% of them function as office spaces [5].

Notably, in rental buildings, spatial modifications may occur not only during occupancy but also in the pre-occupancy phase.

These interventions often generate considerable volumes of construction and demolition (C&D) waste and accelerate material consumption [6, 7]. C&D waste results from construction, renovation, and demolition phases and accounts for 10–30% of global landfill waste [8, 9]. Within this category, fit-out waste—originating from tenant-specific interior alterations—constitutes 10–20% of C&D waste and has disproportionately high embodied environmental impacts [10, 11]. In this context, the life cycle of rental offices exerts considerable pressure on ecological systems, contributing to air, water, and soil pollution, and exacerbating climate change [12].

A Swedish study reported that refurbishment-related waste in office spaces amounts to 31–38 kg/m², with an associated embodied carbon footprint of 93–96 kg CO_2e/m^2 [13]. Likewise, Eberhardt et al. [14] found that building materials in long-lifespan office buildings (80+ years) were responsible for 72% of total greenhouse gas emissions and 50% of primary energy use. During tenant transitions, walls and ceilings account for over 70% of the generated waste [15], and material production was identified as the leading contributor to embodied carbon, surpassing impacts from construction or end-of-life phases [16].

Addressing waste at its source has gained momentum in sustainable construction discourse. The waste management hierarchy emphasizes reduction, reuse, and recycling, with minimization regarded as the most effective strategy [17, 18]. Researchers argue that minimizing waste during the design stage is crucial to reducing life-cycle emissions [9].

Flexible building design has been proposed as a viable strategy, allowing spatial adaptability without demolition and thereby reducing material turnover and fit-out waste. Li & Yang [19] emphasized the need for innovative design strategies for waste reduction in office interiors. Forsythe and Fini [20] quantified that up to 55% of fit-out waste in Australian office refurbishment projects ends up in landfills, primarily due to rigid space planning and materials that are difficult to disassemble.

Salgın et al. [6], in a study on a multifunctional public building in Kayseri, demonstrated the value of maximizing vertical and horizontal openings to allow different spatial uses over time. Similarly, Mateus et al. [21] found that movable partitions enhance both flexibility and sustainability by minimizing waste generation. Modular components such as raised floors, suspended ceilings, and demountable panels are seen as essential features of adaptable office interiors [22, 23].

Although the environmental implications of tenant changes have been examined in terms of waste quantification [20], life-cycle cost assessment [24], and flexible interior systems [14], few studies have addressed the embodied energy and carbon impacts of such transformations, particularly in the context of megacities. Moreover, the environmental impact of interior flexibility have rarely been quantified through life cycle assessment (LCA) methods. To address this research gap, the present study evaluates how flexible interior strategies in rentable offices can mitigate fit-out waste, embodied energy (EE), and embodied carbon (EC). “Embodied energy loss” is also introduced to highlight the resource inefficiencies associated with premature removal of building components. As waste prevention is the primary step in the waste management hierarchy, this study contributes to the environmental sustainability agenda of urban office design. This study was conducted to guide designers, office owners, and material manufacturers toward more durable and resource-efficient building applications. While the scope of this study focuses on environmental indicators such as embodied energy, carbon emissions, and waste production, the results may also form a basis for future research integrating the economic and investment aspects of sustainable office design. Economic aspects, reuse and recycling strategies are excluded from the scope of this study.

2. Material and Methodology

This section outlines the materials and methodological framework employed in the study. The methodology is structured around the testing of

three core hypotheses concerning the environmental implications of flexible interior design strategies in rentable office buildings.

2.1. Objective, assumptions, and delimitations

The primary objective of the study is to evaluate how flexible design strategies—specifically open-plan layouts and movable partition walls—affect environmental outcomes in rentable offices. The analysis focuses on four office types located in Ankara, Türkiye's capital city, assessing parameters such as waste generation, total embodied energy (LCEE), energy losses, and global warming potential (GWP) across the building life cycle.

Three hypotheses were formulated and tested across four office typologies. In defining these hypotheses, multiple user and material change scenarios were established. The study is limited to the GWP category; other environmental impact indicators (e.g., acidification, eutrophication), strategies such as recycling, reuse and economic aspect of the strategies are excluded from scope.

The study examines four office configurations to evaluate the influence of flexibility strategies on material consumption and environmental impact:

Office 01: S – Standard office with a closed-plan layout and fixed partitions (no tenant change assumed)

Office 02: RCF – Rentable office with closed-plan layout and fixed partitions

Office 03: ROF – Rentable office with open-plan layout and fixed partitions

Office 04: RCM – Rentable office with closed-plan layout and movable partitions

In the standard office, material replacement occurs only upon reaching the end of service life (B4 phase), whereas in rentable types, material changes are triggered by tenant transitions.

The assumed service life of the office unit is 50 years, consistent with similar studies [14, 25]. Lease duration is defined as five years, based on real estate consultant interviews and literature, indicating typical tenant turnover for office spaces under 1000 m² [10]. It is assumed that the initial tenant is a non-health-related business, followed by a health sector occupant—triggering interior modifications—repeating every five years. Two sensitivity analyses were conducted to determine the influence of these parameters.

Interior wall material, floor and ceiling coverings were considered as having the largest area and are the most frequently replaced materials. The building materials of the offices were selected as carpet tiles and linoleum on the floor, gypsum panels and glass on the walls, paint for open ceilings and gypsum panels for suspended ceilings to match the types of companies. Paint and rock wool applied with gypsum board/panel also taken into consideration. In addition, a movable partition wall made of medium density board (MDF) was applied as a separate scenario for both health-related and non-health-related office types.

Material properties (density, unit mass, service life, unit embodied energy) were collected from Environmental Product Declarations (EPDs). The One Click LCA software was employed to calculate GWP using EN 15978 methodology [26]. This platform is widely used in LCA-based research in the building sector due to its comprehensive material database [27, 28].

Environmental impacts were evaluated over the life cycle stages A1–A3 (production), B4 (replacement), and B5 (refurbishment). Following Moisio et al. [29], B4 encompasses replacements due to end-of-life; B5 covers changes due to user needs (e.g., tenant changes). Obrecht et al. [30] emphasize the importance of distinguishing between these cycles in environmental assessments.

Three hypotheses were tested:

- Hyp. A: Rentable offices generate greater amounts of fit-out waste (kg/m²) and higher life-cycle embodied energy (LCEE, MJ/m²) than standard offices.
- Hyp. B: Among rentable offices, those with closed-plan configurations produce more fit-out waste (kg/m²) and exhibit higher LCEE (MJ/m²) than open-plan equivalents.
- Hyp. C: Incorporating movable partitions instead of fixed ones in rentable offices reduces total fit-out waste generation (kg/m²) and improves LCEE (MJ/m²) performance.

These hypotheses were tested through a comparative LCA of four office typologies, where fit-out waste, LCEE, and EC were used as the main quantitative indicators. These indicators were examined by modeling four office types in Autodesk Revit, extracting material quantities through BIM schedules, and computing environmental data via One Click LCA. Material and occupancy scenarios were based on real estate data and tenant change patterns. A summary of the office typologies, service life, replacement cycles, simulation tools, databases, and core research themes is presented in Fig. 1.

To provide a clear overview of the research workflow, Fig. 1 summarizes the methodological steps followed in this study. Step 1 presents the selection of the case building and the context. Step 2 outlines the formulation of hypotheses and their relationship with office types. Step 3 illustrates the BIM-based modeling and data collection process. Step 4 shows the evaluation of the scenarios using One Click LCA and Excel. Finally, Step 5 presents the comparative analysis the results. These five stages collectively represent the methodological framework applied throughout the study.

2.2. Case study

The case study was selected based on representativeness and accessibility criteria. Ankara, the capital of Turkey, was chosen because it is a metropolis with a high concentration of office buildings and high-rise commercial structures, reflecting the country's contemporary building practices. The selected high-rise office building represents the modern office structures commonly found in metropolitan areas, featuring a central core and flexible office units suitable for various usage models. Further reasons for selecting the building include the availability of accessible data and architectural plans that facilitate embodied energy analysis. The building comprises 18 floors, each containing four separate office units measuring 234 m².

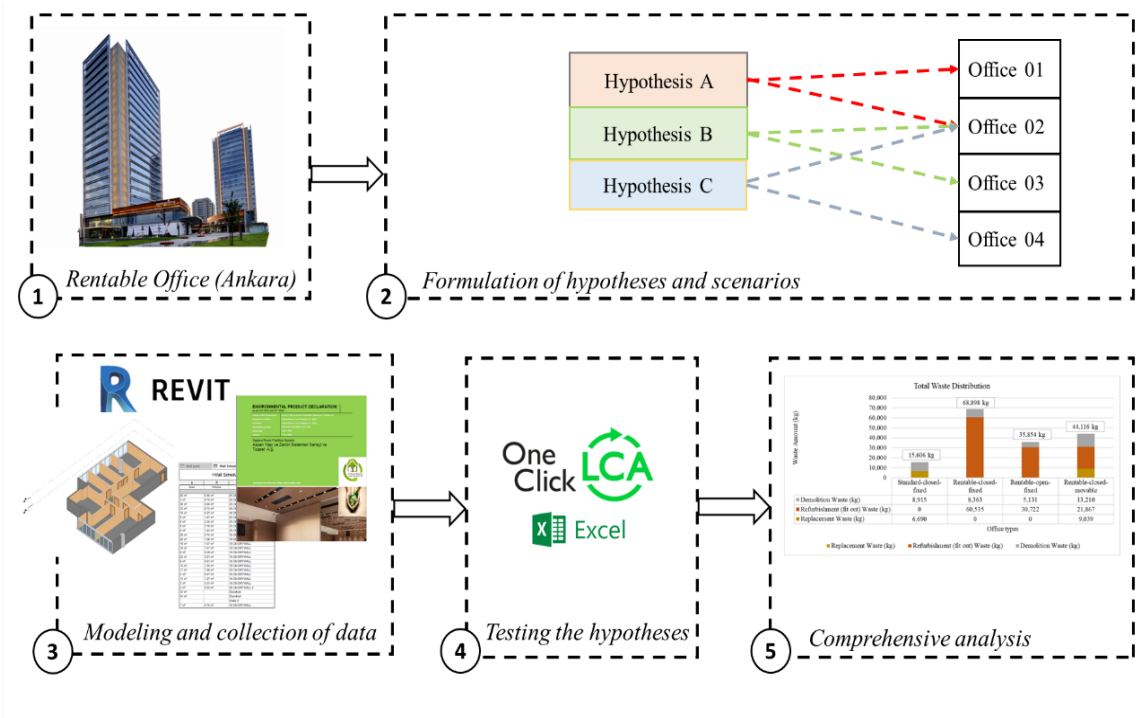

Fig. 1. Workflow of the study

For the purposes of this study, a single office unit was analyzed. The layout of the selected unit includes an entrance, six enclosed offices, a kitchen, a meeting room, and two restrooms. To develop an alternative office type based on spatial flexibility, an open-plan layout was also modeled by merging the individual office spaces with the entrance area (Fig. 2).

To obtain detailed and up-to-date information on rentable office practices, a semi-structured interview was conducted with the building's sales consultant. The interview aimed to gather qualitative data related to tenant behaviors, interior material choices, and the building's functional configuration. The key findings obtained from the interview, which form the empirical basis of this study, are summarized below:

- The average lease renewal or tenant turnover cycle is approximately every five years.
- Tenants generally belong to either the healthcare or non-healthcare sectors.
- Standard material finishes currently in use include:
  - ✧ Carpet tiles for flooring
  - ✧ Drywall for partition walls
  - ✧ Paint applied directly to open ceilings
- For tenants in the healthcare sector, alternative materials are often preferred for functional and hygienic reasons. These include linoleum flooring, glass partition walls, and plasterboard ceilings to facilitate natural lighting and maintain sanitary conditions.

2.3. Embodied energy and embodied carbon

Embodied energy (EE) refers to the total energy consumed throughout the life cycle of building materials, including their production, transportation, installation, maintenance, replacement, and eventual demolition [31]. Embodied carbon (EC), on the other hand, represents the amount of greenhouse gas emissions associated with these processes [32]. Both EE and EC are calculated by multiplying the unit value of a material (MJ/kg for EE or $kgCO_2e/kg$ for EC) by the material's total mass (kg).

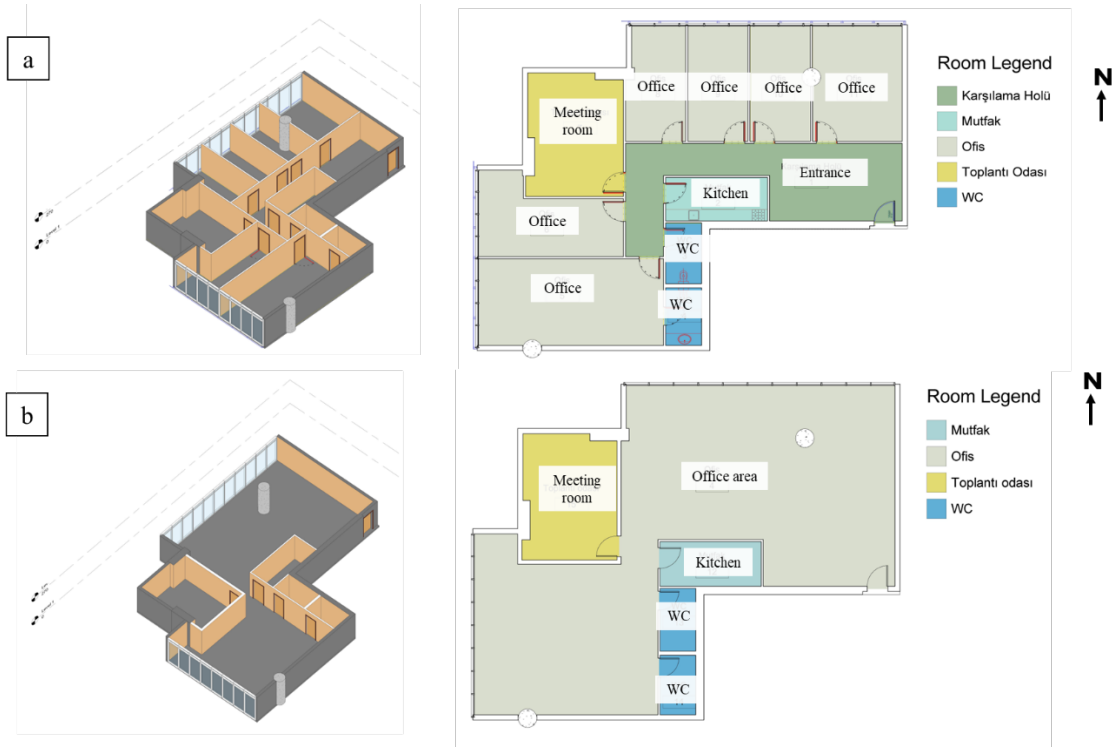

Fig. 2. The office unit with closed-plan (standard office) (a) and open-plan (b)

This study evaluates the lifecycle embodied energy (LCEE) and embodied carbon (EC) of an office unit over a 50-year service period. Calculations were performed manually using Microsoft Excel. The manual calculation method was selected because the Environmental Product Declarations (EPDs) for the analyzed materials were obtained directly from the manufacturers. Each EPD provides standardized environmental impact indicators per functional unit (e.g., 1 kg or 1 m^2). No LCA software was used in the study because it was not deemed necessary to re-enter the standardized values already available in the EPDs into a database. Since the scope of the study focused solely on the embodied carbon calculation (A1-A3, B4-B5 phases) of specific materials, there was no need for the modules of a comprehensive process-based LCA software. Manual calculations were obtained directly from EPD data in accordance with international standards (EN 15804 and ISO 14044).

The selection of building materials is based on the type of tenant sector—healthcare or non-healthcare. As detailed in Table 1, offices occupied by companies outside the health sector use gypsum board (including rock wool insulation and paint) for interior walls, carpet for flooring, and painted open ceilings. In contrast, healthcare offices use glass partition walls, linoleum flooring, and suspended gypsum panel ceilings to meet hygiene and lighting needs. Paint is assumed to be renewed with each tenant change, regardless of sector.

Service lives for materials exceeding 20 years in Environmental Product Declarations (EPDs) are standardized as 25 years to match evenly with the 50-year service life of the building. While most interior materials are assumed to be replaced at every tenant change (i.e., every 5 years), movable partition walls are assigned a replacement cycle of 25 years due to their reusability and spatial adaptability.

Both renewable and non-renewable resource consumption is included in the calculations. Building materials were selected based on proximity to the case study location and the availability of reliable EPDs from manufacturers (Table 2). For the movable and glass partition walls, material specifications were obtained through direct communication with a representative from Aspen.

This study introduces a concept termed "Embodied Energy Loss" (EEloss), which quantifies the energy wasted due to the disposal of a building material prior to the end of its expected service life. EEloss serves as an indicator of inefficiency in material utilization, particularly relevant in rentable office buildings where frequent interior refurbishments are common.

Table 1. Office types, plan layout and building materials

Office type	Company type	Plan scheme	Partition type	Floor	Wall	Ceiling	Frequency of tenant change
Standard	Non-health	Closed	Fixed	Carpet	Gypsum board	Paint	-
Rentable	Non-health	Closed	Fixed	Carpet	Gypsum board	Paint	5 years
Rentable	Health	Closed	Fixed	Linoleum	Glass	Gypsum board	5 years
Rentable	Non-health	Open	Fixed	Carpet	Gypsum board	Paint	5 years
Rentable	Health	Open	Fixed	Linoleum	Glass	Gypsum board	5 years
Rentable	Non-health	Closed	Movable	Carpet	MDF system	Paint	5 years
Rentable	Health	Closed	Movable	Linoleum	MDF system	Gypsum board	5 years

Table 2. Database of the selected building materials

Material	EE (MJ/kg)	EC (kgCO2e) (A1-A3)	Source
Gypsum board	4.2	1.72	[33]
Rock wool	32.12	19.6	[34]
Paint	25.7	1.72	[35]
Glass panel	75.2	115	Personel communication
MDF panel	50.2	73.2	Personel communication
Carpet tile	36.9	5.03	[36]
Linoleum	54.4	6.51	[37]

In the scope of this research, it is assumed that all waste is directed to landfills at the end-of-life stage. Therefore, tracking EEloss provides valuable insight into energy losses embedded in materials that are prematurely removed and discarded.

$$EE_{loss} = EE_m - [EE_m * (t_p / t_s)] * t \quad (1)$$

where:

EE_{loss} is the embodied energy loss (MJ),

EEm is the embodied energy required for manufacturing the material (MJ),

t_p is the actual time the material is used in the building (years),

t_s is the nominal service life of the material (years).

t represents the number of times the material is replaced or used over the building's 50-year lifecycle.

By incorporating EE_{loss} into the assessment, this study emphasizes the importance of material longevity and design strategies that reduce premature replacement, thereby supporting more sustainable construction practices.

2.4. Office utilization and material change scenarios

Tenant turnover in rentable office spaces typically results in the replacement of interior finishes—particularly wall partitions, flooring, and ceiling materials—leading to significant amounts of fit-out waste. In this study, it is assumed that each tenant occupies the office for a 5-year period, with alternating tenant types representing non-health-related sectors (e.g., software, architecture, law) and health-related sectors (e.g., medicine, chemistry, sports).

This tenant alternation cycle continues over the 50-year service life of the office unit, with interior materials being replaced at the end of each lease period. These recurring modifications simulate real-world refurbishment patterns that contribute to embodied energy losses and carbon emissions. The material change scenarios for each office type over the service life are detailed in Table 3, illustrating how different interior layouts and material strategies affect overall environmental performance.

Additionally, the waste generated throughout the life cycle of the office units was categorized under three main stages: refurbishment, replacement, and demolition. Waste resulting from the scheduled replacement of materials that have reached the end of their designated service life is classified under Stage B4 (Replacement). In contrast, premature removal of materials due to tenant changes—before the materials reach their end-of-life—is classified under Stage B5 (Refurbishment).

Based on the material usage sequence outlined in Table 3, materials installed by the final tenant and remaining in place at the end of the 50-year service life of the office unit are considered demolition waste, and are accounted for under Stage C1 (End-of-Life), as summarized in Table 4.

2.5. Effect of parameter variations on results

Due to the variability of input parameters, reliance on assumptions, and incomplete information, it is important to identify uncertainties through sensitivity analysis in LCA [38].

Table 3. Scenarios for material changes during the service life of the office

Years	Wall	Floor	Ceiling
1-5	Gypsum board	Carpet tile	Paint
6-10	Glass panel	Linoleum	Gypsum board
11-15	Gypsum board	Carpet tile	Paint
16-20	Glass panel	Linoleum	Gypsum board
21-25	Gypsum board	Carpet tile	Paint
26-30	Glass panel	Linoleum	Gypsum board
31-35	Gypsum board	Carpet tile	Paint
36-40	Glass panel	Linoleum	Gypsum board
41-45	Gypsum board	Carpet tile	Paint
46-50	Glass panel	Linoleum	Gypsum board

Table 4. Service life and frequency of change of building materials due to office type

Material	Service life	Replacement (B4) cycle	Refurbishment (B5) cycle
G. board	50	0	4 (rentable)
R. wool	50	0	4 (rentable)
Glass	25	0	4 (rentable)
Carpet	10	4 (standard)	4 (rentable)
Linoleum	25	0	4 (rentable)
Paint	5	9 (standard)	4 (rentable)
M.partition	25	1 (rentable)	0

*(G.board: gypsum board; R.wool: rockwool; M.partition: movable partition)

To assess the robustness of the results, a deterministic one-at-a-time (OAT) sensitivity analysis was performed by varying two key parameters (tenant turnover rate and building service life) by ±20% from its base value. The reason for selecting a ±20% variation range is that this is a standard value often accepted as the margin of uncertainty in material properties or model parameters [39]. The environmental impacts include total waste generation and embodied energy over the building's lifetime.

2.6. Data adjustment for benchmark comparison

To validate the findings, the waste quantities calculated in this study were compared with existing benchmarks in the literature. Since previous studies present waste amounts on a per square meter basis for single refurbishment events, the current results were normalized accordingly. The study assumes a 50-year service life for each office unit, with nine refurbishment cases and one demolition over this period. Accordingly, one-time refurbishment waste has been calculated using the following equation to make it comparable with other studies.

$$O_W = {}^{T_w}/_{n} \quad (2)$$

where:

O_w indicates waste amount per one-time refurbishment (kg/m²); Tw represents total refurbishment waste amount over 50 years (kg/m²); and n is the number of refurbishment cycles in 50 years. n is taken as 9.

3. Results and Discussion

This section presents the outcomes of the hypothesis testing outlined previously. The validity of Hypotheses A, B, and C is evaluated in sequence, followed by an analysis of the embodied environmental impacts of the applied flexible design strategies.

3.1. Hypothesis testing

Hypothesis A compares LCEE (MJ/m²) and total waste generation (kg/m²) of a standard office and a rentable office with a closed-plan layout and fixed partitions across life cycle stages A1–A3, B4, and B5. The findings reveal that the rentable office has a 7.3-fold increase in LCEE and a 4.4-fold increase in total waste compared to the standard office. Because all material service lives are multiples of the building's 50-year service life (5, 10, 25 years), the standard office incurs no EE loss, whereas the rentable office incurs more EE loss due to premature material replacements. Given that both LCEE and waste generation are lower in the standard office, Hypothesis A is validated.

To test Hypothesis B, two rentable office types with fixed partitions—one with a closed-plan and the other with an open-plan scheme—were compared. Results show that the open-plan layout reduces LCEE by 61.3%, EE loss by 64%, and total waste by 48% relative to the closed-plan layout. These findings confirm the validity of Hypothesis B.

Hypothesis C was evaluated by comparing rentable offices with closed plans utilizing either fixed or movable partitions. The use of movable partitions reduced LCEE by 38.1%, EE loss by 84.3%, and total waste by approximately 36% compared to fixed partitions. Thus, Hypothesis C is supported.

Overall, the open-plan layout proves to be most effective in minimizing total waste, whereas movable partitions are more efficient in reducing embodied energy loss (Fig. 3). In terms of overall life cycle embodied energy (LCEE) performance, the ranking from most to least favorable scenario for rentable offices is open-plan layout with fixed partitions, closed plan with movable partitions and closed-plan with fixed partitions.

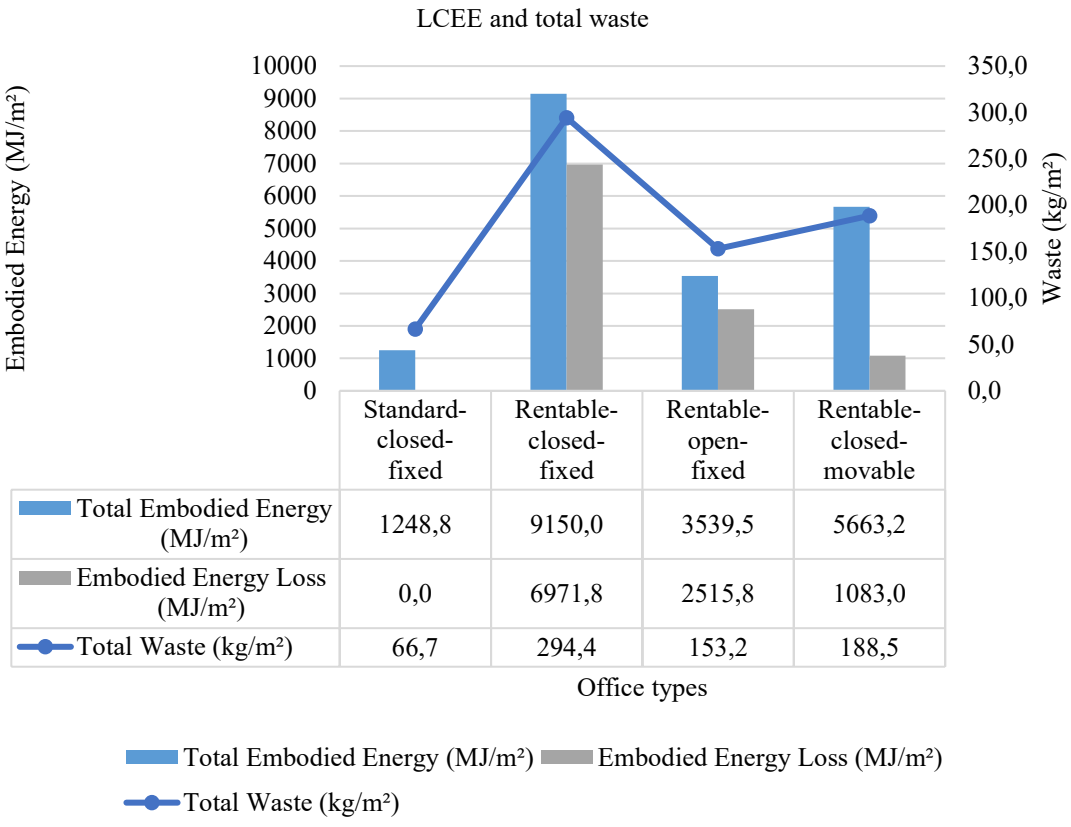

Fig. 3. Comparison of four office types in terms of total embodied energy, embodied energy loss and total waste

When examining the life cycle stages of the office types individually, it becomes evident that rentable offices consume more than five times the embodied energy of standard offices during the production phase (A1–A3). This is primarily due to the frequent use of varied materials, with each material's first application being assessed within the production scope. However, implementing an open-plan layout in rentable offices reduces the embodied energy consumed during this phase by approximately 61%. Conversely, the introduction of movable partitions increases the embodied energy in the production phase.

In the replacement phase (B4), no embodied energy was recorded for the standard or rentable offices with fixed partitions. This is because materials in rentable offices are seldom used for their overall service life due to tenant changes every five years. However, in rentable offices with movable panels, the embodied energy associated with replacements is approximately twice as high as in standard offices, owing to the continued material changes throughout the building's lifecycle.

Tenant turnover also necessitates the introduction of new materials, particularly during the refurbishment phase (B5). Fig. 4 illustrates the EE comparison between different stages. In this comparison, the total embodied energy (EE) of each scenario is normalized to 100%, and the contribution of each lifecycle stage (A1–A3 Product, B4 Replacement, and B5 Refurbishment) is presented as a percentage of the total. The most remarkable improvement is observed in the rentable-closed-movable case. Thus, the comparison reveals that employing movable partition systems can effectively redistribute and reduce embodied energy demand across the building life cycle (Fig. 4).

3.2. Total waste distribution

A detailed assessment of total waste generation reveals that rentable offices produce four times more waste than standard offices, even when both share identical plan schemes and fixed partition walls. This increase is solely attributed to tenant turnover, which leads to frequent interior alterations. In contrast, demolition waste levels are comparable between the two office types.

When the plan scheme of the rentable office is modified to an open-plan layout, the total waste amount is reduced by 48%, primarily due to a 50% decrease in fit-out waste. Additionally, open-plan configurations lead to lower end-of-life waste compared to closed-plan schemes, reflecting their more efficient material use.

The integration of movable partition walls further reduces the total waste by approximately 36% compared to fixed partition walls. This is because movable partitions provide spatial flexibility and are retained for longer periods despite frequent tenant changes. Notably, fit-out waste is lowest in the office type employing movable partitions among all rentable office models.

However, replacement and demolition waste are slightly higher in these configurations. This is explained by the completion of the movable partition’s service life, which necessitates a one-time replacement during the office's 50-year life span (Fig. 5).

3.3. Embodied carbon

Embodied carbon across the different life cycle stages of each office typology were calculated using the One Click LCA tool, following the EN 15978 methodology. Results indicate that adopting an open-plan layout has the most significant effect in reducing greenhouse gas emissions, particularly during the production stage (A1–A3).

By contrast, the highest emissions from material exchange activities (stages B4–B5) were observed in the rentable office with a closed plan scheme and fixed partitions, where frequent tenant turnover necessitates repeated material replacement and refurbishment.

Overall, the implementation of an open-plan configuration in rentable offices results in a 61% reduction in total embodied carbon emissions. Similarly, the use of movable partition systems contributes to a 45.2% reduction in total global warming potential (GWP) when compared to standard fixed-partition office layouts (Fig. 6).

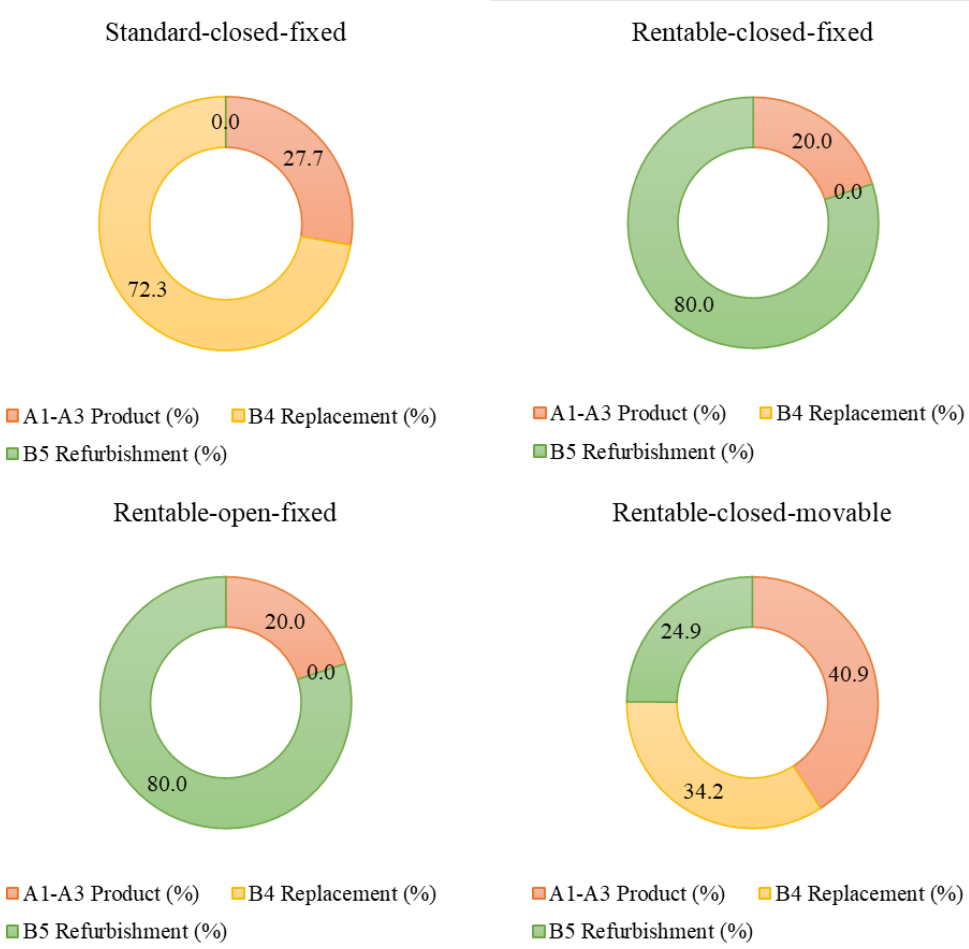

Fig. 4. Comparison of embodied energy of the lifecycle stages (%)

These findings demonstrate that spatial flexibility strategies—specifically open-plan design and movable partitions—not only minimize material waste but also substantially mitigate embodied carbon emissions over the building's lifecycle.

3.4. Building components and materials

A more granular evaluation of the embodied environmental impacts associated with specific building components and materials provides critical insight into the sustainability performance of different office configurations. To this end, the study analyzes the types of waste, total embodied energy (EE), and embodied energy losses (EE_{loss}) generated by material changes over a 50-year lifecycle of the rentable office typologies.

For ceilings, the analysis includes gypsum board, rock wool, and paint in the case of suspended systems, and only paint for open ceiling configurations. Carpet tiles and linoleum are considered for flooring, while wall assemblies incorporate gypsum panels, glass partitions, rock wool, paint, and movable medium-density fiberboard (MDF) partitions, depending on the office type and function.

Among these, the flooring contributes the least to both material waste and embodied energy, owing to its limited material diversity. In contrast, ceilings exhibit the lowest lifecycle embodied energy (LCEE) due to the relatively low energy intensity of gypsum board and minor quantities of paint and insulation.

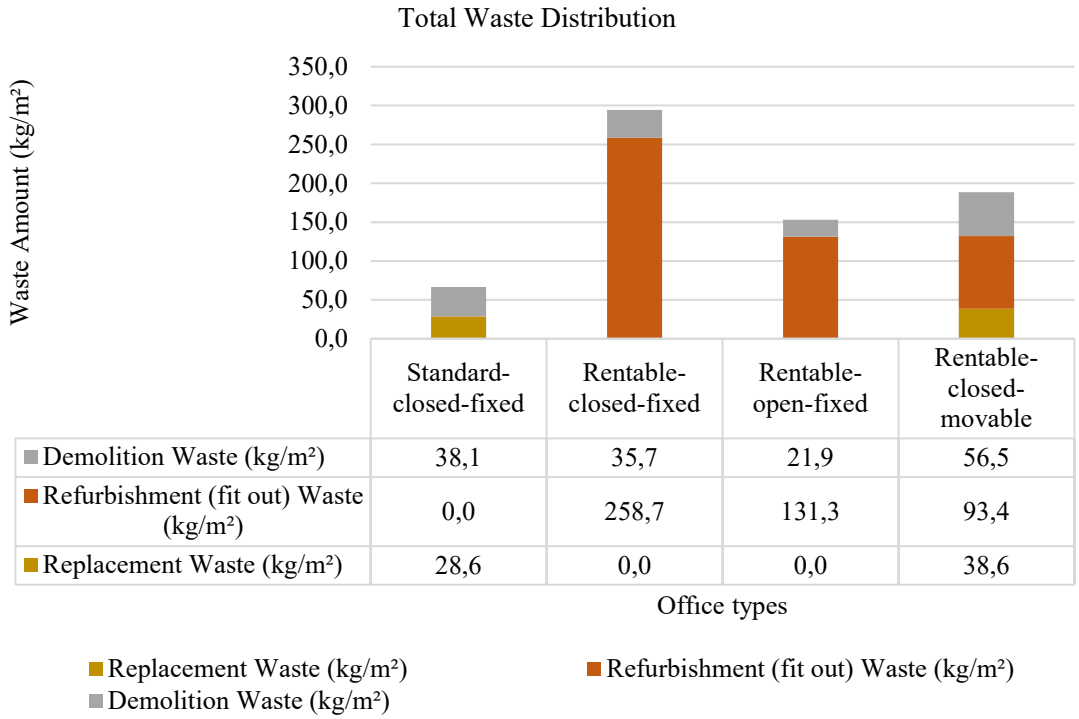

Fig. 5. Waste generation due to plan layout and partition type

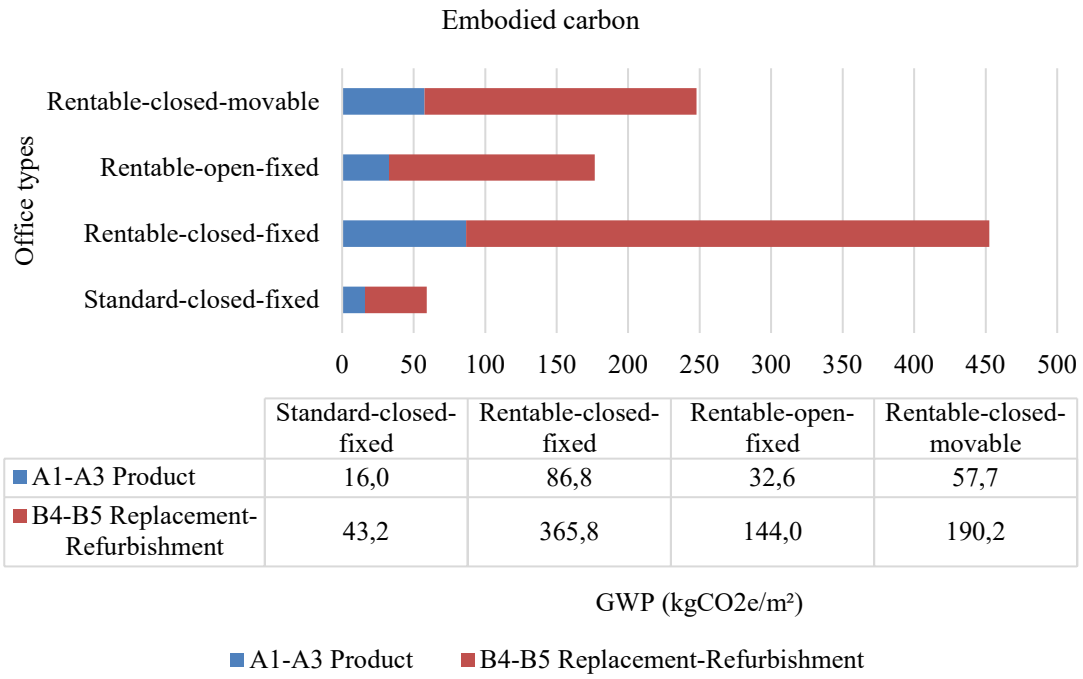

Fig. 6. Comparison of embodied carbon of the lifecycle stages ($kgCO_2e/m^2$)

For all rentable office scenarios, the embodied energy and waste associated with floor and ceiling components remain constant: approximately 1289 MJ/m² and 30 kg/m² for flooring, and 584 MJ/m² and 82 kg/m² for ceilings, respectively.

The walls, however, display substantial variation across scenarios, primarily because wall components are directly affected by the plan layout and partitioning strategy. Walls represent the dominant source of material waste, largely due to their expansive surface area and higher turnover rates. For instance, in the rentable office with a closed plan and fixed partitions, wall-related waste reaches 183 kg/m², while this figure is significantly reduced in the open-plan scenario (42 kg/m²) and the movable partition scenario (77 kg/m²).

In terms of embodied energy loss, walls again constitute the most significant contributor. The closed-plan, fixed-partition office exhibits the highest EEloss at 5779 MJ/m², while the movable partition scenario eliminates EE losses entirely (0 MJ/m²), as the panels are reused throughout the building's life without premature removal (Fig. 7).

These results reinforce the importance of flexibility in wall systems—particularly the use of demountable partitions—in minimizing both material waste and energy losses, thereby supporting environmental sustainability goals in office design and refurbishment practices.

3.5. Material-based embodied energy and waste analysis

Building materials are among the primary determinants of embodied energy (EE) demand in buildings. In addition to their unit EE intensities and physical quantities, other critical factors such as replacement/refurbishment frequency and material service life substantially influence the lifecycle embodied energy (LCEE). To evaluate these effects, key interior materials—gypsum board, rock wool, paint, glass panels, carpet tiles, linoleum, and medium-density fiberboard (MDF) used for movable partitions—were compared across rentable office types in terms of both waste generation and embodied environmental impact.

As the flooring system remains constant across all office configurations, carpet tiles and linoleum perform identically in each scenario and are therefore represented only once in Fig. 6. In contrast, materials used in interior wall assemblies (gypsum board, rock wool, paint, and glass) are highly influenced by flexible design strategies, particularly those involving layout and partition modifications.

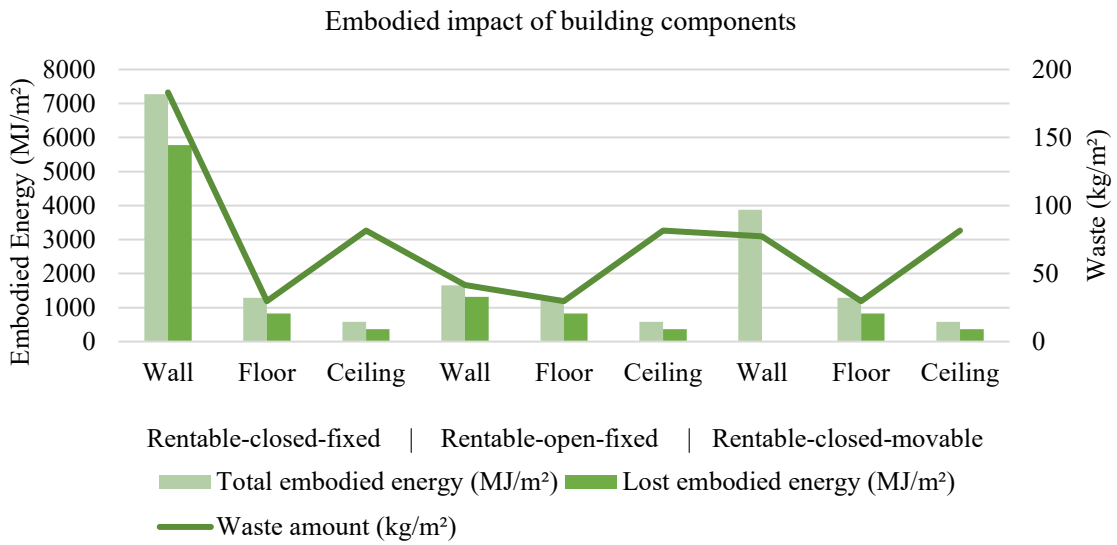

Fig. 7. Embodied energy and waste amount of building components for rentable offices

In rentable offices with movable partitions (RCM), only MDF is utilized for wall divisions, whereas gypsum board, rock wool, and paint are still present in ceiling components and thus retained in the analysis. Performance comparisons are organized by office type: rentable–closed plan with fixed partitions (RCF), rentable–open plan with fixed partitions (ROF), and rentable–closed plan with movable partitions (RCM).

Among all materials, glass panels exhibit the highest LCEE, reaching 6736 MJ/m² in RCF, followed by MDF at 3878 MJ/m². This is primarily due to their high EE intensities: glass at 75.2 MJ/kg and MDF at 50.2 MJ/kg. Although linoleum also has a high unit EE (54.4 MJ/kg), its relatively low quantity results in a modest overall LCEE. Notably, paint and MDF showed zero EE loss, attributed to the synchronization of their service lives with the 50-year building lifespan, eliminating premature material disposal.

In terms of waste generation, results further confirm that flexible design strategies contribute to material conservation. Over the building's life cycle, gypsum board waste decreased from 158.7 kg/m² in RCF to 91.3 kg/m² in ROF, and further to 71.3 kg/m² in RCM. Rock wool waste showed a similar trend: 5.5 kg/m² in RCF, 3.9 kg/m² in ROF, and 3.4 kg/m² in RCM. For glass panels, waste was significant in fixed-wall offices—approximately 89.6 kg/m² in RCF—but dropped to 20.5 kg/m² in ROF, reflecting reduced material usage due to open-plan configurations (Fig. 8).

These findings emphasize that adopting flexible spatial configurations, particularly movable partitions and open-plan layouts, can play a critical role in minimizing both material waste and embodied energy across the building life cycle.

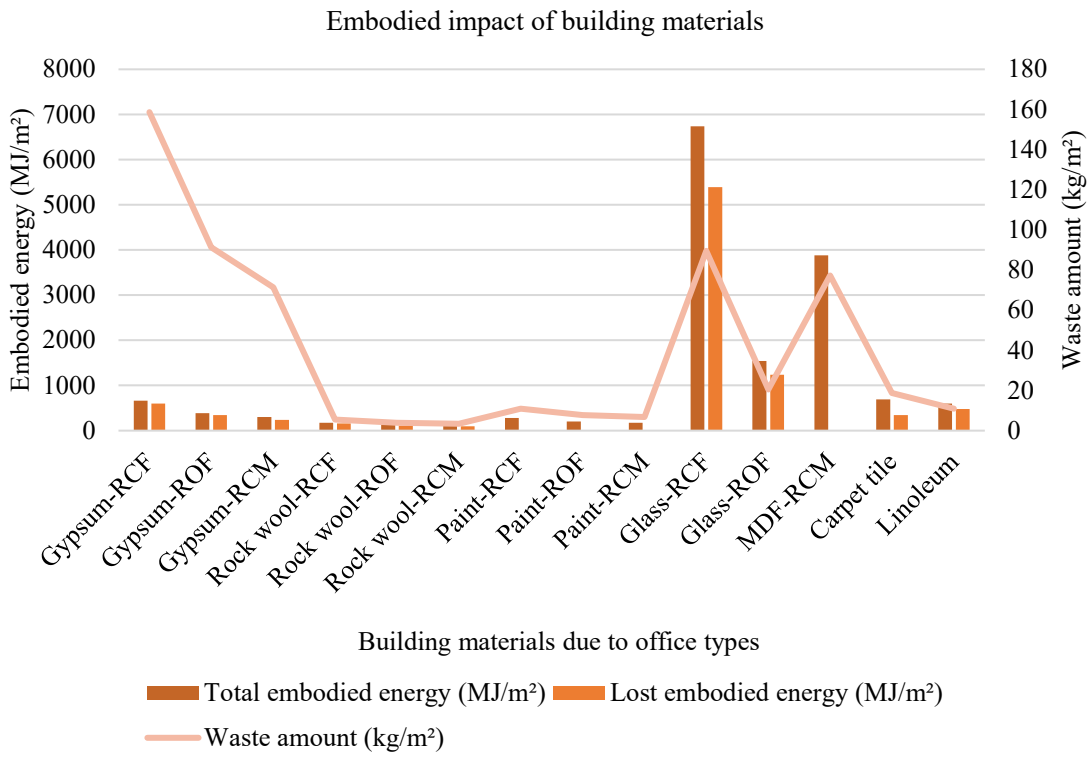

Fig. 8. Embodied energy (MJ/m²) and waste amount (kg/m²) of building materials for rentable offices

3.6. Sensitivity analysis

The sensitivity analysis shows that the tenant turnover rate has a significant impact on both total material waste and life cycle embodied energy (LCEE). For instance, increasing the tenant turnover rate by 20% leads to an increase of up to 32.9% in total waste and up to 23.8% in LCEE in the RCF scenario. Conversely, a 20% decrease in the turnover rate reduces waste and LCEE by reasonable amounts. Among the scenarios, the ROF scenario shows the highest sensitivity to tenant turnover; a ±20% change leads to the largest changes in total waste and LCEE, at 34.4% and 27.4%, respectively. The RCM scenario shows relatively lower sensitivity, indicating that design choices such as movable partitions can mitigate the environmental impact of frequent tenant turnover.

±20% changes in building service life had a minimal impact on total waste and LCEE across all scenarios, indicating that the results are relatively insensitive to reasonable assumptions regarding service life (Fig. 9). Overall, these findings emphasize that tenant turnover rate is a critical factor affecting total building material waste and embodied energy, whereas changes in building service life within the range considered have a limited impact. This highlights the importance of flexible interior strategies in managing environmental impacts under changing usage conditions.

To assess the reliability of the parameters, the ranking stability of office types was examined through the variable variation range. Considering that the main objective of the study was to compare office types, it was observed that the results did not change when the office rankings were checked for each scenario. Although uncertainty analysis requires the assignment of probability distributions and the execution of Monte Carlo simulations, the focus of this study was to evaluate the relative impact of the fundamental assumptions that constitute the study. Therefore, sensitivity testing was deemed sufficient at this stage. Probabilistic uncertainty analysis is recommended for future research.

3.7. Comparison with literature values

To ensure comparability with literature values, which typically report waste generation from a single refurbishment event ($kg \cdot m^{-2}$ per refurbishment), the model outputs were converted accordingly. In this study, the 50-year total refurbishment waste ($kg \cdot m^{-2}$) was divided by the assumed number of refurbishment cycles (nine times over 50 years, based on the tenant turnover of 5 years). This conversion yielded the waste generated in a single refurbishment cycle, allowing direct comparison with published benchmarks. One-time refurbishment waste occurring in this study was calculated using Equation 2. The results obtained are as follows:

- The rentable-closed-fixed (RCF) office scenario generates 28.7 kg/m^2 of waste per refurbishment cycle.
- The rentable-open-fixed (ROF) scenario results in 14.6 kg/m^2 per cycle.
- The rentable-closed-movable (RCM) alternative yields 10.4 kg/m^2 per cycle.

These figures were then benchmarked against literature values. Budiyani [13] reported waste values for four office refurbishment projects in Sweden, while Forsythe and Fini [20] conducted an extensive study across 23 office fit-out projects in Australia. Only case studies where one floor had been stripped out were considered from the data in the study by Forsythe and Fini. This is to ensure that consistent results are obtained with this study. The ranges of waste generated as a result of one-time refurbishment are given in Table 5.

As shown in Table 5, the estimated renovation waste values in this study are generally consistent with the range of 24–52 $kg \cdot m^{-2}$ [20] and 31–38 $kg \cdot m^{-2}$ [13] reported in previous studies. The rentable-closed-fixed configuration, representing the conventional rentable office layout without flexible design solutions, produced 28.7 $kg \cdot m^{-2}$ of refurbishment waste; this value is within the mid-range of values in the literature. Even if the number of the studies is limited, this consistency supports the reliability of the modeling approach and demonstrates that the study's assumptions are based on empirical findings.

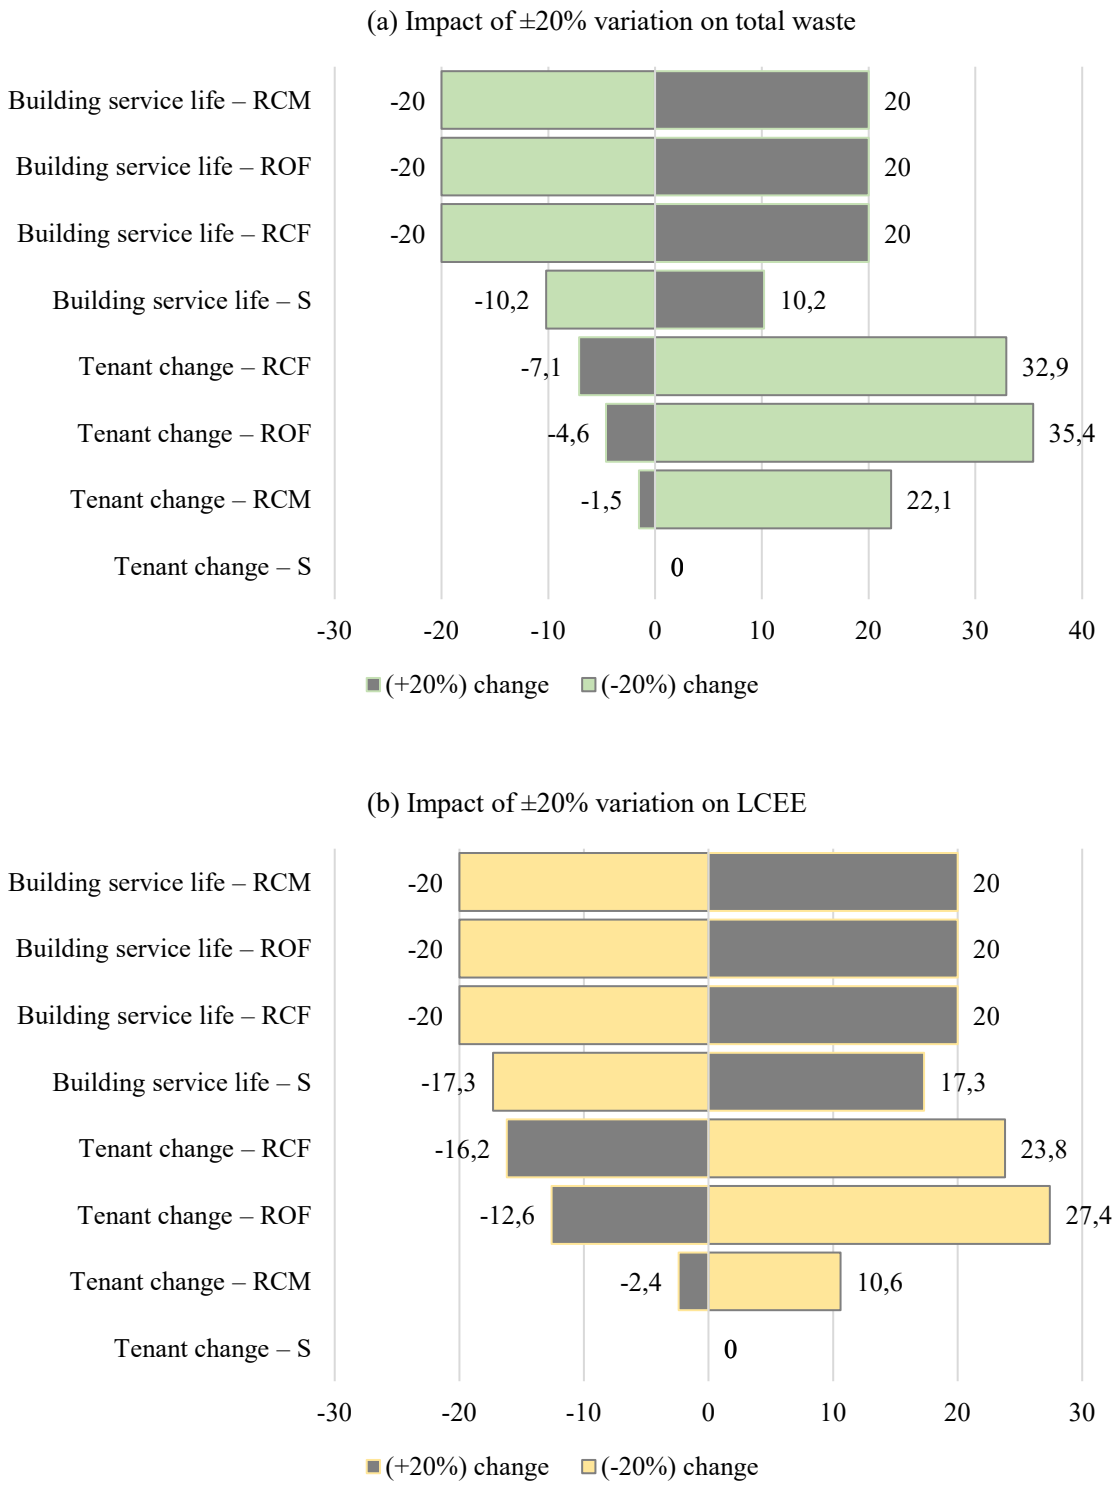

Fig. 9. Sensitivity analysis using the OAT approach (±20% variation) showing the influence of parameters on total waste (a) and total embodied energy (b)

Table 5. Comparison of refurbishment waste with literature findings (temporally normalized per single refurbishment cycle, kg·m⁻²)

Source	Fit-out waste generated in a one-time refurbishment project (kg/m²)
[20]	24.1 – 52.1 kg/ m²
[13]	31-38 kg/m²
Rentable-closed-fixed (this study)	28.7 kg/m²
Rentable-open-fixed (this study)	14.6 kg/m²
Rentable-closed-movable (this study)	10.4 kg/m²

In contrast, layouts incorporating spatial flexibility, such as rentable-open-fixed and rentable-closed-movable types, showed significantly lower waste production (14.6 and 10.4 kg·m⁻², respectively). These reductions can be attributed to the minimization of demolition and material replacement needs through open-plan and modular design strategies. The results confirm that flexible and demountable interior systems can significantly reduce renovation-related waste and are consistent with previous studies emphasizing design for adaptability and reuse.

Overall, the findings indicate that spatial configuration and partition type are decisive factors in concrete resource performance. The close alignment between the rentable-closed-fixed scenario and established reference values enhances the model's reliability, while the lower waste intensities observed in flexible configurations highlight the environmental potential of adaptable design strategies in the rentable office sector. These insights provide strong evidence that integrating flexibility principles into rentable buildings can significantly reduce refurbishment waste and contribute to circular economy goals.

3.8. Limitations of the study

This study presents a series of scenarios based on a selected high-rise office building, focusing on different material types, office configurations, and refurbishment cycles in relation to tenant changes. While these scenarios offer useful insights into the embodied impacts of rentable office configurations, they are shaped by a number of assumptions that inherently limit the generalizability of the findings. Moreover, this study is based on the analysis of a single office building; therefore, the findings cannot be generalized to all office buildings. Variations in building design, occupancy patterns, and refurbishment practices may lead to different outcomes in other contexts.

A primary limitation stems from the scarcity of empirical data and prior research specifically addressing waste generation and embodied impacts in rentable office buildings. Due to this gap, the study's assumptions—particularly regarding tenant change frequency and refurbishment cycles—were informed by limited literature and stakeholder interviews. Consequently, the comparison of waste quantities is constrained by the small number of relevant studies available, limiting the scope for broader benchmarking.

Additionally, although materials with verified Environmental Product Declarations (EPDs) were selected to ensure data reliability and consistency, it is acknowledged that a wide variety of alternative materials may be used in office fit-outs. This could result in variability in embodied energy (EE) and waste profiles not captured within the selected material set. Moreover, this study introduces a reinterpretation of the replacement (B4) and refurbishment (B5) stages as defined by EN 15978. The distinction between these two stages—though essential to accurately calculate EE and waste over a building's lifecycle—is not consistently addressed in the existing literature. Thus, the methodology developed here is based on a rational framework informed by material life cycles, but future research is needed to further validate and standardize these classifications across building types and geographies.

Although this study includes sensitivity analyses related to tenant turnover cycles and the assumed building service life, it does not incorporate a dedicated uncertainty or sensitivity analysis of the embodied carbon values. As embodied carbon assessments can be influenced by variations in input data, methodological

assumptions, and emission factors, the absence of such an analysis represents a limitation. Future research should therefore explore uncertainty quantification and sensitivity analysis to enhance the robustness and generalizability of embodied carbon results.

3.9. Discussion

The results of this study emphasize that design flexibility can substantially reduce fit-out waste, embodied energy, and embodied carbon emissions in rentable office buildings. In the context of Türkiye, where the office market is concentrated in metropolitan areas such as Ankara and İstanbul, frequent tenant turnover intensifies material replacement cycles and resource depletion. The finding that flexible interior strategies can reduce embodied energy loss by over 80% suggests that waste prevention through design could play a critical role in achieving national resource efficiency goals.

Türkiye's Zero Waste Strategic Plan (2019–2023) and the National Climate Change Mitigation and Adaptation Strategy and Action Plan (2024–2030) both highlight the importance of circular economy practices in the construction sector. However, current regulatory frameworks primarily address waste management at the post-generation stage—through collection, recycling, and disposal—rather than prevention at the design phase. The outcomes of this study reveal that integrating spatial flexibility into design guidelines for rentable offices could complement these national policies by reducing refurbishment frequency and minimizing embodied carbon at the source.

Moreover, while international frameworks such as the European Green Deal and the United Nations Sustainable Development Goals (SDG 12: Responsible Consumption and Production) promote life-cycle thinking, there remains limited alignment between policy intent and design practice in emerging economies. By quantifying the environmental benefits of open-plan and modular partition systems, this study provides empirical support for shifting national building regulations from static performance metrics toward adaptable, circular design principles.

Overall, these results reinforce that environmental sustainability in the building sector cannot be achieved solely through material efficiency or end-of-life recycling. Instead, policies must recognize flexibility as a preventive strategy that reduces embodied impacts before they occur, thereby bridging the gap between design practice, building regulation, and circular economy goals.

4. Conclusion

High tenant turnover in rentable office buildings often necessitates frequent interior refurbishments, leading to substantial fit-out waste and increased raw material demand. These repeated changes exacerbate environmental impacts throughout the building's life cycle. Particularly in Türkiye, where waste management infrastructure is limited, implementing design-stage strategies is critical for mitigation.

This study compared standard and rentable office models to quantify waste generation and assess embodied environmental impacts. It also evaluated the effectiveness of two flexible design strategies—open plan layouts and movable partition walls—in reducing EE, embodied carbon (EC), and total waste. Results showed that open plan layouts reduced LCEE by 61.3%, EE loss by 64% and embodied carbon (EC) by 61%, primarily due to minimized use of interior partitions. Although movable partitions require higher initial EE, they achieved an 38.1% in LCEE, 84.3% reduction in EE loss, and 45.2% in EC by allowing reconfiguration without complete replacement of material.

A comprehensive assessment of total waste, LCEE, EE loss, EC, and component-specific impacts revealed that each design strategy offered distinct environmental advantages. Open plans were more effective in reducing overall LCEE, total and demolition waste, and EC across all life cycle stages. Movable partitions, on the other hand, excelled in minimizing fit-out waste and refurbishment-phase (B5) energy consumption.

At the component level, interior walls contributed the most to environmental impacts due to their extensive surface area and frequent alteration. Among wall materials, glass and MDF exhibited the highest embodied energy values, while gypsum board and glass contributed most to waste. However, MDF showed significant potential in minimizing EE loss due to its durability and reusability, aligning well with circular design principles.

In light of these findings, it is recommended that architects and designers prioritize materials based on their service life, reusability, and adaptability to evolving functional needs within office spaces. Emphasizing design strategies that minimize material replacement and support longevity can significantly reduce environmental impacts over the building's life cycle. Building owners and tenants should be made aware of the long-term operational and ecological benefits associated with flexible interior layouts and component choices. Furthermore, material manufacturers are encouraged to focus on the development of modular, demountable, and lightweight systems that facilitate disassembly and reuse, thereby supporting circular economy principles in the construction sector.

Future studies should delve into the performance of advanced flexible systems, such as dynamic walls, raised floors, and adaptive ceiling systems, within the life cycle context of commercial buildings. In addition:

- Empirical data collection through user surveys and interviews could provide grounded insights into material change patterns and tenant needs.
- Cost-benefit analyses integrating carbon and energy metrics can offer a holistic understanding of the trade-offs between initial investment and life cycle performance.
- Policy-level recommendations should focus on regulatory frameworks and incentives that promote material efficiency and low-waste interior design practices in rentable office markets.

By expanding awareness and applying informed design strategies, stakeholders can significantly reduce the environmental impact of the built environment, especially in high-density urban contexts.

Abstract

Achieving Net-Zero Energy Building (NZEB) performance requires a comprehensive approach that integrates both passive and active energy strategies. This study investigates the standalone impact of various passive design measures on reducing heating and lighting energy demands in an existing educational facility located in Safranbolu, Türkiye, a region characterized by a continental climate with mild summers and cold winters. Utilizing dynamic energy simulations conducted via DesignBuilder and the EnergyPlus engine, the research evaluates a range of envelope retrofit strategies, including optimized window-to-wall ratios (WWR), high-performance glazing systems, double-skin façades (DSFs), and advanced insulation materials. The results indicate that while passive envelope enhancements can significantly improve thermal performance, the most effective configuration identified in this case study, combining a cavity wall with aerogel insulation and triple-pane argon-filled low-emissivity glazing, achieved a 34.9% reduction in heating demand under the specific conditions of the building and climate analyzed. While passive strategies effectively reduce energy losses, they are insufficient on their own to eliminate dependence on external energy sources. To overcome this limitation, the integration of active renewable energy systems, such as photovoltaic (PV) panels and solar thermal collectors, is essential. Furthermore, incorporating energy storage technologies and smart energy management systems can enhance system reliability and efficiency. This study underscores that a hybrid approach, combining passive design with active solar technologies, offers the most viable path to NZEB achievement. Notably, the research provides an original and detailed multi-scenario evaluation of passive-only retrofit strategies, quantifying their individual and combined potential prior to the introduction of active energy systems.

1. Introduction

As global energy demand continues to rise, the building sector remains one of the largest contributors to both primary energy consumption and greenhouse gas emissions, accounting for nearly 40% of global energy use and over 30% of CO_2 emissions [1]. In response to mounting environmental pressures, the concept of Net-Zero Energy Buildings (NZEBs) has emerged as a cornerstone of sustainable building practices.

NZEBs aim to balance annual operational energy use with on-site renewable energy generation, thereby minimizing their environmental impact and reliance on external energy sources [2]. Driven by regulatory frameworks such as the European Union's Energy Performance of Buildings Directive (EPBD), which mandates that all new buildings must be nearly zero-energy by 2030, NZEBs are becoming an increasingly important benchmark for both new construction and building retrofits [3].

While the design and performance of newly constructed NZEBs have been widely studied, the retrofit of existing buildings to NZEB standards presents a more complex challenge, especially for older structures with limited insulation, inefficient glazing systems, and suboptimal envelope design [4].

Passive design strategies, such as enhanced insulation, high-performance glazing, optimized window-to-wall ratios (WWR), and natural ventilation, are considered the most cost-effective first step in reducing building energy demand [5, 6]. These strategies utilize architectural form, material properties, and environmental conditions to enhance thermal performance while minimizing reliance on mechanical systems. However, the effectiveness of passive measures is highly dependent on local climate conditions, building use patterns, and spatial constraints, making climate-responsive design a fundamental requirement [7]. However, their effectiveness is highly dependent on climate conditions, building orientation, and material availability, making climate-responsive design a key necessity [8].

The window-to-wall ratio (WWR) is an essential design variable that significantly influences a building's energy performance, with its optimal value varying widely based on climate and building orientation [9]. Studies conducted in cold climates, such as the "severe cold area of Shenyang city" [10] shows that the most energy-efficient WWR is between 10-15% for east and west facades and 10-22.5% for southern facades. This is due to the need to balance passive solar gains with minimizing heat loss through the less insulated glazed surfaces [11]. Conversely, in hot and semi-arid climates, the primary concern is managing heat gain. A study in Tripoli, Libya [12], found that increasing the WWR generally led to higher cooling consumption. Although heating demand could decrease to zero on southern walls due to passive solar heating. Similarly, a study in Iran, characterized by a semi-arid climate [13], showed that while the lowest energy consumption was achieved with a WWR of just 5%, a much higher ratio of 45-55% was often considered optimal to balance thermal performance with essential daylighting needs. In Mediterranean climates, where both heating and cooling are relevant, research in Italy Marino et al. [14] identifies the window system as a crucial element for managing solar gains, influencing overall energy consumption. These findings are further supported by a broader analysis of US office buildings, where Troup et al. [15] found that increasing WWR is a significant predictor of increased cooling and lighting energy use. In a broader context, Arshad et al. [16] emphasized that optimizing building envelope parameters like WWR is among the critical energy retrofit strategies aligned with the Sustainable Development Goals (SDGs) for achieving Net Zero Energy Building (NZEB) targets. Similarly, Aloshan [17] identifies building envelope optimization, including façade orientation, glazing type, and WWR, as fundamental to achieving near-zero energy performance in hot climates. The literature collectively demonstrates that while the impact of WWR is not universal, its proper optimization is a fundamental first step in significantly reducing energy loads and moving a building closer to Net-Zero Energy performance.

The other crucial static window technology is Low-emissivity (Low-E) glazing, designed to improve a window's thermal and optical performance. These coatings work by reducing heat transfer through the window, thereby minimizing energy consumption [18]. The energy-saving potential of double-glazed windows is well-established and widely adopted in cold climates to reduce heating energy [19]. Conversely, in hot and

humid climates, Low-E glazing is primarily used to reduce heat gain and lower the air-conditioning load [20]. The study by Somasundaram et al. [21] on a retrofit solution in Singapore found that combining a solar film with a retrofit double-glazing unit could reduce annual HVAC energy consumption by up to 20%. Another related study by Somasundaram, et al. [20] observed that installing a hard-coat Low-E double glazing unit could lead to annual energy savings of 3% for a clear glass facade and up to 7.5% for an existing tinted grey glass facade in a tropical climate with a 20% WWR. Harmati and Magyar [11] also investigated the influence of glazing properties on heating and cooling demand, emphasizing its importance in different climatic conditions. Xiaoxiang et al. [22] further highlight glazing material and light transmission as key performance indicators in NZEB retrofits across diverse climate zones, supported by bibliometric trend analyses. The literature highlights that upgrading glazing is a critical measure for a building's envelope and is a fundamental step toward achieving NZEB state [23].

Another advanced architectural strategy for improving a building's envelope performance is the use of double-skin facades (DSFs). This building technology consists of two layers of facade separated by a ventilated air gap, which can significantly improve a building's thermal and daylight performance when properly designed [24]. The performance of DSFs highly depends on climate and specific design parameters such as glazing type and cavity depth [25]. In hot arid climates, DSFs can be beneficial, with research demonstrating their ability to reduce cooling loads compared to conventional single-skin facades [26]. Similarly, in Mediterranean climates, studies show that DSFs can improve energy consumption in high-rise office buildings, with optimization of the facade being critical to achieving the desired energy performance [27]. For subtropical and temperate climates, the energy performance of DSFs has also been extensively investigated. A study on a typical office building in Hong Kong showed that, while DSFs could provide some energy benefits, their financial payback period might be long depending on the specific configuration [28]. Research conducted in Seoul confirmed that the glazing type of the inner layer significantly impacts energy consumption, highlighting the importance of a detailed, quantitative analysis in the design phase [29]. More recently, a study focusing on Turkey investigated the potential of integrating DSFs with nanotechnological materials to further enhance energy efficiency in office buildings [30]. These studies confirm that the effectiveness of DSFs is not universal and that their proper implementation requires sophisticated, climate-specific design and optimization, making them a key, albeit complex, strategy in the pursuit of a NZEB.

Moving beyond facade design, the use of advanced materials offers a complementary approach to enhancing thermal performance. Thermal insulation is one of the most effective methods for reducing a building's energy consumption where it helps lower the overall energy load from heating and air conditioning systems and meet thermal comfort needs [31]. A study by Shahee et al. [32] focuses on assessing thermal insulation and shading to optimize energy efficiency, save expenses, and foster environmental sustainability in residential buildings. The use of insulation is a fundamental first step toward achieving the high energy performance required for a NZEB. In addition to conventional insulation materials, advanced "superinsulation" materials, such as aerogels, are being developed due to their superior thermal performance and potential for significant energy savings [33, 34]. Aerogel insulating panels exhibits ultra-low thermal conductivity, making them excellent thermal insulators for building energy efficiency. Research by Cuce et al. [35] highlights that optimizing the thickness of aerogel insulation can make a significant contribution to energy savings and greenhouse gas abatement, especially in colder climates and for investments with a longer lifetime. The literature collectively demonstrates that the proper selection and optimization of insulation, including both conventional and advanced materials, is a critical component of a building's envelope design, directly influencing its energy

performance and helping to achieve net-zero energy goals.

The transformation of existing buildings into NZEBs has emerged as a central focus in contemporary energy research. While a substantial body of literature has explored the design principles and operational performance of newly constructed NZEBs, comparatively limited attention has been devoted to the retrofitting of existing buildings using exclusively passive design strategies. This study seeks to address this gap by adopting a passive-only approach to NZEB retrofitting, applied to an existing educational facility. Through the use of a real-world case study and advanced simulation tools, the research evaluates the feasibility and effectiveness of passive retrofit measures in achieving significant energy performance improvements, without the integration of active mechanical or renewable energy systems. In doing so, it offers a distinct contribution to the broader discourse on sustainable retrofitting and NZEB compliance in educational building typologies.

Most NZEB research has focused on residential or office buildings, often neglecting the unique spatial, functional, and operational characteristics of educational buildings [8-36]. These facilities pose distinct energy challenges due to high occupancy densities, variable schedules, and strict daylighting requirements. Many NZEB case studies are set within temperate or Mediterranean climates [37, 38], limiting the generalizability of their findings to cold or transitional climate zones. In addition, existing studies tend to evaluate passive strategies in isolation or as part of hybrid systems that also include active renewable technologies, making it difficult to assess the standalone potential of passive retrofitting.

This research addresses these gaps by evaluating passive retrofit strategies applied to an existing higher education facility located in Safranbolu, Türkiye, a UNESCO World Heritage city characterized by a continental climate with cold winters. According to the Turkish State Meteorological Service, Safranbolu experiences average winter temperatures below 0°C, making heating demand dominant in annual energy use.

The case study building is representative of the regional building stock, with limited thermal insulation, high window-to-wall ratios, and outdated glazing systems. These features make it an ideal subject for assessing the impact of envelope-level passive interventions.

This study investigates whether passive retrofit measures alone can bring an educational building closer to NZEB performance without integrating active systems such as solar photovoltaics or mechanical HVAC upgrades. Specifically, it aims to:

- Assess the baseline energy performance (heating and lighting) of the existing building;
- Simulate and compare the effect of various passive retrofit scenarios, including:
- Quantify the energy savings potential of each measure under a heating-dominant climate condition;
- Identify the most effective passive combination strategy in terms of thermal efficiency and visual comfort.

In this study, by adopting a passive-only approach, the study aims to isolate and quantify the maximum achievable energy reduction prior to integrating active renewable systems. This also enables future cost-benefit analyses to determine the required scale and feasibility of active measures to close the NZEB performance gap.

This research contributes original insights to the field of sustainable retrofitting by:

- Providing one of the few comprehensive, scenario-based simulations of passive-only NZEB retrofits in educational buildings;
- Applying a parametric modeling approach using EnergyPlus and DesignBuilder for high-fidelity hourly energy simulations;
- Generating design guidance specific to continental climates and educational typologies, where data is currently sparse.

The findings are expected to inform architects, policymakers, and facility managers engaged in the retrofit of public educational infrastructure, particularly in climate zones where heating energy

dominates and space for renewable installations may be limited.

2. Material and Method

2.1. Case study

2.1.1. Overview of the selected educational buildings

This case study investigates the S.Ş.D. Vocational School of Higher Education Building, an educational facility located in Safranbolu, Türkiye (Fig. 1). The building was selected due to its representative characteristics of educational institutions, which possess distinct energy consumption profiles when compared to residential or commercial structures. Educational buildings typically exhibit variable occupancy patterns, elevated internal heat gains resulting from occupants and electronic equipment, and specific ventilation and lighting requirements. These attributes make such facilities particularly suitable for evaluating the effectiveness of passive design strategies aimed at enhancing energy efficiency and indoor thermal comfort.

The building under study is a multi-story educational facility with an approximate gross floor area of 4,712 m², oriented along the cardinal directions, with its principal façades facing north and south (Fig. 2). Located in Safranbolu, the building is subject to a cold climate, characterized by cold winters, necessitating the implementation of heating strategies throughout the year. Under these climatic conditions, optimizing the building's thermal envelope, glazing systems, and ventilation strategies plays a critical role in reducing overall energy consumption while enhancing indoor environmental quality.

2.1.2. Baseline energy performance assessment

Prior to the implementation of any passive design strategies, a baseline energy performance analysis was conducted using DesignBuilder, a dynamic building simulation tool that incorporates the EnergyPlus engine. The baseline model was developed to accurately reflect the building's existing operational conditions and thermal performance under current use patterns (Fig. 3).

The simulation was configured to reflect realistic operational conditions, assuming a 24-hour usage schedule to account for extended occupancy beyond standard working hours due to academic and administrative activities.

Fig. 1. Building of Safranbolu Şefik Dizdar (S.Ş.D.) Vocational School of Higher Education

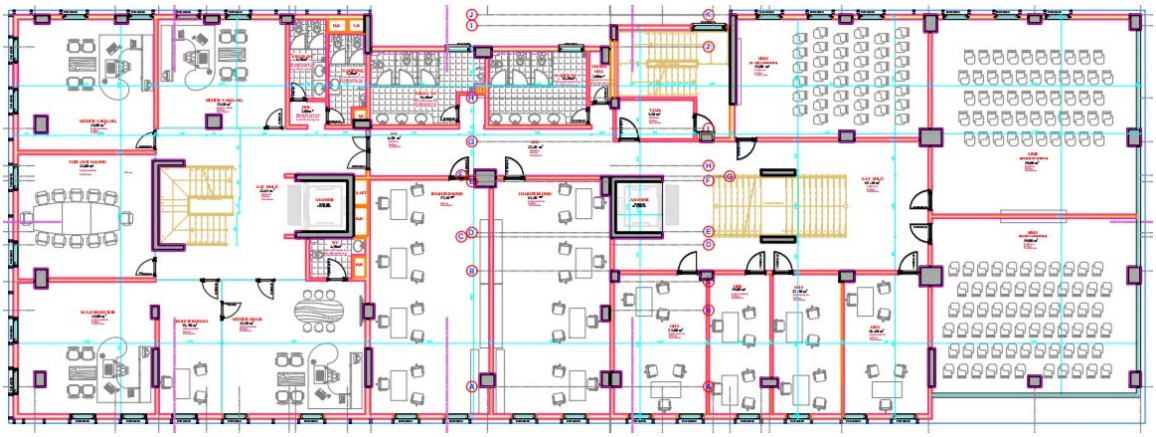

Fig. 2. The ground floor plan

Fig. 3. Building model in design builder

Indoor thermal comfort parameters were maintained in accordance with ASHRAE Standard 55, with heating and cooling setpoints set at 18°C and 24°C, respectively. The existing glazing system consisted of 6+12+6 mm reflective double glazing, offering moderate thermal insulation but limited solar control capabilities. Exterior walls included 5 cm of insulation, which falls below recommended standards for cold climate regions and contributes to elevated heating loads during winter. An air tightness value of 1 Air Change per Hour (ACH) was applied, representing a moderate level of air infiltration consistent with prevailing construction practices. The thermal properties of all building envelope components are detailed in Table 1.

The results of the baseline simulation revealed that the building experiences substantial heating loads, primarily driven by excessive heat loss during winter. The inadequate thermal performance of the building envelope, particularly the insufficient wall insulation and significant air infiltration, contributed to elevated heating demand in colder months. Furthermore, the simulation identified uneven indoor temperature distribution across different zones, highlighting the need for improved thermal comfort and energy performance. These findings confirm that targeted modifications to the building envelope, window-to-wall ratio, glazing specifications can substantially enhance thermal performance and contribute to significant reductions in overall energy consumption.

Table 1. Thermal properties of layers in existing model

	Layers	Thermal Conductivity (W/mK)	Thickness (m)
Wall	Brick cladding	0.54	0.015
	XPS thermal insulation	0.034	0.05

2.1.3. Assumptions for energy modeling

To ensure the accuracy and reliability of the energy performance simulations, several key assumptions were established concerning building operation, occupant behavior, and environmental conditions. The simulation incorporated historical climate data specific to Safranbolu, obtained from the EnergyPlus Weather Data (EPW) database, to reflect local climatic conditions with fidelity. Occupancy patterns were modeled based on actual usage profiles of various functional spaces within the building, including classrooms, laboratories, and administrative offices, each assigned distinct operational schedules to represent real-world activity levels.

The lighting and HVAC systems were assumed to operate according to scheduled demand rather than continuous operation, thereby simulating more realistic control strategies aimed at optimizing energy consumption while maintaining indoor environmental quality. An air infiltration rate of 1 Air Change per Hour (ACH) was applied to represent typical air leakage through windows, doors, and construction joints, in accordance with existing building conditions. These assumptions were critical in constructing a simulation model that closely reflects the actual energy performance of the building under current operational circumstances. It is important to acknowledge that, in line with conventional practices in building energy simulation, this study primarily concentrates on the internal performance of the building and its interaction with macroclimatic conditions derived from historical weather data. External contextual factors, such as the presence of adjacent buildings, shading effects from surrounding topography or vegetation, and localized urban heat island phenomena, were not explicitly incorporated into the simulation model. While these elements can exert a meaningful influence on actual energy performance, their detailed modeling was beyond the scope of this preliminary assessment. Future research should consider integrating these external variables to enhance the accuracy and contextual relevance of simulation outcomes.

2.2. Development of retrofit scenarios

To improve the energy efficiency of the S.Ş.D. Vocational School of Higher Education Building, a

series of passive retrofit scenarios were developed, with a primary focus on modifications to the building envelope and the optimization of glazing systems. These scenarios were systematically designed to assess the impact of various passive design strategies on the building's overall energy performance. The analysis specifically examined changes in heating and daylighting demand, and thermal comfort, providing a comprehensive evaluation of the effectiveness of each intervention under the building's existing climatic and operational conditions.

2.2.1. Scenarios 1-2: Modifying the window-to-wall ratio (WWR)

The window-to-wall ratio (WWR) is a critical design parameter that significantly influences the quantity of natural daylight entering indoor spaces, thereby impacting both visual comfort and energy consumption. Higher WWR values enhance daylight penetration, potentially reducing reliance on artificial lighting; however, they can also lead to increased cooling loads due to greater solar heat gains. In contrast, lower WWR values contribute to improved thermal insulation and reduced heat loss during winter but may necessitate increased artificial lighting due to limited daylight access. Two retrofit scenarios were developed to evaluate the energy performance implications of WWR modifications:

Scenario 1: In this scenario, the Window-to-Wall Ratio (WWR) on the south-facing façades was increased by 10% to enhance daylight penetration within interior spaces (S-WWR: 0.43+0.10).

Scenario 2: The WWR was reduced by 10% on south façade to enhance thermal insulation and minimize both heating losses in winter (S-WWR:0.43-0.10).

2.2.2. Scenarios 3-5: Upgrading glazing systems

In this study, glazing systems were selected with careful consideration of Safranbolu's predominantly heating-dominated climate, where the primary objective was to minimize winter heat losses while maintaining sufficient visible light transmittance. The existing 6+12+6 mm reflective double glazing offers only moderate thermal insulation and, due to its limited solar control, contributes to high heating loads. To address this, Low-E coated glazing systems, known for reducing conductive heat loss by reflecting infrared radiation while largely preserving visible light transmission, were evaluated. These glazing types were chosen not only for their proven high performance in heating-dominated climates but also for their wide market availability, ensuring the proposed solutions are both technically effective and practically applicable. For Scenarios 3-5, the Low-E coating is applied to surface 3 (the inner surface of the outer pane) of the double-glazing units. In line with the study's aim of "reducing heat losses through passive measures," these systems were comparatively tested to identify the most efficient retrofit options. The retrofit scenarios were designed to assess improvements in insulation, solar control, and condensation resistance, as outlined below:

Scenario 3: Replacement with Low-E double-glazed windows with a U-value of 2.4 W/m²·K, designed to minimize heat loss during winter through enhanced infrared reflectivity.

Scenario 4: Upgrading to Low-E triple-glazed windows (6+12+6+12+6 mm) with a U-value of 1.9 W/m²·K, designed to improve thermal insulation, enhance resistance to condensation, and reduce overall U-values.

Scenario 5: Incorporating argon gas-filled Low-E triple-glazed windows (6+12+6+12+6 mm) with a U-value of 1.6 W/m²·K, designed to achieve superior thermal performance by reducing convective heat transfer within the glazing layers, while maintaining visible light transmission and preventing condensation.

2.2.3. Scenario 6: Implementing a double-skin façade (dsf) system with Low-E glazing

A double-skin façade (DSF) system integrates an additional glazed layer to create an intermediate air cavity between the exterior and interior façade surfaces. This cavity serves as a thermal buffer zone, enhancing the building's overall insulation performance, reducing cooling loads, and, when

properly designed, improving the effectiveness of natural ventilation. As a passive design strategy, DSFs offer considerable potential for moderating indoor thermal conditions across different seasons.

Scenario 6: This scenario involves the implementation of a non-ventilated double-skin façade system on the south-facing façade, incorporating Low-E double glazing to enhance thermal efficiency. An 80 cm-wide air cavity was introduced between the glazing layers to retain heat during the winter months and to limit solar heat gain in the summer. The cavity functions as a static insulation layer, contributing to overall energy savings and promoting seasonal thermal balance without reliance on mechanical systems.

2.2.4. Scenarios 7-9: Cavity wall and enhancing wall insulation

Minimizing heat transfer through the building envelope is essential for reducing heating demand in winter and cooling loads in summer. This study investigates the performance implications of employing a cavity wall configuration supplemented with mineral wool insulation, in combination with different triple Low-E glazing systems. Mineral wool was selected due to its proven fire resistance, acoustic performance, and stability under varying moisture conditions. On the fenestration side, triple Low-E units with either air or argon gas fill were evaluated to determine the incremental thermal performance gains achievable within the same wall construction.

Scenario 7 incorporates a cavity wall with the addition of 7.5 cm of mineral wool insulation. This arrangement enhances the thermal resistance of the wall assembly while providing improved fire safety and acoustic comfort. In this scenario, standard glazing is retained, thereby isolating the effects of wall insulation enhancement from fenestration upgrades.

Scenario 8 builds upon the configuration in Scenario 7 by replacing the existing windows with triple Low-E air-filled glazing units. This modification is expected to significantly reduce radiative heat transfer through the glazing, while the air fill introduces additional thermal resistance. The combined improvements in wall and window performance aim to achieve notable reductions in winter heating demand.

Scenario 9 maintains the same cavity wall and mineral wool insulation configuration as Scenario 8 but replaces the air fill in the glazing units with argon gas. Due to its lower thermal conductivity compared to air, argon filling further reduces the U-value of the glazing assembly. This enables a higher level of thermal performance with minimal increases in assembly thickness, thereby minimizing both heating and cooling loads relative to the other scenarios.

The comparative analysis of these three scenarios allows for a clear assessment of the contribution of cavity wall insulation alone, as well as the incremental benefits of upgrading to triple Low-E glazing with air or argon gas fill. This integrated approach provides an evidence-based framework for optimizing wall and fenestration design in passive retrofit strategies for energy-efficient buildings

2.2.5. Scenario 10: Integrating aerogel insulation with triple-pane argon-filled glazing

Scenario 10 examines an advanced, fully integrated envelope retrofit strategy that combines a cavity wall with aerogel-based insulation and high-performance triple-pane, argon-filled Low-E glazing. Aerogel was selected due to its exceptionally low thermal conductivity, among the lowest of any commercially available insulation material, enabling significant thermal resistance within minimal thickness. This characteristic makes it particularly advantageous in retrofit applications where increasing wall thickness is constrained by architectural or spatial limitations. Additionally, aerogel offers hydrophobic properties, long-term stability, and resistance to compression, ensuring consistent insulating performance over the building's service life.

In this configuration, the cavity wall serves as the base structural assembly, while the aerogel layer minimizes conductive heat transfer through the opaque portions of the envelope. The triple-pane, argon-filled Low-E glazing further reduces heat losses through fenestration by combining low-

emissivity coatings, multiple insulating layers, and an inert gas fill with lower thermal conductivity than air. By addressing both opaque and transparent elements of the building envelope with state-of-the-art passive technologies, Scenario 10 aims to achieve maximum reductions in heating demand, while improving indoor thermal comfort and overall energy efficiency.

2.3. Energy performance simulation and analysis

In this study, the DesignBuilder software was used to evaluate the building's energy performance. DesignBuilder integrates the EnergyPlus simulation engine and enables dynamic, hourly-based energy modeling. Its selection was motivated by its ability to deliver high-resolution analysis of heating loads and daylighting performance under a variety of climatic and operational scenarios.

While several commercially available tools, such as Autodesk Insight, Tally, and Sefaira, are widely used for comparing passive and active design strategies, they often rely on static or semi-dynamic assumptions. These simplified methods may overlook complex thermal interactions, internal heat gains, and environmental variability. In contrast, the EnergyPlus-based approach employed in this study allows for a more precise and detailed assessment of both the individual and combined impacts of passive design strategies on energy consumption and thermal comfort.

2.3.1. Simulation setup

Each retrofit scenario was simulated under consistent boundary conditions, with variations applied exclusively to the building envelope, glazing configurations, and insulation strategies. To ensure climatic accuracy, all simulations utilized historical weather data specific to Safranbolu, obtained from the EnergyPlus Weather Data (EPW) database. This approach enhances the reliability of the results by grounding them in real-world environmental conditions. The simulation setup incorporated the following key parameters:

Building Operation: A 24-hour usage schedule was applied to reflect both academic and administrative functions, accounting for extended occupancy beyond standard working hours.

Indoor Thermal Comfort Standards: Heating and cooling setpoints were maintained between 18°C and 24°C, in accordance with ASHRAE Standard 55, to ensure occupant comfort.

Occupancy Patterns: Distinct occupancy schedules were defined for classrooms, laboratories, and administrative offices to reflect actual usage trends and space utilization.

Internal Heat Gains: Thermal contributions from lighting systems, electronic equipment, and occupant activities were incorporated to represent internal loads accurately.

Air Tightness Factor: An air infiltration rate of 1 Air Change per Hour (ACH) was assumed, reflecting the current construction quality and envelope sealing characteristics of the existing building.

2.3.2. Performance metrics for analysis

Each retrofit scenario was evaluated using a set of defined Key Performance Indicators (KPIs) to quantify the effectiveness of passive design strategies in improving building energy performance. The primary KPIs included:

Heating Loads: Seasonal variations in heating demand were analyzed to identify potential energy savings achieved through modifications to the building envelope, glazing systems, and insulation. These values provide insights into the improvements in thermal efficiency resulting from each passive intervention.

Daylighting Energy Load: The extent of natural daylight penetration was assessed to ensure that changes to the window-to-wall ratio (WWR) and glazing specifications did not compromise visual comfort or increase reliance on artificial lighting. This KPI was critical in evaluating the balance between daylight utilization and thermal performance.

A defining characteristic of Safranbolu's climate is its relatively mild summer season, during which ambient temperatures rarely necessitate substantial active cooling. Consequently, space heating represents the predominant energy demand throughout the year. Within this climatic context,

the primary objective of the study, and the central focus of the detailed performance analysis, was to assess the extent to which passive design strategies could effectively reduce heating and lighting energy loads, which constitute the major components of the baseline building's overall energy consumption.

Although cooling demand was included in the comprehensive energy simulations performed using DesignBuilder and EnergyPlus, detailed analysis and scenario-specific reporting of cooling loads were excluded from the core scope of this study, as cooling was determined to be a relatively minor contributor to the building's annual energy profile in this regional context.

3. Results

This section presents the outcomes of the simulation-based energy performance analysis for the existing building and examines the effectiveness of a range of passive retrofit strategies. The findings reveal baseline inefficiencies in the current building configuration and quantify the potential energy savings achievable through targeted interventions. The analysis includes a comparative evaluation of key passive design measures, such as adjustments to the window-to-wall ratio (WWR), upgrades to glazing systems, the implementation of a double-skin façade (DSF), and the application of advanced insulation materials. Each scenario is assessed in terms of its impact on heating loads, daylighting performance, and overall thermal efficiency, providing critical insights for the development of low-energy retrofit solutions in educational buildings located in cold climate regions.

3.1. Baseline energy performance of the existing building

Prior to the implementation of any retrofit strategies, the baseline energy performance of the existing S.Ş.D. Vocational School of Higher Education building was evaluated to identify inefficiencies related to heating and cooling. Simulation results indicated an annual heating demand of 61.22 kWh/m² and an annual lighting demand of 34.36 kWh/m². The building exhibited elevated heating loads during the winter months, primarily due to significant heat loss through the building envelope and uncontrolled air infiltration.

The principal sources of energy loss were identified as follows; the existing 6+12+6 mm reflective double glazing provides moderate thermal insulation but lacks effective solar control, leading to substantial heat loss during the heating season. The wall assembly, incorporating only 5 cm of insulation, was determined to be insufficient for achieving adequate thermal resistance, resulting in excessive heat transfer. An air exchange rate of 1 Air Change per Hour (ACH) further exacerbates heating and cooling demand by increasing the load on HVAC systems to maintain indoor comfort conditions.

These findings underscore the potential for significant energy savings through passive retrofit interventions, including the installation of high-performance glazing, enhanced thermal insulation, and optimized window-to-wall ratios (WWR). Such improvements are expected to reduce both heating and cooling loads, while also contributing to improved indoor thermal comfort and overall energy efficiency.

3.2. Energy performance of the scenarios 1-2

The Window-to-Wall Ratio (WWR) is a critical design parameter that significantly influences the balance between natural daylight availability, solar heat gains, and overall energy consumption in buildings. Adjusting WWR values allows for the optimization of either daylight penetration or thermal performance, depending on the building's specific energy efficiency goals. In this study, two alternative WWR adjustment scenarios were developed and analyzed to assess their impact on lighting and heating energy demands. The comparative energy performance results of the baseline model, along with those of Scenario 1 and Scenario 2, are presented in Table 2.

In Scenario 1, the Window-to-Wall Ratio (WWR) on the south-facing façade was increased with the aim of enhancing daylight penetration into interior spaces.

Table 2. The energy performance results of the baseline model and Scenarios 1 and 2

	Annual Lighting Demand	Annual Heating Demand
Baseline	34.36 kWh/m^2	61.22 kWh/m^2
Scenario 1	34.56 kWh/m^2	62.39 kWh/m^2
Scenario 2	34.02 kWh/m^2	60.08 kWh/m^2

Consequently, the annual lighting energy demand exhibited a slight increase, rising from 34.36 kWh/m² to 34.56 kWh/m².

The annual heating demand increased from 61.22 kWh/m² to 62.39 kWh/m², primarily due to elevated thermal losses through the enlarged glazed surfaces, particularly during the winter season. While improved daylighting performance contributes positively to visual comfort and indoor environmental quality, the expanded window area introduces the potential for increased cooling loads during the summer months due to greater solar heat gains. Although cooling performance was not within the primary scope of this analysis, this emerging risk underscores the need for further investigation.

Overall, the results suggest that increasing WWR on the south façade can be advantageous in terms of daylight utilization but comes at the cost of higher heating energy consumption. Therefore, this approach may be more suitable for buildings located in milder winter climates.

It is also important to note that, although Scenario 1 aimed to improve daylight performance through a higher WWR, the design and optimization of external shading devices, such as overhangs or vertical fins, were not integrated into this phase of the analysis. As a result, the strategy's full energy-saving potential remains underutilized. Incorporating climate-responsive external shading solutions in future design iterations could not only enhance daylighting efficiency but also play a critical role in limiting undesired solar heat gain, particularly during warmer seasons. This presents a valuable direction for future research and refinement of passive design strategies.

In Scenario 2, the Window-to-Wall Ratio (WWR) was reduced in order to decrease the total glazed surface area, thereby enhancing the building envelope's thermal insulation and minimizing heat loss during the winter season. This intervention led to a slight reduction in lighting energy demand, from 34.36 kWh/m² to 34.02 kWh/m², as the diminished daylight penetration necessitated greater reliance on artificial lighting in certain interior spaces.

More significantly, the annual heating demand decreased from 61.22 kWh/m² to 60.08 kWh/m², reflecting improved thermal performance attributable to reduced conductive heat transfer and air infiltration through the façade. Although the reduction in WWR limited the potential for passive solar heat gain, an element typically advantageous during winter months, the overall outcome yielded a net decrease in heating load.

However, the effectiveness of this approach depends on the implementation of complementary daylighting strategies. Without optimized interior lighting design or daylight-responsive control systems, the increased reliance on artificial lighting could partially offset the energy savings achieved through improved thermal insulation.

Overall, Scenario 2 demonstrates superior performance in reducing heating energy demand and is particularly well-suited for cold climate regions where winter heat retention is critical. Nonetheless, an integrative approach, combining façade optimization with advanced lighting design, is essential to maximize energy efficiency without compromising visual comfort.

The selection of glazing systems is a critical determinant in achieving an optimal balance between thermal insulation, daylighting efficiency, and overall energy performance in buildings. Variations in glazing properties, specifically the U-value, Solar Heat Gain Coefficient (SHGC), and Visible Light Transmittance (VLT), substantially influence the building's energy profile. These parameters govern the extent of solar heat gain, the effectiveness of thermal insulation, and the quality

and quantity of daylight admitted into interior spaces. Consequently, they have a direct impact on both heating and lighting energy demands, underscoring the importance of precise glazing selection in passive design strategies.

3.3. Energy performance of the scenarios 3-5

To evaluate the impact of glazing system upgrades on building energy performance, three alternative low-emissivity (Low-E) glazing configurations were assessed in comparison to the baseline reflective double-glazing system. The primary objective was to determine the most effective glazing solution for minimizing heating energy demand while ensuring sufficient daylight availability. The corresponding lighting and heating energy demands for each scenario are summarized in Table 3.

The selection of glazing systems is a critical determinant in achieving an optimal balance between thermal insulation, daylighting efficiency, and overall energy performance in buildings. Variations in glazing properties, specifically the U-value, Solar Heat Gain Coefficient (SHGC), and Visible Light Transmittance (VLT), substantially influence the building's energy profile. These parameters govern the extent of solar heat gain, the effectiveness of thermal insulation, and the quality and quantity of daylight admitted into interior spaces. Consequently, they have a direct impact on both heating and lighting energy demands, underscoring the importance of precise glazing selection in passive design strategies.

In Scenario 3, Low-E double-glazed windows with air-filled cavities were introduced. This configuration resulted in a substantial reduction in annual lighting energy demand, decreasing from 34.36 kWh/m² to 31.62 kWh/m², indicating enhanced visible light transmittance and, consequently, reduced reliance on artificial lighting. In parallel, the annual heating demand decreased significantly, from 61.22 kWh/m² to 54.86 kWh/m², demonstrating a considerable improvement in thermal insulation compared to the baseline glazing system.

These outcomes confirm that Low-E coatings effectively mitigate conductive heat loss while allowing sufficient solar gain to support passive heating strategies. Thus, Scenario 3 presents a favorable balance between daylight utilization and thermal performance. However, it is important to note that while this glazing type performs well under moderate winter conditions, its insulation capacity may be inadequate for buildings located in severe cold climate zones, where more advanced glazing technologies, such as triple-glazing systems, may be necessary to achieve the desired energy savings.

In Scenario 4, Low-E triple-glazed windows with air-filled cavities were implemented. This configuration led to a slight increase in annual lighting energy demand, rising from 31.62 kWh/m² (Scenario 3) to 33.75 kWh/m², corresponding to a 6.73% increase. The reduction in visible light transmittance is attributed to the additional glazing layer, which diminishes daylight penetration. However, this trade-off was offset by a notable improvement in thermal insulation, as annual heating demand declined from 54.86 kWh/m² to 50.64 kWh/m², representing a 7.70% reduction relative to Scenario 3, and a 17.3% decrease when compared to the baseline condition (61.22 kWh/m²).

These findings suggest that while triple glazing with air-filled cavities enhances insulation performance in winter, it slightly compromises daylight availability.

Table 3. The energy performance results of the baseline model and Scenarios 3, 4 and 5

	Annual Lighting Demand	Annual Heating Demand
Baseline	34.36 kWh/m^2	61.22 kWh/m^2
Scenario 3	31.62 kWh/m^2	54.86 kWh/m^2
Scenario 4	33.75 kWh/m^2	50.64 kWh/m^2
Scenario 5	33.75 kWh/m^2	48.73 kWh/m^2

Therefore, the integration of daylight-responsive control systems and climate-adaptive shading strategies becomes critical to mitigate increased lighting energy consumption.

In Scenario 5, Low-E triple-glazed windows with argon gas filling were tested. Lighting demand remained constant at 33.75 kWh/m², confirming that the substitution of air with argon gas does not influence visible light transmission. However, annual heating demand was further reduced to 48.73 kWh/m², yielding a 3.77% improvement compared to Scenario 4, and a 20.38% reduction compared to the baseline model.

The enhanced performance is attributed to argon's lower thermal conductivity (~0.016 W/m·K) relative to air (~0.024 W/m·K), which significantly reduces conductive heat losses through the glazing units. Among all glazing scenarios analyzed, Scenario 5 demonstrated the greatest reduction in heating energy demand, making it the most thermally efficient solution, particularly for buildings located in heating-dominant climates.

3.4. Energy performance of the scenario 6

The double-skin façade (DSF) system constitutes an advanced passive architectural strategy designed to enhance thermal insulation, facilitate natural ventilation, and enable effective solar control. By incorporating an additional layer of glazing, the DSF forms an intermediate ventilated air cavity between the interior and exterior façades. This buffer zone plays a crucial role in reducing heat loss during winter and mitigating solar heat gains in summer, thereby contributing to seasonal thermal stability.

In Scenario 6, a Low-E double-glazed DSF system was implemented on the south-facing façade to evaluate its effectiveness in improving the building's thermal performance and overall energy efficiency. The DSF in this configuration included an 80 cm non-ventilated cavity, designed to trap air and enhance thermal resistance.

Table 4 presents a comparative analysis of lighting and heating energy demand between the baseline model and the DSF-enhanced configuration in Scenario 6. The results provide insight into the trade-offs between enhanced insulation and potential reductions in daylight penetration associated with DSF systems.

In Scenario 6, the application of a Low-E double-glazed double-skin façade (DSF) system led to a measurable shift in both lighting and heating energy performance indicators. Specifically, annual lighting energy demand increased by approximately 4.3%, rising from 34.36 kWh/m² to 35.82 kWh/m². This increase is attributed to the reduced daylight transmittance resulting from the additional glazing layer, which, while beneficial for thermal buffering, introduced shading effects that diminished natural daylight penetration and subsequently heightened reliance on artificial lighting.

In contrast, annual heating energy demand was significantly reduced by 25.9%, decreasing from 61.22 kWh/m² to 45.38 kWh/m². This substantial improvement is primarily attributed to the thermal buffer created by the 80 cm non-ventilated air cavity between the two glazing layers, which effectively mitigated conductive and convective heat losses through the façade during colder periods. Moreover, the incorporation of Low-E coatings further enhanced thermal performance by minimizing long-wave radiative heat transfer.

These results highlight the efficacy of DSF systems with Low-E glazing in heating-dominant climates, where reducing winter heat loss is a key energy performance objective.

Table 4. The energy performance results of the baseline model and Scenario 6

	Annual Lighting Demand	Annual Heating Demand
Baseline	34.36 kWh/m^2	61.22 kWh/m^2
Scenario 6	35.82 kWh/m^2	45.38 kWh/m^2

However, the increase in lighting energy consumption also emphasizes the need for integrated daylighting strategies, such as light shelves or smart shading systems, to compensate for diminished daylight availability and ensure visual comfort.

Future research is recommended to explore the comparative benefits of ventilated versus non-ventilated DSF configurations, as well as their dynamic interactions with solar orientation and seasonal variations. Such investigations will be critical in optimizing the balance between thermal insulation and daylight utilization within high-performance façade systems.

3.5. Energy performance of the scenarios 7, 8 and 9

The building envelope plays a pivotal role in regulating thermal performance, directly influencing heating energy demand and indoor environmental quality. Achieving Net-Zero Energy Building (NZEB) standards requires a highly insulated envelope capable of minimizing heat losses while ensuring occupant comfort. This section evaluates the impact of retrofitting the envelope through the use of cavity wall construction supplemented with mineral wool insulation, as well as the integration of high-performance triple Low-E glazing systems, under cold-climate conditions.

Scenario 7 involves the implementation of a cavity wall supplemented with 7.5 cm of mineral wool insulation. This intervention resulted in a modest increase in lighting energy demand to 34.67 kWh/m² (0.9% above the baseline of 34.36 kWh/m²), likely due to slight changes in interior surface reflectance affecting daylight distribution. In contrast, annual heating demand decreased by 18.7%, from 61.22 kWh/m² to 49.74 kWh/m², indicating a marked improvement in thermal resistance. The reduction in thermal conductivity of the modified wall assembly effectively limited heat transfer through the opaque façade, improving indoor comfort and lowering winter heating loads.

Scenario 8 builds upon Scenario 7 by integrating triple-pane, Low-E air-filled glazing. Lighting demand remained constant at 34.67 kWh/m², demonstrating that the glazing upgrade did not compromise daylight availability. Annual heating demand was reduced to 42.48 kWh/m², representing a 30.6% decrease relative to the baseline. This improvement can be attributed to the synergistic effect of combining cavity wall insulation with advanced glazing technology. The Low-E coatings minimized long-wave radiative heat losses while allowing high visible light transmission, thereby enhancing both energy efficiency and daylight performance.

Scenario 9 retains the same cavity wall and mineral wool insulation configuration but replaces the air-filled glazing with triple-pane, Low-E argon-filled units. Lighting demand again remained stable at 34.67 kWh/m², confirming that the type of inert gas fill has no measurable impact on daylight transmittance (Table 5). Heating demand, however, decreased further to 41.59 kWh/m², corresponding to a 32.1% reduction from the baseline. The enhanced performance of argon-filled glazing is attributed to argon's lower thermal conductivity compared to air, which further suppresses convective heat transfer through the transparent envelope components.

Among the configurations examined, Scenario 9, combining cavity wall insulation with triple-pane, Low-E argon-filled glazing, yielded the greatest reduction in annual heating demand while maintaining acceptable lighting energy levels.

Table 5. The energy performance results of the baseline model and Scenarios 7, 8 and 9

	Annual Lighting Demand	Annual Heating Demand
Baseline	34.36 kWh/m^2	61.22 kWh/m^2
Scenario 7	34.67 kWh/m^2	49.74 kWh/m^2
Scenario 8	34.67 kWh/m^2	42.48 kWh/m^2
Scenario 9	34.67 kWh/m^2	41.59 kWh/m^2

These results confirm its suitability for cold-climate retrofit applications, where heating demand dominates the overall energy profile.

In cold-climate regions, where heating demand constitutes the dominant share of building energy consumption, the integration of a cavity wall with 7.5 cm mineral wool insulation and argon-filled triple-pane Low-E glazing emerges as the most effective passive retrofit strategy for improving both energy efficiency and thermal performance. This combined configuration substantially reduces heat loss through both opaque and transparent elements of the building envelope, while preserving adequate daylight availability and avoiding increased dependence on artificial lighting. To promote large-scale adoption, future research should incorporate comprehensive cost–benefit assessments and evaluate long-term payback periods, with particular emphasis on applications in educational facilities, which often present complex operational schedules and variable thermal behavior.

3.6. Energy performance of the scenario 10

Scenario 10 investigates an advanced passive retrofit configuration in which aerogel insulation is incorporated into a cavity wall assembly and combined with triple-pane, argon-filled Low-E glazing. Aerogel was selected for its exceptionally low thermal conductivity, among the lowest of any commercially available insulation material, allowing substantial thermal resistance to be achieved within a minimal thickness. Its slim profile makes it particularly advantageous for retrofit applications where increasing wall thickness is constrained by architectural or spatial limitations. In this scenario, the integration of high-performance glazing further enhances the thermal barrier by reducing radiative and conductive heat losses through fenestration.

Table 6 presents the comparative results for annual lighting and heating energy demands between the baseline condition and Scenario 10. Lighting demand increased slightly from 34.36 kWh/m² to 34.67 kWh/m², consistent with other scenarios employing cavity wall construction. This marginal change is likely due to subtle alterations in interior surface reflectance and wall composition, which may slightly reduce daylight penetration. In contrast, annual heating demand dropped markedly from 61.22 kWh/m² to 39.84 kWh/m², corresponding to a 34.9% reduction. This significant improvement is primarily attributable to the exceptional insulating capacity of the aerogel layer, which despite a thickness of only 2 cm, substantially limited conductive heat transfer through the opaque envelope components.

The addition of triple-pane, argon-filled Low-E glazing provided a further reduction in heat losses through the transparent envelope by lowering both long-wave radiative transfer and convective heat flow within the glazing unit. This combination achieved one of the highest thermal performance levels among all retrofit configurations assessed, particularly benefiting heating-dominant climates. While the modest increase in lighting energy demand represents a minor trade-off, the overall energy savings from reduced heating requirements substantially outweigh this effect.

These findings reinforce the potential of aerogel-based insulation, when paired with high-performance glazing, as one of the most effective passive retrofit solutions for reducing heating energy demand in existing buildings. However, even such high-performing envelope strategies alone may not suffice to meet Net-Zero Energy Building (NZEB) targets.

Table 6. The energy performance results of the baseline model and Scenario 10

	Annual Lighting Demand	Annual Heating Demand
Baseline	34.36 kWh/m^2	61.22 kWh/m^2
Scenario 10	34.67 kWh/m^2	39.84 kWh/m^2

For broader implementation, future research should include comprehensive cost–benefit assessments, life cycle analyses, and evaluations of the long-term durability and economic feasibility of aerogel-based systems across diverse building typologies.

4. Discussion

Each retrofit scenario was developed to assess targeted modifications involving the window-to-wall ratio (WWR), glazing configurations, façade systems, and insulation strategies. Table 7 and Fig. 3 present the resulting annual lighting and heating energy consumption for each scenario, benchmarked against the baseline model to determine their relative effectiveness in reducing energy demand.

The simulation results for WWR adjustments reveal the expected trade-off between daylight access and thermal performance.

Table 7. The energy performance results of all scenarios

	Annual Lighting Demand	Change (%)	Annual Heating Demand	Change (%)
Baseline	34.36 kWh/m^2	0	61.22 kWh/m^2	0
Scenario 1	34.56 kWh/m^2	0.58	62.39 kWh/m^2	1.91
Scenario 2	34.02 kWh/m^2	-0.99	60.08 kWh/m^2	-1.86
Scenario 3	31.62 kWh/m^2	-7.97	54.86 kWh/m^2	-10.38
Scenario 4	33.75 kWh/m^2	-1.78	50.64 kWh/m^2	-17.28
Scenario 5	33.75 kWh/m^2	-1.78	48.73 kWh/m^2	-20.4
Scenario 6	35.82 kWh/m^2	4.25	45.38 kWh/m^2	-25.87
Scenario 7	34.67 kWh/m^2	0.9	49.74 kWh/m^2	-18.75
Scenario 8	34.67 kWh/m^2	0.9	42.48 kWh/m^2	-30.61
Scenario 9	34.67 kWh/m^2	0.9	41.59 kWh/m^2	-32.06
Scenario 10	34.67 kWh/m^2	0.9	39.84 kWh/m^2	-34.92

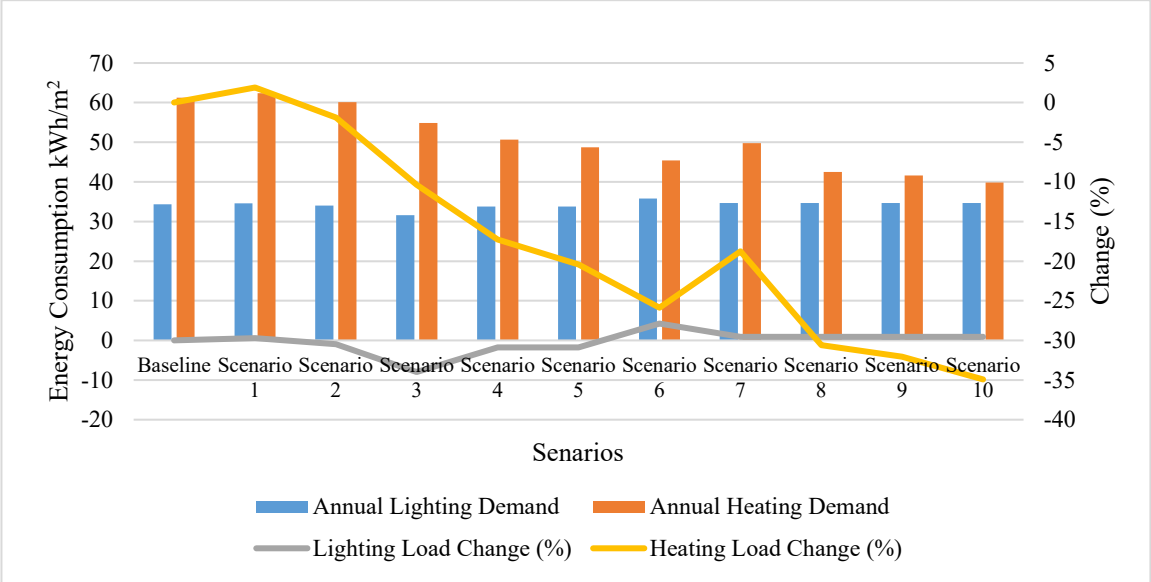

Fig. 3. Energy consumption analysis: Baseline vs. improved scenarios

Increasing the WWR on south-facing façades (Scenario 1) resulted in a 1.9% increase in annual heating demand, whereas reducing the WWR (Scenario 2) yielded a 1.9% decrease. These findings are consistent with the observations of Tzempelikos and Athienitis [39], who reported that higher WWR values in cold climates increase conductive heat losses through glazing, and with Goia [40], who demonstrated that lower WWRs improve insulation performance but may marginally increase reliance on artificial lighting. In this study, Scenario 2 exhibited only a minimal change in lighting demand, suggesting that daylight availability remained adequate even with reduced glazing area, consistent with Konis [41], who highlighted the role of daylight-responsive lighting controls in mitigating such effects.

Upgrading glazing systems produced more substantial energy savings. Transitioning from Low-E double glazing (Scenario 3) to Low-E triple glazing (Scenario 4) reduced heating demand from 61.22 kWh/m² to 50.64 kWh/m², a 17.3% improvement. The addition of argon gas in Scenario 5 further lowered heating demand to 48.73 kWh/m², corresponding to a 20.4% reduction relative to the baseline. These results align with previous research by Arasteh et al. [42] and Cuce & Riffat [43], which demonstrated that Low-E coatings reduce long-wave radiative heat transfer, and that argon-filled glazing suppresses convective heat transfer within glazing cavities. The additional 3.1% improvement from Scenario 4 to Scenario 5 supports the findings of Cuce & Riffat [43], who noted the enhanced insulating effect of inert gas fills in multi-pane systems.

Scenario 6 employed a double-skin façade (DSF) system, achieving a 25.9% reduction in heating demand. This outcome is consistent with Saelens et al. [44], who reported 20–30% energy savings with DSF systems depending on design and ventilation strategies. However, lighting demand increased to 35.82 kWh/m² (a 4.2% rise from baseline), reflecting the self-shading effect commonly observed in DSFs, as also documented by Gratia and De Herde [45]. To mitigate this, Loonen et al. [46] recommended integrating adaptive shading or dynamic glazing to balance solar gains with daylight availability.

Scenario 7 introduced a cavity wall with 7.5 cm mineral wool insulation, resulting in an 18.7% reduction in annual heating demand (from 61.22 kWh/m² to 49.74 kWh/m²). This confirms the significant role of improving wall thermal resistance in cold climates, in line with the findings of Rosas Flores [47], who reported up to 20% heating load reductions with higher R-value wall assemblies.

Scenario 8 combined the same cavity wall and mineral wool insulation with triple-pane Low-E air-filled glazing. This configuration achieved a 30.6% reduction in heating demand (to 42.48 kWh/m²), while lighting demand remained stable at 34.67 kWh/m², indicating that the glazing upgrade did not compromise daylight availability.

Scenario 9 retained the cavity wall and mineral wool insulation but incorporated triple-pane Low-E argon-filled glazing. Heating demand decreased further to 41.59 kWh/m², a 32.1% reduction compared to the baseline,while lighting demand again remained unchanged. The superior thermal performance of this configuration is attributed to argon's lower thermal conductivity compared to air, which reduces convective heat transfer within the glazing cavities.

The results for Scenarios 8 and 9 validate the synergistic benefits of integrating high-performance glazing with enhanced wall insulation, supporting the conclusion of Asdrubali et al. [48] that combined passive strategies offer superior energy savings compared to isolated measures.

Scenario 10 integrates a cavity wall with aerogel insulation and triple-pane, Low-E argon-filled glazing, achieving the greatest reduction in annual heating demand among all configurations, a 34.9% decrease relative to the baseline. This result confirms the exceptional thermal performance of aerogel, consistent with the findings of Baetens et al. [49] and Jelle [50], who reported thermal conductivities as low as 0.013 W/m·K, placing aerogel among the most efficient insulation materials commercially available [33, 34]. While this configuration resulted in a slight increase in

lighting energy demand due to marginal reductions in daylight transmittance, the overall net energy savings highlight its effectiveness as a high-performance passive retrofit strategy.

In cold-climate regions, where space heating accounts for the majority of annual building energy consumption, Scenario 10 offers one of the most balanced solutions in terms of thermal resistance, energy efficiency, and occupant comfort. However, despite the significant reductions in heating loads, the residual energy demand still exceeds Net-Zero Energy Building (NZEB) thresholds. This finding underscores that passive measures alone are insufficient to achieve full NZEB compliance and should be complemented with renewable energy systems or hybrid passive–active solutions.

Despite these significant improvements, the results reveal a critical limitation: passive design strategies alone are insufficient to achieve Net-Zero Energy Building (NZEB) performance. While they substantially improve thermal resistance and reduce energy losses, passive measures cannot fully eliminate dependence on external energy sources. Bridging this gap requires integrating active renewable energy systems, such as photovoltaic (PV) panels, solar thermal collectors, and hybrid renewable solutions. Deng et al. (2014) emphasize that a hybrid approach,combining passive and active measures,is essential to meeting NZEB targets [51].

The incorporation of solar PV systems offers a practical means of enhancing energy self-sufficiency. Whether installed as rooftop arrays, façade-mounted systems, or integrated into the building envelope as building-integrated photovoltaics (BIPV), PV technology can meet 60–100% of a building's total electricity demand, depending on system capacity, efficiency, and climatic conditions. Similarly, solar thermal systems for domestic hot water production and HVAC support can further reduce heating loads; Hernández and Kenny [52] report that when coupled with passive envelope improvements, solar thermal collectors can deliver up to an additional 30% energy savings.

Although the present study primarily addresses operational energy savings, it is important to account for the embodied energy and carbon emissions associated with material production, transportation, and installation. High-performance materials such as aerogel, despite their superior insulating properties, may have a higher embodied environmental cost than conventional insulation alternatives. To ensure that retrofit strategies are both energy-efficient and environmentally responsible, future research should incorporate a comprehensive Life Cycle Assessment (LCA) that evaluates operational and embodied energy, as well as the carbon footprint of each scenario. Such an integrative approach is essential for informing sustainable retrofit design and policymaking.

5. Conclusion

This study has demonstrated the effectiveness of a range of passive design strategies, including optimized window-to-wall ratios (WWR), advanced glazing systems, double-skin façades (DSFs), and high-performance insulation materials, in reducing heating and lighting energy demands in existing educational buildings. The results highlight that improvements to envelope insulation and glazing performance can yield substantial reductions in heating loads, with Scenario 10 (cavity wall + aerogel insulation + triple-pane Low-E argon-filled glazing) achieving the greatest decrease in annual heating demand (34.9%). These findings are consistent with previous research that underscores the exceptional thermal properties of aerogel insulation and the energy-saving potential of triple-glazed, inert gas-filled windows.

Energy storage systems and smart energy management technologies are critical enablers of NZEB performance. Battery storage allows surplus PV-generated electricity to be used during periods of low generation or peak demand, improving energy reliability. Intelligent monitoring and control systems can further optimize building operations by adjusting lighting, heating, and cooling in real time based on occupancy patterns and environmental conditions.

A hybrid strategy that integrates both passive and active measures provides a robust and scalable pathway toward NZEB achievement. Emerging technologies such as adaptive façades, combining PV panels, phase change materials (PCMs), and daylight-responsive shading, offer dynamic energy optimization beyond the capabilities of conventional static systems. To fully exploit the potential of such integrated solutions, holistic energy modeling and scenario-based optimization are essential to determine the most cost-effective retrofit strategies for various building typologies and climatic contexts.

A limitation of the present study is its focus on heating and lighting energy demand, which reflects the heating-dominant climate profile of Safranbolu. In warmer regions or during summer periods, passive measures that enhance solar gain or reduce heat loss may inadvertently increase cooling loads. Therefore, future research should evaluate these retrofit strategies in hot and mixed-humid climates to provide a balanced assessment of both heating and cooling performance.

In conclusion, while passive design principles form the foundation for improving building energy efficiency, achieving NZEB performance requires a comprehensive approach that incorporates renewable energy generation, energy storage, and intelligent control systems. Future work should investigate the economic feasibility of such hybrid retrofits through detailed cost–benefit analyses, accounting for capital investment, operational savings, payback periods, and long-term environmental impacts. Such insights are critical for policymakers, designers, and facility managers aiming to transform existing building stock into high-performance, net-zero energy assets.

Keywords: building material | PCM | sustainable architecture | thermal energy storage | waste

ABSTRACT

The utilization of waste-based thermal energy-storing building materials in construction is a significant advancement in the reduction of the environmental impact of human activities. Such materials provide thermal comfort, reduce energy consumption, and promote the use of renewable resources. Phase change materials (PCM) have been the subject of these achievements in recent years regarding their heat storage potentials. On the other hand, the utilization of waste is of significant consequence with regard to the sustenance of a circular economy and the alleviation of waste-related environmental concerns. However, the majority of studies on PCM in the literature tend to concentrate on the thermal, physical, chemical, and mechanical properties of the materials, and thus fails to provide a comprehensive perspective on the sustainability of these materials. In this study, 11 articles selected from a total of 178 studies aiming to produce building materials with waste-PCM combinations are analyzed according to five categories related to sustainable built environment, which are resource use, environmental impact, health, comfort, and cost. As a result, it is proved that composite building materials that contain waste and store thermal energy have the potential to contribute significantly to sustainable architecture.

1 | Introduction

The construction of buildings necessitates the utilization of a plethora of building materials throughout the entirety of their life cycle and the construction sector is responsible for 25% to 45% of the total energy during extraction of raw materials and transporting processes [1]. Moreover, around 12% of global emissions are caused by building materials such as cement and steel [2]. As indicated by the Energy Information Administration (EIA), the projected increase in carbon emissions from energy consumption by 2023 is 37.2 Gt [3]. Consequently, the objective of the European Union (EU) countries is to reduce greenhouse gas emissions by 40% between 1990 and 2030 [4]. Furthermore, the EU aims to decarbonize the building stock by 2050 [5]. The twin challenges of resource depletion and climate change require a fundamental rethink of the built environment [6]. In order to address this situation, it is necessary to implement measures that will ensure the efficient use of resources, facilitate a shift towards renewable energy sources [7]. It is of the utmost importance that such decisions are made in order to construct a sustainable built environment.

One of the reasons for the observed increase in energy consumption for space cooling in buildings is the transition from the use of traditional materials with thermal mass properties, such as stone and brick, to the adoption of lightweight structural materials, including wood and composites [8]. The utilization of thermal mass is of significance in the context of space cooling, as it serves

to retain heat and enhance thermal comfort [9]. The advantages of thermal energy storage have been acknowledged and incorporated into environmental policies at the international level. In accordance with Directive 2023/2413 of the European Parliament and of the Council, the integration of thermal energy storage is to be made mandatory in order to achieve greater energy efficiency and cost-effectiveness. In this context, it is of paramount importance that EU Member States promote interoperability for heating and cooling systems and thermal energy storage units [10]. It is imperative that all EU policies on energy efficiency in buildings address the potential of thermal mass in conjunction with other solutions, including insulation, heating and cooling systems, and renewable energy. Moreover, sustainability policies in the construction sector should encompass social aspects such as well-being and comfort [11].

While there are no specific measures for thermal energy storage in Turkey's national energy policies, various strategies have been proposed to reduce energy consumption. The 2017–2023 National Energy Efficiency Action Plan aims to reduce Turkey's primary energy consumption by 14%. In accordance with the EU Energy Efficiency Directive, the report anticipates a 50% surge in residential heating demand by 2040 and mandates that all edifices exceeding 2000 m^2 must attain the status of nearly zero-energy buildings (nZEB) by 1 January 2025 [12]. The action plan, which covers the period from 2024 to 2030, aims to reduce total emissions by 100 million tons [13].

In light of the prevailing patterns of energy consumption, the significance of renewable resources is further underscored. In light of the aforementioned considerations, the capacity of building materials to store thermal energy and provide passive heating and cooling functions within buildings has constituted a significant research focus in recent years. Phase change materials (PCM), which offer the potential for the utilization of solar energy, can also be employed in the creation of highly effective composites in the field of thermal energy storage.

The utilization of PCM and heavy thermal masses has the potential to reduce the intensity of mechanical air conditioning systems, as they are capable of storing excess heat [14]. PCM constitutes a subgroup of thermal energy storage systems, functioning on the principles of latent heat storage and sensible heat. They are capable of storing considerable quantities of heat energy within narrow temperature ranges. In order to utilize PCM in a building, it is necessary for the materials in question to possess a number of different physical, chemical, environmental and economic properties. Nevertheless, no PCM product currently available on the market exhibits all of these properties simultaneously. The greater the number of these properties that a PCM exhibits, the more significant its contribution to the building users, the environment, the budget and the lifetime of the structure [15].

PCMs are classified into three categories: organic, inorganic, and eutectic [16–18]. The organic group comprises paraffins, alcohols and fatty acids, whereas the inorganic group includes salt hydrates and metallic species. The eutectic group comprises combinations of at least two distinct organic and/or inorganic species [19–22]. Each type of PCM has inherent advantages and disadvantages; therefore, it is essential to implement appropriate measures to mitigate the disadvantages. It is recommended that paraffins, fatty acids, salt hydrates and their eutectic mixtures be employed in order to achieve optimal energy efficiency and thermal comfort in buildings [23–25]. A variety of techniques have been developed to apply thermal energy storage in building materials, including direct mixing, impregnation, encapsulation, and shape and form stabilization [26, 27].

A substantial body of research on PCM has been published in recent years. Jouhara et al. [28] investigated the active and passive applications of PCM types with latent heat storage in a variety of sectors, including food, automotive and construction. Some papers concentrated on a single type of PCM. For instance, Purohit and Sistla [29] underscored the attributes of salt hydrates, including their high thermal heat storage capacity, cost-effectiveness, and non-flammability. Furthermore, a number of methods have been put forth with the aim of addressing the negative properties of PCMs, including corrosiveness, supercooling and phase separation. Other research on PCM has concentrated on their behavior in accordance with climatic conditions [30], cooling-only [31] or heating-only applications. A limited number of comprehensive review articles have been published that examine the materials used in waste-derived PCM production [32]. Additionally, studies have addressed the economic and environmental properties of waste-based PCM composites [33]. The aforementioned study provides a comprehensive examination of active and passive systems and applications according to waste types.

Furthermore, numerous studies in the literature examine PCM products derived from waste materials within the context of laboratory analyzes and experimental studies [34–36]. Nevertheless, the number of articles that synthesize these studies in a comprehensive framework is relatively limited. The development of an approach, particularly within the context of the architectural field, is of significant importance with regard to the integration of waste into the circular economy and the provision of sustainable architectural solutions through the utilization of innovative building materials. It is therefore essential that the evaluation of studies be conducted with a multidisciplinary approach.

The novel aspect of this study is the evaluation of the waste-based thermal energy storage systems in buildings within the context of sustainable architectural principles. The study investigates examples from the last decade. In addition to technical features, this study considers the holistic implications for the human being, the social subject of architectural design, the natural environment in which architecture comes to life, and the economic investments that make architecture feasible. This study focuses exclusively on the waste-based, thermal energy-storing building materials for passive applications in buildings. The target audience includes architects, building material manufacturers, environmental, civil and material engineers, and academics engaged in research in this field.

2 | Materials and Methods

A search of the Web of Science database was conducted using the following keywords: "waste*," "reuse*," "recycl*," "reclaim*," "thermal energy," "material*," and "building*." The language

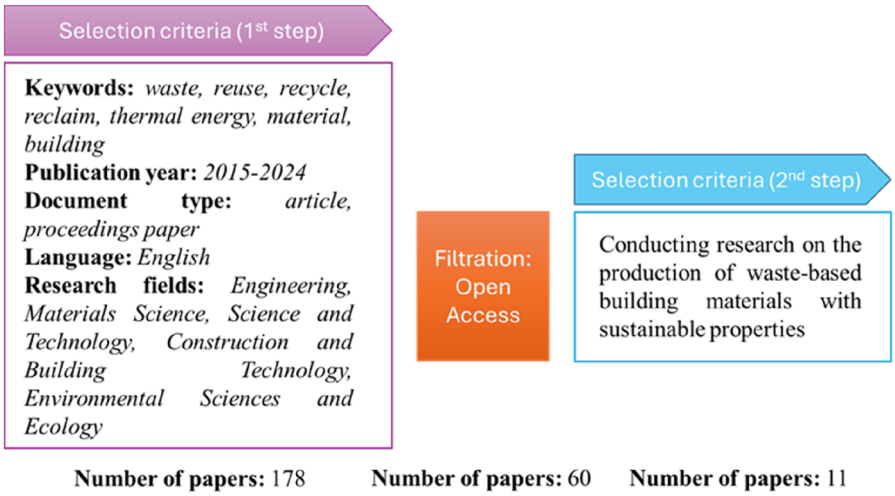

FIGURE 1 | Selection methodology.

was set to English, and the search was limited to articles and proceedings papers published between 2015 and 2024. The studies identified were confined to the disciplines of engineering, materials science, science and technology, construction and building technology, and environmental sciences and ecology. In accordance with the aforementioned criteria, 60 of the 178 documents retrieved were identified as being available via open access (Figure 1).

All 11 studies exhibit common characteristics, including the utilization of waste materials, the development of PCMs that can be integrated into the composition of building materials, and the utilization of thermal storage systems that can operate within temperature ranges aligned with thermal comfort standards for indoor environments. Furthermore, the studies were selected on the basis of their presentation of data pertaining to at least one of the following categories: resource use including energy, raw material and water, environmental impact analysis, cost analysis, occupant comfort and health.

3 | Research Status

3.1 | Waste Utilization

The requisite characteristics of a PCM for utilization in a structural context are elucidated in Chapter 1. In the event that these properties are not satisfied, a number of issues may arise within the structure. Such issues may manifest as insufficient thermal and chemical stability, elevated supercooling temperatures, reduced thermal conductivity, leakage problems, and low viscosity. The utilization of various waste materials serves to prevent such problems.

A review of the literature reveals that a considerable number of waste materials derived from biological, agricultural, industrial and construction sources are employed in the manufacture of thermal energy storage building materials. The principal reasons for the preference of these wastes are their low environmental impact, accessibility, cost advantages and biodegradability. However, it is also observed that wastes that are not biodegradable (such as tire rubber) or that may contain harmful components (such as electrical arc furnace dust) are also employed in the production of PCM (Figure 2).

In selecting waste materials for use in PCM, it is essential to consider their porosity and water absorbency, as these properties can prevent potential leaks that may occur during the phase change of the material. In addition to enhancing thermal performance, some wastes are also employed to improve acoustic performance, augment structural strength and regulate viscosity. For instance, the high porosity and absorbency characteristics of waste materials permit their effective utilization in form stabilization applications. Furthermore, waste cooking oils have been identified as a viable thermal energy storage agent in direct applications.

The utilization of waste materials in the construction industry plays a pivotal role in advancing environmental sustainability. Furthermore, the incorporation of waste into the circular economy and the production of energy-efficient materials derived from it also influences the embodied and operational energy consumption of buildings. It has been demonstrated that the incorporation of appropriately selected waste materials can enhance not only the energy performance but also the overall strength, fluidity, water absorbency and acoustic properties of materials.

In this context, waste materials and PCM are employed in the production of building materials designed to enhance energy efficiency and thermal comfort in buildings. These building materials are typically in the form of composites, panels, concrete, and mortar (Table 1).

3.2 | Laboratory Analysis and Experiments

The tests and analyses employed during the production of building materials are typically conducted within a laboratory setting. The objective of these studies is to evaluate the chemical, thermal and physical characteristics of materials, as well as to ascertain their structural strength. Given that PCM-waste-based building materials are predominantly composite, it is of paramount importance that the components of these materials function in unison.

TABLE 1 | Characteristics of the wastes used and their intended use in material production.

Ref.	Waste	Waste properties	Waste as . . .	Building material
{1} [4]	Cuttlebone and pomelo peel	Porous, biodegradable, renewable, safe to use, cheap, abundant	Shape stabilizer	Composite material
{2} [37]	Coconut peat	Oil absorber, causing environmental pollution by dumping, abundant, cheap, biodegradable	Shape stabilizer	Composite material
{3} [38]	Hemp shives	Improves thermal properties, biodegradable, renewable	Shape stabilizer	Composite wall panel
{4} [39]	Apricot kernel shells	Abundant, cheap, low ash content, cellulosic	Shape stabilizer and thermal conductivity agent	Activated carbon
{5} [40]	Waste cooking oil (glycerine, fatty acid)	Low environmental impact	PCM	Cement-based composite panel
{6} [41]	Fly ash	Abundant, cheap, low environmental impact	Viscosity modifier	Geopolymer paste
{7} [42]	Electrical arc furnace dust	Acoustic insulation, hazardous	Shape stabilizer and insulation	PCM dense sheet
{8} [43]	Tire rubber	Non-biodegradable, abundant, hazardous when it burns	Shape stabilizer and thermal conductivity agent	Composite material
{9} [44]	Recycled expanded glass	Heat resistive, low embodied energy, rigid surface, recyclable, high absorption, good thermal and structural performance	Heat resistive shape stabilizer with low embodied energy and rigid surface	Concrete panel
{10} [45]	Recycled concrete powder	High porosity	Shape stabilizer	Foam concrete
{11} [46]	Recycled expanded glass aggregate	High porosity and adsorption	Shape stabilizer	Cement mortar

The principal analytical techniques employed in the various studies, together with their intended applications, are set out below.

X-ray diffraction (XRD) is a technique used to analyze the crystal structure of a material. It generates pattern graphs that illustrate the chemical interactions and crystal structure of the components that constitute the material's structure. This analysis is employed for the identification of crystalline phases within the microstructure of the building material [4].

Scanning electron microscopy (SEM) and energy-dispersive spectroscopy (EDS) are further analytical techniques that can be employed in this context. SEM provides microscopic images that can be used to determine the pore structure, homogeneity and

25778196, 2025, 3, Downloaded from https://onlinelibrary.wiley.com/doi/10.1002/eng2.70034 by Turkey Cochrane Evidence Aid, Wiley Online Library on [03/03/2025]. See the Terms and Conditions (https://onlinelibrary.wiley.com/terms-and-conditions) on Wiley Online Library for rules of use; OA articles are governed by the applicable Creative Commons License

physical compatibility of the components. The EDS method is employed to ascertain the chemical distribution of elements on the surface of the material, with this analysis conducted on the basis of the aforementioned images [39].

Fourier transform infrared spectroscopy (FTIR) is a technique used to analyze the molecular structure of materials. This technique is employed to examine the chemical constitution of composite materials and the compatibility of chemical bonds between their constituent components. This method is particularly well-suited to the analysis of the chemical structure of PCM-based materials. This method is typically employed to assess the chemical stability of a material subjected to prolonged thermal cycling [43].

DSC (differential scanning calorimetry) is employed to ascertain the thermal properties and thermal strength of materials. This analysis provides insight into the phase change temperatures of materials and their thermal behavior, including melting and freezing. The analysis is typically repeated after more than 100 thermal cycles to ensure the reliability of the results [41].

Thermogravimetric analysis (TGA) is a technique used to determine the thermal stability of materials. The technique is employed to quantify the loss of material and assess thermal stability as a function of temperature. This analysis examines the mass loss and degradation behavior of the material over a given temperature range, thereby providing information on its thermal stability [38].

Infrared thermography (IRT) is a technique that employs thermal imaging to analyze the infrared radiation emitted by objects. This technique is employed to ascertain the heat storage performance of materials. The distribution of temperatures across the sample surfaces is illustrated through the use of infrared thermal imaging. This method enables the analysis of heat transfer properties through the visual presentation of temperature differences on the surface of the material [46].

These analytical techniques are fundamental to ascertain the compatibility of the components employed in the manufacture of building materials and their thermal, chemical and physical properties. The repetition of such analyzes, particularly in the context of PCM-waste-based materials, is beneficial for the evaluation of the long-term performance and durability of the materials (Figure 3).

It can be observed that experimental studies are conducted within a laboratory setting in the majority of cases. Nevertheless, experimental setups designed to assess the performance of the materials under actual temperature conditions were incorporated into only half of the studies examined. The two distinct methodological approaches, namely theoretical and practical, yield results encompassing a multitude of parameters, including thermal, physical, chemical, acoustic, mechanical, and environmental properties of the materials under investigation (Table 2).

4 | Results

This section addresses the impacts of waste-PCM composites in the field of sustainable architecture, as examined in the 11 studies reviewed. The aforementioned impacts are evaluated in terms of energy, water and material utilization, as well as environmental impacts and user health, economic impacts and comfort parameters.

4.1 | Energy Efficiency

The utilization of building materials that are capable of storing energy and facilitating its subsequent utilization represents an effective strategy for the reduction of non-renewable energy resource consumption. A review of the numerical data reveals that a single gram of the building materials produced within the scope of the studies examined can store a range of energy between 10 and 193 J during a phase change. The number of thermal cycles tested ranged from 100 to 1200. It is possible that chemical interactions between PCM and waste materials may have an adverse effect on the thermal performance of the material, even if the interaction is weak. It is therefore crucial to ensure that the selected waste materials do not induce chemical incompatibility or instability during the thermal cycles of PCM [4]. In related studies, it has been demonstrated that the energy storage capacity of building materials exhibits minimal reduction during thermal cycling periods. Based on a phase change rate of 300 times per year [47], these findings indicate that waste-based PCM may have a functional lifespan of approximately 4 years.

The phase change temperatures of PCM are situated in proximity to indoor comfort ranges, thereby performing an efficacious function in ensuring thermal comfort. However, it is also necessary to consider the climatic characteristics when selecting or adjusting the phase change temperature. A review of the literature reveals that all of the PCM types under examination are organic in nature. It has been documented that the thermal conductivity of alcohol derivatives is less than that of fatty acid derivatives, whereas paraffin exhibits a thermal conductivity value that falls between these two categories.

The low thermal conductivity of PCM impedes effective heat transfer, thereby limiting the material's potential for heat storage [48]. The addition of certain waste materials has been shown to significantly enhance the thermal conductivity of the resulting material. For instance, the thermal conductivity of a material can be enhanced by incorporating apricot kernel shell or tire rubber. As illustrated in Table 3, the thermal conductivity of the material can be increased by up to 2.61 and 2.3 times, respectively.

The utilization of waste materials enables the storage of energy without the loss of material that would otherwise occur during a change of state. The composite building material produced by impregnation method using bio-based waste materials, including cuttlebone and pomelo peel, demonstrated a 70% increase in thermal energy storage capacity compared to the reference case, where only PCM obtained from oil was utilized [4]. Similarly, it was demonstrated that the composite material obtained from coconut peat by vacuum impregnation has the potential to be

25778196, 2025, 3, Downloaded from https://onlinelibrary.wiley.com/doi/10.1002/eng2.70034 by Turkey Cochrane Evidence Aid, Wiley Online Library on [03/03/2025]. See the Terms and Conditions (https://onlinelibrary.wiley.com/terms-and-conditions) on Wiley Online Library for rules of use; OA articles are governed by the applicable Creative Commons License

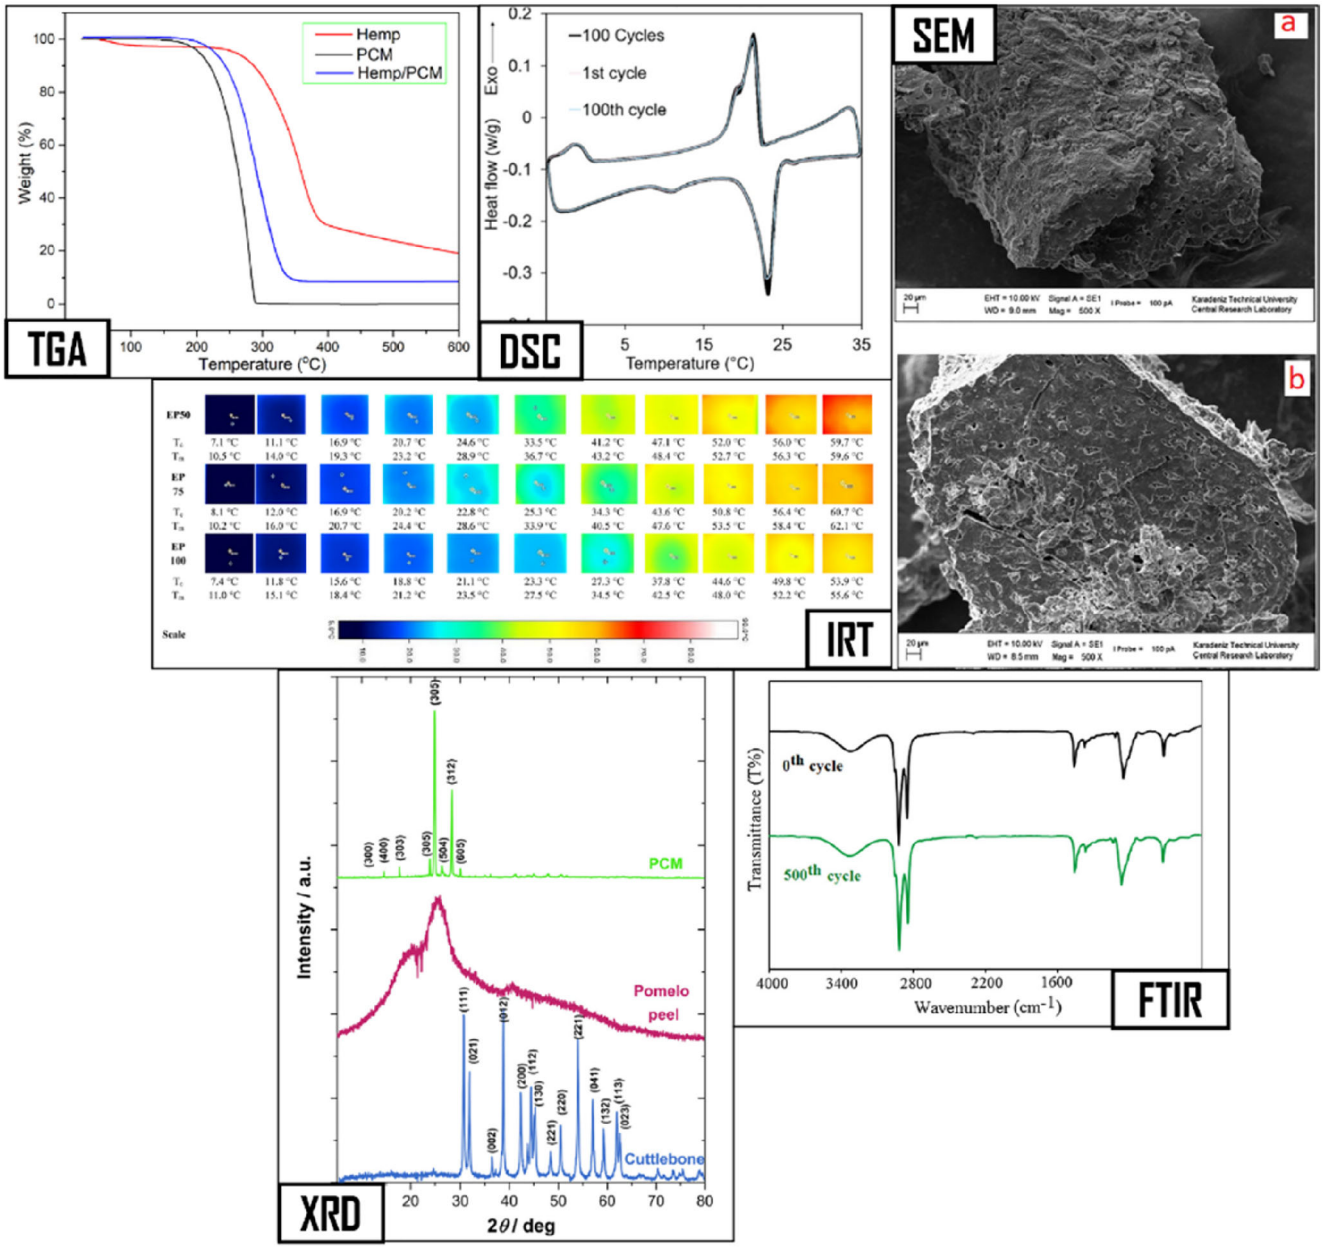

FIGURE 3 | Laboratory analysis methods used in the measurement of material properties [4, 39–46].

employed as a wall panel that provides passive cooling in buildings, due to its energy storage capacity of over 100 J/g [37]. The heat storage capacity of another composite material produced by vacuum impregnation of alcohol into rubber was found to be 181 J/g, and a 2.3-fold increase in the thermal conductivity of the material was observed as a result of the waste material used [43].

The contribution of waste to the reduction of energy consumption is as significant in the production of building materials as it is in the operational phase of the building. Kumar et al. [44] asserted that the recycled expanded glass panels they produced in their study exhibited reduced embodied energy and carbon compared to the gypsum board panels currently available on the market. Furthermore, the energy consumption of active and passive houses during their respective use phases was calculated through the utilization of the EnergyPlus program for building energy simulation. In the study in which the life cycle energy and carbon emissions were calculated together, it was determined that the panel produced provided a 4.5% reduction in total energy and a 12% reduction in total carbon emissions in comparison to the reference. The aforementioned studies demonstrate that waste has yielded significant outcomes in the domain of thermal energy storage.

4.2 | Effective Water Use

The efficient utilization of water in buildings is of paramount importance in order to avert the looming threat of water scarcity, which is one of the most significant challenges of our time. In this study, the water efficiency of the wastes incorporated into the

TABLE 4 | Water retention and utilization properties of the waste types used.

Article ID	Waste	Explanation
{1}	Cuttlebone	Water absorption, prevention of leakage up to 100 cycles.
{2}	Coconut peat	Hydrophilic, resistant to evaporation, prevention of leakage.
{3}	Hemp-shives	Cellulosic, prevention of leakage.
{4}	Apricot kernel shells	Cellulosic, prevention of leakage.
{5}	Waste cooking oil	There is a need to improve the water and energy consumption used in the waste treatment process.
{6}	Fly ash	Desired viscosity is ensured up to 100 thermal cycles.
{7}	Electrical arc furnace dust	Prevention of leakage.
{8}	Tire rubber	Prevention of leakage up to 500 thermal cycles.
{9}	Recycled expanded glass	High water absorption, prevention of leakage.
{10}	Recycled concrete powder	Prevention of leakage up to 300 thermal cycles when used at 20% by weight.
{11}	Recycled expanded glass aggregate	High water absorption (80%), prevention of leakage.

structure of PCM was evaluated through an assessment of their water retention properties. The majority of the waste materials employed in the studies were observed to have the capacity to trap water due to their porous structures. As a result of these characteristics, they are capable of providing impermeability to the material and preventing the necessity for water supplementation by ensuring the continuous utilization of water.

The use of shape stabilizers is frequently employed to avert leakage issues that may arise when PCM transitions to the liquid phase. The primary characteristics of the stabilizers employed include high porosity, recyclability, innocuousness, and economic viability [4]. It is feasible to employ a range of waste materials as shape stabilizers in the production of composite PCM. The aforementioned materials include hemp-shive, coconut peat, cuttlebone, and pomelo peel, which are biologically based wastes. Furthermore, fly ash and concrete powder, which are industrial by-products, can also be employed to impart sealing properties to the material.

Despite undergoing a drying process, coconut peat's hydrophilic structure enables it to resist evaporation, thereby allowing its incorporation into the PCM structure as a shape stabilizer [37]. Cuttlefish are renowned for their capacity to regulate the volume of water within their bones, enabling them to maintain a vertical position in aqueous environments. The capacity of this bone structure to retain water endows the PCM with a leak-proof quality, which can benefit up to 100 thermal cycles [4].

Conversely, the processing of waste materials entails the consumption of energy and water. Baldassarri et al. [40] posit that improvements can be made to the water, electricity, and natural gas consumption during the waste oil treatment process in order to facilitate the incorporation of waste oil into building materials and utilize it as thermal energy storage. Moreover, the utilization of waste materials in PCM production is of significant importance in ensuring the fluidity of materials processed by 3D printing. In a study where fly ash was incorporated into microencapsulated paraffin wax, it was observed that thermal stability and the desired viscosity were achieved over 100 thermal cycles in the production of miniature 3D-printed houses [41] (Table 4).

4.3 | Raw Material Conservation

PCM optimizes the utilization of materials in the construction industry, thereby contributing to sustainability. The utilization of waste and recycled materials in the production of PCM serves to reduce the consumption of natural resources. The findings of studies conducted by Sarı et al. [43] and Baldassarri et al. [40] indicate that PCM produced from recycled materials exhibits enhanced energy storage capabilities while necessitating a reduced reliance on new materials. This constitutes a notable contribution to the conservation of natural resources. As materials with energy storage capacity, PCM reduces the necessity for insulation of buildings, thereby reducing the quantity of material utilized in construction projects. In a similar vein, Gencel et al. [38] posit that hemp-shive and PCM-based building materials can provide the same thermal performance with less material than conventional building materials. This contributes to environmental sustainability while reducing costs. The incorporation of PCM into building materials enhances their durability, thereby reducing the necessity for renovation. Kumar et al. [44] asserted that building materials incorporating PCM demonstrate prolonged performance, thereby reducing the necessity for the periodic replacement of building components. Consequently, the utilization of materials is also made more efficient.

In all of the studies reviewed, the utilization of waste material as a substitute for raw materials serves to reduce the necessity for raw materials and to guarantee the continuity of resources. Nevertheless, in certain studies, the characteristics of waste materials that enhance thermal performance also diminish the necessity for supplementary insulation. To illustrate, the utilization of carbonized waste rubber derived from tires to enhance thermal conductivity and serve as a PCM support represents a valuable contribution to the circular economy [43].

4.4 | Environmental Impacts and User Health

A significant proportion of waste is generated by sectors such as agriculture, construction, and industry. In the construction sector alone, millions of tons of waste are generated worldwide every

25778196, 2025, 3, Downloaded from https://onlinelibrary.wiley.com/doi/10.1002/eng2.70034 by Turkey Cochrane Evidence Aid, Wiley Online Library on [03/03/2025]. See the Terms and Conditions (https://onlinelibrary.wiley.com/terms-and-conditions) on Wiley Online Library for rules of use; OA articles are governed by the applicable Creative Commons License

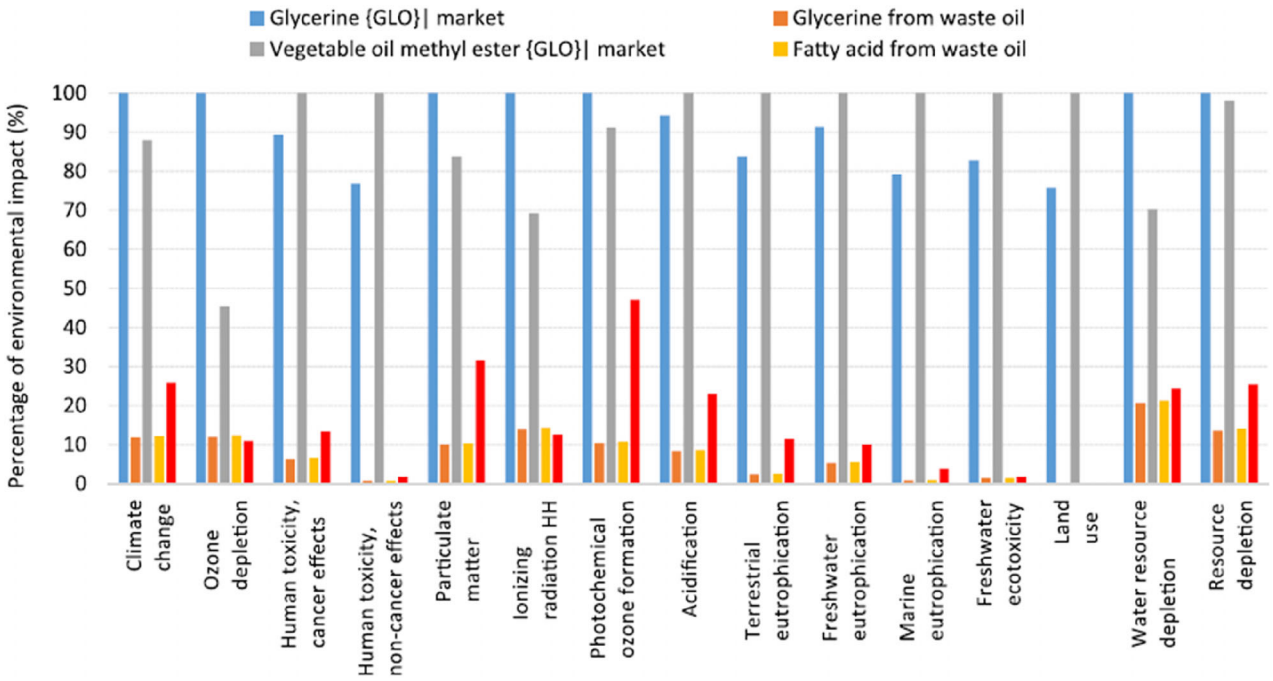

FIGURE 4 | Comparison of the environmental impact of waste oil used as PCM with the same type of oil on the market [40].

year as a consequence of the utilization of building materials [49]. The term "embodied energy" is used to describe the energy consumed during the production, use, and lifetime of building materials. This energy can be 20 to 50 times the annual operational energy consumption of a building [50]. It is therefore of great importance to consider the energy consumption and greenhouse gas emissions associated with the materials to be used in the construction of the building.

The utilization of waste materials can yield both beneficial and detrimental consequences for the natural environment. The incorporation of waste into the system can facilitate resource continuity, reduce the necessity for raw materials, and mitigate the burden on landfills. The negative effects of waste include the potential presence of harmful compounds, lack of biodegradability, and the release of volatile organic compounds into the environment. These factors, which also impact indoor air quality, are addressed in section 4.6 on comfort parameters. This section will examine the behaviors that fall within the scope of environmental impact classes as defined in international standards.

Kumar et al. [44] found that using waste can reduce lifecycle energy by 4.5%. Therefore, energy-related carbon emissions decreased 12%. In another study employing vegetable oils derived from waste cooking oil as phase-change materials (PCMs), wall panels were subjected to energy simulation in 50 distinct countries and four different climate zones [40]. In the study in which the environmental impacts of PCM-containing panels designed as single and double layers were tested, it was observed that the utilization of waste oils had a mitigating effect on the negative impacts, particularly in regard to poisoning, non-cancer health threats, eutrophication, clean water and land use. The study highlighted the potential for glycerin derived from waste oils to serve as a substitute for paraffin, a material currently prevalent in the market. It is hypothesized that the elevated levels of toxicity and non-cancer health risks associated with oil derivatives in the market are attributable to the nitrogen and phosphate fertilizers employed in the cultivation of the seeds from which the oil is derived. Furthermore, other activities, such as soil cultivation and irrigation, can result in eutrophication and significantly impact the availability of clean water and land use (Figure 4). In this regard, the selection of waste materials can be regarded as an environmentally benign decision.

Moreover, the utilization of waste as building materials within the context of circular economy principles confers environmental benefits, including a reduction in resource consumption and the circumvention of raw material processing. The recycling of waste materials and their utilization as building materials serves to reduce energy consumption and contribute to the conservation of natural resources and the advancement of environmental sustainability. Conversely, the disposal of waste materials in the natural environment can result in environmental contamination. Given their low economic value, coconut shells are discarded in considerable quantities on an annual basis, which can result in adverse environmental consequences. However, its cellulosic structure, biodegradability, ease of accessibility, and low cost make it a potentially viable bio-based PCM supporter [37].

No health analysis was conducted in the selected studies. However, Barreneche et al. [42] conducted a leaching test to find out if industrial waste used as wall material contained any hazardous substances.

4.5 | Economic Perspective

One of the principal criteria for the utilization of PCM in construction projects is its economic viability. In the event that

25778196, 2025, 3, Downloaded from https://onlinelibrary.wiley.com/doi/10.1002/eng2.70034 by Turkey Cochrane Evidence Aid, Wiley Online Library on [03/03/2025]. See the Terms and Conditions (https://onlinelibrary.wiley.com/terms-and-conditions) on Wiley Online Library for rules of use; OA articles are governed by the applicable Creative Commons License

solutions designed to enhance the energy performance of buildings have a payback period that exceeds the lifespan of the building in question, the aforementioned solutions will effectively become devoid of any meaningful purpose. It is therefore of great importance to develop cost-effective solutions. Inorganic PCM types are typically less expensive than organic and eutectic types. However, the application method of PCM can also have a significant impact on the total cost [28]. For instance, while encapsulation techniques can assist in preventing leakage, they are typically not the preferred option due to the high initial costs involved [42, 44].

Consequently, more cost-effective techniques have been devised that can prevent leakage without the utilization of capsules in PCM production. One such method is the form-stabilization technique, whereby the PCM is impregnated into a porous matrix. An alternative approach is the shape-fixing method, whereby the PCM is melted and mixed with a supporting matrix [51]. Nevertheless, these techniques may result in a reduction in the heat transfer performance of the composite materials produced. Accordingly, the incorporation of fillers with high thermal conductivity may prove an effective means of enhancing heat transfer. Due to their low cost, these fillers are typically selected from waste materials [43].

Waste materials can be employed not only as filler material but also, on occasion, as PCM itself. For example, Baldassarri et al. [40] produced cement-based composite panels using waste cooking oil and employed this waste oil as a PCM. Such applications result in reduced material costs and contribute to environmental sustainability. Furthermore, the utilization of recyclable waste materials in PCM production renders these materials a more economically viable option. In conclusion, in order to achieve cost-effectiveness in PCM production, the utilization of waste materials, non-encapsulated fixation methods, and low-cost filler materials represents a significant contribution to the overall cost-effectiveness of the process.

4.6 | Comfort Parameters

In the context of sustainable architecture, social sustainability is concerned with enhancing the quality of human life. Consequently, it is closely associated with human necessities pertaining to health and well-being, as well as cultural and psychological aspects [52]. The provision of thermal, acoustic, visual comfort and indoor air quality enables the design of comfortable buildings. A deficiency in thermal comfort can impede physical and mental work, whereas poor indoor air quality can endanger human health by precipitating a range of illnesses.

The quality of the air within buildings is of great importance. The utilization of waste materials in the production of building materials has the potential to negatively impact indoor air quality. It is therefore essential to ascertain whether the waste in question contains any harmful substances, and if so, to what extent, and whether such substances are released into the indoor or outdoor environment. In accordance with the European Directive, the heavy metal content of waste is categorized as inert, harmless, or harmful. In light of the aforementioned considerations, the present study was designed to assess the ability of heavy metals to be filtered through the use of a leaching test. A leaching test is a chemical analysis method that is used to detect the presence of hazardous substances in waste. In the study in which electrical arc furnace dust (EAFD), an industrial waste, was employed in the production of PCM, it was asserted that this material is hazardous and should be deposited in landfills with caution [42]. In order for such hazardous waste materials to be employed in construction projects, a number of remediation techniques can be proposed. One such method is encapsulation. Nevertheless, this approach represents a provisional solution, given its high cost and lack of specificity in addressing the issue of heavy metal removal [42]. While fixation and solidification techniques are relatively inexpensive, the elevated pH value of the leachate can potentially give rise to certain issues. It is therefore imperative that professionals from a range of disciplines, including environmental and materials engineers, collaborate to develop remediation methods that are tailored to the specific characteristics of the waste in question. Despite the utilization of waste in all of the reviewed studies, no supplementary studies were identified.

The concept of thermal comfort is defined as the condition of mind that expresses satisfaction with the thermal environment. The test cabinets produced in the studies allow for the determination of the temperature values and time delays reached in comparison to the reference situation. In a study conducted by Gencel et al. [38], two $20 \times 20 \times 20$ cm modules were designed using hemp shive and lauryl alcohol (LA). The modules were equipped with skylights and examined under real atmospheric conditions to analyze the temperature behavior of the wall panels produced. One of the modules serves as a reference cube, devoid of PCM but containing solely hemp shive and encased in an outer layer of 5 cm-thick expanded polystyrene (EPS). The second comprises a cabin with 45% PCM (LA) and hemp shive. The experiment {3} was conducted over a four-day period in August in Bartın, Turkey. The temperature data obtained from the temperature meters placed on the inner surface of the prepared cabin revealed a temperature difference of 6°C between the two cabinets [38].

The configuration of {6}, comprising miniature test chambers produced via 3D printing, was evaluated within a temperature range of 15°C–30°C, reflecting typical diurnal fluctuations. The temperature transitions were conducted over a 12-h period. Among the tested cabinets, the GPP-0% model does not contain macroencapsulated PCM, whereas the GPP-20% model contains 20% PCM. The temperature differential between the two chambers was 1.2°C [41].

In a separate study {7}, the temperature differential between two cabinets, one equipped with PCM and the other without, tested at a temperature differential of 18°C–28°C was found to be 3°C [42]. In the experimental setup {9} consisting of a wood panel and insulation material, tested in a simulated environment in Australia, it was found that extreme temperatures were reduced by 12.4% and carbon emissions from cooling could be reduced by 14% thanks to the concrete panel with PCM [44]. Finally, in {10}, which was constructed with material comprising MDF, EPS, and recycled concrete powder, a 5°C decrease in the highest daily temperatures and a 3.6°C increase in the lowest temperatures were

25778196, 2025, 3, Downloaded from https://onlinelibrary.wiley.com/doi/10.1002/eng2.70034 by Turkey Cochrane Evidence Aid, Wiley Online Library on [03/03/2025]. FIGURE 5 | Experimental setups of the selected studies ([38] {3}; [41] {6}; ([42] {7}; [44] {9}; [45] {10}).

observed in the PCM-containing cabinet in comparison to the reference cabinet without thermal storage [45]. The manufactured experimental cabinets are illustrated in Figure 5.

The acoustic comfort of the environment is a key consideration in the design of any acoustic space. In their 2016 study, Barreneche and colleagues observed that the industrial waste (EAFD) utilized in their investigation provided 4 dB of acoustic insulation in the PCM-containing cabin when compared to the reference cabin. The high density of heavy metal oxides present in the material has an effect on the improvement of the acoustic performance of the waste material.

5 | Discussion of the Results

The results and evaluations of the 11 studies on PCM present disparate findings with regard to energy storage capacities, thermal comfort, environmental impact, and cost analysis. The studies encompass both bio-based and industrial waste-derived materials.

In the initial investigation, the researchers observed a 70% increase in thermal energy storage capacity relative to the baseline PCM, accompanied by a volumetric efficiency of 90%. The material was demonstrated to remain stable for 100 thermal cycles. Nevertheless, cost analysis, environmental impact assessment, and health risk analysis have yet to be conducted. In the study employing coconut peat (2), the latent heat storage capacity was determined to be 108.5 J/g. It was established that a material suitable for passive cooling with minimal leakage was produced and could be utilized as a building slab. No leakage was observed in the bio-based PCM produced with 45% weighted shape-stabilized PCM (SSPCM). In terms of thermal comfort, when the external temperature exceeded 50°C, the experimental chamber remained 4°C cooler than the reference chamber.

25778196, 2025, 3, Downloaded from https://onlinelibrary.wiley.com/doi/10.1002/eng2.70034 by Turkey Cochrane Evidence Aid, Wiley Online Library on [03/03/2025]. See the Terms and Conditions (https://onlinelibrary.wiley.com/terms-and-conditions) on Wiley Online Library for rules of use; OA articles are governed by the applicable Creative Commons License

Conversely, when the external temperature was 20°C, the internal temperature of the chamber was 2°C higher than that of the reference chamber. Industrial and bio-based phase-change materials. The material demonstrated a latent heat storage capacity of 193.7 J/g. Nevertheless, cost analysis, an environmental impact assessment and a health risk assessment were not conducted.

The potential of heat storage materials derived from bio-based waste was assessed across 15 distinct environmental impact categories, with climate-based evaluations conducted for 50 cities. The present study offers a significant contribution to the environmental analysis of sustainable heat storage systems. The product, comprising 20% by volume of PCM, exhibits a latent heat storage capacity of 10 J/g. The substance in question has a melting temperature of 21.2°C and a thermal conductivity of 0.5 W/mK. The material has demonstrated thermal stability over 100 cycles.

In the study (7), which examined the use of industrial PCM and acoustic insulation, a reduction in indoor temperature of 3°C was observed. Furthermore, the results of the leakage test indicated that the material was not hazardous. Furthermore, the EAFD was observed to provide 4 dB of sound insulation due to its heavy metal content. In the study (8), which is notable for its high heat storage capacity, a latent heat capacity of 181 J/g was obtained. The thermal conductivity of this PCM was found to be 2.3 times higher than that of conventional materials and remained stable for 500 cycles. Furthermore, it did not leak until the weight of alcohol reached 78%.

The PCM derived from construction waste was evaluated for use in the building sector and was found to result in a 4.5% reduction in the life cycle energy. The application of the material resulted in a reduction of carbon emissions by 12% and a reduction in the incidence of summer overheating by 12.4%. The cost of the panel containing the PCM is 11% higher than that of the base panel. Another PCM under investigation exhibits a latent heat capacity of 34 J/g and no leakage when utilizing 20% PCM. The material has demonstrated stability over 300 cycles, exhibiting a decrease of 5°C at the highest temperatures and an increase of 3.6°C at the lowest temperatures. The economic analysis revealed that the payback period of the PCM obtained from construction waste {11} was 25 years. The findings of the studies that contribute to architectural sustainability are summarized in Table 5.

Summarizing the above findings in terms of sustainable architecture, the following points stand out:

1. *Energy*: Waste-based building materials can absorb thermal energy between 10 and 193 J per gram. The phase change temperature should be within the comfort range.
2. *Water*: Utilization of porous waste helps to keep the water within the material. Thus, less water is consumed. Thermal cycles range from 100 to 1200 without any leakage.
3. *Raw material*: The use of biobased and industrial-based waste reduces the need for raw materials. This ensures circular economy and resource sustainability.
4. *Environment and user health*: There is not enough study on the health effects of waste-based materials. However, production and use stages of the waste-based building materials have been studied. It is proved that in most of the environmental impact category, using waste is more environmentally friendly than buying raw materials from the market.
5. *Economy*: Wastes are effective in minimizing the economic burden of building materials both in the production and the use stages. However, methods such as encapsulation may require high initial costs.
6. *Comfort*: Waste-based building thermal energy-storing building materials can be beneficial in ensuring thermal and acoustic comfort. However, studies examining the effects on indoor air quality should be diversified.

Among these sustainability criteria, energy is the most studied subject, followed by water absorption, and comfort. Biobased wastes are popular, especially in the production of composite materials. It is known that industrial-based wastes are used in various fields such as composite, adhesive, and panel production. On the other hand, construction waste can improve the thermal properties of concrete, by incorporating it into the structure (Figure 6).

6 | Conclusions and Recommendations

This comprehensive study illuminates the potential of integrating waste-based PCM into building materials for sustainable architectural design. The findings of the 11 studies demonstrate the considerable environmental, social, and economic advantages of these materials in construction applications. The waste-based PCM demonstrated effective thermal energy storage capabilities, with latent heat storage capacities within the range of 10 to 193 J/g. The utilization of these materials facilitates the storage and subsequent release of excess heat, thereby reducing the necessity for mechanical heating and cooling systems. As evidenced by multiple studies, PCM has the capacity to reduce indoor temperatures by up to 5°C during periods of high external temperature and increase them by up to 3.6°C during periods of low external temperature.

The incorporation of waste materials into PCM has been demonstrated to markedly diminish the carbon emissions and embodied energy associated with structural components. The utilization of biodegradable, renewable, and recycled waste materials (e.g., hemp shive, coconut peat, apricot kernel shell) serves to mitigate environmental degradation by facilitating the reuse of industrial and organic waste.

Although economic analysis of waste-based PCM is scarce, the potential for long-term savings in energy consumption and building maintenance has been identified. While the utilization of waste materials may result in cost savings, the economic implications of the selected PCM can be a significant consideration, particularly in relation to the specific materials employed. The incorporation of waste-based PCM into construction materials is aligned with the global sustainability objectives of reducing the environmental impact of the construction industry. By enhancing energy efficiency, curbing carbon emissions, and leveraging waste materials, these materials facilitate the transition towards greener and more sustainable construction practices.

TABLE 5 | Evaluation of the analyzed studies within the scope of sustainable architecture principles.

Article ID	Proposed material features (Waste type)	Findings and evaluation
{1}	Environmentally friendly, cost-effective, efficient (biobased)	*Energy storage*: Biodegradable and renewable composite production. 70% of thermal energy storage capacity and 90% of volumetric efficiency compared to base PCM. *Water efficiency*: Stabilization is ensured for 100 thermal cycles. PCM ratio is 80% by weight.
{2}	Less environmental pollution (biobased)	*Energy storage*: Latent heat storage is 108.5 J/g. Potential material for passive cooling in buildings. Can be used as a wallboard. *Water efficiency*: Minimal leakage when waste-PCM ratio is 3:7.
{3}	High thermal energy storage (biobased)	*Water efficiency*: No leakage at 45% weight SSPCM. *Thermal comfort*: When the outside temperature is more than 50°C, inside of the experimental cabin is 4°C cooler than the reference cabin. When outside is 20°C, inside temperature is 2°C higher than the reference cabin.
{4}	No leakage and high thermal conductivity (industrial-biobased)	*Energy storage*: Latent heat storage is 193.7 J/g. *Water efficiency*: No leakage at 70%–75% PCM ratio.
{5}	Climate-sensitive, spatially and environmentally efficient (biobased)	*Environmental analysis*: Waste oil can be a counterpart of paraffin in terms of environmental performance. *Raw material use*: Insulation thickness can be reduced 25% without reducing thermal performance.
{6}	Ensures thermal comfort, energy efficiency and sustainability (industrial)	*Energy storage*: The latent heat of the product with PCM at 20% by volume is about 10 J/g. *Thermal comfort*: Melting temperature is 21.2°C, thermal conductivity is 0.5 W/mK. *Water efficiency*: Stability is achieved for more than 100 cycles.
{7}	High acoustic and thermal performance (industrial)	*Thermal comfort*: Indoor air temperature decreased 3°C. *Health analysis*: According to leaching test, this material is not hazardous. *Acoustic comfort*: EAFD can insulate sound up to 4 Db due to its heavy metal content.
{8}	No leakage (industrial)	*Energy storage*: Latent heat capacity is 181 J/g. Thermal conductivity is 2.3 times higher. *Water efficiency*: Stable for 500 cycles. No leakage until alcohol weight reached 78%.
{9}	Low embodied energy, low CO_2 emission and high thermal performance (constructional)	*Environmental analysis*: Lifecycle energy is found to be 4.5% lower than the base case. Carbon emission is reduced by 12%. *Thermal comfort*: Summer overheating is decreased 12.4%. *Cost analysis*: The proposed precast panel has 11% more initial cost than the reference panel.
{10}	High energy efficiency and thermal performance (constructional)	*Energy storage*: The composite has approximately 34 J/g of latent heat capacity. *Water efficiency*: No leaks when waste-PCM ratio is 20% by weight. Stable for more than 300 cycles. *Thermal comfort*: Highest temperature is reduced 5°C and lowest temperature is increased 3.6°C.
{11}	No leakage and high thermal storage capacity (constructional)	*Cost analysis*: Payback period of the produced PCM is 25 years.

It would be beneficial for future projects to investigate the thermal stability and mechanical durability of PCM in different climatic conditions and over an extended period of time. In particular, studies examining the durability of PCM subjected to environmental conditions over 1000 cycles are becoming increasingly significant. A number of existing studies provide only limited information on the costs and life cycle analysis. In future research, a more comprehensive analysis of the costs associated with the production, application, and recycling of PCM is required. Furthermore, life cycle assessments of PCM should be conducted, incorporating a greater number of cities and climatic conditions. It is of great importance for sustainability that efforts to utilize recyclable and bio-based wastes in PCM production are increased. In particular, it would be beneficial to investigate whether new waste types and industrial by-products can be integrated into PCM.

There is a paucity of information regarding the effects of PCM on indoor air quality (IAQ) and human health. It would be beneficial for future research to analyze the potential long-term health risks associated with building materials containing PCM, as well as examining whether these materials release toxic substances. Further life cycle assessments (LCA) are required to gain a full understanding of the environmental impacts of PCM-containing building materials. It is recommended that future assessments include parameters such as recycling processes, the amount of energy and water used in the production processes of materials, and carbon footprint.

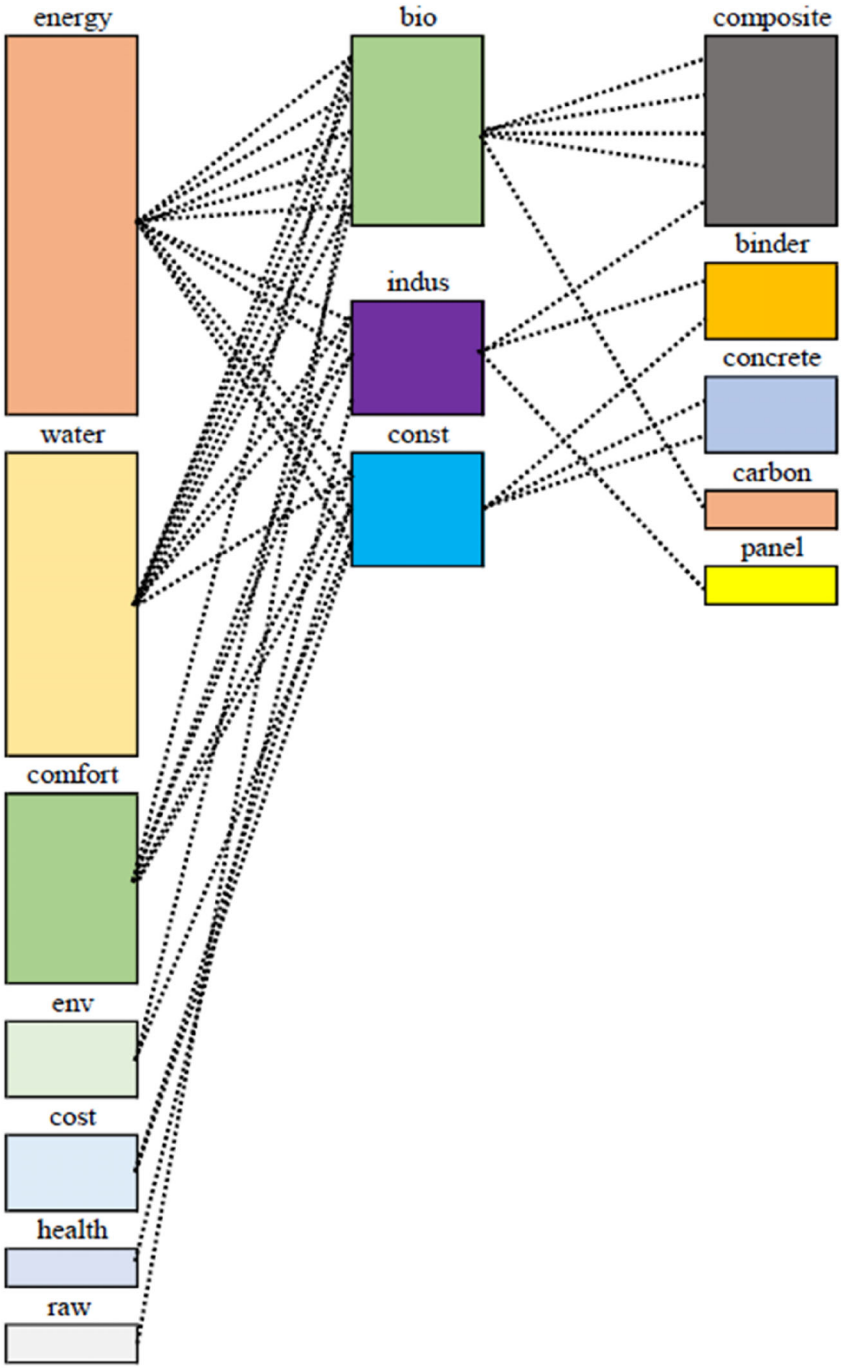

FIGURE 6 | Three-field plot showing the relation between sustainability aspects (left), waste type (middle), and produced building material (right).

In order to enhance the contribution of PCM to sustainable architecture, it is essential to establish global collaborations between researchers, industry partners, and governments. Such collaborations can facilitate the exchange of knowledge across different regions, thereby promoting the wider adoption of PCM. It would be beneficial for local and international regulatory bodies to provide incentives for the wider use of waste-based PCM in the construction sector. It is within the power of governments and environmental agencies to offer financial support programs and tax benefits with the intention of increasing the use of sustainable construction materials. In order to ascertain the suitability of PCM for different climatic and regional conditions, it is essential to develop application guidelines based on local climatic characteristics. The objective of these guidelines is to optimize the thermal and environmental impacts of PCM in the context of building material selection. It would be beneficial to implement training and awareness-raising programs for architects, civil engineers, and professionals in the building industry, with a focus on PCM technologies and their advantages.

Accepted 15 January 2025

Abstract

Purpose – This study examines the influence of disciplinary differences and applied practices between architecture and engineering on students' cognitive and affective responses to online education systems by employing the Technology Acceptance Model (TAM).

Design/methodology/approach – A questionnaire addressing the aimed TAM constructs is conducted with 483 architecture and engineering students. Partial least square structural equation modeling (PLS-SEM) is used to test the direct and indirect relationships between students' attitudes towards using (ATU), perceived usefulness (PU), perceived ease of use (PEOU) and system quality (SQ) based on disciplines' diverse learning methods and approaches.

Findings – This research shows that online education systems' quality (SQ) influences students' attitudes toward using (ATU) directly and indirectly. The strongest relationship is observed between system quality (SQ) and perceived ease of use (PEOU), proving that online education adoption is strongly linked to the environment's quality where applied practices are conducted. Architecture students' attitude is significantly shaped by the system's visual and interactional attributes parallel to constructivist and experiential learning. Oriented towards multidimensional problem-solving, engineering students' attitude is mainly influenced by their efficiency and productivity.

Originality/value – This research contributes to the knowledge of technology acceptance in online education by exploring students' attitudes and the less-examined differences between architecture and engineering disciplines. Emphasizing the impact of system quality on online education concerning applied practices, the study also underlines the possible shortcomings of the generalization of approaches. The findings offer insights into tailoring online education more inclusively and effectively by considering discipline-specific applied learning methods.

Keywords Online education, Architecture, Engineering, Technology acceptance model

Paper type Research paper

1. Introduction

Education is a fundamental human right and should be accessible to all regardless of the conditions (UN, 1948, Article 27). However, in periods of emergencies and disasters that result in the destruction of educational facilities and displacement of students and instructors, access to education can be seriously disrupted. For example, in the 2005 earthquake in Pakistan, 853 teachers and 18,095 students lost their lives, and more than 7,500 schools were destroyed (World Bank, 2005). Similarly, according to UNESCO (2020), the Covid-19 pandemic has affected 91% of students worldwide. In Türkiye, following the earthquakes in 2023, approximately one in five students were affected negatively. The emergencies could severely affect the continuing provision of education, which results in further adverse effects on society as a whole, socially and economically (Almaiah *et al.*, 2020). In these situations where

DOI 10.1108/OHI-07-2024-0255

adequate provision of educational services in conventional ways is not possible, alternative online education methods are adopted (Torani *et al.*, 2019). Online education has become a rapid and beneficial answer to emergencies, especially in higher education, and the applications have significantly increased since the COVID-19 pandemic (Salas-Pilco *et al.*, 2022). It is also adopted by Turkish educational institutes following the earthquake in 2023 (Ozer, 2023).

Online education is an educational approach in which learning methods and information within the scope of the course are provided remotely via the internet, and students can access educational materials at any time and from anywhere (Alassafi, 2022). Through digital platforms, online education encourages student engagement and interactive learning experiences (Zhang and Zhou, 2003; Lee, 2008). Due to these advantages, online education has become a highly applicable method beyond emergencies. However, for the effective use of online education, it is necessary to improve adaptation to the use of technology (Bojović *et al.*, 2020; Rajabalee and Santally, 2021). This involves the selection of appropriate technology for the specific needs of students, the variety of interaction opportunities provided to students and the appropriate use of technology by the instructors (Crawford-Ferre and Wiest, 2012). In this respect, the system quality of the technology has become an essential determinant for the effective use of technology and its acceptance among students concerning their satisfaction and quality perception. Considering this, the effective adoption of online education significantly varies among disciplines due to their internal differences in teaching methods, particularly between theory- and practice-oriented programs.

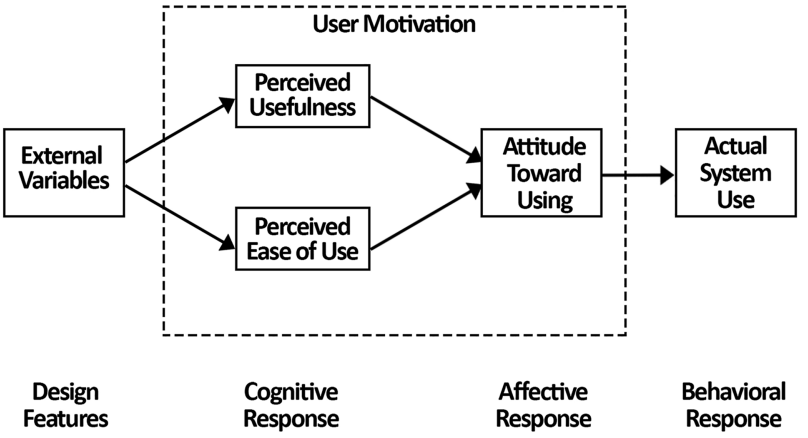
While theory-oriented programs have maintained a certain level of effectiveness in the adoption of online education, the necessary use in practice-oriented programs has brought several challenges to ensure the development of skills suitable for applied fields of learning (Coman *et al.*, 2020; Dayagbil *et al.*, 2021). Contrary to instructor-centered teaching methods in theory-oriented programs, where the students remain passive receivers of knowledge through listening, the learning process occurs more reflexively and engagingly in applied fields. The students are required to utilize acquired knowledge in practice. The form and level of interaction resulting from this applied nature diversify to a great extent, even among the practice-oriented programs. In Türkiye and similar developing countries, it is observed that many higher education institutions approach online education with a more generalized perspective, adopting the same formula for many practice-based disciplines. Therefore, it is important to inquire about how online education can be effectively implemented in a particular applied field, how students' learning processes are influenced and how they respond to adopting new education methods.

In light of these issues, the paper aims to evaluate how students from different disciplines perceive transitions to online education methods and how their perception is shaped by the quality of the technologies and platforms provided for online education concerning the discipline-specific applied learning methods and tools. Accordingly, the study focuses on architecture and civil engineering as distinct fields serving a similar sector. The post-pandemic period has been a challenge and opportunity simultaneously to enhance education concerning the use of information technologies in both fields. However, despite the diverging applied nature of these fields, a more generalized approach is adopted in most institutions of Turkiye as part of online education practices. Moreover, providing online education in these applied fields necessitates further evaluation of the software qualities and interaction opportunities online technologies serve. These aspects can be identified as the system quality of the online technology. Thus, the study also addresses the relationship between system quality and students' perceptions and attitudes toward using online technologies. In the study, the Technology Acceptance Model (TAM) is used to measure the effectiveness of online education and students' acceptance levels of technologies within the framework of applied educational practices in architecture and civil engineering. The model allows for evaluating the correlations between the students' perceived ease of use, perceived usefulness, attitudes towards using and external variables in each discipline and drawing comparative results

regarding the use of online education in applied practices (Sinha and Bag, 2022; Thi *et al.*, 2022). Structural Equation Modelling (SEM) is utilized as an advanced multivariable analysis method in the data analysis process. SEM allows several constructs of TAM to be simultaneously expressed by the system quality construct, which ensures strong validity, conclusion and verifiable reliabilities in the findings (Nachtigall *et al.*, 2003).

2. Architectural and engineering education

The basic need for shelter that emerged since the beginning of humanity was the foundation for architecture as a profession, which was identified as a whole with engineering. In the first known written source in this field from antiquity, Vitruvius pointed out that the person who will perform this profession should benefit from the theory and practical knowledge acquired through regular practice (Vitruvius, 1960). The disciplinary separation of these practice-based professions began in the seventeenth century with the Age of Enlightenment when rationalism and scientific approaches brought different methods to the foreground. Especially in the academies established under the leadership of France in Europe, a new educational method based on the knowledge of structure, form and art and progressed through mentorship has emerged under the Ecole de Beaux Arts Institute of Architecture (Benhamou, 1989; Griffin, 2020). The Ecole Polytechnique, founded in the same period, focused on teaching engineering as a distinct discipline by systematically integrating the previously disconnected fields of knowledge developed with military applications using mathematics and science. During that period, the foundations of today's civil engineering, which focuses on industrial development and construction applications, were formed in England (Chrimes and Bhogal, 2012). Since this separation, the two disciplines serving the same sector have benefitted from various theories, methods and tools in their educational approaches (Soyluk and Harmankaya, 2012). Thus, the applied practices in their education have evolved into distinct characters.



The design studio tradition is the most dominant aspect of applied practice in architectural education. In the design studio, students apply their theoretical and technical knowledge to exercises that help with multi-skill development, including students' problem-solving, critical reflection and communication abilities (Ceylan *et al.*, 2020; Ilerisoy *et al.*, 2021; Mosier *et al.*, 2023). The current approaches to the studio following Schon's conceptualization of its reflexive nature direct to an intertwined and layered learning and competency-based assessment process involving continuous reviewing (Schon, 1985, 1987; Salama, 1995). The studio environment incorporates various forms of review and feedback called "critique": table critiques (individual and/or group), peer reviews, panel discussions and public critiques in the form of juries (Elrawy and Abouelmagd, 2021). Thus, the applied practice of the studio is fundamentally constructed through co-occurring interactions and communication between the actors – the student and the tutor. The object of the studio practice also gains a representational quality to cater to such reflexive action; so, students also design and structure their communication as part of the applied process. Contrastingly, traditional engineering education is defined as content-centered and design-oriented, and it encapsulates the problem-solving processes and development of students' skills accordingly (Bourne *et al.*, 2013). Deductive thinking structures based on trusted laws are utilized to resolve cause-effect relations in a demand-oriented manner (Kersten, 2018). As a result of these qualities, the applied practices in engineering denote another strong environment for the discipline, similar to the design studio for architecture, the laboratories. Engineering education involves multiple levels of applied engagement in many kinds of laboratories through the design and conduct of experiments, the analysis and interpretation of acquired data and the design and development of tools and systems that address the studied problems through appropriate techniques and technologies.

Although some institutions approach with an integrated and unified disciplinary notion to both fields and provide education in the department of "architectural engineering," most institutions in the Anglo-American context, including Türkiye, tend to differentiate both disciplines in terms of educational tools, instructional bodies, teaching and learning

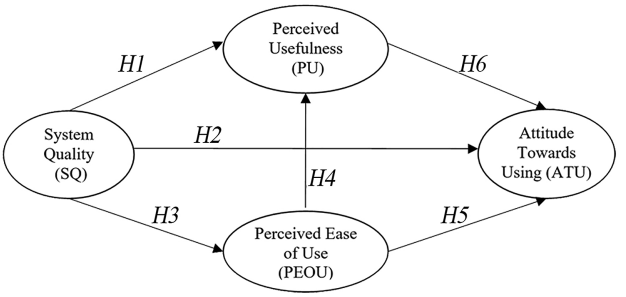
approaches as explained (Parasonis and Jodko, 2013). Parallelly, they benefit from technology and digital tools in their applied practices differently. This has become more evident in the post-pandemic period with the rise of online education. The traditional studio environment of architectural education is moved into the virtual realm, which is perceived as positive in several studies regarding the easy access to several practitioners, critiques through screen sharing and better time and organization management (Ceylan *et al.*, 2020; Mosier *et al.*, 2023; Zairul *et al.*, 2023). However, it is also considered challenging due to less experiential learning and limited interaction opportunities. For engineering education where there is a need for a common working environment and equipment use in laboratories, the emphasis has been put on the challenges of providing a virtual laboratory environment online that could serve similarly to its physical form (Bourne *et al.*, 2013). To summarize, although online education brings to the table diverging challenges and opportunities for both disciplines, a common discussion is formed around the systemic qualities in technology provision in the post-pandemic period of online education, which necessitates further analysis.

3. Theoretical background and hypotheses

Predicting the users' level of acceptance as early as possible is highly essential for many fields. Considering the user's response to technology, the Technology Acceptance Model (TAM) is a commonly utilized framework to examine the relationship between several factors influencing the level of acceptance. The theoretical foundation of the model developed by Davis (1986) is based on Ajzen and Fishbein (1977) Reasoned Behavior Theory, and it brings a psychological perspective to the examination of the users' cognitive and affective responses to digital systems (Davis, 1989). The fundamental constructs of the model are identified as perceived ease of use and perceived usefulness based on the prior empirical literature on human behavior (Davis, 1989; Marikyan and Papagiannidis, 2023). Perceived usefulness refers to an individual's subjective assessment of the possible benefits of employing a particular system, whereas perceived ease of use refers to the extent to which an individual believes that using a particular system would require a minimum effort. According to TAM (Figure 1), technology acceptance occurs through three consecutive and interrelated stages: the users' engagement with the external factors (the system features) prompts cognitive responses (perceived usefulness and perceived ease of use), which creates an affective response (attitude towards

Source(s): Davis (1986)

Figure 1. Technology acceptance model (TAM)



using) (Davis *et al.*, 1989; Davis, 1993). As a result of this process, the users' behavioral intentions are shaped.

Due to its limited number of variables and strong explanatory power, TAM has gained popularity quickly and has been the focus of numerous research studies. It is seen that many recent studies about online education mainly rely on TAM since it allows identifying and measuring the influence of specified constructs on learners' adoption of the technology – the environment for online education. In this respect, the particular research areas about learning are determined through various definitions of "external variables" in TAM. In their systematic review of recent studies using TAM in investigating students' acceptance of online education, Mustafa and Garcia (2021) point out that TAM is combined with many other theoretical models, and several predictor variables are shown to be influential. Other studies also indicate the importance of other variables like student stability, student resilience, academic performance, system quality, student self-efficacy, subjective norm and attitude on students' acceptance of online education (Huang *et al.*, 2006; Park, 2009; Lai *et al.*, 2012; Salloum *et al.*, 2019; Sinha and Bag, 2022; Thi *et al.*, 2022). A significant variable in this respect to be emphasized is "System Quality." System quality refers to the information system processing quality involving software and data components, and it assesses the extent to which the system is technically reliable (Gorla *et al.*, 2010). In the context of online education, system quality is related to the performance and attributes of the utilized technology that impact students' experience. It involves the availability and reliability of platforms, how students navigate within, how the environment is organized and offers various possible fields for interaction and assessment, how it responds to synchronous or asynchronous activities and how technical qualities of the technology like sound and visual qualities facilitate learning. Although not including system quality as another construct, several studies investigate the students' acceptance of an online platform, which implicitly relates to the qualities provided by the system (Al-Maroof and Al Emran, 2018; Bag *et al.*, 2020). Similarly, Ohanu *et al.* (2022) examine system quality as an external variable for developing and accepting online education environments. Considering the variety of educational contexts and disciplines where online education practices are conducted, it is essential to understand the importance of the system as an external variable influencing the implementation success.

3.1 Hypotheses of the study

As mentioned above, this study argues that system quality is a crucial external variable in the TAM for online education, particularly in applied disciplines. While a higher quality IT system can support users' approach and affective response to use positively in online education, an inadequate level of system quality can reduce the efficiency and longevity of technology adoption in the education processes (Ohanu *et al.*, 2022). Because of the limitations in the technology access and the variability of students' attitudes and predispositions, measuring and understanding the impact of system quality on students' acceptance is highly significant, especially in developing geographies like Türkiye, to improve future implementations of online education towards more accessible and inclusive forms.

Considering the great diversity of educational methods, tools and techniques among disciplines, it is also essential to identify how system quality influences students' technology acceptance and attitude diversification. Particularly in the applied practices of architecture and engineering, system quality is crucial since it directly defines the medium for necessary interaction for knowledge transition between students and instructors and implicitly facilitates efficiency and accuracy during the application processes (Ceylan *et al.*, 2020). Therefore, the influence of the system quality should be approached comparatively between these two disciplines to unfold common necessities and diverse qualities that should be addressed in information technology provision to these disciplines for online education. In light of these, the proposed model of technology acceptance for online education in two disciplines based on Davis (1986, 1989) and the hypotheses put forward in the study are presented in Figure 2.

H1	The system quality has a positive and significant impact on the perceived usefulness.
H2	The system quality has a positive and significant impact on the attitude towards use.
H3	The system quality has a positive and significant impact on the perceived ease of use.
H4	The perceived ease of use has a positive and significant impact on the perceived usefulness.
H5	The perceived ease of use has a positive and significant impact on the attitude towards use.
H6	The perceived usefulness has a positive and significant impact on the attitude towards use.

Figure 2. Proposed theoretical framework and hypotheses

Accordingly, this study examines the influence of system quality (SQ) in the two disciplines on the students' attitudes towards using (ATU) online education systems directly (H2) and indirectly through its influence on their perceived usefulness (PU) and perceived ease of use (PEOU) (H1, H3). Moreover, the study tests whether students' perceived usefulness and perceived ease of use enhance their affective response to using online education systems (H5, H6). Lastly, since the online education systems and/or platforms are not only a mere interface for knowledge transition but an environment in which students interact and produce, the research also investigates to what extent perceived ease of use mediates perceived usefulness and if there is a disciplinary change in their cognitive responses (H4). In the existing literature on the use of TAM for online education, many different predictor variables are used as mentioned (Mustafa and Garcia, 2021). While this study is built on the already discussed relationship between system quality and attitude toward online education, a two-level exploratory analysis is conducted, which enhances the existing approaches: While the variables are tested regarding students' acceptance of online education, a simultaneous and discipline-based comparison is conducted to interpret the changing hierarchical relations among the variables and their impact.

4. Methodology

4.1 Participants and data collection

The questionnaire designed to measure the relationships stated in the hypotheses is divided into five sections. The first section includes demographic information, and the other sections include questions related to TAM constructs to measure the acceptance of online education by students in the faculty of architecture and engineering, including system quality (SQ), perceived usefulness (PU), perceived ease of use (PEOU) and attitude towards using (ATU). The TAM scales, which were taken from Davis *et al.* (1989) and Venkatesh *et al.* (2003), served as the basis for the questions, which were modified to match the unique context of the factors influencing online learning in particular disciplines (Table 1). All the elements in the study model were operationalized by utilizing common scales from earlier works of literature that have demonstrated their reliability and validity. In Figure 1, the suggested model is displayed. The survey instruments were adapted from previous research studies that have

Table 1. List of measurement indicators

Construct	Definition	Survey item code	Survey item	Adapted source
System Quality	refers to the technical soundness of the information system processing, including software and data components	SQ1	The sound quality of the online education platforms is sufficient	Roca and Gagné (2008), Al-Fraihat *et al.* (2020), Yavuz and Akkılıç (2021)
		SQ2	The visual quality of the online education platforms is at a sufficient level	Roca and Gagné (2008), Al-Fraihat *et al.* (2020), Yavuz and Akkılıç (2021)
		SQ3	Online education platforms perform efficiently, even during peak hours of usage	Kurt (2015)
		SQ4	Online education platforms enable interaction with the course instructor	Sedera and Gable (2004), Dorobăţ *et al.* (2019), Al-Fraihat *et al.* (2020)
Perceived Usefulness	refers to an individual's subjective assessment of the possible benefits of employing a particular system	PU1	Using online education platforms enabled me to complete tasks faster	Selim (2003), Al-Fraihat *et al.* (2020), Ahmed (2021)
		PU2	Using online education platforms increased my learning proficiency	Selim (2003), Ahmed (2021)

		ATU3	The online education platforms are easy to use	Selim (2003), Al-Fraihat *et al.* (2020), Ahmed (2021)
		ATU4	I intend to visit online education platforms frequently	Al-Fraihat *et al.* (2020), Ahmed (2021)

Source(s): Authors' own work

demonstrated their reliability and validity. The students were asked to evaluate survey items adapted for technology acceptance in online education using a 5-point Likert Scale (1 = Strongly disagree, 5 = Strongly agree) to assess their participation and opinions towards the established TAM models.

The study utilized the survey technique to collect data, and the sample was chosen using the criteria sampling approach. The state institutions in various locations were selected to establish a uniform sampling group through Türkiye. Faculty of architecture and engineering students from six major universities in Türkiye's metropolitan and nonmetropolitan cities (Ankara, Istanbul, Samsun, Mardin, Karabuk, Bolu and others) have been included in the study. To eliminate any potential geographical misinterpretations due to a dominant institution, the students are selected from diverse regions representing the overall geography of Türkiye. Before further analysis, the data is evaluated comparatively to ensure reliability regarding the homogeneity of institution and student profiles. Since most institutions of Türkiye are part of the same higher education infrastructural network and similar systems are adopted during online education, the data is revealed to be meaningful to analyze the results further concerning disciplinary differences for technology acceptance. A total of 550 senior students were informed of the study's objectives, and 520 participated in the survey. Following the review of

questionnaire forms, 37 were excluded because of inaccurate or missing answers. A total of 483 students' answers were statistically investigated, and the following findings were reached.

Based on the results of the data set collected from 483 participants, the primary demographic data are presented in Table 2. As illustrated, of the 483 students participating in this research, 344 (71.2%) are studying architecture and 139 (28.8%) are studying engineering. A total of 272 (56.3%) participants are female and 211 (43.7%) are male. A total of participants (53.6%) used Teams, 123 (25.5%) used Perculus and 79 (16.4%) used Zoom. Most participants (391; 81%) reported using laptops as their device of choice for online education platforms. The participants' age distribution shows that most of them are between the ages of 20–23, as expected.

4.2 Explanatory factor analysis

An exploratory factor analysis (EFA) is conducted to understand the underlying conceptual structure of the data and the extent to which the factors obtained from the literature correspond to each other (Fabrigar *et al.*, 1999). With the Varimax rotation of the principle component analysis, four components with eigenvalues greater than 1 were obtained, and it was seen that the cumulative variance explanation ratios of these components were satisfactory and overlapped with the fictional structure created (Table 3).

4.3 Measurement model assessment

For this study, the researchers employed the Partial Least Squares (PLS) algorithm, a specific approach within structural equation modeling (Fornell and Larcker, 1981). PLS-SEM is a statistical technique to model complex multivariate relationships involving observed and latent variables. Unlike other statistical analyses, PLS-SEM offers more flexibility as it does not rely on strict assumptions in multivariate statistics (Fornell and Bookstein, 1982). It is particularly advantageous for analyzing small data structures and can yield satisfactory results even when dealing with missing observations (Hair *et al.*, 2013).

Before PLS modeling is conducted, the correlation matrix of the observed variables related to the latent variables is examined, and the agreement between the observed variables, the high correlation, is questioned. In this regard, the correlation analysis reveals the desired relationships between the relevant variables. For this purpose, the Pearson correlation coefficient is utilized. When examined in SEM, a minimum correlation of 0.5 is sought between the variables. The correlation matrix of the latent variables for implementing the model designed in line with the study in two different disciplines is given in Table 4. According

to the correlations among the latent variables, ATU, PEOU, PU and SQ have a substantial positive connection with all other factors in architecture and engineering.

4.4 Confirmative Factor Analysis

PLS-SEM application typically begins with Confirmative Factor Analysis (CFA), and the results are interpreted by referring to validity and reliability benchmarks. Because of the benefits of the PLS algorithm, this technique was chosen for the investigation, and the SMART (PLS version 3) software was employed. The adequacy of the designed model is determined by various criteria gathered under three main headings. Internal consistency, convergent validity and divergent validity are obtained through CFA. Variables observed to be problematic regarding validity and reliability in the preliminary study were excluded from the model. The manifest variables significant in the altered models are PU5, PU6, PU7 and PEOU3. Cronbach's Alpha, CR and Rho_A references for the internal consistency of the models, AVE for convergent validity and finally, factor loadings for divergent validity were considered.

Table 5 shows the relevant validity and reliability indexes, and the reference values of these indexes are considered sufficient in the literature.

Previous research has advocated the goodness of fit indices; standardized root means square residual (SRMR), and norm fit index (NFI) for evaluating model fit. Model fit is attained when the SRMR is less than 0.10 or 0.08, and the NFI is between 0 and 1, closer to one (Bentler and Bonnet, 1980; Hu and Bentler, 1999). In this study, the SRMR for the architecture and engineering students are, respectively, 0.061 and 0.060. NFI for the architecture model is 0.852, and for the Engineering model is 0.860. Models are deemed sufficiently compatible based on these findings.

An experimental distribution is formed by randomly selecting a sample from the original sample and producing a new sample of the same size. This experimental distribution allows for hypothesis testing and the creation of confidence intervals for path coefficients. The study established an experimental distribution by completing 1,000 re-sampling, and the significance of road coefficients was examined at the 0.05 significance level. The path coefficients between the latent variables are positive, as shown in Table 6. According to these findings, the PEOU path coefficient for the design engineering model is not statistically significant. In other words, PU does not explain the change in PEOU (Table 7). Other independent latent factors considerably influence path coefficients depending on latent variables.

5. Findings

When the technology acceptance of students from architecture and engineering departments in the context of online education is evaluated, it is observed that system quality (SQ) had a direct effect on students' attitude (ATU) and an indirect effect through perceived usefulness (PU) and ease of use (PEOU). Since applied education methods are utilized in both disciplines, the quality of the online education system becomes a primary determinant for perceived ease of use (PEOU), which significantly influences the students' attitudes. However, the comparative evaluation of the latent factors that influence students' technology acceptance shows significant changes in the two disciplines as seen in Figure 3, necessitating further discussion over the diverse educational tools and approaches specific to both areas.

System quality (SQ) directly influences architecture students' attitudes toward technology use (ATU), whereas, for engineering students, it has a more indirect effect through usefulness (PU) and ease of use (PEOU). The root of this differentiation can be associated with the change in learning approaches within the scope of both disciplines' applied education. Since

SQ	PEOU	0, 533	√		SQ	PEOU	0, 659	√
PU	ATU	0, 442	√		SQ	PU	0, 512	√
SQ	ATU	0, 384	√		PU	ATU	0, 509	√
PEOU	PU	0, 353	√		PEOU	ATU	0, 401	√
SQ	PU	0, 331	√		SQ	ATU	0, 157	√
PEOU	ATU	0, 194	√		PEOU	PU	0, 124	X

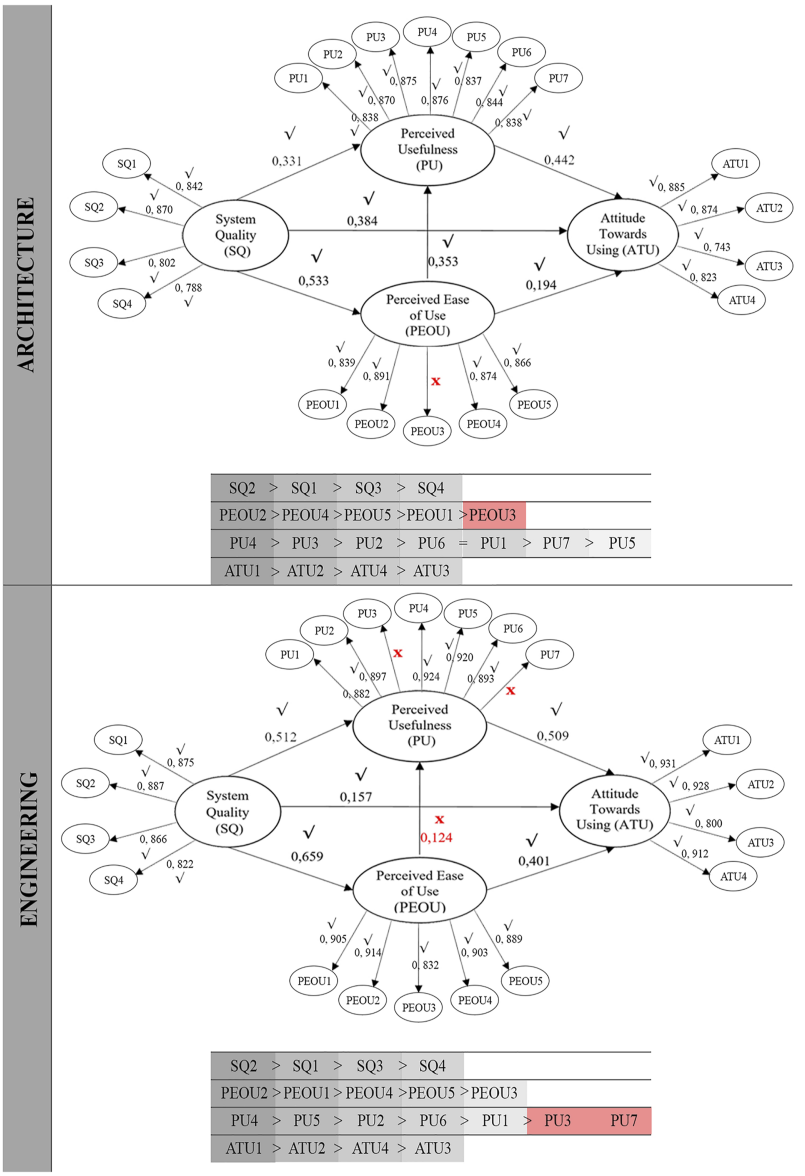
Figure 3. Path analyses for architecture and engineering students (hierarchical correlations are represented with gradient coloring)



constructivist and experiential understandings are at the forefront of architectural education, the learning process occurs more engaging and transformative. Learning is seen as constructing meaning through experience, involving both the comprehension and the reshaping of experience (Kolb, 1984; Duffy and Cunningham, 1996). Therefore, the extent to which the environment is immersive has become an essential determinant in the student's development, whether in a physical or digital environment. Thus, the system's auditory and visual interaction quality becomes highly critical. Additionally, architectural education prioritizes both instructor-student and peer interaction as part of constructivist learning within the tradition of design studio, which is utilized as a distinctive instructional approach to applied practices as expressed by Schön. The design knowledge is co-constructed and produced in an interactive social and physical environment that allows for coaching and scaffolding based on the principle of reflection-on-action (Schon, 1987; Kurt, 2011).

In contrast to the situation among the architecture students, the results show that civil engineering students' attitudes (ATU) are related more to the correlations between system quality (SQ), perceived usefulness (PU) and perceived ease of use (PEOU), which is due to the particular applied character of education and related assessment methods in the discipline. Despite having constructivist aspects, engineering education diversifies in its problem-solving approach, in which the problem is handled multidimensionally in a more processual and scientific form (Kolmos and Graaff, 2015). In contrast, the applied problem-solving in architecture is more form-oriented, subjective and open to interpretation. In this regard, the fact that the perceived usefulness (PU) factor is relatively more dominant in engineering students indicates that their technology acceptance is shaped by the efficiency and productivity they achieve through online learning tools and environments.

A distinctive difference among architecture and engineering students' attitudes toward online education is seen in the latent correlation between perceived ease of use (PEOU) and perceived usefulness (PU). While architecture students' perception of educational technologies in terms of easiness determines their perception of usefulness (PU), a significant path coefficient cannot be found for engineering students. TAM presumes that there is a positive relationship between PU and PEOU; however, the results show otherwise for engineering students. This implies that for engineering students the easiness provided during the applied practice process is not a determinant of their perception of the technology's usefulness. From an educational perspective, these results can be interpreted as that since engineering education is mostly outcome-oriented, online education technologies need to cater to students' applications in terms of concrete or observable ways. The definition of "usefulness" changes for architecture students, which will be explained further in the following discussion about the outer model estimation results.

The results derived from the hierarchical relations of items leading to latent correlations derived from outer model estimations are presented in Figure 4. For architecture and engineering students, the loading of survey items concerning the system quality (SQ) and attitudes towards using (ATU) are precisely the same. Although all the items are valid regarding students' responses to online education, the overall benefit provided by the platform is seen as the primary determinant of students' attitudes (ATU1). In contrast, the platform's ease of use is seen as the least impactful (ATU4). Regarding the system quality, it is observed that SQ2 –"The visual quality of the online education platforms is at a sufficient level" is dominant for both disciplines, which emphasizes the fact that applied practices in architecture and engineering necessitate a certain level of visual quality and interaction and this influences students acceptance of online education technologies.

Despite the exact hierarchical impact of survey items in variables of system quality (SQ) and attitudes toward using (ATU), it is seen that there are drastic differences in the hierarchical ordering of the items and some invalid ones in perceived usefulness (PU) and perceived ease of use (PEOU) due to the disciplinary specificities. PU3 is identified as a significant determinant among architecture students but not a valid item for engineering students. The fact that the statement "*Using online education platforms increased my efficiency and productivity*" is

Source(s): Authors' own work

Figure 4. PLS structural model and hypotheses results for architecture and engineering students (hierarchical correlations are represented with gradient coloring)

more indicative in defining the benefits of online learning platforms for architecture students is interpreted as a result of constructivist education, as emphasized above. The design studio's more iterative and changing processes lead to critical reflections and constant reproduction of practices: it is an experiential process involving students' active participation, creation and critical reflection (Salama, 2008). Thus, the efficiency provided by online education platforms

concerning the ongoing production practices of architecture students' becomes influential in forming their attitudes. Parallelly, PU7 –"Using online education platforms helpful in my study" – was found effective in architecture students' perceived usefulness (PU), but it was not valid for engineering students.

Looking at the item hierarchy concerning the perceived ease of use, the results indicate that PEOU1 is comparably higher among engineering students. This shows that although the perceived ease of use does not necessarily mean usefulness for engineering students, the easiness of a platform is highly determinant of their positive attitudes towards accepting online education. Following this, the item PEOU3 – "It is easy for me to interact and does not take much of my mental effort on online education platforms" – is invalid for architecture students. This shows that interaction through the program has an immense influence on the usability perception of architecture students in the learning process. The use of platforms and the opportunities they offer require an intense mental effort and interaction for architecture students.

6. Conclusion

Online education has become a highly adopted approach for necessary conditions where adequate physical conditions cannot be provided, thanks to technological developments and the proliferation of digital tools and environments. The educational implementations realized during such periods are supported by further research, which directs to the potential use of online environments within the scope of regular formal education. In the higher education context, the quality of education provided with such an approach and its benefits on students' learning process should be examined more critically through specific cases on diverse disciplines and contextual changes. In developing geographies like Turkiye, it is especially essential to consider how the varying degrees of access to technology, adequate infrastructural organization in general and familiarity with technology at the individual level influence online applications. The quality of the system appears critical in this regard. Moreover, the existing unique disciplinary approaches of higher education institutions developed over the years should be considered concerning the quality of the online education systems and the desired learning processes and conditions. With this study, the authors have shown to what extent disciplinary differences, particularly in applied fields, influence students' cognitive and affective responses to the systems used for online education and how the system's quality determines students' attitudes explicitly and implicitly. The results show that it is highly crucial to choose online education environments where the system quality is sound and adequate to continue applied practices in architecture and engineering. Because of the constructivist and experiential learning approach in architectural education, students' perceived usefulness and ease of use of the online education environments are related to the extent to which the system facilitates their interaction with each other and the instructors – also related to various forms of critiques occurring in the design studio. Therefore, it is important to select appropriate technologies that can simultaneously support dialogue between the studio actors and increase their agency to intervene and transform the online interfaces. On the other hand, it is seen that engineering students' cognitive and affective responses are shaped according to productivity since their education necessitates a problem-solving approach based on scientifically methodological methods and controlled processes toward an outcome beyond subjective perspectives.

In Türkiye and other countries with similar Ecole, architecture and engineering are often structured as related fields in the same faculties or a close organizational order. Therefore, online education implementations are realized through shared systems. Compared to current approaches, this study showed how students' needs and expectations from the systems vary significantly due to different applied practices adopted in architecture and engineering disciplines, necessitating further consideration from the higher institutions' perspective. Therefore, even if there are conditions in which a more general online education system can be

adopted, it is of great importance to develop online environments and systems to satisfy the requirements of architecture and engineering simultaneously. Accordingly, it is more suitable to adopt an online education system that fosters a constructivist and experiential learning environment of architecture and the methodological processes of engineering involving identifying problems, conducting tests and analyzing and consequently reaching results. Although this study focuses directly on the influence of system quality on students' attitudes, the model can be expanded for each discipline in further studies to include new indicators specific to architecture or engineering. Considering the gradually developing skills of architectural students in their applications, a separate study focusing on how students from different levels respond to online education can provide valuable insights to expand system requirements. Within the scope of the study, students' attitude toward online education is analyzed also concerning the diverse platforms but it is seen that there is no significant differentiation. In future studies, the particular features of these platforms can also be addressed to understand how they affect the conduct of applied practices to guide educators and institutions to appropriate platform selection.

Mezar Taşlarında Ebcetle Tarihlendirme: Kastamonu Şeyh Şaban-ı Velî Haziresi Örnekleri

Dating Tombstones with Abjad: Examples from the Tomb of Şeyh Şaban-ı Velî in Kastamonu

Mehmet Mutlu*

Öz

Türk-İslam sanatındaki kitabeler, diğer sanat formlarıyla birlikte zaman içinde gelişim ve değişim göstermiştir. Başlangıçta daha basit ifadelerle ortaya çıkan kitabeler, özellikle Osmanlı döneminde edebi metinlerin eklenmesiyle zenginleşmiş ve edebi bir platform haline gelmiştir. Ayrıca, edebiyatta ustalık göstergesi olarak kabul edilen ebcedin mezar taşlarında kullanılması, hayranlık uyandıran örneklerin de ortaya çıkmasını sağlamıştır. Kastamonu'daki Şeyh Şaban-ı Velî Külliyesi haziresi, az ama oldukça nitelikli mezar taşlarının bulunduğu bir mezarlık alanıdır. Bu alan, seçkin kişilerin defnedildiği bir yer olup, mezar taşları malzeme, işçilik, kitabe ve yazı gibi özelliklerde oldukça nitelikli örnekler sunmaktadır. Bu özelliklerin yanı sıra, kitabelerinde Türk sanatının önemli ve ilgi çekici bir alanını oluşturan ebcetle tarih düşürme tekniğinin kullanıldığı örnekler de bulunmaktadır. Bu çalışmada, hazirede tespit edilmiş olan dört adet ebcet kitabeli mezar taşında kullanılan ebcet tekniğinin çözümlenmesi ve değerlendirilmesi yapılacaktır. Bu konu üzerine daha önce benzer bir çalışma yapılmamış olup, bu açıdan araştırma özgündür ve mezar taşları bu yönüyle ilk kez değerlendirilecektir. Bu araştırma, Kastamonu Şeyh Şaban-ı Velî Külliyesi haziresinde bulunan ebcetle tarih düşülmüş mezar taşlarını tespit ve analiz etmek amacıyla gerçekleştirilmiştir.

Anahtar Kelimeler: Ebcet, Kitabe, Tarih düşürme, Mezar taşları, Kastamonu.

Abstract

In Turkish-Islamic art, inscriptions have evolved alongside other art forms over time. Initially emerging with simpler expressions, these inscriptions became enriched during the Ottoman period with the addition of literary texts, transforming them into a literary platform. Moreover, the use of Abjad, regarded as a mark of literary mastery, on tombstones has led to the creation of remarkable examples. The cemetery of the Şeyh Şaban-ı Velî Complex in Kastamonu is a burial ground with a few but highly distinguished tombstones. This area, where prominent individuals are buried, presents high-quality examples of material, craftsmanship, inscription, and calligraphy. Additionally, some examples employ the Abjad dating technique, an essential and intriguing aspect of Turkish art, in their inscriptions. This study will analyze and evaluate the Abjad technique used on four identified tombstones in the cemetery. No similar study has been conducted on this topic, making this research original in its field and offering a new perspective on evaluating tombstones. This research was conducted to identify and analyze tombstones inscribed with dates using the Abjad numerical system in the cemetery of the Şeyh Şaban-ı Velî Complex in Kastamonu.

Keywords: Abjad, Inscription, Dating, Tombstones, Kastamonu.

Giriş

Ebcet, Arap alfabesindeki harfleri yan yana getirerek alfabenin kolayca ezberlenebilmesini sağlayan, kendi başına anlamı olmayan altı kelimenin ilkidir.[1] Bu kelime aynı zamanda Arap alfabesinin genel adı, yani Arapçanın alfabesidir.[2] Ebcet, çok eskiden beri kullanılmakta olan bir tekniktir. Tekniğin bir sanat olarak ilk defa kim tarafından geliştirildiği belli olmamakla beraber, 12. yüzyılda, önce Fars edebiyatında ortaya çıktığı, sonra İslâm kültürünün etkisiyle Arap harflerini kullanmaya başlayan İranlılardan Türklere ve Türkler'den de Araplara geçtiği değerlendirilmektedir.[3] Ebcet hesabının kuralları hemen hemen her kültürde aynıdır. Alfabede ilk 10 harf 1'den 10'a kadar birer birer, 10'dan sonra gelen 10 harf 10'dan 100'e kadar onar onar, kalan harfler ise tamamı bitene kadar yüzer yüzer değer alırlar.[4] (Tablo 1).

Tablo 1. Ebcet Sistemine Göre Harflerin Sayısal Karşılıkları

Birlik Değerliler			Onluk Değerliler			Yüzlük ve Binlik Değerliler		
Harfler	Türkçe Okunuşu	Sayısal Değeri	Harfler	Türkçe Okunuşu	Sayısal Değeri	Harfler	Türkçe Okunuşu	Sayısal Değeri

28 harfli Arap alfabesi, yüzyıllar öncesinde (harflerin aynı zamanda rakam olarak da kullanılması sebebiyle) harf dizilişi açısından bugünkünden farklıydı. "et-tertîbü'l-ebcedî" denilen[5] bu dizilişe göre harfler, alfabede rakamsal değerlerine göre sıralanmıştı. Bu sıralamada 1'den 9'a (9 harf); 10'dan 90'a (9 harf) ve 100'den 1000'e (10 harf) kadar olan 28 sayı, Arap alfabesinde bir harfe karşılık gelmekteydi. Alfabenin bu kullanımına göre dizilimindeki ilk 4 harf (Elif, Be, Cim, Dâl), bu sisteme (Ebcet) ismini vermiştir.

Türkler, 10. yüzyılda İslamiyet'i kabul ettikten sonra Arap alfabesini kullanmaya başlamışlardır. Bu durum, ebcetin Türk kültür ve medeniyetinde çok yoğun uygulama

alanı bulmasında en önemli başlangıç noktasıdır. Tarih düşürme tekniği, Türk edebiyatında 14. yüzyılla beraber hızla gelişmeye başlamış ve özellikle 18. yüzyılda en parlak dönemine ulaşmıştır. Osmanlılarda Kanuni Sultan Süleyman dönemine kadar çoğunlukla Arapça ve Farsça ile yazılan tarih kitabeleri, 16. yüzyıldan itibaren daha çok Türkçe olarak yazılmaya başlanmıştır.[6]

Ebcet, edebiyatla yakından ilişkili olmasının yanı sıra, sayısal faktörlerin doğrudan etkisi nedeniyle matematiği de kapsayan bir tekniktir. Başlangıçta sadece edebi eserlerde kullanılmakla beraber, zamanla yapı kitabeleri ve mezar taşlarında da güzel örnekler vermiş ve bu sayede daha fazla insana ulaşarak daha çok dikkat çekmiştir. Ebcedin mezar taşlarında da kullanılması, edebiyatın estetik tarafı ile mezar taşlarının kaynaşmasını sağlamıştır. Ebcetle ifade edilen manzum tarihlerin (tarih düşülmüş şiirler) mezar taşlarında kullanılması, onu sadece ifade ettiği sayı değeri olarak değil, aynı zamanda ona yeni bir anlam ve değer kazandırarak onun sanat, estetik ve tarih arasında bağ kuran bir sanat eseri haline gelmesini sağlamıştır.

Tarih manzumesi yazan şairler "müverrih" olarak tanımlanmaktadırlar.[7] Bu tanımlama, şiirlerinde ebcet tekniğini kullanan şairler tarafından da benimsenmiş bir sıfattır. Birçok şair yazdığı şiirde kendini müverrih olarak nitelendirmiştir.[8] Müverrihler genellikle tarih veren mısranın hemen öncesinde "tarih" kelimesini ve kendi isim ya da mahlaslarını (eserlerinde kullandıkları takma adlarını) zikrederler. Ebcet kullanılmış bir şiirde "tarih" kelimesinin anılmadığı manzumeler, ebcedin tespitinde güçlüklere yol açtığı için makbul sayılmamıştır.[9]

Türk edebiyatında tarih düşürme, özellikle 18. yüzyıldan sonra bir nevi hüner sergileme sahasına dönüşmüş ve bu yüzden şairler ebcedin çok fazla çeşidini ortaya koymuşlardır. Bilmeceli biçiminde, kinayeli (dolaylı), taklîb (döndürme) veya tashîf (bilerek yanlış yazma) yoluyla, akrostiş veya vefk tarzında anlaşılması çok zor ve derin edebî sanatlar içeren tarihler söylemişlerdir.[10]

Ebcet, Türk kültür ve sanatında çok farklı alanlarda kullanılmıştır. Bazı günlük ihtiyaçların karşılanmasında, isim sembolü olarak, yeni doğmuş çocuklara isim vermede, resmi devlet kayıtlarında, büyü ve muska gibi kendine has bilgilerde, tasavvuf ve din ilimlerinde ve önemli görülen herhangi bir olayla ilgili tarih düşürmede ebcet hesabının kullanıldığı çok fazla örnek bulmak mümkündür. Buna rağmen ebcet denildiğinde akla ilk önce tarih düşürme gelmektedir.

Türk sanatında kullanılmış olan ebcet örnekleri üzerinde yapılan çalışmalar, ebcet kullanımının çok fazla türünün olduğunu göstermektedir. Yakıt'ın, on binlerce metin ve kitabe örneğini inceleyerek yaptığı tipoloji, bugüne kadar yapılan en kapsamlı çalışma olarak dikkati çekmektedir.[11] Yakıt, çalışmasında edebiyatta kullanılan ebcet türlerini yedi ana başlık altında toplamıştır. İsmail Yakıt'ın yaptığı bu çalışma dışında, ebcet türleriyle ilgili yapılan bir diğer önemli çalışma da Turgut Karabey'e aittir.[12] Karabey, çalışmasında ebcedi üç ana başlık altında gruplandırmaktadır. Bu iki çalışmayı referans kabul ederek, ebcet türlerini söyleniş bakımından, hesaplanış bakımından ve harflerin kullanılışı bakımından üç ana başlık altında toplamak mümkündür.

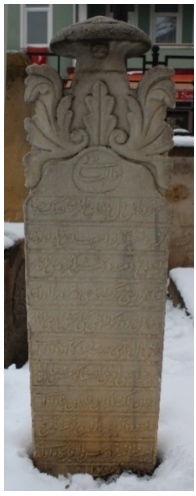
Söyleniş bakımından ebcet, mânen tarih, lafzen tarih ve her ikisinin bir arada kullanıldığı manen ve lafzen tarih olarak üç başlıkta değerlendirilmektedir. İfade edilmek istenen tarihin, manzum metinde kullanılan harflerin sayı değerlerinin toplamıyla ortaya çıkartılması "manen tarihlendirme" olarak isimlendirilmektedir. Ebcedin, hesaplama tekniği kullanılmadan, rakamla değil de metinle verildiği tarihlendirme biçimi ise "lafzen tarihlendirme" olarak tarif edilir. Bu ikisinin bir arada kullanıldığı teknik ise "lafzen ve mânen tarihlendirme tekniği" yöntemi olarak tanımlanır.

Hesaplanması bakımından ebcet çeşitleri ise, "tam tarih", "ta'miyeli tarih" ve "dütâ tarih" olarak üç grupta toplanabilir. Mânen tarih tekniği kullanılmak suretiyle, hesaplandığında ifade edilmek istenen sayının (yılın) tam olarak ortaya çıktığı tarihlendirme tekniğine "tam tarih tekniği" adı verilir. Bu teknik en zor ve dolayısıyla da en makbul sayılan tarihlendirme çeşididir. Ebcet tarihini veren metin içinde belirtilen sayıları, verilen ebcet cümlesine eklemek ya da çıkartmak suretiyle söylenen tarih düşme tekniği ise "ta'miyeli tarih" olarak isimlendirilir. Bu teknik eksiltme ya da ekleme durumuna göre "eksik ta'miyeli" ve "fazla ta'miyeli" olmak üzere iki farklı şekilde kullanılmaktadır. Tarihi ortaya çıkartan mısra harflerinin, söylenmek istenen yılın iki katını verdiği tarihlendirme biçimine "dütâ tarih" denmektedir. Dütâ tarihlerin en çok beğenileni, tarih veren mısra iki bölüme ayrıldığında her bölümün ayrı ayrı istenen tarihi gösterdiği ebcet şekildir. Bu, aynı zamanda en zor söylenen, dolayısıyla en başarılı sayılan tarih çeşididir. Genelde yazma eserlerde karşımıza çıkan bir tarihlendirme biçimidir.

Harflerin kullanılışı bakımından ebcet çeşitleri ise yine üç grupta incelenebilir. Bunlardan ilki, mevcut bütün harflerin kullanılmasıyla verilen tarih tekniğidir. Tarihe işaret eden metin içinde, yalnız noktalı harflerin hesaba dahil edilmesiyle ortaya konan tarih, bu grubun ikinci çeşidini oluşturur. Buna münakkat, menkūt, mücevher, cevher, cevherî, cevherdâr, cevherîn, gevher, güher gibi farklı isimler de verilebilir. Metin içinde bu tarihlendirme tekniğinin kullanılmış olduğuna dair mutlaka bir işaret bulunur. Noktalı harflerle tarihlendirme, hesaplanması bakımından ebcet türleri ile kombinasyon halinde de (ta'miyeli-noktalı tarih gibi) kullanılabilir. Sonuncu grup ise, noktasız (mühmel) harflerle yapılan tarihlendirmedir. Noktalı tarihlendirme tekniğinin tam tersi olarak, tarih veren metin içinde sadece noktasız harflerin hesaba dahil edilmesiyle ortaya

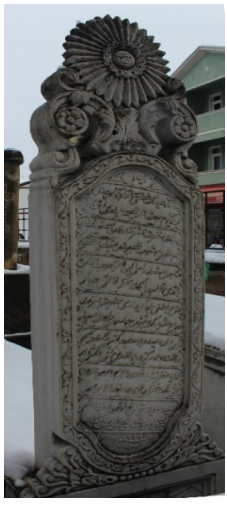
[11] Bu gruplandırma için bkz: Yakıt, *a.g.e*, 301-391.
[12] Bu gruplandırma için bkz: Karabey, *a.g.e.*, 80-82.

çıkan tarihlendirme tekniğidir. Bu teknik, "bî-nukat", "bî-cevher" ve "sâde tarih" vs. gibi isimlerle de anılır. Noktasız harflerin ebcet sayı değeri büyük olmadığından, özellikle büyük rakamların ortaya konmasında bu teknik zor bir teknik olarak dikkati çeker.



Kastamonu'da yer alan Şeyh Şaban-ı Velî Külliyesi, Türkiye'nin önemli tasavvuf merkezlerinden biridir. Külliye, cami, kütüphane, dergâh konutları, şadırvan, Şeyh Şaban-ı Velî'nin türbesi ve küçük bir hazireden oluşmaktadır.[13] Külliye, Osmanlı İmparatorluğu döneminde, özellikle 16. yüzyılda yaşamış ünlü bir sufi olan Şeyh Şaban-ı Velî'nin adıyla anılmaktadır.

Halvetiye tarikatının, Şabaniye kolunun kurucusu olan, Şeyh Şaban-ı Velî, 1481 yılında Kastamonu'nun Taşköprü ilçesinde dünyaya gelmiştir. Kastamonu'daki ilk eğitiminin sonrasında İstanbul'a gitmiş ve eğitimine orada devam etmiştir. İstanbul'da ilk eğitiminin ardından, Fatih Sahnı Semen medreselerinde tahsilini tamamlamıştır. Müderris olarak belirli bir süre İstanbul'da hizmet verdikten sonra, memleketi olan Kastamonu'ya dönüş yolundayken, öncesinde ismini duymuş olduğu, Hayreddin-i Tokadî Hazretlerini, Bolu'daki dergâhında 1508 yılında ziyaret etmiş ve dergâhta 12 sene kalarak Hayreddin-i Tokadî Hazretleri'nin ilminden faydalanmış ve tasavvuf ilminde olgunluğa erişmiştir. Daha sonra döndüğü Kastamonu'da 4 Mayıs 1569 tarihinde vefat etmiştir.[14] Şeyh Şaban-ı Velî, Osmanlı toplumunun ilim ve kültür mimarları arasında da seçkin bir mevki kazanmıştır.[15]



Külliye unsurlarından caminin olduğu yerde daha önce bir mescit bulunmaktaydı. Bu mescidin banisi Halveti Şeyhi Seyyid Sünneti Efendi, caminin kıble duvarının hemen önünde medfundur.[16] Buradan, külliye içindeki hazirenin Şeyh Şaban-ı Velî'den çok önce oluşmaya başladığı anlaşılmaktadır. Şeyh Şaban-ı Velî'nin türbesinin yapımına, vefatının 43. yılında Şabaniye kolunun postnişinlerinden Şeyh Ömer Fuadî tarafından başlanmış, ancak eser halkın yardımlarıyla 1611 senesinde tamamlanabilmiştir.[17] Hazirede, Şeyh Şaban-ı Velî'nin yanı sıra onun takipçileri, dervişler, alimler ve farklı dönemlerin önemli isimleri yatmaktadır. Haziredeki mezar taşları, Osmanlı döneminin mezar taşı özelliklerini taşıyan, süsleme sanatının ve hat sanatının güzel örneklerini sergileyen örnekler olarak dikkati çekmektedir (Resim 1-2).

Hasan Fehmi Efendi'ye Ait Mezarın Ayak Şahidesi Dış Yüzü

Kastamonu Şeyh Şaban-ı Velî cami haziresinde 64 adet mezar bulunmaktadır. Bunların 16 tanesi sadece baş şahidesine sahip iken, 48 tanesinin ise hem baş ve hem de ayak şahidesi bulunmaktadır. Türbenin içinde ise 16 adet sandukalı mezar bulunmaktadır.

2. Kastamonu Şeyh Şaban-ı Velî Haziresi Örnekleri

2. 1. Emine Hanım'a Ait Mezar Taşı

Toprak mezar tipolojisindeki mezar, baş şahidelidir.[18] Şahidenin dış yüzü kuzeye dönük durumdadır. Şahide, 105x30x10 cm. ölçülerinde olup, yukarıya doğru hafifçe genişleyerek yükselmektedir. Şahidenin üst bölümde yüksek kabartma tekniği ile yapılmış gösterişli akantus yaprakları bulunmaktadır. Boyun kısmı tepeliğe doğru daralarak yükselirken başlık kısmı ise hotoz şeklinde sonlanmaktadır (Resim 1).

Kitabesinden, mezarın H.1277/M.1860-61 tarihli olduğu anlaşılmaktadır. Mermer malzemeli şahidenin dış yüzeyinde bulunan Osmanlıca kitabe, kabartma tekniğinde ve sülüs hat ile yazılmıştır. Cetvellerle ayrılmış zemine yazılmış olan kitabe 12 satırdan meydana gelmektedir. Kitabenin metni, transkripsiyonu[19] ve anlamı[20] şöyledir:

Metni	Transkripsiyonu

Anlamı: *O, Baki'dir (sonsuzdur). Gönül ehli Ramiz Paşa'nın muhlisine yazık oldu. Gül bahçesinin seçkin goncası, umutları boşa çıktı. Yani, yeni açmış temiz kız çocuğu aniden Fani gül bahçesini terk etti, cennete doğru yol aldı. Henüz gönül süslemeye papağan gibi başlamıştı. Ölüm onu susturdu, hasret gözlerine ah oldu. "Dön" emrini ruhuyla işitince temiz ruhu, yüce cennette sığınak buldu. Ah dumanıyla yazıldı ölüm tarihi: "Emine Hanım, yüce cennette yer buldu". Sene 1277 (1860-61)*

[18] Mezarların tipolojik gruplandırılmalarında Halit Çal'ın tipoloji çalışmasından faydalanılmıştır. (Detaylı tipoloji için bakınız: (Halit Çal, "Türklerde Mezar-Mezar Taşları," *Aile Yazıları*, 8 (2015): 295-332.

[19] Çalışmada bulunan kitabelerin metnini okuyarak yazımı yapan Dr. Öğr. Üyesi Bahar Sultan Quarrie'ye teşekkür ederim.

[20] Çalışmada bulunan kitabeleri günümüz Türkçe'sine çeviren Tarihçi Halis Talha Özcan'a teşekkür ederim.

Tablo 2. Emine Hanım'a Ait Mezar Taşı Kitabesinin Ebcet Çözümlemesi

| امینه خانمه فردوس بالا جایگاه اولدی *(Emine Hanım'a Firdevs-i bala cây-gâh oldu)* | | |

Anlamı: *Ey Allah'ım! Bu zat, Ramazan ayının ortasında oruçlu olarak göçtü. Cumartesi günü cennet yurdunda iftar etti. Ramazan'ın ortasında olan mağfirete lütuf olsun. Tam anlamıyla cennette yerini buldu. İstanbul doğum yeri iken, temiz bedenini yüce yaratıcının emriyle bıraktı. Hazret-i Pir'in feyz kanadını sığınak edindi. Mahşer sabahına kadar kabrinde çok rahat bulsun. Bu, bu mütevazı kişinin kayınvalidesidir ki vefatında burada defterdarın annesi bulundu. Allah'ım, kusur, suç ve isyandan mağfiret eyle. günahları affedilmiş şehitlerin hakkı için Saîda, Fatıma Hanım'ın ölüm tarihini söyledim: "Cumartesi günü cennet yurdunda iftar etti". 1290 senesi Ramazan'ın 18'i. (9 Kasım 1873)*

Ayak taşı 195x45x16 cm. ölçülerinde olup, kadın mezar taşlarında sıkça görülen gelin başı şeklinde bir buket ile sonlanmaktadır (Resim 2). Buketin ortasında üç adet gül motifi yer almakta ve etrafında akantus yaprakları bulunmaktadır. Gövdede ise ayaklı, iki kulplu bir vazo içinden çıkan dallar, dallara bitişik yapraklar ve bu dalların ucunda bulunan beş adet gül motifinin yer aldığı bir kompozisyon görülmektedir[21].

Sandık kısmının her cephesinde birer şemse motifi bulunmaktadır. Köşelere ise şemse motifini tamamlayan köşebentler işlenmiştir. Sandık kısmının uzun kenarlara sahip yüzeyinde bulunan şemseler, kısa kenarlı yüzeydekilere göre daha büyük tutulmuştur.[22]

Tablo 3. Fâtıma Hanım'a Ait Mezar Taşı Kitabesinin Ebcet Çözümlemesi

گیدوب یوم سبت دار نعیمده ایلدی افطار *(Gidip yevm-i sebt dar-ı naîmde eyledi iftâr)*																														
گ	ي	د	و	ب	ي	و	م	س	ب	ت	د	ا	ر	ن	ع	ي	م	د	ه	ا	ي	ل	د	ي	ا	ف	ط	ا	ر

1290																														

Kitabenin 14. satırında verilen "*Saîda söyledim târih-i fevtin Fâtıma Hanım*" cümlesi ile, takip eden satırda ebcet tekniği ile tarih verileceğine işaret edilmektedir. Buna göre 15. satırda yer alan "*Gidip yevm-i sebt dar-ı naîmde eyledi iftâr*" cümlesi ise, ebcet hesabıyla Fâtıma Hanım'ın ölüm tarihini veren 1290 sayısını vermektedir (Tablo 3). Ebcet tekniği olarak, "mânen tarihlendirme tekniği" kullanılmıştır.

2. 3. Mahzer-zâde Hacı Mehmet Ağa'ya Ait Mezar Taşı

Hazireye girilen güney kapısının batı tarafındaki alanda, duvarın hemen yanında bulunmaktadır. Mezar baş ve ayak şahideli, sandık mezar tipolojisindedir. Yapım malzemesi, mermerdir. Baş şahidesi 150x35x9 cm. ölçülerindedir. Şahidenin gövdesi bir sarıkla sonlanmaktadır. Baş şahidesinin dış yüzeyinde, 16 satırdan oluşan sülüs yazı ile kabartma tekniğiyle, Osmanlı Türkçesi kullanılarak yazılmış kitabesi bulunmaktadır. Satırlar eğik olarak düzenlenmiş kartuşlar içerisine yazılmıştır. Kitabenin etrafı, kıvrık dal ve yapraklardan oluşan bitkisel bezemeli ince bir bordür çevrelemektedir (Resim 1).

Anlamı: *O, Baki'dir (sonsuzdur). Ey ikbal ve şeref devrinde olanlar, dünyanın sizi bu halde bırakacağını sanmayın. İman ışığıyla kalbinizi aydınlatınız. Bu dünyada gerçek şeref ve saadet ancak budur. Düşünün ki bu yolculuk için bir menzil yeri olmuştur. Toprak altı ne kötü bir yer ne karanlık bir meydan. Kim gelirse gelsin, elbet gider, kimse ebedilik bulamaz. Yalnızca yüce Allah ezeli ve ebedidir. Ey bu mezarın yanından geçenler, hiç mi bir bakış atmazsınız? Lütfen geliniz ve bir Fatiha okuyunuz. Yıl ve ölüm tarihi noktalı harflerle bir fazladır: "Mehmed'in ruhunun kuşu cennet kafesinde bir mekân buldu". Saygın tüccarlardan Mahzerzâde el-Hac Mehmed Ağa'nın ruhu için Fatiha. 1309 senesi rebiü'l-ahir'in 14'ü. (17 Kasım 1891)*

Ayak şahidesi 135x30x8 cm. ölçülerindedir. Ayak şahidesinin üst bölümü bir sarıkla sonlanmaktadır (Resim 2). Şahidenin dış yüzeyinde ayaklı ve iki kulplu bir vazo içinden çıkan sarmaşık dalları ve bu dallara bitişik yaprakların olduğu bir kompozisyon bulunmaktadır. Ayrıca dalların aralarında gül goncaları ve kıvrım yapan bölümlerinde de iki adet gül motifi bulunmaktadır.[23]

Mezarın sandık kısmı da mermer malzemeden yapılmış ve üst bölümü de yine mermer malzemeli bir kapakla örtülmüştür. Sandığın her yüzüne birer adet şemse motifi yerleştirilmiştir[24].

Kitabenin 12. satırında bulunan *"Fazladır bir nokta-ı harfler ile Sâl-ı vefât"* ifadesi, ebcedle ilgili çok önemi ipuçları vermektedir. Bu cümlede öncelikle verilecek ebcet metninin değerinin, ifade edilmek istenen değerden bir fazla çıkacağı ifade edilmektedir. Cümlede dikkati çeken önemli bir husus da cümle içinde geçen "*…nokta-ı harfler…*" vurgusudur. Bu vurgu ile hem ebcete ve hem de kullanılan ebcet tekniğine işaret edilmekte olup, açıkça noktalı harflerle tarih verildiği ifade edilmektedir. Sonraki mısrayı oluşturan *"Murğ-i rûh-i Mehmed'e var kafes-i firdevste mekân"* cümlesi, ebcet

[23] Vural, a.g.e., 39-40.
[24] Vural, a.g.e., 40.

tekniğiyle tarih vermektedir. Bu cümle içinde kullanılan harflerden noktalı olanların ebcet değerleri hesaplandığında bulunan 1310 değerinden "1" rakamı çıkarıldığında Mehmet Ağa'nın ölüm tarihi olan 1309 rakamına ulaşılmaktadır (Tablo 4).

Tarih veren bir mısranın sayı değerleri toplamı, ifade edilmek istenen sayıyı tam olarak vermezse, o zaman sonuca ne kadar sayı ilave edileceği veya çıkarılacağı bir önceki mısrada ya üstü kapalı olarak ya da açık bir üslupla belirtilir. Bu tür tarihlere "ta'miyeli tarih" denir. Ta'miyeli tarih, eksik ya da fazla ta'miye olarak iki farklı şekilde kullanılabilir. Eksik ta'miyeli tarih tekniği, tarih mısrasının toplamının ulaşılmak istenen sayıdan eksik gelmesi halinde, ebcetin verdiği rakama kaç sayısının eklenmesi gerektiğini, müverrihin bir önceki mısrada açık veya imalı bir şeklide belirttiği tekniktir. Bu tür ebcetlere "tarh" usulü veya "tenzil" yoluyla tarihlendirme adı da verilmektedir[25].

Tablo 4. Mahzer-zâde el-Hac Mehmet Ağa'ya Ait Mezar Taşı Kitabesinin Ebcet Çözümlemesi

مرغ روح محمّده وار قفس فردوسده مکان *(Murğ-i rûh-i Mehmed'e var kafes-i firdevste mekân)*																														
ن	ا	ک	م	ه	د	س	و	د	ر	**ف**	س	**ق**	**ف**	ر	ا	و	ه	د	م	ح	م	ح	و	ر	**غ**	ر	م			
50	1	20	40	5	4	60	6	4	200	**80**	60	**100**	**80**	200	1	6	5	4	40	8	40	8	6	200	**1000**	200	40			
1309 (1310-1)																														

Bu örnekte, üst satırdaki cümlede yer alan, "*Fazladır bir nokta-ı harfler...*" ifadesinden, hesaplanan tarihten 1 rakamının çıkartılmasının gerektiği işaret edilmiş ve bu şekliyle de "fazla ta'miyeli tarih" tekniği kullanılmıştır.

2. 4. Hasan Fehmi Efendi'ye Ait Mezar Taşı

Mezar, hazire içinde Şeyh Şaban-ı Velî Türbesi'nin batısında bulunmaktadır. Hem baş hem de ayak şahidesi üzerinde kitabesi bulunmakla beraber, ebcet kullanılan kitabe metni ayak şahidesindedir. Mezar baş ve ayak şahideli, sandık mezar tipolojisindedir. Yapım malzemesi, şahidelerde mermer, sandık kısmında ise taştır. Şahideler yukarıya doğru genişleyen silindirik formdadır. Hasan Fehmi Efendi'nin ölüm tarihi ayak şahidesinin kitabesinde Muharrem 1328 (M. Ocak-Şubat 1910) olarak verilmiştir.

Baş şahidesi 150 cm. yüksekliğinde ve ortalama 17 cm çapındadır. Yukarıya doğru genişleyerek devam eden şahidenin alt bölümü, akantus yapraklarıyla düzenlenmiş silmeli bir kürsü biçiminde düzenlenmiştir (Resim 1). Silindirik gövdenin dışarıya bakan yüzünde sülüs hat ile kabartma tekniğinde ve Osmanlı Türkçesiyle yazılmış kitabesi bulunmaktadır. 9 satırdan oluşan kitabe, 9 bölüm meydana getiren kartuşların içerisine yerleştirilmiştir[26]. Kitabenin metni, transkripsiyonu ve anlamı şöyledir:

[25] Yakıt, *a.g.e.*, 315.
[26] Vural, a.g.e., 59.

Anlamı: *O, Baki’dir (sonsuzdur). Aslen Vizeli olup, Kastamonu’da Hukuk Mahkemesi başkanlığında bulunurken ebedi aleme göç eden Merhum Hasan Fehmi Efendi’nin Ruhu için, Allah rızası için Fatiha.*

Silindirik gövdeli ayak taşı 130 cm. yüksekliğinde ve yaklaşık olarak 14 cm. çapındadır. Gövde, aşağıdan yukarıya doğru genişlemektedir. Şahidenin alt bölümü, baş şahidesinde görülen düzenlemeyle aynı şekilde, akantus yapraklarıyla düzenlenmiş silmeli bir kürsü biçiminde düzenlenmiştir. Ayak taşının dış yüzünde 13 satırlık sülüs yazı, 12 bölüm olarak düzenlenen kartuşların içerisine yerleştirilmiştir (Resim 2). Kitabe kabartma tekniğinde, sülüs hatlı ve Osmanlı Türkçesi kullanılarak yazılmıştır. Kitabenin metni, transkripsiyonu ve anlamı şöyledir:

١٢- لله الفاتحه	*12- Lillâh-il-fâtihâ*
١٣- سنه ١٣٢٨ محرم	*13- Sene 1328 Muharrem*

Anlamı: *Allah’ın rahmeti üzerine olsun. Ah, faziletli ve edepli bir zat idi. Halkın nazarında sevgiliydi, güzel ahlak sahibiydi. Müptelâ olduğu nefes darlığından kurtuldu. Allah’ın rahmeti üzerine olsun, bu asil kişi kurtulamadı. Nebevi hadislerde şehit sınıfına katıldı bu faziletli ve bahtiyar garip. Temiz kızı ve kederli eşine Allah büyük ecir ve sabır versin. Fevzi, vefat tarihini üzülerek söyledi: “Zeki olarak övülen güzel Fehmi zayi oldu”. Allah rızası için Fatiha. 1328 senesi Muharrem ayı. (Ocak-Şubat 1910)*

Mezarın sandık kısmının, baş ve ayak şahideleriyle karşılaştırıldığında daha niteliksiz bir taş malzemeyle yapıldığı görülmektedir.

Kitabenin 10. satırında verilen *“Bi’t-te’essüf dedi târîh-i vefâtın Fevzî”* cümlesi ile, takip eden satırda ebcet tekniği ile tarih verileceğine işaret edilmektedir. Buna göre 11. satırda yer alan *“Hasan Fehmî-i memdûh-ı Lebîb”* cümlesi, ebcet hesabıyla Hasan Fehmi Efendi’nin ölüm tarihini olan 1328 yılını vermektedir (Tablo 5). Ebcet tekniği olarak ise, “mânen tarihlendirme tekniği” kullanılmıştır.

Tablo 5. Hasan Fehmi Efendi'ye Ait Mezar Taşı Kitabesinin Ebcet Çözümlemesi

Ebcet, zaman içinde kendi kullanım kurallarını ortaya koymuş bir sanat dalıdır. Bu kurallardan en önemlilerinden birisi de metnin okunuşuna değil yazılışına itibar edilmesidir[27]. Çünkü zaman zaman ebcet hesabının tutturulabilmesi için bilinçli olarak küçük imlâ hataları yapılabilmektedir. Nitekim bu örnekte, kitabede *Hasan Fehmi* isminin yazılışında, ismin sonunda hemze (ء) gerekmediği halde, metnin müverrihi Fevzî, ebcet hesabını tutturabilmek için kitabe yazımında "ye" harfini hemzeli olarak (ئ) kullanmıştır.

[27]Yakıt, *a.g.e.*, 70.

Değerlendirme ve Sonuç

Bu çalışmada Şeyh Şaban-ı Velî Külliyesinin haziresinde bulunan mezar taşlarından ebcet tarihlendirmesine sahip örnekler ve kullanılan ebcet teknikleri incelenmiştir. İncelenen örneklerden en erken tarihli olanı 1227 (M.1860-61) tarihini veren Emine Hanım'ın mezarıdır. En geç tarihli örnek ise Muharrem 1328 (Ocak-Şubat 1910) tarihinde vefat ettiği bilgisi verilen Hasan Fehmi Efendi'ye ait mezardır (Tablo 6).

Çalışma kapsamında detaylı olarak incelediğimiz dört adet ebcetli kitabe örneğinde, üç farklı ebcet türünün kullanıldığı görülmüştür. Örneklerin tamamı söyleniş bakımından manen ebcet örneği olup, incelenen mezar taşlarında lafzen ebcede rastlanmamıştır. Hesaplama açısından ise üç örnek tam tarih, bir örnek ise fazla ta'miyeli ebcet örneği olarak karşımıza çıkmaktadır. Harflerin kullanılışı bakımından ise üç örnekte tüm harfler kullanılmışken, bir örnekte ise noktalı harflerle ebcet düşme tekniği tercih edilmiştir (Tablo 6).

Tablo 6. Hazirede bulunan Ebcedli Mezar Taşı Kitabelerine Ait Özellikler

Sahibi	Tarihi		Ebcet Kitabesinin Yeri	Ebcet Türü		
	Hicri	Miladi		Söyleniş	Hesaplama	Kullanış
Emine Hanım	1227	1860-61	Baş şahidesi dış yüzü	Manen	Tam Tarih	Tüm Harfler
Fatıma Hanım	18 Ramazan 1290	9 Kasım 1873	Baş şahidesi dış yüzü	Manen	Tam Tarih	Tüm Harfler
Mehmet Ağa	14 Rebiül-ahir 1309	17 Ekim 1891	Baş şahidesi dış yüzü	Manen	Fazla Ta'miyeli	Noktalı Harfler
Hasan Fehmi	Muharrem 1328	Ocak/Şubat 1910	Ayak şahidesi dış yüzü	Manen	Tam Tarih	Tüm Harfler

Emine Hanım'ın mezar taşında *"Emine Hanım'a Firdevs-i bâlâ cây-gâh oldu"*; Fatıma Hanım'ın mezar taşında *"Gidip yevm-i Sebt-dâr-ı Na'îmde eyledi iftâr"* ve Hasan Fehmi Efendi'nin mezar taşında da *"Oldu zâyi' Hasan Fehmî-i memdûh-ı Lebîb"* cümleleri tam tarih tekniği ile ölüm tarihlerini doğrudan vermektedir.

İncelediğimiz örneklerden birinde (Mansurzâde el-Hac Mehmet Ağa'nın mezar taşında) ta'miyeli ebcet tekniği kullanılmış olup, bu örnek fazla ta'miyeli olarak kullanılmıştır. Kitabenin 12. satırında bulunan *"Fazladır bir nokta-ı harfler ile Sâl-ı vefât"* ifadesi, ebcedin istenen değerden bir fazla çıkacağını bildirmektedir. Bu cümle içinde kullanılan harflerden noktalı olanların ebcet değerleri hesaplandığında bulunan 1310 değerinden "1" rakamı çıkarıldığında Mehmet Ağa'nın ölüm tarihi olan 1309 rakamına ulaşılmaktadır (Tablo 4).

Tarihi veren mısrayı oluşturan harflerden sadece noktalı olanların hesaba katılmasıyla ortaya çıkan tarihlere "noktalı harflerle tarih" denir. Bu tür tarihlere "Mu'cem", "mu'accem", "cevher", "cevheri", "cevherdâr", "gevher", "güher", "mücevher", "menkut" ve "noktadar" gibi adlandırmalar yapılmıştır. Sadece cümlede geçen noktalı harflerin hesaplanmasıyla bulunabilen tarihler ise "asıl noktalı harflerle tarihlendirme" olarak isimlendirilir[28]. Müverrihler, metin içinde

[28] Yakıt, *a.g.e.,* 324.

yaptıkları bazı göndermelerle[29] bu eş anlamlı tabirleri genellikle ebcet mısrasından önceki mısrada belirtirler. Zor bir teknik olarak kabul edilen bu tarihlendirme, bir örnekte, yine Mansurzâde el-Hac Mehmet Ağa'nın mezar taşında karşımıza çıkmaktadır. Kitabenin 12. satırında bulunan *"Fazladır bir nokta-ı harfler ile Sâl-ı vefât"* ifadesindeki, "*…nokta-ı harfler…*"göndermesi, ebcet hesabında sadece noktalı harflerin dikkate alınması gerektiğini bildirmektedir. Nitekim, ebcet cümlesi olan sonraki mısrayı oluşturan *"Murğ-i rûh-i Mehmed'e var kafes-i fırdevste mekân"* cümlesini oluşturan noktalı harflerin (غ / ق / ف / ف) ebcet değerleri toplamı tarih vermektedir. Bu cümle içinde kullanılan harflerden noktalı olanların ebcet değerleri hesaplandığında bulunan 1310 değerinden "1" rakamı çıkarıldığında Mehmet Ağa'nın ölüm senesi olan 1309 rakamına ulaşılmaktadır (Tablo 4).

Görüleceği gibi ebcet hesabıyla tarih düşürme, mezar taşları da dahil olmak üzere her türden eserin kitabesinde sıklıkla kendine yer bularak şairlerin veya tarihçilerin ilgisini çeken bir konu olmaktan çıkıp görsel sanatların örneklerinde de varlığını hissettirmiştir. Bu yöntem, sadece kelime oyunları veya tarihsel kayıtlarla sınırlı kalmayıp, eserlerin tasarımında ve estetiğinde de derin etkiler yaratmıştır. Mezar taşlarında ebcet hesabının matematiksel ve sembolik boyutu kullanılarak bu eserlerin anlam dünyasını zenginleştirmiş, bir nevi taşıdığı tarihi ve manevi mesajları harfler aracılığıyla ifade etmiştir. Ebcet hesabı sadece yazılı kaynaklarda değil, aynı zamanda mezar taşlarının da anlam katmanlarını zenginleştirerek estetik bir derinlik sunmuştur.

Bu çalışma, mezar taşlarında ebcet kullanımının hem estetik hem de kültürel boyutlarını inceleyerek, bu geleneksel uygulamanın Osmanlı dönemi mezar taşlarına nasıl derin anlamlar kazandırdığını ortaya koymaktadır. Elde edilen bulgular, ebcet tekniklerinin sadece bir süsleme unsuru olarak değil, aynı zamanda dönemin matematiksel ve mistik düşünce yapısının bir yansıması olarak da kullanıldığını göstermektedir.

[29] Noktalı tarihlendirmeye işaret eden çok sayıda tabir bulunmaktadır. Bu tekniğin kullanıldığı ebcet örneklerinde,genellikle ebcet tarihini veren cümlenin öncesinde bulunan cümlenin içerisinde geçen "gevher-i bahr-i remel", "târih-i menkûtum...", "cevherin târih...", "noktadâriyle dedim...", "mücevher harf ile..", "tarih-i cevherdârın", "tebşir idüb...", "olsa gevher-pâş-ı teşrifat", "menkuta hurûf...", "dürdâne...", "dürr-i yektâ...", "dürr-i ferid...", "dâne-dârından...", "tar-si'a...", "hurde-i yakut...", "süreyya-rütbet...", "gevher-nazir...", "süreyya reşkeder...", "encüm-dârına...", "encüm-tabına...", "ilm-i nücûm...", "le'âli...", "kilk-i gevherdar...", "cevâhirle müzeyyen...", "katre-i eşkim- le...", "katre-i rahmetle...", gibi tabirlerle sadece noktalı harfleri hesaplamak suretiyle tarih bulunacağına işaret edilir (Yakıt, *a.g.e.,* 324).

Abstract

Under the influence of the consumer culture that dominates the relationship between cultural heritage and tourism, competing cities have begun to resemble each other and their identities have been damaged. It is thought that the Safranbolu Historical Bazaar is an example of the process described due to its constant marketing by the tourism industry and the danger of its unique culture being commodified and collapsing. In this study, it is aimed to first examine and reveal the threats to the sustainability of cultural heritage through the relations established by the space with the concepts of production-consumption and tourism, and then to create a framework that will ensure the sustainable development of the transformation that the space undergoes throughout the production process in historical cities. Based on this, the study aims to contribute to the development of alternative conservation approaches for the Historical Bazaar by producing information that will strengthen and transfer the unique value of the space. The study was designed with qualitative research methods and multiple data collection tools were used together. Observations and in-depth interviews were conducted in order to reveal spatial practices. As a result of the evaluations in the Historical Bazaar, it was seen that the transformation of the city was shaped around a heritage discourse that emphasised consumption, and suggestions were presented to contribute to the sustainability of cultural heritage.

Keywords

production of space, consumption, historical city, Safranbolu historical bazaar, transformation of space

1 Transformation and Consumption in the Production of Space in Historical Cities

Time and space are subject to social, historical, and political transformation. In other words, time and space cannot merely be treated as abstract concepts; instead, their qualities—which are embedded directly within life itself and ultimately constitute life in its broadest sense—must be comprehended holistically across disciplines. Time and space are neither empty, formal molds lacking content nor categories that independently provide knowledge of an external reality removed from human existence. Although time and space are distinct formations, they are interdependent; the existence of one necessitates the other. Therefore, a comprehensive and profound understanding of time and space must be reconsidered to include bodily experience alongside social formations and historical conditions. Lefebvre, who acknowledges the mutual interaction between time and space, argues that all historical conditions are essentially related to the production of space (Kurtar, 2013).

According to Lefebvre (2015), understanding space as a social product requires a deeper analysis of production, the product, and the interrelations between them. Spatial and social components must be evaluated dialectically as parts of a whole. Societies produce their own spaces and cultures through their specific modes of production. In the social structure, social space is redefined in every era through its tendency to transform society alongside the prevailing mode of production. Moreover, although space both influences and is influenced by the mode of production, it transforms along with it (Lefebvre, 2015). Through Lefebvre's spatial analysis, a new framework emerges for reevaluating space not just as a physical reality but in terms of social relations.

In traditional social production modes, the maintenance and reproduction of production relations occurred within space, without space itself posing a problem for sustaining these relationships. Today, however, the spread of new forces of production within the framework of capitalist modes and relations of production is evident (Ghulyan, 2017). At its current stage, capitalism's emerging global dominance increasingly manifests itself through the transformation of cities and architecture (Çoban, 2015)

The transition from one mode of production to another—fragmenting space and shaped by the contradictions embedded in social production relations—holds significant theoretical value. Each mode of production generates a new space suitable to itself during this transition. Conversely, these transitions necessitate the transformation of space and the reorganization of its structure (Lefebvre, 2015). This process began with modernism.

How the city inherits previous production forms and how new production relations are integrated and become dominant within the city has been the focus of numerous urban studies. The subsequent transformation of this inherited structure by capitalism, the positions it assumes to meet changing needs, its interaction with the city, and how it reconstructs urban form in accordance with political and economic imperatives should be viewed through the structural and dialectical lens of Marxism. In the process of self-reproduction, capitalism transforms everything it interacts with—especially nature and social life—including environment, objects, and human relations. This transformation inevitably includes the geography, region, and space in which production relations occur. In this accumulation process, particularly today, the city occupies a pivotal place both as the locus of production and as a resource commodified by capitalism (Şahin, 2020). The reorganization of production enables capitalism's geographic mobility and facilitates the use of distinctive local features, while also contributing to changes in spatial organization through new work arrangements (Durukan, 2020).

In traditional societies, space was produced by everyday life, enriched with historical and social relationships and values that generated authentic experiential qualities. However, under the influence of capital, the historical production and social significance of space are often disregarded unless they contribute to its exchange value. This process suppresses the unique experiential qualities of social space, leading to the loss of its cultural and social values (Ayşin and Turhanoğlu, 2014). The transformation of traditional production relations has caused the breakdown of certain everyday life practices. Newly acquired behaviours have contributed to the spread of consumer culture. Hence, studies concerning cities often begin by examining the modes of production and forms of spatial organization that influence urban space (Öztürk and Yamaçlı, 2023).

Over the past two decades, geographers have increasingly focused on how space is socially produced. Notably, Lefebvre (2015) and Soja (2019) argue that space is a product of human imagination and activity, emphasizing that the concept of space is more closely related to how we experience, value, and develop our surroundings than to intrinsic physical characteristics. These structures evolve over time and reflect our cultural understanding of the world. Harvey (2006) highlights the economic forces that shape places, especially the dominant role of capital. Following Urry (2018), studies have explored consumption cultures and the social construction of consumption, deepening our understanding of places as objects of consumption. One of Urry's conceptualizations—the visual consumption of places—refers to how tourists consume local lifestyles and, through their actions, contribute to reshaping those spaces. These ideas have provided fertile ground for geographers and scholars studying consumption (Overton, 2010).

As one of globalization's most powerful tools, the consumption economy has led to significant functional and formal changes in urban physical spaces. Global capital demands the creation of new spaces that stimulate consumption (Görgülü and Koca, 2009). Urban space is increasingly being produced as a consumption object, and repeated spaces shaped by consumption patterns now resemble products rather than architectural works.

Furthermore, another outcome of capitalism's consumption-driven spatial organization is the aestheticization of urban spaces through reinterpretation and representation, aiming to transform them into centres of culture, art, tourism, and entertainment. In this process, cities are defined in diverse ways to appeal to different types of tourists.

This study examines consumption in historical cities as a complex phenomenon, not limited to organizing places for specific uses or opening adjacent areas to economic use. Rather, places are increasingly consumed visually, their inherent qualities transformed into perceivable images. This transformation of space and its reproduction for consumption purposes are closely tied to advancements in transportation and communication, as well as the organization of social time. The growth of the tourism industry, enabled by the planning of leisure time and expanding travel opportunities following industrialization, has accelerated this in historical cities (Koçyiğit, 2007).

Tourism holds significant economic and social value by offering the opportunity to experience a place's unique qualities. However, space now often functions as a tool that guides visitors toward consumption. This goes beyond the

consumption of objects within a space to include the consumption of space itself as a commodity. Urry (2018) notes that tourism is an alternative form of consumption in which space is at least visually consumed. Central to tourist consumption is the viewing of landscapes or urban scenery that contrast with everyday life and offer new experiences. In this way, space becomes an image, leading to a shallow, placeless transformation that erases distinctions between places.

Post-globalization shifts in production and consumption dynamics have altered perceptions of historical cities. As cities lose many of their former functions, social and economic balance has become difficult to maintain. Cities, under the pressure of economic development, have been reorganized as tourism areas, placing the preservation of cultural heritage—beyond the physical—at risk. Influenced by consumer culture, competition among cities has caused them to resemble one another, damaging their identities. Thus, there is a growing need to develop strategies for the creative and sustainable transformation of historical cities' social, cultural, and economic values. The danger of space being consumed in historical cities corresponds to capitalism's powerful, restructuring-driven transformation. In-depth analyses of this process can help identify potential threats to urban sustainability. Within this framework, a critical and creative perspective is essential to developing governance tools that respond to evolving community needs (Öztürk and Yamaçlı, 2024).

In historic city centres, visually consumption-oriented approaches weaken experiential and communicative aspects that define a sense of place. The new communication system driven by capital transforms historical cities into visual consumption centres, reducing their identity to commodities. In this global system, the lack of balance between development and conservation leads to the erosion of place attachment, urban integrity, and social identity. The physical pressure of tourism—necessary for urban continuity and economic development—manifests in the increasing identification of places with consumption. This is also evident in Safranbolu's historical bazaar, where shifts in production relations and economically driven policies have placed space at risk of being consumed (Öztürk and Yamaçlı, 2023). The city's economy heavily depends on successfully presenting and interpreting its historical character (Strange, 1996). This may result in a transformation that undermines the historical identity of the city. The failure to sustain the unique experiences embedded in daily life, despite preserving physical elements for economic reasons, is one of the key drivers of this negative transformation (Öztürk and Yamaçlı, 2023).

Efforts to protect historical city centres and ensure their socio-economic development today have largely cantered on transforming them into tourism-focused spaces, often sidelining their social and cultural foundations. The transformation of historical spaces into objects of tourist consumption contradicts sustainable urban development. Practices that overlook the needs and expectations of local residents lead to the consumption of space, both physically and symbolically, through the erasure of local uses and meanings.

2 Purpose and Significance of the Research

This study primarily aims to identify the threats to the sustainability of cultural heritage by examining the interrelations between the production and consumption of space and the phenomenon of tourism. Subsequently, the objective is to propose a framework that will enable the sustainable development of spaces undergoing transformation in historical cities. In this context, the study intends to contribute to the development of alternative conservation approaches for the Safranbolu Historical Bazaar, alongside principles, strategies, and recommendations that will reinforce the original value of space and ensure its transmission to future generations.

Focusing on this objective, the research explores the relationship between the transformation of historical cities under the influence of consumer culture and strategies developed for their sustainable development.

The study employs qualitative research methods to examine the spatial transformation of historical cities under the impact of capitalism. Within the scope of the case study, multiple qualitative data collection tools were utilised. To uncover spatial practices, observation and in-depth interview techniques were employed. Physical traces of spatial transformation were mapped through spatial analyses, which were enriched using archival sources and recent academic studies relevant to the research area.

In this sense, this research, unlike previous studies on this topic, examines the area not only through its tangible values but also through social, cultural, and economic perspectives. Another key distinguishing feature of this study is its use of MAXQDA software to systematically analyze verbal, visual, and textual data.

3 Research Methodology

The methodology of the study is structured around three stages: defining the problem, conducting the analysis, and

developing recommendations (Fig. 1). This method was developed in light of the fact that the research topic has occurred or is still occurring in the selected region and that the majority of the data to be assessed is qualitative in nature.

The first step towards generating sustainable proposals for historical city centres influenced by consumer culture is to understand spatial transformation through the lens of changing production relations. By analysing the transformation of space in historical cities, it becomes possible to reveal the values of social space, assess the risks of its commodification, and thereby contribute to the sustainability of cultural heritage.

To identify the nature of spatial transformation, it is essential to understand how capitalist reproduction processes reposition human activities and modes of production in the city according to the needs of each era. This perspective informs the second stage of the methodology—analysis—which involves defining the areas of investigation and the spatial aspects to be explored. These areas, when examined in line with the initial conceptual framework, will form the basis for the broader analysis of the city.

Within daily life, communities experience the formation of space through diverse functions. Historical cities are shaped not only by physical elements but also by the social values they embody and the historical relations they reflect. These relationships are manifested within spaces where economic and social life unfolds. Urban spaces where the fundamental functions of city life occur include public spaces for social interaction, private spaces for living and domestic life, places of worship, and recreational areas.

To reveal the transformation of these identified spaces, field observations were conducted, and data gathered from in-depth interviews with users who actively experience these spaces were analysed thematically through a coded, section-based approach. The results were interpreted alongside the findings from observational data. The spatial representation of the collected data was supported through mapping techniques.

The MAXQDA program was used in the analysis of the transcripts obtained from the in-depth interviews. MAXQDA is a software designed for computer-assisted qualitative and mixed-method data, text, and multimedia analysis in academic and commercial institutions. The program is a qualitative software that can be used to analyze data and quantitative findings in all fields, suitable for explanation and theoretical analysis of social and cultural phenomena (Marjaei et al., 2019). Maxqda is the preferred software for researchers who want to work with quantitative and qualitative data in many fields, such as interview research, focus group analysis, internet-based surveys, and the analysis of audiovisual documents.

In the final stage, based on the findings obtained through analysis, general recommendations and principles were developed concerning the intensity and nature of changes affecting the original value of space. The purpose of this phase was to generate knowledge that could inform and support alternative conservation decisions in the future.

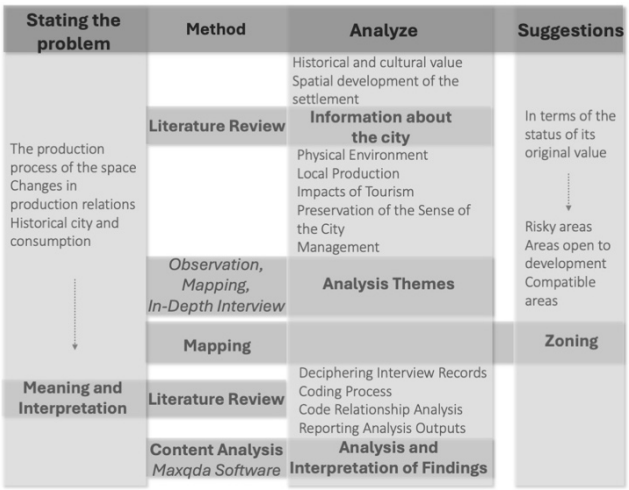

Fig. 1 Method of the study

3.1 Data Collection

To understand the relationship between consumption and space, it is essential to employ multiple data collection methods. Since the formation of social space is a process, and given the need to identify rupture points that affect the production of space, a combination of methods was used in the fieldwork—including in-depth interviews, archival research, literature reviews, and direct observation.

Archival research was conducted to enhance the validity of the study by incorporating written and visual materials relevant to the subject, alongside the spatial analysis. Before the fieldwork, relevant literature was reviewed, and the area's maps and satellite images were analysed.

The sample group for the in-depth interviews was selected from among actors who were both influential in the transformation of the region and simultaneously affected by it. The sample consisted of participants from various professional backgrounds residing in Safranbolu. The interviews aimed to collect participants' experiences and insights regarding the variables that have turned cities into spaces of consumption, without imposing constraints on

their responses. The combination of visual and textual data helped contextualise the relationship between social, cultural, spatial, and economic variables and consumption within the broader social reality—a reality that, as Lefebvre (2015) suggests, cannot be divorced from urban space and spatial practices.

Interviews were conducted in May, June, and August of 2024. A total of 21 individuals participated in the in-depth interviews. Audio recordings, ranging from 25 to 72 minutes, were transcribed for analysis.

To access everyday spatial practices, observation was also conducted. These observations were used to characterise the physical conditions of the space, its usage, and general patterns of use by the local community. Photographic documentation was employed to record observations. Observational data were particularly important in supporting the interview findings. To test the reliability of the data, documents obtained from literature reviews and institutional sources (such as statistics, journals, and maps) were also reviewed and included in the study.

3.2 Data Analysis

The MAXQDA software programme was used to analyse the transcriptions from the in-depth interviews. This programme was chosen for its ability to efficiently organise and assess large volumes of qualitative data, thereby facilitating the development of a conceptual model in line with the qualitative research design of the study.

Interview transcripts were interpreted within the conceptual framework established at the beginning of the research. During the coding process, a list of codes—derived from both the theoretical framework and research questions—was used, along with new codes and themes that emerged organically from the interviews and observations. These transcripts were then coded using MAXQDA, allowing for a quantitative reflection of frequently mentioned concepts and helping to clarify the central findings.

4 Investigating the Sustainable Transformation of Space in Safranbolu

In this section, based on the theoretical framework of spatial theory, the study discusses the transformative influence of global capitalism on the Safranbolu Historical Bazaar and proposes ideas for responding to the evolving needs of the local community while preserving the city's unique qualities.

Urry (2018) argues that many localities in contemporary societies are being transformed by various forms of rapid economic restructuring. At the heart of these restructurings lies consumer culture, which manifests itself spatially (Ölmezses Şentürk, 2023). Places are shaped through consumption, and different consumption cultures lead to the emergence of various consumption-oriented spaces (Overton, 2010). In the case of Safranbolu, the change in user demographics in the city centre and the tourism-focused approach to economic development are the primary drivers behind both spatial and cultural transformation.

The concern that forms the foundation of this study arises from the observation that conservation efforts in Safranbolu, once focused on tangible heritage, are now entering a phase of commodification and representation of history tailored to a growing consumer market (Öztürk and Yamaçlı, 2023).

4.1 Safranbolu's Historical and Cultural Value

The settlement of Safranbolu developed following the Turkish conquest in the 11th century, evolving into a prominent trade centre. By the 13th century, it had become a major caravan station on the east-west trade route (Canbulat, 2016). Economic developments driven by the region's geographical position and characteristics enabled the city to reach a certain level of prosperity (Aktüre and Şenyapılı, 1976).

Following the decline of traditional caravan routes, the socio-economic structure shifted. Vineyards, originally worked for agricultural purposes, were transformed into summer houses. By the 19th century, two distinct residential zones emerged: the summer district known as Bağlar, and the winter settlement, referred to as the City or Bazaar (Çarşı). Additionally, separated from the Çarşı by a deep valley to the west lies Kıranköy, which was predominantly inhabited by Greek Orthodox residents until the population exchange of 1923. Thus, Safranbolu comprises three main areas—Çarşı, Kıranköy, and Bağlar—each with distinct spatial characteristics (Böke, 2020) (Fig. 2).

These three settlements—Safranbolu City (Historical Bazaar), Kıranköy, and Bağlar—were inscribed on the UNESCO World Heritage List in 1994 by the World Heritage Committee. The present study focuses specifically on the Historical Bazaar, which today is the primary site of tourism activities.

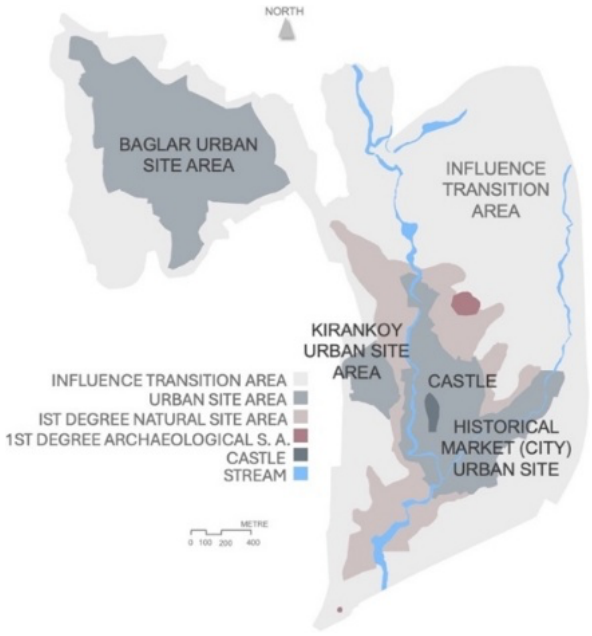

Fig.2 Safranbolu city protected areas

4.2 Spatial Transformation of Production and Settlement in Safranbolu

Safranbolu maintained its position as a significant commercial centre until the first half of the 20th century. However, with the construction of railway lines in the 19th century, trade routes shifted, diminishing the strategic importance of Safranbolu, which lay on one of the now-defunct routes. The successive wars that followed led to nationwide economic hardship, which was also reflected in the town, resulting in the deterioration of its socio-economic structure. Production declined, labour shortages emerged, and out-migration increased (Böke, 2020).

The core driver of this transformation of space was the shift in the town's fundamental production relations. Traditional leather manufacturing, unable to keep up with technological advancements and further weakened by the establishment of the Karabük Iron and Steel Factory, lost its economic viability. Likewise, handicrafts based on the master-apprentice model faced extinction due to the labour gap. A leather factory established in the early 20th century also closed due to lack of skilled workers and operational difficulties.

As the historical bazaar lost its primary functions, local residents began to abandon their mansions, which they could no longer maintain. The town's new residents were largely composed of incoming industrial workers (Aktüre and Şenyapılı, 1976, p.83; Doğanalp Votzi, 2022). This demographic shift brought with it changes that also influenced the town's cultural fabric.

From the 1970s onward, preservation initiatives began, and in 1994, Safranbolu was inscribed on the UNESCO World Heritage List. Interest in the region grew significantly thereafter, and tourism initiatives gained momentum. While the factory had previously positioned industry as a major economic sector, by the 1990s, tourism began to dominate the local economy. Today, tourism ranks among the town's most vital sectors (Türker, 2022), prompting the urban space to reorganise itself increasingly around the service industry.

4.3 Findings

This section explores the lived experiences of participants with different professional backgrounds residing in Safranbolu, specifically within the Historical Bazaar—the designated area of focus. Data obtained through semi-structured in-depth interviews were analysed using the content analysis method, a widely applied qualitative technique.

The findings from these interviews were categorised under five main themes: the physical environment, local production, the impacts of tourism, preservation of the sense of the city, and governance (Table 1). Upon reviewing these codes, the recurring themes of commercial concern and authenticity emerged prominently—aligning with previous research on the Safranbolu Historical Bazaar (Somuncu and Yiğit, 2009; Böke, 2020; Doğanalp Votzi, 2022; Türker, 2022).

The relationships between overlapping or closely related codes in the text were identified using MAXQDA's Code Relations Browser. The concept map representing intersections among the created codes was generated using MAXQDA's code model and is presented in Fig. 3 as a code co-occurrence model. The thickness of connecting lines indicates frequency, with thicker lines denoting stronger correlations.

The relationship between each main theme and the associated codes was tabulated using MAXQDA's code relations table and is presented in two tables under Table 2.

Table 1 The codes extracted from the interviews and the order of the themes they combine with their frequency values.

Themes	Codes	Subcodes
Physical Environment (60)	Places needed in the city (26)	Pharmacy (3) Workshop- training center (3) Museum (3) Places for young people (5) Quality place(6) Public space (6)
	Purpose of use (34)	To explore (2) Technical trip - research(3) Working-living (5) Food and drink (7) Showing guests around (7) Walking - sightseeing(10)
Local Production (77)	Lack of production (8) Lack of quality in products (12) Ongoing original production (16) Extinction of local crafts (16) Lack of originality of products (25)	
Impact of Tourism (58)	Negative effects of tourism (51)	Crowd (4) Physical wear (9) Inability to experience the city center (10) Traffic problem (10) Exceeding the city's capacity (14)
	Positive effects of tourism (7)	
Preserving the Sense of the City (104)	Identity change (4) Being seen as a potential customer (7) Transforming into a museum city (9) Changing demographic structure (13) Interruption of authentic daily life (17) Decline of the originality of the city (21) Trade-oriented approach (33)	
Management (174)	Misjudgment of tourism (4) Need for control (7) Lack of communication between stakeholders (8) Failure of the work to achieve its purpose (9) Need for public support (9) Successful conservation (11) Innovative work (11)	
	Extension of information period (25)	Ineffective use of social media (4) Inability to access cultural activities (10)
	Problems related to the use of space(46)	Inter-regional disconnect (5) Bringing vehicles inside (10) Presentation and interpretation techniques (14) Limited space usage (17)
	Education and research(44)	Lack of dialogue with local people(6) Lack of Awereness (27)

When examining the code relations tables that visualise the intensity of intersections between participants' statements within the coding system, the strongest intersection is observed between the theme of governance and the sub-code decline of local crafts. In parallel, a notable overlap is identified between the theme preservation of the sense of the city and the sub-code presentation and interpretation techniques.

In the second tier of frequency, the theme local production intersects with innovative and positive initiatives, while preservation of the sense of the city intersects with demographic shifts and interruption of authentic daily life. The governance theme also prominently intersects with the sub-code loss of authenticity.

In the third tier of intersection frequency, the governance theme overlaps with lack of awareness, commerce-oriented approach, innovative initiatives, presentation and interpretation techniques, and traffic problems. Similarly, preservation of the sense of the city co-occurs with lack of awareness and commerce-driven approach, while the impacts of tourism theme intersects notably with physical deterioration and vehicular access to pedestrian areas (Table 2)

5 Discussion

As a result of transformations in production relations, it is evident that traditional professions no longer survive in the town. Primary livelihoods such as leatherworking, forestry, and livestock farming have been largely replaced by tourism. Doğanalp Votzi (2022, p. 325), in her fieldwork conducted in 1982, observed that traditional trades were still active within the Historical Bazaar, with its shops, workshops, mosques, baths, inns, and weekly grain and vegetable markets, serving as the town's economic and social hub. However, she also noted that as traditional crafts diminished, the bazaar began to lose its productive function and gradually transformed into a museum-like display catering to tourist consumption.

As shown by earlier studies (Köse, 2019; Dağı and Çelik, 2020; Deniz and Çelik, 2020; Yaman, 2022; Öztürk and Yamaçlı, 2023) and field-based analyses, traditional crafts have not been adequately preserved in the Bazaar, and commercial functions serving tourism have intensified as part of an economic development strategy. According to the code co-occurrence model, the disappearance of local crafts

is closely related to a lack of awareness among the local population.

While the Historical Bazaar has garnered attention for its tangible heritage preservation, the failure to protect traditional crafts and production techniques poses a risk to the intangible heritage. As tourism's influence grows, craftspeople striving to continue their work have shifted their product lines from everyday items to goods tailored for tourists. Today, these crafts—used in restoration work—are performed and reinterpreted as touristic spectacles, gaining new meanings through stylised presentations (Köse, 2019). Currently, only a few coppersmiths and blacksmiths continue traditional production, alongside a single yemenici (traditional shoemaker). Outside these few, most of the products in the Bazaar are mass-produced souvenirs lacking authenticity.

Historically, Safranbolu was also a prominent agricultural production area and settlement (Türker and Gür, 2024). During fieldwork, participants highlighted the insufficiency of locally produced goods. Safranbolu Delight remains one of the few original products still in production. Yet, with the increasing number of shops, concerns regarding quality and discomfort caused to visitors during aggressive sampling practices have been raised by participants.

Kaya (2019) identifies one of the major conservation issues in urban heritage areas like Safranbolu as the inability to maintain the social fabric of the town. The departure of original inhabitants, alongside the repurposing of buildings for different functions, causes the historical environment to lose its essence as a "city" and instead turn into a visually appealing but experientially empty museum. This scenario is seen as a potential risk for Safranbolu as well. With the pressures of modern living, the traditional lifestyle is no longer observable in its original form. Today's local residents largely consist of families who settled in vacant houses following the establishment of the iron and steel factory, as well as investors who moved in for commercial purposes.

The presence of multiple social groups in the region has led to changes in senses of belonging and identity, resulting in the disruption of traditional daily practices (Çırak, 2019; Kaya, 2019). The fundamental elements that give meaning to space—through shared societal interactions—are now at risk. The use of historical character for economic strategies has gradually diminished residential functions and, in turn, reduced the density of the local population. Many mansions located near commercial areas in the centre of the Bazaar have been converted into tourist accommodations (Fig. 4).

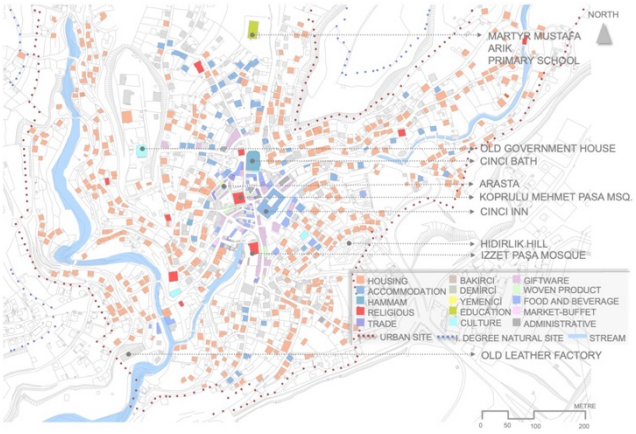

Fig.4 Transformation of the functional status of the Old Bazaar centre

In the Safranbolu Bazaar area, the gradual withdrawal of the local population from the space—alongside the erosion of original uses and values in a physically preserved yet socially disconnected environment—brings with it the looming threat of spatial consumption. The data obtained from the field study support this concern, revealing that the loss of values contributing to the sense of the town is closely linked to demographic changes, the interruption of authentic daily life, and a general lack of awareness.

New residents, who are often unfamiliar with the nuances of traditional life in the area, struggle to fully grasp the meaning and significance of heritage. One of the key findings that emerged from the study is the tendency of these newcomers, who engage in production with a commercially driven mindset and lack a strong connection to the sense of the place, to reduce heritage to its economic utility. As a result, spaces undergoing transformation are increasingly commodified through newly assigned, market-oriented functions.

Sevgi (2024) stresses that in the Historical Bazaar, the failure to adhere to the principle of designing new functions in relation to former uses results in spaces becoming commodified entities, disconnected from their historical context. This loss of continuity effectively transforms once-vital urban places into consumable objects devoid of cultural memory. UNESCO's 2006 Periodic Reporting also highlights several threats and risks, including development pressure, visitor/tourism pressure, lack of infrastructure, renewal trends focused on tourist accommodation, and serious traffic/parking problems (UNESCO, 2025). As outlined in the monitoring report, Safranbolu presents a visible example of the tension between tourism and conservation. While tourism is undeniably instrumental in generating urban and regional economic value, if managed

solely with a consumption-oriented development perspective, it may lead to several adverse effects on the transformation of historic towns.

Recent research indicates that the Historical Bazaar is particularly prone to overcrowding during holidays, which results in the physical overcapacity of the site being breached (Sevgi, 2024; Türker et al., 2024). Both direct observations and participant statements from the field confirm that the Bazaar is undergoing physical wear and tear due to excessive use—effectively becoming consumed in a literal sense. Combined with increased vehicular traffic, this situation impairs the perceptibility of the historical fabric, thereby negatively affecting visitors' and locals' spatial experience (Fig. 5).

Let me know if you'd like a [summary of Fig. 5](f), [policy suggestions to mitigate over-tourism](f), or [examples of adaptive reuse done right](f).

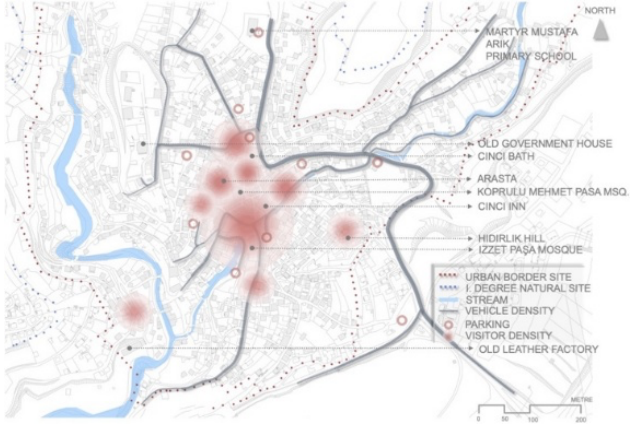

Fig.5 Areas of the centre that are exposed to heavy use in the Bazaar

In addition to the issue of capacity overload within the Historic Bazaar, spatial usage patterns reveal broader concerns stemming from the unplanned management of tourism. The over-concentration of visitors in certain zones, while peripheral areas such as Kıranköy and Bağlar remain underutilised, indicates a lack of balanced spatial planning. Furthermore, vehicular access into the narrowest streets of the Bazaar creates significant pressure on both the physical fabric and the spatial experience. Field data confirm that traffic congestion—particularly during peak periods—is one of the town's most pressing issues. The unrestricted entry of vehicles at all times has led to visible wear and tear on the urban texture (Fig. 6), underscoring the urgent need for alternative, locality-specific traffic solutions.

Fig.6 The density of people in the Historical Bazaar centre at different dates, the congestion caused by vehicles in narrow streets and the restriction of pedestrian movement.

Since Safranbolu's inscription on the UNESCO World Heritage List in 1994, there has been a notable increase in tourist activity. However, due to insufficient visitor management strategies, tourist flows remain highly concentrated in specific commercialised areas of the town. This concentrated usage not only exacerbates physical degradation but also undermines equitable visitor distribution. Participants in the study affirm that while the central Bazaar remains overwhelmed, moving toward its peripheries reveals spaces where more authentic daily life can still be observed—albeit sporadically (Fig. 7).

Görmüş et al. (2018) support these findings by noting that the streets associated with shopping and heritage façades form a visible tourist axis, where photographic evidence lacks details of everyday life. This suggests that either such everyday scenes have vanished or that the architectural aesthetic has overridden the lived experience in the tourist gaze.

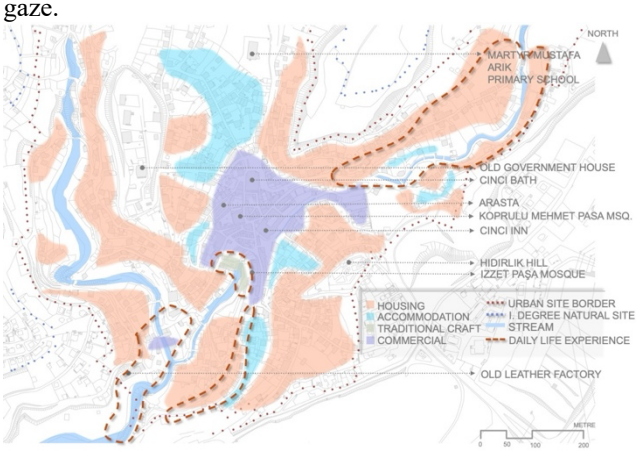

Fig.7 The general area uses of the market centre and the areas where participants enjoy experiencing the city and daily life are experienced.

While participants largely acknowledged the success of tangible heritage conservation in the Historic Bazaar, they

also criticised the overemphasis on aesthetic restoration aimed solely at tourism. This selective transformation disrupts the relationship between space and community, rendering such places incapable of delivering genuine experiential value. Detached from their social context, towns undergoing similar transformations often risk becoming homogenised—losing their unique character and drifting toward placelessness. In such settings, heritage itself becomes endangered by the very tourism it is meant to sustain.

At the heart of this issue is image-based consumption: the selection and re-presentation of spatial elements that are visually appealing to tourists. This process reduces place to a set of curated images, fostering visual rather than meaningful engagement. The Historic Bazaar appears to follow this trajectory, as conservation efforts prioritise the aesthetic dimensions of tangible heritage. Ölçer Özünel (2011) notes that in such artificially reconstituted spaces, not only is the setting commodified, but culture itself is reconstructed through consumption.

One of the study's most striking findings was the frequent co-occurrence of presentation and interpretation techniques with concerns over the loss of authenticity. The reinterpretation of Safranbolu's historic character to fit within a competitive tourist market, while effective in attracting visitors, has contributed to a shallow, image-driven representation of place.

Among all coded themes, "management" emerged with the highest frequency. This theme encompasses vital areas such as the importance of continuous education and research, the need to reconsider how intensely used spaces are evaluated, and the critical role of knowledge transfer in shaping the urban experience. These elements are essential for developing resilient strategies that protect the integrity of place while allowing it to evolve meaningfully.

6 Conclusions and Recommendations

Cultural heritage sites serve as sources of knowledge not only locally but also internationally. Due to the impact of globalization, heritage sites that possess particular local significance—especially those that represent a unique and exceptional testimony to history and are inscribed on the UNESCO World Heritage List as part of humanity's common heritage—have attracted increasing attention. This interest has significantly contributed to the growth of cultural tourism, which is considered a major type of tourism (Sevgi, 2024). However, while historic cities are increasingly highlighted for their unique characteristics, they are simultaneously undergoing transformation under the influence of new spatial reorganization dynamics.

Everyday life, as the true centre of human production, encompasses a multitude of complex relationships and lived practices (Lefebvre, 2015). In this context, the preservation of authentic daily life in historical environments—reimagined through new modes of spatial organization in a changing world—is critical. Research should explore how traditional living practices, which shape historical environments, can be sustained by integrating modern needs. In the case of Safranbolu's Historical Bazaar (Çarşı), a sustainable model is needed—one that both serves multiple functions and maintains the site's authenticity. Strategies should be developed to allow tourism and everyday life practices to coexist and remain experienceable.

This study, based on in-depth interviews conducted in Safranbolu's Historical Bazaar, foregrounds participants' spatial experiences to identify not only the threats to the sustainability of the city's qualities but also the areas with potential for improvement. Through the fieldwork and interviews, the study proposes actionable steps for the creative and sustainable transformation of historic urban spaces.

- A primary step for the Historical Bazaar—which bears the traces of a consumption-driven transformation—is to reassess the heritage awareness of the user groups, which have changed due to socioeconomic factors, and to collaboratively rediscover distinctive natural, cultural, and social resources with all stakeholders. It is essential to evaluate the features that reflect the "sense of place" through appropriate thematic frameworks (Öztürk and Yamaçlı, 2023).
- For crafts under threat of extinction, institutional collaboration becomes paramount. In Safranbolu, there are already institutions with the capacity to support such efforts. Through workshops where visitors can experience local production practices, cultural transmission can be enhanced via hands-on engagement. Experiencing local production not only deepens tourist encounters but also fosters direct communication with the local population. Art faculties and cultural education centres in the city hold potential to offer design support, thereby enhancing the originality of local production. Creative workshops that raise local awareness and allow visitors to participate in production could be

realized using existing but currently unused buildings in the city centre (Köse, 2019).

- Supporting traditional production is crucial for sustaining the region's unique commercial functions. This requires both the preservation and the creative reinterpretation of traditional crafts.
- With the growth of tourism, local products like vinegar and molasses have gained prominence. New varieties based on grape production, for example, can be developed to create tourism-related value (Türker and Gür, 2024). Awareness-raising among producers is also essential to ensure that these traditional practices are maintained despite increased demand.
- Safranbolu must avoid becoming a static, museum-like city visited only during certain hours. It must instead remain a vibrant, living city where daily life continues alongside its historical character (Kaya, 2019). Accordingly, research should place greater emphasis on the relationship between cultural activities and everyday practices.
- To enable daily life to persist in the Historical Bazaar, communities must be able to engage with the space through diverse functions. According to participants, in addition to core urban amenities such as banks, pharmacies, and open public spaces, there is a need for museums, youth- and child-oriented venues, and especially quality gastronomic establishments. In a place where users are constantly changing in short cycles, developing an awareness of local values will require sustained effort. Thus, ensuring the continued presence of the local population and attracting younger residents to the area is essential. This can be supported through long-term awareness initiatives beginning in childhood, and by planning dedicated activity spaces for children.
- Tourism strategies in the Bazaar should be more discerning in terms of content, quality, and the target visitor groups. To elevate the quality of what is currently a rapid, consumption-based form of tourism, the link between authentic cultural characteristics and spatial experiences must be emphasised. Enhancing the quality of on-site experiences will help leverage local knowledge and transmit historical narratives. Beyond basic signage and wayfinding, interactive and engaging environments should be created where local residents can share their creativity and stories directly with visitors.
- Safranbolu's overreliance on tourism limits its ability to preserve and enhance its physical heritage in alignment with the needs of the local community. Therefore, ways must be explored to support the continued presence of locals in the area. Creative tourism practices—usually aligned with cultural tourism—offer promising alternatives. These approaches prioritize understanding and experiencing the city through its unique values. By adopting creative tourism as a strategy, the city can maintain the functionality of its residential fabric, encourage the return of younger populations, and support their long-term residence. Creating spaces that highlight local values, fostering institutional collaborations, and establishing creative networks are vital steps.
- Continuity in heritage conservation requires raising heritage awareness and ensuring the transmission of local knowledge. Participants consistently highlighted the inadequacy of information sharing in the Historical Bazaar. Tourism should therefore focus not just on visitor numbers but on fostering interaction and shared experiences.
- To address new community needs, and to manage their impact on the city, a political framework is necessary. The city's physical, social, economic, and administrative challenges, needs, and potentials must be assessed. Prioritized strategies for preservation and development should be identified. New governance policies that utilize tools aligned with sustainable development principles will reinforce the long-term success of local heritage management. (Öztürk and Yamaçlı, 2023). In this sense, the management models implemented by cities such as Regensburg and Edinburgh, which are on the UNESCO World Heritage List and have both old and new urban fabrics, like Safranbolu, can be taken as examples in terms of their holistic approaches (Ripp, 2012; Ripp and Rodwell, 2016). In Safranbolu, the absence of an implemented management plan is a critical gap. A well-structured plan that highlights both tangible and intangible heritage values can pave the way for a process of heritage-based spatial production.

This study focuses on capitalist modes of production and organization that affect historic urban centres. Based on spatial theories and a specific research approach, the study does not aim to generalize about space. Rather, it acknowledges the transformative influence of capitalist production on space, aiming to interpret new modes of spatial production shaped by redefined social practices in historic cities. The relationship between space and production processes, as well as the nature of spatial transformations, are critical for the conservation and sustainability of cultural heritage. A holistic understanding of both tangible and intangible heritage values depends on properly identifying the components of authenticity. In this context, analysing the transformation of space through various forms of consumption is essential for developing a creative perspective on sustainability. This study offers a space-experience-based analytical framework that can be adapted to different historical cities. The proposed method can be employed to investigate consumption-driven transformations and the processes underlying them, grounded in the lived social and cultural experiences of historic urban centres.

TARİHSEL SÜREÇTE KARABÜK'TEKİ TİCARET YAPILARI ÜZERİNE BİR ARAŞTIRMA

Öz:
Kent merkezlerinde yer alan ticaret yapıları, yalnızca ekonomik faaliyetlerin yürütüldüğü fiziksel alanlar olmanın ötesinde; sosyal etkileşimlerin geliştiği, kültürel sürekliliğin sağlandığı ve kentsel kimliğin biçimlendiği önemli kamusal mekânlar olarak öne çıkmaktadır. Özellikle yaya hareketliliğinin yoğun olduğu akslar üzerinde konumlanan iş hanları ve pasaj yapıları, geçirgen plan organizasyonları sayesinde hem kamusal bir nitelik kazanmakta hem de ticari işlevlerin daha geniş kullanıcı gruplarına ulaşmasına olanak tanımaktadır. Bu tür yapılar, iç avlu veya iç sokak gibi kamusal kullanıma açık kurgularla hem çevresiyle bütünleşmekte hem de sosyal etkileşimleri destekleyerek kent yaşamına katkı sunmaktadır.
Bu çalışma, Türkiye'nin önemli sanayi kentlerinden biri olan Karabük'teki ticaret yapılarının tarihsel gelişimini inceleyerek, kentsel mekânda ticaretin dönüşümünü anlamayı amaçlamaktadır. Özellikle Karabük kent merkezinin tek yaya aksı olan Kemal Güneş Caddesi üzerinde yer alan üç ayrı pasaj – Mako Çarşısı, Beyaz Saray Pasajı ve Bedesten – mekânsal özellikleri bağlamında ele alınmıştır. Bu kapsamda, söz konusu yapıların kentle kurduğu bağ, yaya sirkülasyonuna katkıları ve ticari işlevlerin dönüşüm sürecindeki rolleri analiz edilmiştir. Çalışma, geleneksel çarşı anlayışından modern alışveriş yapıları tipolojisine geçiş sürecini Karabük özelinde ortaya koyarak, bu dönüşümün kentsel yaşam ve mekân organizasyonu üzerindeki etkilerini değerlendirmeyi hedeflemektedir. Söz konusu cadde üzerinde pasaj özelliği gösteren bu yapılardan başka yapının bulunmaması ve Karabük'e ilişkin araştırmalar kapsamında ticari yapılara ilişkin çalışmaların kısıtlılığı çalışmanın özgün yanını ortaya koymaktadır.

Anahtar Kelimeler: Karabük, Kent Merkezi, Ticaret Yapıları

A RESEARCH ON TRADE STRUCTURES IN KARABÜK IN HISTORICAL PROCESS

Abstract:
Commercial buildings located in city centers are not only physical areas where economic activities are carried out; they also stand out as important public spaces where social interactions develop, cultural continuity is ensured and urban identity is shaped. Especially, commercial buildings and arcades located on axes with intense pedestrian mobility gain a public character thanks to their permeable plan organizations and allow commercial functions to reach wider user groups. Such buildings both integrate with their surroundings with open-to-public structures such as inner courtyards or inner streets and contribute to urban life by supporting social interactions. This study aims to understand the transformation of trade in urban space by examining the historical development of commercial buildings in Karabük, one of the important industrial cities of Türkiye. In particular, three types of commercial buildings located on Kemal Güneş Street, the main pedestrian axis of Karabük city center – Mako Bazaar, Beyaz Saray Arcade and Bedesten – are discussed in the context of their historical, spatial and typological characteristics. In this context, the historical connection established by these structures with the city, their contribution to pedestrian circulation and the roles of commercial functions in the transformation process were analyzed. The study aims to reveal the transition process from the traditional bazaar concept to the modern shopping structures typology in Karabük and to evaluate the effects of this transformation on urban life and spatial organization.

Keywords: Karabük, City Center, Commercial Buildings

Giriş

Kent merkezlerinde bulunan iş hanları, pasajlar ve alışveriş merkezleri gibi mekanlar, kentlerin ekonomik, sosyal ve kültürel hayatında önemli işlevler üstlenen, kentsel dokunun ayrılmaz unsurlarıdır. Hem fiziksel hem de işlevsel açıdan farklılıklar göstererek kent kimliğinin oluşumuna ve gelişimine katkıda bulunmaktadırlar. Zamanla değişen ticaret anlayışına karşılık ticaret yapılarında da dönüşüm yaşansa da merkezi iş alanları (MİA) olarak tanımlanan ve şehrin ana finans hareketliliğinin gerçekleştiği bölgeler her zaman yüksek arazi değerine sahip mekanlardır.

İlk olarak antik çağdaki agoralar ve Roma dönemindeki forumlar gibi kamusal alanlarda başlayan ticari faaliyetler, Orta Çağ Avrupası'nda çarşı ve kapalı pazarlar biçiminde örgütlü olarak varlığını sürdürmüştür (Odabaş, 2018; 2053). 12. Yüzyılda ticaretin gelişmesiyle birlikte iş ve ev ortamını birleştiren, aynı çatı altında toplayan 'şehirli evi' anlamına gelen *burgher's house* yapı tipi ortaya çıkmıştır. Bu yapılarda zemin katlar ticaret, üst katlar yaşam mekanı olarak planlanmış, usta evlerine ek olarak çıraklar için de odalar ayrılmıştır. Avrupa'da sanayi devriminden sonra üretime dayanmayan iş kollarının (muhasebe, sigorta, avukatlık, banka vb.) ortaya çıkmasıyla da büro binaları gelişmiştir[1] (Gülenaz, 2011; 71-78). Latince kökenli olan sözcük, şık yazı masalarının içinde bulunduğu mekanları tanımlamaktadır. Büro ve ofis[2] kelimelerinin eş anlamlı olarak aynı özellikleri içeren mekanları nitelediği anlaşılmaktadır.

Anadolu'da erken dönemde (Selçuklu ve Beylikler dönemi) pazar yerleri ya da kervansaraylar etrafındaki ticari yapılanma, Osmanlı döneminde bedesten, arasta, kapalı çarşı ve şehir içi hanı gibi farklı ticari anlayışla sahip ve ticareti kendi üretim iç yapılanmasının gerektirdiği şekilde devam ettiren yapı türleri ile devam etmiştir. Bu yapılar, aynı zamanda ticari ve sosyal hayatın merkezlerini oluşturmaktadır (Kejanlı, 2010; 292). Bedestenler, diğer ticari yapılar arasında esnafının bilirkişi olması veya bir malın birim fiyatının belirlenmesinde etkin rol oynaması sebebiyle öne çıkmaktadır. Arastalar, aynı işi yapan zanaatkarların bir arada olduğu, üretim ve satışının aynı ürün üzerinden gerçekleştirildiği ticari yapılardır. Kapalı çarşılar, üzeri örtülü ve sokaklara yayılmış bir bütünün içinde aynı ürünün satışını gerçekleştiren esnafın belli sokaklarda yoğunlaştığı düzene dayanan ticaret alanlarıdır. Şehir içi hanları ise, belli bir malın satışının yapıldığı ve o malın adıyla anılan ticari yapılar olarak Osmanlı döneminin ticari yapılanmasının bileşenlerini oluşturmaktadır.

Sanayi Devrimi sonrasında, ticaret yapıları içerisinde yeni bir yapı türü olarak pasajlar Avrupa kentlerinde yoğunlaşarak modern ticaret mekânlarına dönüşmüş ve özellikle 19. yüzyılda mimari açıdan özgün pasaj örnekleri ortaya çıkmıştır (Öncel, 2022; 319). 19. yüzyılda Avrupa'daki gelişmelere bağlı olarak, Latince'de adım anlamına gelen passus kelimesinden türeyen pasajlar, özellikle başkent İstanbul'da inşa edilmiştir. Başı ve sonu olmayan bir mekana işaret eden pasaj, her iki yanında dükkanların sıralandığı, cam çatılı bir geçidi tanımlayan bir kavram olarak da kullanılmıştır. Bunun yanında daha çok sanayi bölgelerinde olan ve zanaatkârların kendilerine yer bulunduğu, örtü sistemi olmayan açık pasajlar da bulunmaktadır (Gülenaz, 2011; 78). 20. yüzyılda ise iş hanları, farklı disiplinlerdeki serbest meslek çalışanlarının üretim ve ticaretini aynı noktaya toplayan, çok katlı yapılar olarak modern kentlerin simgeleri haline gelmiştir (Aktürk Çetin, 2018; 4-6). Özellikle ekonomik büyüme ve kentleşme süreçleri bu yapıların sayısı hızla artmıştır. Günümüzde, teknolojik yeniliklerle donatılarak dükkan, mağaza, atölye, ofis fonksiyonlarını barındırmakta ve kentsel yaşamın merkezinde konumlanmaktadır.

19. yüzyılın ikinci yarısında *department store* ya da *bon marche* olarak adlandırılan ticaret yapıları büyük şehirlerde alternatif ticaret yapıları olarak görülmektedir (Gülenaz, 2011; 82).

[1] İngilizce' de counting-house veya office buildings, Almanca' da Kontorhaeuser veya bürogebaeude.

[2] Ofis, Latince opus kökünden gelerek yapıt, iş anlamını ifade etmektedir.

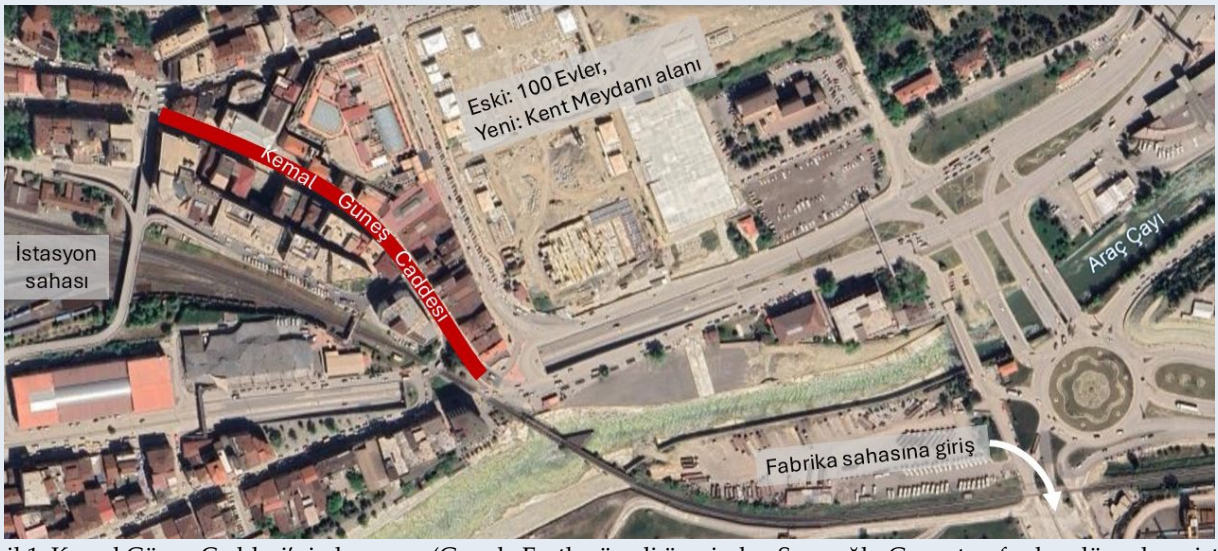
MİA'ların belirlenmesinde ekonomik faaliyetlerin yoğunluğu, ulaşım altyapısının gelişmişliği, erişilebilirlik düzeyi ve nüfus hareketleri gibi kriterler temel alınmaktadır. Bu bölgeler genellikle kentlerin en işlek ve merkezi konumlarında yer alır ve yoğun yaya trafiği ile toplu taşıma bağlantılarının odak noktasını oluşturur. Geçmişte de merkezi iş alanlarına eşdeğer olabilecek ticaret mekanları, ticaret yollarının kesişme noktaları olarak doğal bir şekilde gelişmiştir.

Alışveriş mekânları günümüz kent yaşamında sosyal etkileşimin de gerçekleştiği kamusal alanlar olarak değerlendirilmektedir (Erdönmez ve Akı, 2005; 74). Merkezi iş alanlarında yer alan bu tür mekânlar, ticari faaliyetlerin yanı sıra sosyal buluşma noktaları olarak da önem kazanmakta ve kentsel yaşamın sürekliliğini sağlamaktadır. Yaya odaklı tasarımlar ile donatılmış alışveriş mekânları, kent merkezlerinin yaşanabilirliğini artırmakta ve sürdürülebilir kentsel kalkınmaya da katkıda bulunmaktadır. Özellikle yayalaştırılmış güzergâhlar üzerinde yer alan iş hanları, pasajlar ve alışveriş mekânları, kentsel yaşamın dinamizmini besleyen, ekonomik canlılığı sürdüren ve kent kimliğinin şekillenmesine katkıda bulunan kritik unsurlardır. Bu yapıların işlevselliği ve mimari özellikleri, kentin sosyal ve ekonomik sürekliliği açısından büyük önem taşımaktadır.

Pasajlar, ticari işlevlerinin yanı sıra, kamusal alan niteliği taşıyan mekânlar olarak ön plana çıkmaktadır. Pasajların kapalı veya yarı kapalı mekânsal kurguları, kullanıcılarına güvenli ve konforlu bir alışveriş ortamı sunmakta, aynı zamanda farklı ticari ve sosyal fonksiyonların bir arada bulunmasını sağlamaktadır. Mekânsal örgütlenme açısından pasajlar, genellikle lineer bir düzen içinde tasarlanarak iki sokak arasında doğrudan bağlantı sağlamaktadır. Bu düzenleme, yaya sirkülasyonunun ve alışveriş odaklı hareketin mekân içinde birlikteliğine olanak tanır. Bu tasarım sayesinde kapalı veya yarı kapalı yapı formunda olan pasajlar, sadece transit geçiş noktaları olmaktan çıkarak, küçük ölçekli ticari birimler ve yiyecek-içecek mekanlarıyla sosyal etkileşim alanları haline gelmektedir. Özellikle tarihi pasajlar, kültürel miras açısından da önemli olup, kent merkezlerinin cazibesini artıran özgün mimari örneklerdir (Hızlı ve Ulubay, 2017 ;115-116).

2000'li yıllardan sonra yaygınlaşan alışveriş merkezleri ise (AVM), tarihsel süreçte kent yaşamının dönüşümü ile paralel olarak gelişmiş, çok fonksiyonlu, her mevsim ve günün büyük bir bölümünde kullanılabilir mekânlar olarak ortaya çıkmıştır. Farklı yaş gruplarına hitap eden mağazalar ve hizmetlerle donatılarak alışveriş deneyimine yeni bir tarz getirmiştir (Aytar Sever, 2020; 113-115). AVM'ler sosyal, kültürel ve eğlence fonksiyonlarının bir arada sunulduğu, içerisinde sinemalar, restoranlar, çocuk oyun alanları, spor salonları ve kültürel etkinlik alanları gibi çok çeşitli fonksiyonları barındıran mekanlar haline dönüşerek, her yaştan kullanıcı için çekim merkezi haline gelmiştir.

Karabük ili, tarihsel gelişimi ve ekonomik yapısıyla Türkiye'nin önemli sanayi merkezlerinden biridir. Özellikle demir-çelik sektörünün kentin ekonomik hayatına yön vermesi, ticaret alanlarının da buna bağlı olarak şekillenmesini sağlamıştır. Kentteki ticari mekanlar, genellikle merkezi konumda yer alarak ekonomik faaliyetlerin yoğunluğunu artırmakta ve sosyal yaşamın da önemli noktalarını oluşturmaktadır.

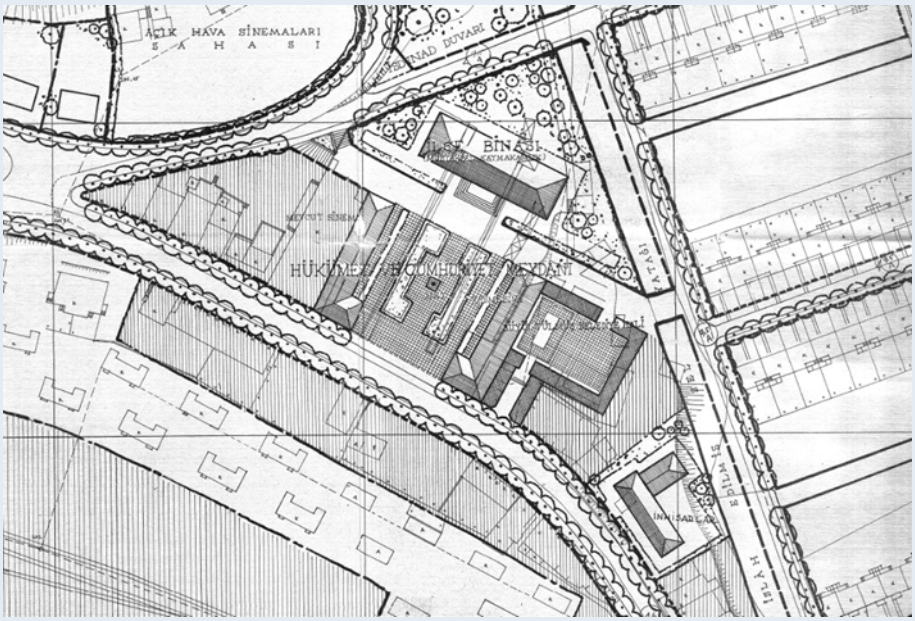


Karabük merkezindeki ticaret mekânları, genellikle iş hanları, alışveriş merkezleri ve çeşitli pasajlardan oluşmaktadır. Erken Cumhuriyet Dönemi'nden bu yana varlığını sürdüren, kent sosyolojisinin de bir parçası olan ve Karabük'ün kent ticaret kültürünü ortaya koyan küçük ölçekli dükkânlar da halen faaliyetlerine devam etmektedirler. Bu alanlar, esnaf kültürünü ve geleneksel ticari anlayışı sürdürerek kentsel yaşamın özünü oluşturmaktadır. Pasajlar, özellikle Karabük kent merkezinde küçük ölçekli işletmeleri barındıran, ticaret ve sosyal etkileşimin iç içe geçtiği mekânlar olarak göze çarpmaktadır. Bu pasajlar, ticari hayatın canlılığını sürdürürken, aynı zamanda kenti sosyo-ekonomik açıdan da geliştirmektedirler. Aynı zamanda kentte ticaretin hakim olduğu kamusal alan olarak ticari odak oluşturmaktadırlar. Diğer yandan modern alışveriş merkezleri ise son yıllarda hızla gelişen kentleşme süreciyle birlikte Karabük'te de yaygınlaşmıştır. Ulusal ve uluslararası markaları kent sakinleriyle buluşturarak, kent merkezinin ekonomik cazibesini artırmaktadır. Alışveriş merkezlerinin içinde yer alan sosyal tesisler, sinemalar ve restoranlar da kentte yaşayanların sosyal ihtiyaçlarını karşılayan önemli mekânlar haline gelmiştir.

Karabük ilindeki ticaret mekânları, gelenekselden moderne doğru genişleyen bir yelpazede kent ekonomisinin canlanmasında ve sosyal hayatın şekillenmesinde önemli roller üstlenmektedir. Bu mekânların çeşitliliği ve dinamik yapısı, Karabük'ün ekonomik ve kültürel sürdürülebilirliğine katkıda bulunan temel unsurlardır. Bu çalışmada Karabük ili Merkez ilçede, şehrin ticaret merkezinde yer alan Kemal Güneş Caddesi üzerindeki ticaret mekanlarından üç örnek incelenecektir. Bu cadde günümüzde yayalaştırılmış olmasıyla tektir ve kent için bir cazibe noktasıdır. Diğer caddelerle karşılaştırıldığında bu cadde üzerindeki yaya sirkülasyonunun daha yoğun olması nedeniyle dükkan ve mağaza gibi ticaret mekanlarıyla yeme-içme birimleri de sayıca daha fazladır.

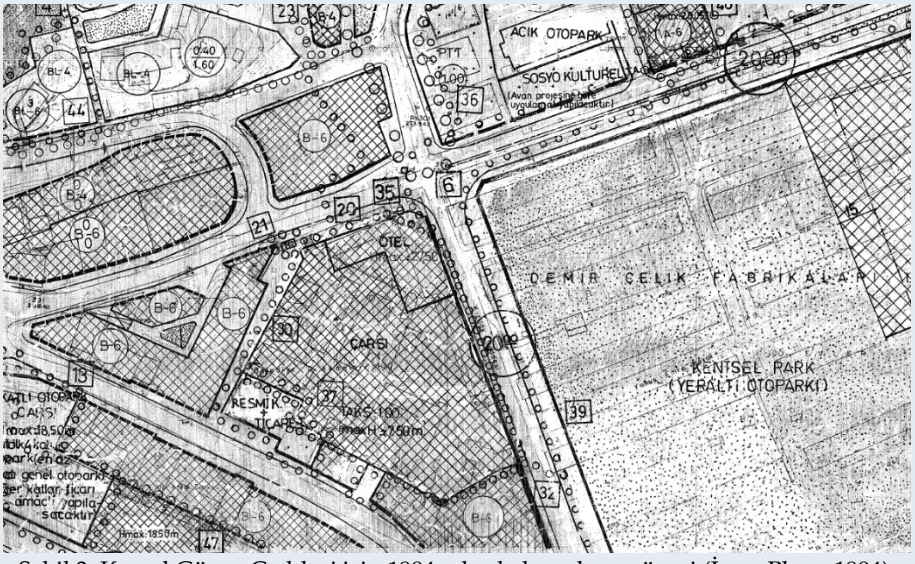
1. Kemal Güneş Caddesi ve Ticaret Yapıları

Cumhuriyet'in sanayileşme hamlelerinden olan ve kuruluşu 1937 yılına tarihlenen Karabük Demir Çelik Fabrikası (günümüzde Kardemir), 1939 yılında faaliyete geçmiştir. "Fabrikalar Kuran Fabrika" ünvanıyla anılan (Kardemir, 2025) fabrika, 2024 yılı verilerine göre Türkiye'nin en büyük 28. sanayi kuruluşudur (İstanbul Sanayi Odası, 2025). Kurulduğu günden bugüne endüstrisiyle ve fabrikaya bağlı konut üretimleriyle bulunduğu kentin ve çevresinin gelişimine olanak sağlamış ve 6 Haziran1995 yılında yayınlanan, 22305 sayılı Resmi Gazetedeki, 550 sayılı Kanun Hükmünde Kararnameyle Karabük'ün il statüsü kazanmasına da vesile olmuştur (KHK/550, 1995; 1-2).



Kemal Güneş Caddesi de Kardemir'in fabrika saha girişinin kuzeyinde bulunan ve günümüzde birçok ticaret yapısına ev sahipliği yapan, yayalaştırılmış bir caddedir (Şekil 1). Karabük Ticaret ve Sanayi Odası da bu cadde üzerinde yer almakta olup; Karabük Belediyesi, PTT, İl Halk Kütüphanesi, Defterdar, Karabük Adliyesi, Karabük Müftülüğü, Karabük İl Özel İdaresi gibi kamu binaları da bu caddeye çıkan diğer caddeler üzerindedir. Kemal Güneş Caddesi üzerinde otuz yapı bulunmaktadır. İşlev itibariyle tamamı ticaret yapısı olan bu yapılar konaklama fonksiyonu içermemektedir. Cadde üzerinde 2 AVM (Kares ve Onel), 4 banka (Albaraka Türk, Yapı Kredi, Halkbank, Denizbank) ve çeşitli dükkanlar bulunmaktadır. Yayalaştırılmış bir yol olması nedeniyle yaya sirkülasyonuna hitap edecek çeşitlilikte zemin katlarda yeme- içme, giyim, kuyumcu, döviz bürosu, iletişim, eczane, mobilya gibi birçok dükkana rastlanabilmektedir. Cadde üzerinde yer alan binaların üst katları da muayenehane, sigortacı, muhasebeci, serbest çalışan mimarlık ve mühendislik büroları, terzi, petshop gibi hizmet sektöründen sayılan iş yerlerine ayrılmıştır.

Şekil 1. Kemal Güneş Caddesi'nin konumu (Google Earth görseli üzerinden Saraçoğlu Gezer tarafından düzenlenmiştir).



Caddenin bulunduğu konum her zaman cazibe merkezi olarak görülmüş, parsel değeri yüksek bir bölgedir. Hızla büyüyen fabrika, çevresini etkilemiş ve gelişimi de hızlandırmıştır. Karabük için hazırlanan

imar planlarında da fabrika sahasına yakın olan mahalleler hep ilgi çekici olmuş ve değerlendirmeye alınmıştır. 1948 yılında Nezihe ve Pertev Taner tarafından hazırlanan imar planında şehir merkezinin genişletilmesi ve küçük esnafın tren istasyonunun kuzeyine açılacak paralel caddeye alınması önerisi sunulmuştur. Şehir merkezi diye anılan bölgenin de Hükümet ve Cumhuriyet Meydanı olarak tanımlanarak resmi binaların bu bölgede olması planlanmıştır (Şekil 2). O dönem için henüz ilçe statüsünde olmayan Karabük için 'Müstakbel Kaymakamlık' binasının yeri de belirlenmiştir (Kesin imar planı izah notu, 1948; 3-4).

Şekil 2. Kemal Güneş Caddesi için 1948 yılında hazırlanan öneri (İmar Planı, 1948).

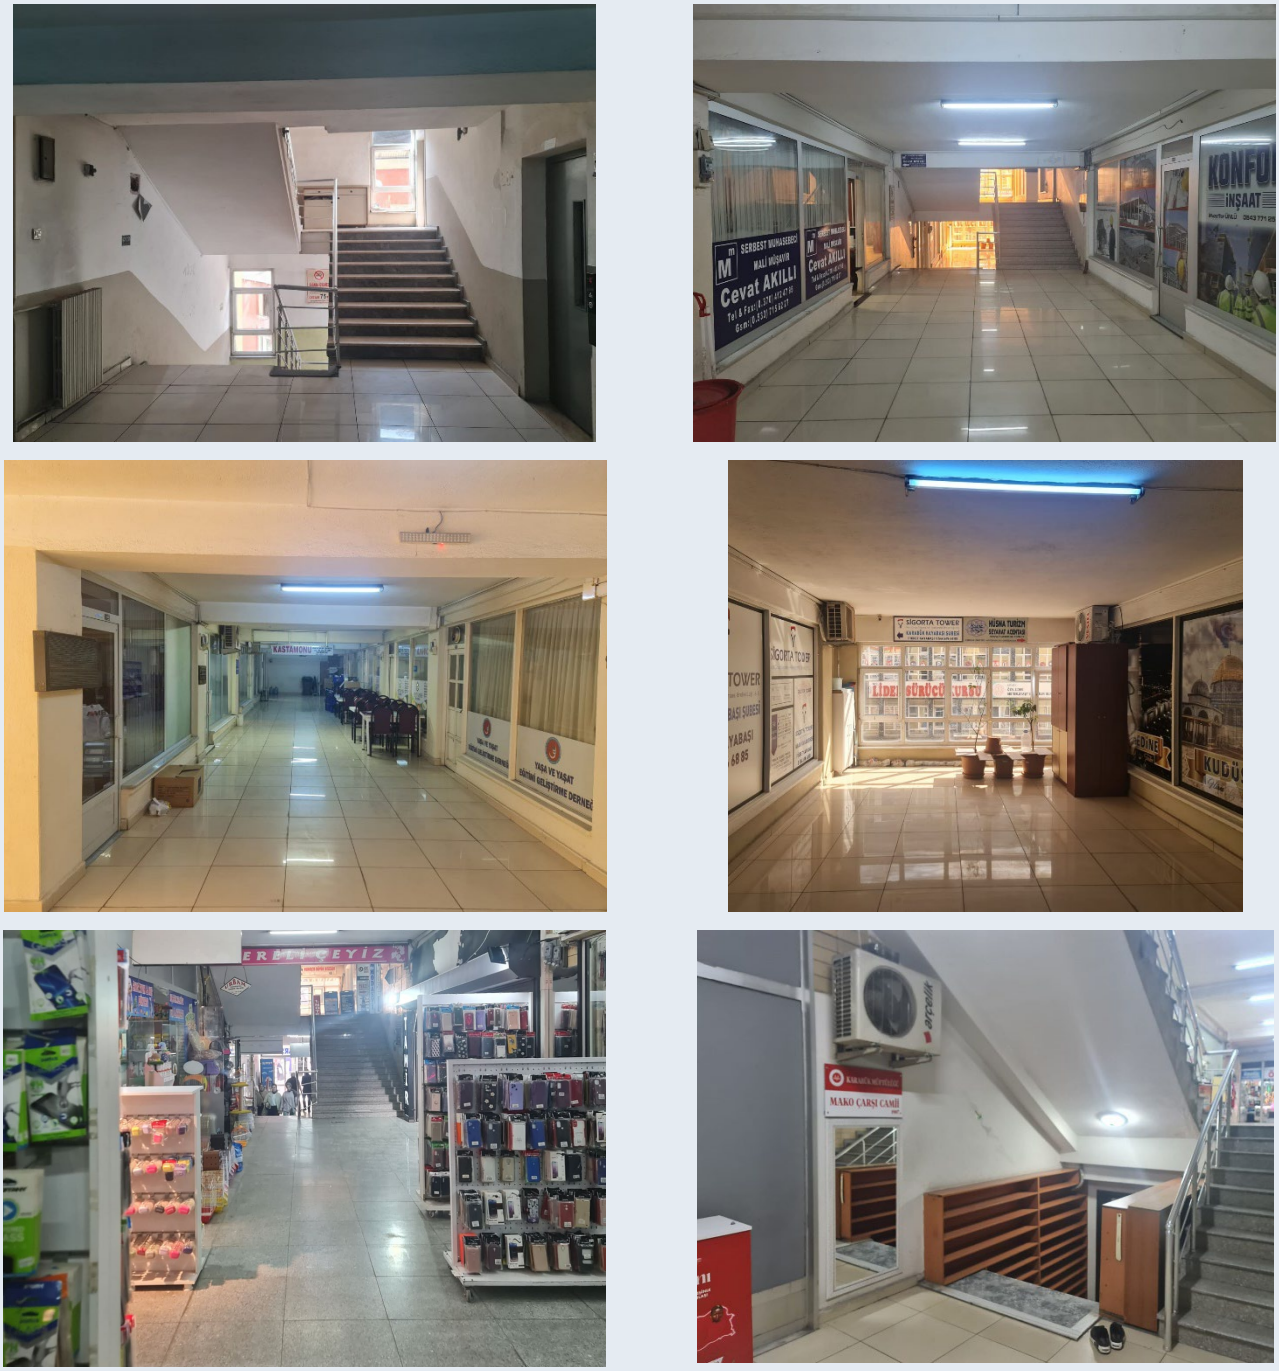
Karabük'ün il statüsüne yükselme kararından önce 1994 yılında hazırlatılan planda da çalışmaya konu olan bölge yine yoğun ticaret bölgesi olarak belirlenmiş, ayrıca bir otel alanı da planlanmıştır. Alana komşu parselde bulunan 100 Evler bölgesi Demir Çelik Fabrikaları Lojmanları olarak işaretlenmiş ve bu bölge için kentsel park ve yeraltı otopark önerisi sunulmuştur (Şekil 3). Günümüzde otel olarak işaretlenen konumda Kares isimli AVM yer almakta olup, 100 Evler yıkılmış, yerine yapılacak olan kent meydanı inşası halen devam etmektedir. Caddenin il statüsü kazandığı dönemde araç trafiğine açık olduğu ve 'Çarşı' bölgesinin içinden geçtiği görülmektedir. Otel alanı için 27,50 m'ye kadar maksimum yüksekliğin verildiği harita üzerinden okunmakla birlikte, mevcut durumda bölgede hala 9 kata ulaşan bir yapı bulunmamaktadır.

Şekil 3. Kemal Güneş Caddesi için 1994 yılında hazırlanan öneri (İmar Planı, 1994).

2. Mako Çarşısı, Beyaz Saray ve Bedesten

Demir-Çelik Fabrikasının 1937 yılında kurulmasıyla beraber kısa sürede kente çalışmak için aileleriyle birlikte gelen kişilerin Karabük'ün ticaret hayatının etkilediği görülmektedir. Örgütsel olarak DÇİ'nin kurulması ve bu şehre yerleşen nüfusun ihtiyaçlarını karşılamak üzere çarşı bölgesinin gelişmeye başladığı anlaşılmaktadır. Fabrika öncesi küçük bir yerleşim yeri olan Karabük'te, günlük ihtiyaçların tedarik edildiği küçük dükkanların varlığından söz etmek mümkündür. Fabrikaya bağlı gelişen konut üretiminin gerçekleştiği, sosyal ve kültürel bir merkez halinde gelişen Yenişehir bölgesinin yanı sıra Kemal Güneş Caddesi'nin içinde bulunduğu çarşı olarak nitelendirilen bölge ticari merkez olarak gelişme göstermiştir. Bu çalışma kapsamında cadde üzerinde yer alan ticaret yapılarından Mako Çarşısı, Beyaz Saray ve Bedesten olarak üç örnek incelenecektir. Yapıların tespitinde cadde üzerinde iki sokağı birbirine bağlayan pasaj özellikli ticaret yapıları olmaları dikkate alınmıştır.

2.1. Mako Çarşısı

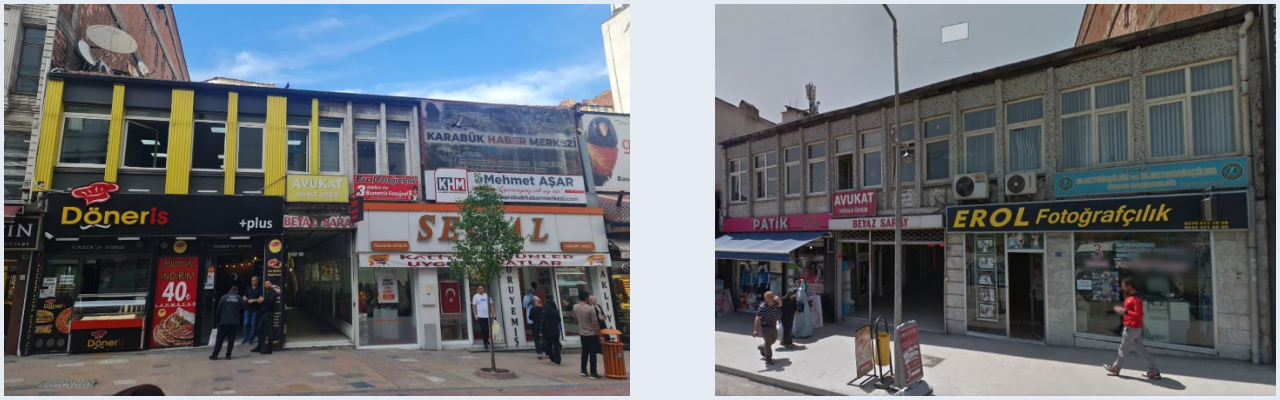


Mako Çarşısı olarak bilinen yapı, esnaftan alınan bilgi doğrultusunda manifaturacılar ve konfeksiyoncuların bir araya gelerek kurmuş oldukları bir ticari merkezdir. İki bloktan oluşan çarşıda, bloklar arasındaki kot farkı merdivenlerle bağlanarak çözülmüştür. Yapının, Kemal Güneş Caddesi üzerinden iki girişi ve ayrıca Kemal Güneş ile Kıbrıs Şehitleri Caddelerini birbirine bağlayan yaya yolu üzerinden de bir girişiyle, toplamda üç girişi bulunmaktadır (Şekil 4). Yapıyla ilgili ulaşılabilen en eski ruhsat belgesi 29.04.1969 yılına tarihlenmekte ve bu ruhsatla 3 kat, 6 dairelik bir yapı olduğu bilgisi edinilmiştir. Yapının 26.08.1981 tarihli bir ruhsatına da ulaşılmış, ruhsata ek tadilat projesindeki bilgilerde ise yapının 2 blok, 8 kat, 115 işyerinden oluştuğu bilgisi yer almaktadır.[3]

[3] Mako Çarşısı yönetiminden elde edilen veriler doğrultusunda aktarılmıştır.

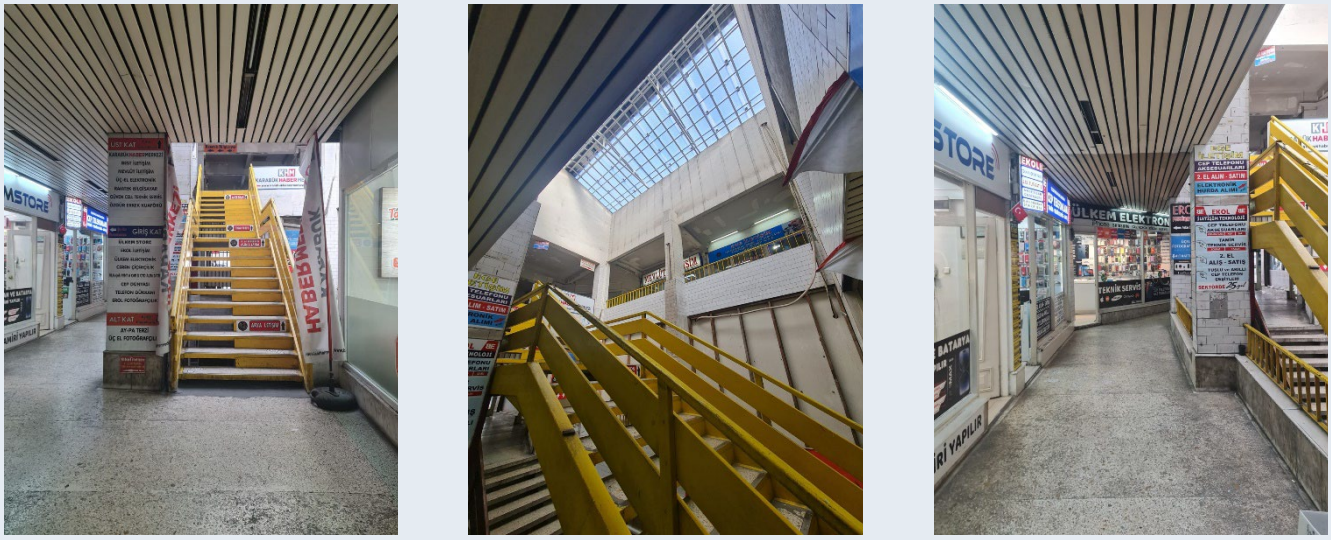
Şekil 4. Mako iş hanına ait giriş kapıları (Söylemez, 2025).

İşhanı, 4 metre genişliğinde bir koridor etrafında yerleştirilmiş dükkanlardan oluşmaktadır. Dükkanlar yaklaşık olarak 30 m^2 ve 50 m^2 arasında değişen büyüklüğe sahiptir. A blokta 2 ve B blokta 1 merdiven olmak üzere 3 ana düşey sirkülasyon hattı kurgulanmıştır (Şekil 5). Farklı kotlardaki zemine oturan yapıda A blokta 1 kat bodrum, B blokta ise 2 kat bodrum bulunmaktadır. Yapının zemin katında Kemal Güneş Caddesi'ne açılan dükkanlar yer almaktadır. Diğer tüm dükkanlar yapı içindeki sirkülasyon alanı olan koridorlara açılan girişlere sahiptir. Bu girişlerin olduğu yüzeyler camla kaplıdır, mağaza olanlarda vitrin olarak değerlendirilmektedir. Zemin katta teknolojik ürün satışı, kuyumcu, halıcı, aktar, mağaza ve milli piyango bayisi bulunmaktadır. Üst katlar; noter, özel dikim giyim mağazaları, inşaat, muhasebe, sigortacı, emlak büroları, kurs gibi çeşitli işlevlerde ticari oluşumlar içermektedir. Çarşı içindeki basit onarımların genel dolaşım alanlarında yapıldığı, iş yerlerindeki değişimlerin de lokal olarak yapıldığı görülmektedir. Mako Çarşısı müstakil ve içe dönük yapısıyla kompakt bir kompleks olarak tanımlanabilmektedir. Yapıda ayrıca müftülüğe bağlı Mako Çarşı Camii de yer almaktadır (Şekil 5).



Şekil 5. Mako içerisinde yer alan merdivenler ve Mako Çarşısı iç mekan görüntüleri (Söylemez, 2025).

2.2. Beyaz Saray



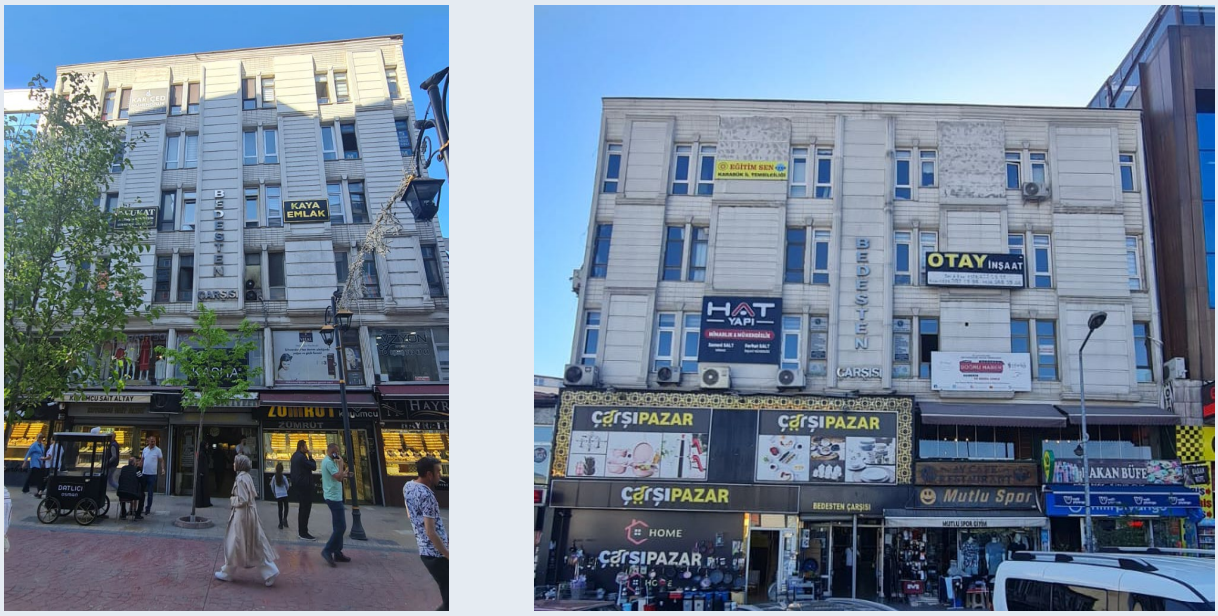
Beyaz Saray Pasajı, yapının Kemal Güneş ve Albay Karaoğlanoğlu Caddelerine cephesi olan ve her iki cepheden de giriş tasarlanmıştır. Yapı bodrum katla birlikte üç kattan oluşmaktadır. Binanın çatı seviyesinde binaya homojen olarak ışıklık sağlayan şeffaf örtüyle aydınlatılması sağlanmıştır. Dükkanlar her iki giriş arasındaki koridorun her iki yanına yerleştirilmiştir. Bu mekan kurgusu yapının pasaj halini almasını sağlamıştır. Bina, Kemal Güneş Caddesi'ndeki cephede tabela kirliliği nedeniyle okunamaz haldedir ancak tabelayla kaplanmayan alandan dış cephede mermer kaplama kullanıldığı anlaşılmaktadır. Dar ve yüksek pencerelerin aralarında ise dikey güneş kırıcılar kullanılarak cephe hareketlendirilmiştir. Binanın Albay

Karaoğlanoğlu Caddesi'ne bakan yöndeki dış cephe özellikleri daha iyi okunabilmekle birlikte burada mermerin yanı sıra beton mozaik kaplama kullanılmıştır (Şekil 6).

Şekil 6. Beyaz Saray İşhanı'nın cepheleri (Söylemez, 2025).

Pasajın ortasındaki avlu hem uzun olan koridorun aydınlanması hem de katlar arasında görsel ilişki kurulmasını sağlamıştır Buradaki metal merdiven düşey sirkülasyonu oluşan tek ögedir (Şekil 7).

Şekil 7. Çelik merdiven, iki caddeyi birbirine bağlayan koridor ve ışıklık (Söylemez, 2025).



2.3. Bedesten

Kemal Güneş ve Albay Karaoğlanoğlu Caddelerinden giriş alan ve pasaj özelliği gösteren yapı, halk arasında "Bedesten Çarşısı" olarak anılmaktadır. Beyaz Saray Pasajı'nın bitişik parselinde bulunmaktadır (Şekil 9). Yapının ruhsat tarihi olarak 27.12.1983 görülmektedir. 1988 yılında ruhsat yenilenmiştir.[4] Yapıda düşey sirkülasyon avluda yer alan merdiven ve asansörün haricinde rampalarla sağlanmaktadır (Şekil 8). Tüm katlar eğimli yüzey üzerinde tasarlandığından birbirleri arasında merdivensiz bağlantı kurulabilmektedir. İç avlunun ortasında asansör ve merdivenin olması aynı zamanda avlunun parçalı algılanmasına neden olmaktadır. Avlunun üzeri çelik taşıyıcılar ve yarı geçirgen bir malzemeyle kapatılmıştır. Dükkanlar, rampaların gerisinde tasarlanmıştır.

[4] Bedesten yönetiminden elde edilen veriler doğrultusunda aktarılmıştır.

Şekil 8. Bedesten'de rampalarla sağlanan sirkülasyon (Söylemez, 2025).

Şekil 9. Bedesten Çarşısı'nın cepheleri (Söylemez, 2025).

Değerlendirme ve Sonuç

Karabük'te sosyo-kültürel gelişim gösteren Yenişehir bölgesinin aksine, ekonomik ve ticari odaklı gelişen bir alanın parçası olan Kemal Güneş Caddesi üzerindeki üç pasaj örneği; Mako Çarşısı, Beyaz Saray ve Bedesten bu çalışmanın temelini oluşturmaktadır. Çalışma kapsamında her üç yapı için de gerekli kurumlardan tapu, plan vb. arşiv belgesine ulaşılamamış, sadece çarşı esnafı ve yapı yönetimleriyle görüşmeler çerçevesinde bilgi edinilmiştir.

Sanayileşmenin etkisiyle 1940'lardan sonra hızla gelişen Karabük, bu süreçte ticaret yapılarının gelişimini de doğrudan etkilemiştir. Kemal Güneş Caddesi, geçmişten günümüze kentin ekonomik ve sosyal yaşamının merkezi haline gelmiştir. Söz konusu yapılar, yalnızca alışveriş yapılan mekânlar değil, aynı zamanda sosyal etkileşim alanları olarak da kentsel yaşamın önemli bileşenleri haline gelmiştir.

Çalışma kapsamında ele alınan ve pasaj niteliği taşıyan yapıların her birinin öne çıkan özellikleri bir diğerine göre ayrıştırıcıdır. Elde edilen ruhsatlara göre Mako Çarşısı 1969'daki ilk ruhsatından sonra 1981'deki ruhsata ek tadilat projesinde genişletilmiştir. Bu durum nüfus artışına bağlı ticaret hacminin genişlemesi nedeniyle gerçekleşmiştir. Birbirini dik kesen iki bloktan oluşan ve L şeklini alan koridora sahip olması nedeniyle, Mako Çarşısı'nda mekanda görsel süreklilik sağlanamamaktadır. Bu durum bütüncül bir mekan algısının bulunduğu diğer iki pasajda görülmemektedir.

Mako Çarşı'nda avlu bulunmamaktadır. Bedesten'de iki parça halinde olan avlu, Beyaz Saray'da merdiveni de içine alan tek parça şeklinde görülmektedir. Bu da pasaj imajının en fazla Beyaz Saray'da hissedilmesine neden olmaktadır. Ayrıca iç sokak formunda dükkanların köşeli yerleştirilmesiyle, merkezinde çokgen şeklinde boşluk tasarlanan Beyaz Saray, yapı içinde duraklama olanağına da imkan sağlamaktadır.

Tasarım kriteri olarak rampalarla tüm yapı içinde dolaşıma olanak sağlayacak şekilde planlanan Bedesten'de iç mekan daha bütüncül şekilde algılanmakta ve düşey hareketlilikte kullanıcıyı yormadan alışveriş birimleri arasında geçişler sağlanmaktadır. Talep edenler için katlar arası merdivene ve asansöre de sahiptir. Bu yönüyle Bedesten, diğer iki yapıdan öne çıkmaktadır.

Tarihsel süreçte arasta, çarşı ve bedesten gibi geleneksel ticaret yapılarından modern iş hanları ve alışveriş merkezlerine evrilen ticaretin mekânsal kurgusu, sadece mimari biçimlenişte değil, toplumsal işlevlerde ve kullanım biçimlerinde de dönüşüm geçirmiştir. Bu bağlamda, Kemal Güneş Caddesi'nin yayalaştırılmış yapısı ve merkezi konumu hem kent ekonomisinin hem de sosyal yaşamın odak noktası olmasını sağlamıştır. İncelenen yapılar, fonksiyonel çeşitliliği ve pasaj karakterleri sayesinde yaya dolaşımını destekleyen, iç mekânlarında farklı sektörleri bir araya getiren çok işlevli alanlardır. Özellikle Bedesten ve Beyaz Saray gibi örneklerde, farklı caddeleri birbirine bağlayan geçişli mekânlar sayesinde kullanıcı hareketliliği artmakta ve mekânsal süreklilik sağlanmaktadır. Bu ticaret yapıları, ekonomik katkılarının yanı sıra sosyal sürdürülebilirlik açısından da kent yaşamına değer katmakta; kullanıcı odaklı tasarımları, iç sokak karakteri, küçük ölçekli dükkânları ve kamuya açık sirkülasyon alanları ile klasik iş merkezlerinden ayrışmaktadır. Sonuç olarak, bu yapıların yapısal ve işlevsel özellikleri, kent belleğinde önemli bir yer tutarak kentsel kimliğin oluşumuna katkı sağlamakta; yerel ekonomik canlılığı sürdürmekte ve geleneksel ticaret anlayışını modern ihtiyaçlarla bütünleştiren mekânsal organizasyonlarıyla hem fiziksel çevrenin niteliğini hem de toplumsal etkileşimi güçlendirmektedir. Kent planlaması ve tasarımında bu yapıların korunması, işlevlerinin güncellenerek yaşatılması ve kamusal niteliğinin desteklenmesi, tarihsel sürekliliğin sağlanması ve kullanıcı deneyiminin zenginleştirilmesi açısından büyük önem taşımaktadır.

Özet

Faydalı bir kalıcılığı merkezine alan sürdürülebilirlik kavramı; birçok geleneksel kültürden izler taşıyan, mimari, şehircilik, iktisat ve sosyoloji gibi akademik disiplinin çalışma konusudur. Sürdürülebilirlik kavramı; insan neslinin devamlılığını sağlamak, artan endüstrileşmenin negatif etkilerini önlemek, gelecek önermeleri getirmek gibi konuların tartışıldığı bir platform oluşturmaktadır. Rönesans, Fransız Devrimi ve Endüstri Devrimi; düşüncenin özgürleşmesini, ideolojilerin değişmesini, bilimin ilerlemesini, buluşların yaygınlaşmasını sağlamıştır. Tarihsel süreçte gerçekleşen önemli olaylar, şehirleşme pratiklerini de etkilemektedir. Bu etkiler, şehirleşme tarihi ve kent tipolojisinin değişimi konusunda, önemli birer kırılma noktası oluşturur. Endüstri devrimi, seri üretim yöntemini yaygınlaştırarak, bilinen gündelik hayatı değiştiren tarihi bir kırılma noktası oluşturmaktadır. Buna bağlı olarak sosyo-ekonomik yapı değişmiş, alışılagelen fiziki mekânların yeniden üretilmesi ve dolayısıyla kentsel mekânın yeniden üretimi söz konusu olmuştur.18. yüzyılda başlayan endüstrileşme hareketi, günümüz dünyasıda; artan nüfüs, azalan kaynaklar, çevre kirliği, iklim değişikliği, kuraklık, kıtlık, savaşlar, bölgesel ve kitlesel göçler gibi pek çok unsuru beraberinde getirmiştir. Bu sorunlara çözüm arayışında, sürdürülebilirlik çalışmalarının rolü oldukça önemlidir. Araştırmada sürdürülebilir endüstri kenti araştırması; ütopya ve heterotopya kavramları bağlamında yapılmıştır. Araştırmada, bir endüstri kenti olan Karabük'te, demir çelik fabrikasının kuruluşundan sonra, kentin planlama süreci, ütopya ve heterotopya yaklaşımları açısından araştırılmış, batılı modern kent tasarım anlayışı ile karşılaştırılmıştır. Böylelikle sürdürülebilir bir endüstri kenti yaklaşımında, ütopya ve heterotopya kavramlarının önemi tartışılmıştır.

Anahtar Kelimeler: Sürdürülebilirlik, Sürdürülebilir Kent, Ütopya, Heterotopya.

Abstract

The concept of sustainability, centered on the notion of beneficial permanence, is rooted in various traditional cultures and constitutes a subject of study within academic disciplines such as architecture, urbanism, economics, and sociology. Sustainability provides a platform for discussing issues such as the continuity of the human species, the mitigation of the adverse effects of increasing industrialization, and the development of prospective strategies. Major historical events, including

the Renaissance, the French Revolution, and the Industrial Revolution, have facilitated the liberation of thought, shifts in ideologies, advancements in scientific knowledge, and the dissemination of inventions. These pivotal moments have also significantly influenced urbanization practices, marking critical turning points in the history of city development and typology. The Industrial Revolution, by popularizing mass production techniques, represented a notable rupture that transformed daily life and subsequently altered socio-economic structures, necessitating the re-production of physical and urban spaces. Since the inception of industrialization in the 18th century, numerous challenges such as population growth, resource depletion, environmental pollution, climate change, drought, famine, warfare, and regional and mass migrations have emerged. Addressing these issues underscores the vital role of sustainability initiatives. This research examines the concept of sustainable industrial cities within the frameworks of utopia and heterotopia. Specifically, in Karabük, where a steel factory was established, the city's planning process across four distinct periods has been analyzed through these paradigms and compared with Western modern urban design principles, thereby highlighting the significance of utopia and heterotopia in the pursuit of sustainable industrial urban development.

Keywords: Sustainability, Sustainable City, Utopia, Heterotopia.

1. Giriş

İnsanlık tarihinde, iklime bağlı gerçekleşen göç hareketleri sonucu uygun coğrafyalarda yerleşik hayata geçilmiştir. Göçebe toplulukların ilk yerleşke izleri, arkalarında bıraktığı mezar yerleri olan nekropollerken, yerleşik hayata geçişle birlikte artan nüfus şehirleşmenin hızını artırmıştır. Şehirleşme hareketi, 19.yüzyıla kadar temel anlamda, yaşamsal faaliyetler olan tarım ve ticareti çevreleyen, barınma alanları ile gerçekleşmiştir. Endüstri Devrimi öncesi şehirleşme hareketi, yerleşkelerin coğrafi konumu ve erkin konumuna bağlı üretim ve tüketim politikaları ile şekillenmektedir (Lampard, 1955; Mumford, 1961).

Avrupa'da Rönesans etkisi ile gerçekleşen reformlar, endüstrileşmenin çarpan etkisi ile siyasal, ekonomik ve toplumsal değişimlere neden olarak şehirleşme pratiklerini etkilemiştir. Siyasal yapının değişimi mevcut otoritenin güç kaybetmesine neden olmuştur. Erkin temsil mekânları olan saraylar ve katedraller işlev değiştirerek sembolik yapılar haline gelmiş, kamuya açılmıştır. Tarım ekonomisinden endüstri ekonomisine geçiş, kapitalist sistemi güçlendirmiştir. Toplumsal sınıfsallık değişmiştir. Avam kabul edilen halkın alt tabakası işçi sınıfına kayarken, ekonomik gücü elinde bulunduran burjuva sınıfı reformların yaygınlaşmasında etkin olmuştur. Şehir merkezlerinde yeni işlevler ortaya çıkmıştır. Saray ve katedrallerin yanında yükselmeye başlayan iş kuleleri ve gökdelenlerle yeniden şekillenen kamusal alanlar, şehir merkezlerinin biçimselliğini etkilemiştir. (Roberts, Erman, ve Akgün, 2016; Stearns, 2021; Yavan, 2023). Bu değişim süreci gündelik hayatın yeniden inşasını ve bu inşaya bağlı olarak da mimari ve şehircilik bağlamında süregelen kuralları değiştirerek, mekânın yeniden üretilmesini sağlamıştır (Lefebvre, 2014).

Endüstri Devrimi'nin etkisi ile 18. yüzyılın sonlarından 20. yüzyılın başlarına kadar, Avrupa ve Amerika Birleşik Devletleri'nde üretim ve tüketim pratiklerinde yaşanan değişim, tarım ekonomilerinden sanayileşmiş ekonomilere doğru geçişi hızlandırırken, tarihsel süreçte önemli bir kırılma noktası oluşturmaktadır (Kartal ve Kartal, 2020; Stearns, 2021; Weber, 2022). Bu durum şehir tanımının yeniden ele alınmasına neden olmuştur. Literatürde zaman, mekân ve coğrafi bağlamsallıklarla ilişkilendirilen şehirlerin yanına yeni kurulan modern endüstri kentleri eklenmiştir (Katznelson, 1992; Spreiregen, 1981; Thorns, 2004; Yücel, 2020). Endüstri devrimi sonrası yükselen kapitalizm ideolojisi; modernizasyon hareketininin gündelik hayata yayılabilmesi için mimari ve şehir planlamayı bir enstrüman gibi kullanmış ve sermaye merkezli, üretim-tüketim pratiklerinin en verimli hale getirilmesini sağlamayı hedeflemiştir.

Modern mimarlık hareketinin ortaya çıkışıyla birlikte, geleneksel mekân anlayışı dönüşüme uğramış; geleneksel malzemelerin sınırlılıklarını aşmak amacıyla betonarme gibi yeni yapı teknolojileri kullanılmaya başlanmıştır. Yeni yapım teknikleri kolay, pratik ve hızlı yapılaşmanın önünü açarken, artan kontrolsüz yapılaşma, mevcut şehir hayatının sürdürülebilirliğini tartışmaya açmıştır. Endüstrileşme, modernizm ile kente nüfus ederek zaman ve mekân arasındaki bağlamsal ilişkinin içi boşaltılmıştır. Moderniteyle birlikte ortaya çıkan yeni bağlam, makineleşmiş bir işlevsellik anlayışıdır. Bu dönemde gündelik yaşamın yeni rutinleri, hümanist değerlerle süslenerek bireyin emek-sermaye döngüsüne uyum sağlaması hedeflenmiştir. Estetik öğelerden sıyrılmış biçimlerin, yeniden konstrükte edildiği modern mimari ve planlama hareketi, soyut mekânın üretimini örgütlemektedir. 18. yüzyılda şehirlerin endüstriyel mekân pratiklerince ele geçirilmeye başlaması; 19. yüzyılın sonu ve 20. yüzyılın başında ilk olarak Ebenezer Howard'ın bahçe-kent ütopyası ile başlayan ekolojik sürdürülebilir kentleşme yaklaşımından, günümüze kadar gelen süreçte mimari ve kentleşmenin gidişatına karşın yükselen eleştirel gündemler sürdürülebilirlik bağlamında tartışmaya açmıştır. Kapitalist sermayenin endüstriyelleşme hamlesi ile fabrika çeperlerinde yığılarak artan nüfus, mevcut şehirlerin geçmişten gelen toplumsal sınıfsallığa bağlı mekânsal dağılımı üzerinde katmanlaşarak heterojen bir biçimsellik

oluşturmuştur. Tarihsel süreç boyunca artarak devam eden bu durum, mevcut şehirleri giderek yaşanmaz hale getirirken, şehir yaşamının sürdürülebilirliği için modernizmin normları ile deneysel ütopya modelleri tasarlanmıştır. Endüstri Devrimi sonrası yeni dünya düzeni kuralcı bir planlama anlayışı ile tasarlanan bu ütopik modeller örnek alınarak inşa edilmeye çalışılmaktadır.Kentlerin kaçınılmaz büyümesi ile artan karmaşık ve katmanlı yapısı, ütopik modellerin sürdürülebilirlik konusunda etkinliğini kaybetmesine neden olmaktadır. Bu durumda ütopyaların kimi zaman karşıtlığında duran kimi zaman da tamamlayıcısı olan heterotopyalar ortaya çıkmaktadır. Avrupa'da başlayan Amerika'da hızla ilerleyen ve dünya genelinde yaygınlaşan Endüstri Devriminin etki alanında kalan şehirlerde kırdan kente göçlerle birlikte toplumsal modernleşmenin mekânsal pratiklerle sağlanması gereği ortaya çıkmıştır. Toplumun modern hayatın gündelik rutinlerine uyumlanabilmesi için mekân kavramı her ölçekte yeniden ele alınarak modern mekân ve dolayısıyla modern kentler tasarlanmıştır.

Çalışmada, endüstrileşme etkisi ile mimari ve şehircilik kurallarının modernleşme süreci; ideal kent ütopyası ve modern kuralların dışında kalan, öteki ve farklı olanın kentsel mekânı olarak heterotopya kavramı aracılığıyla sürdürülebilirlik bağlamında değerlendirilmiştir.

2. Materyal ve Yöntem

Çalışma erken Cumhuriyet döneminin sanayileşme hamlesi olarak kurulan fabrikalardan biri olan Kardemir Demir Çelik Fabrikası'nın konumlandırıldığı coğrafyada bir endüstri kenti olarak kurulan Karabük kentinin planlama süreci ütopya ve heterotopya bağlamında irdelenmiştir. Endüstri mekân pratiği olan fabrikanın çekim etkisi ile yoğun göç alan ve hızla sınırları genişleyen Karabük kentinin planlama sürecinin deşifre edildiği çalışmada, ideal kent ütopyası ve heterotopya araştırması yapılmıştır. Karabük örneği üzerinden kentsel sürdürülebilirlik bağlamında ütopyaların ve heterotopyanın önemi değerlendirilmiştir.

Çalışmanın yönteminde tarihsel retrospektif analiz ile ideal kent ütopyası tipolojik olarak araştırılmıştır. Ütopya kavramının devamı olarak heterotopya kavramı Michel Foucault'nun altı ilkesi ve oluşturduğu örneklem alanı üzerinden değerlendirilmiş ve güncel örneklem alanı yorumlanmıştır. Literatür kapsamında elde edilen bilgiler, örnek bir endüstri kenti olan Karabük üzerinde karşılaştırmalı araştırılmıştır. Karabük kentinin, planlama süreci ile oluşan kentsel tipolojisi içinde ütopya ve heterotopya izleri, güncel örnekler ile karşılaştırılarak yorumlanmıştır. Çalışma kapsamında, Karabük kentinin şehir planlaması; 'Yıldız Mimar-Şehirci (Starchitect)'olarak bilinen; Henri Prost, Nezihe-Pertev Taner, Gündüz Özdeş ve Baran İdil'in dört farklı dönemde yaptıkları çalışmalar; tasarım üslubu, plan kararları, planlama yaklaşımları açısından araştırılmıştır. Böylelikle çalışma kapsamında, Karabük kentindeki ütopya ve heterotopya oluşumları ortaya çıkartılmış, sürdürülebilir endüstri kenti bağlamında değerlendirme yapılmıştır. Çalışmada Karabük ile ilgili, kentin haritalarından, imar planlarından, plan raporlarından, bilimsel yayınlardan yararlanılmıştır.

3. Sürdürülebilirlik Bağlamında İdeal Kent Ütopyası ve Heterotopya

Kent; şehirden farklı olarak, bir topluluğun güç ve kültürünün en yoğun olduğu, sosyal kuvvetlerin somut bir oluşumu olarak oraya ait olanlara özel bir barınma alanı, endüstirleşme ile değişen üretim ve tüketim faaliyetlerinin eş zamanlı gerçekleştiği, depolama ve takas için tesisleri barındıran, emeğin sosyal olarak bölüşüldüğü ve yeni sınıfsal ayrımların ortaya çıktığı, coğrafik bir sinir ağı ve planlı yerleşim alanlarını barındıran yerdir (Lampard, 1955; Mumford, 1961; Katznelson, 1992).

Sürdürülebilirlik kavramı ilk kez 1987 yılında yayımlanan Brundtland Raporunda tanımlanmıştır. Bourdeau (1999), "Fransa'da Sürdürülebilir Kalkınma ve İnşaatın Geleceği" isimli raporunda, sürdürülebilirlik kavramının inşaat sektörü bağlamındaki uygulamalarını incelemiştir. Bourdeau'nun raporunda sürdürülebilirlik kavramı "bugünün ihtiyaçlarını gelecek nesillerin

ihtiyaçlarını karşılama yeteneğinden ödün vermeden karşılayan kalkınma" olarak açıklanmaktadır (Bourdeau, 1999). Raporda, Fransa'daki sürdürülebilir inşaat uygulamalarının geleceği, 1970'lerde belirlenen enerji standartları ve 1989 yılında yürürlüğe giren enerji kullanımı düzenlemeleri bağlamında ele alınmaktadır. Çalışma, inşaat sektörünün çevresel etkilerini azaltmaya yönelik sürdürülebilir çevre yönetimi yöntemlerine odaklanmaktadır. Modern şehirler, hızla artan dünya nüfusu, yoğunlaşan şehirleşme, doğal kaynakların tükenmesi, iklim değişikliği ve çevresel kirlilik gibi önemli ekolojik sorunlarla karşı karşıyadır. Sürdürülebilir kentleşme yaklaşımı, bu tür sorunların çözümünü hedeflemektedir (Ahmed vd.,2020). Her ne kadar sürdürülebilirlik kavramı literatüre 20. yüzyılın sonlarına doğru girmiş olsa da, endüstrileşmenin yol açtığı çevresel ve toplumsal sorunlar, son üç yüzyıldır ideal kent ütopyaları aracılığıyla çözüm arayışlarını canlı tutmaktadır.

Aydınlanma Çağı'na kadar geçen süreçte, şehirleşmenin morfolojik yapısı merkezden halkalar halinde dışa doğru büyüyen bölgelenme ile biçimlenmiştir. Bu bölgelenme işlevsellik ve sınıfsallığa göre yapılmıştır. İnanç sistemi ile desteklenen siyasal erkin, kent içindeki mekânsallığı merkezdedir. Merkezin çeperleri ticari faaliyetlerin gerçekleştiği mekânsal pratikler ile şekillenmektedir. Konut alanları, ticaret alanlarının dış çeperinde konumlanarak, en dış çeper olan kır alanlanları ile etkileşim içinde biçimlenmiştir. Üretim pratikleri tarıma dayalıdır. Bu nedenle tarımsal üretimin yapıldığı kırsal alanlar şehirlerin en dış çeperinde bölgelenmiştir. (Lampard, 1955; Mumford, 1961; Spreiregen, 1981). Toplumsal sınıfsallıkları oluşturan soylu, tüccar ve yerel halk bu bölgelenme içinde merkezden dışa doğru mekânsal karşılık bulmaktadır. Aydınlanma Çağında; ruhban sınıf tarafından baskılanan düşünce özgürleşmiştir.Bu durum felsefe ve bilim alanında yeni bakış açılarının önünü açmıştır. Bu yaklaşım Antik Çağ'ın yaygın "özgür düşünce" ideolojisine öykünen bir retro hareketidir (Burckhardt, 1960; Setton, 1970; Gribbin, 2009). Rönesans hareketi ile başlayan ve Fransız Devrimine kadar geçen süreçte, ticaret ve takas ekonomisini yürüten ve literatürde burjuva olarak geçen sınıf, bilimi ve teknolojiyi finanse etmiştir. Böylelikle bilinen inanç sistemi ve yönetimin mutlak gücü sarsılmıştır. Bu durum toplumsal yapının sınıfsallığında gerçekleşen değişimi tetiklemiştir (Burckhardt, 1960; Moughtin, 2003; Spreiregen, 1981).

Dönemin yükselen değeri olan kapitalizm; Karl Mannheim'e göre (1893-1947), var olan bir toplumsal düzen içindeki bir sınıf veya grubun çıkarlarını kollamaya çalışan ideolojidir (Jameson, 2008; Fishman vd., 2016; Yetiş, 2015). Modernizm, toplumu çağdaşlaştırmış böylelikle endüstrileşme yaygınlaşmıştır. Aydınlanma ile başlayan reform hareketi endüstrileşme ile birleşerek, Avrupa'ya hakim siyasal erk ve dini otoritenin geleneksel yapısını sarsmış ve zamanla bu yapıyı yıkıma uğratmıştır. (Katznelson, 1992; Weber ve Coşar, 2022). Rönesans dönemi, Antik Yunan kültürüne öykünmüştür. Özellikle Platon'un ütopyacı düşüncesine dayanan "Devlet" adlı eserindeki ideal şehir arayışı bu dönemde yeniden canlanmıştır. Bu ütopyacı yaklaşım, hem edebiyat alanında hem de şehircilik anlanında önemli bir yer tutmaktadır.

3.1. Sürdürülebilirlik Bağlamında Sanayi Devrimi ve İdeal Kent Ütopyası

Ütopya kavramı, "Topia" (yer) anlamına gelen sözcük, yok anlamındaki "ou" (veya "u") ile birleşerek oluşan Yunan dil kökenine sahiptir. Eş sesli bir yapıya sahip olan kavram "yok yer", "iyi yer" ve ya "şanslı yer" gibi anlamları barındırmaktadır (Şenses, 2016; Uçan ve Nişancı, 2019). Tarihsel süreçte edebiyat eserlerinde; ideal olanın hayalini betimlemek için kullanılan kavram, zamanla mekânsal bir betimleme ile kentsel literatürde araştırılan ve tartışılan bir konu olmuştur. Edebi tür ütopyalar, mimari ütopyalara değinmez, ancak bu türlerin içeriği mimari ve mekânsal model betimlemeleriyle şekillenir. Bilinmez bir diyar, bir ada, bir ülkenin en ideal hali mekânsal kodlarla betimlenir. Mimari ütopyalar ise bir tasarım ürünüdür ve edebi türden farklı olarak, mutlak suretle toplumsal bir model önermesi ile var edilir (Corbusier, 2022).

18. yüzyılın tarihsel sürecinde burjuva sınıfı güç kazanırken, soyluluk ve dinin sembolizmi yerini bilim, teknoloji ve endüstri devrimine bırakmıştır.Düşünce yapısında çok hızlı bir biçimde gerçekleşen devrim; zihinlerde sarayların, katedrallerin yıkılışını temsil etsede, pratik anlamda şehirleşmenin değişimi yüzyıllar sürecek bir zamana yayılmaktadır. Bilinen şehirleşme pratikleri, zamanın ruhuna göre yeniden şekillenmekte, süregelen geleneksel şehirleşme tipoloji ve morfoloji anlayışında yapısal çözülmeler ve dönüşümlere neden olmaktadır. Rasyonalist düşünceyi fiziki mekâna büründüren, değişimin en belirgin dönemsel mimari örneği, Etienne Louis Boulle'nin (1728-1799), bilime atfedilmiş eseri olan Newton Kenotafıdır. Kenotaf, anıtsal yapı semboliziminde kilise ve katedrallerin yerini alan kentsel anlamda tarihi bir landmarktır, (Şekil 1), (Rona, 1997; Sekman, 2017).Kenotaf, Etienne Louis Boullée tarafından Isaac Newton'un bilimsel dehasını anmak amacıyla tasarlanmış bir anıtsal yapıdır. Geleneksel dini mimarinin biçimlerinden farklı olarak, büyük bir küresel formda tasarlanmış olan bu kenotaf, bilimsel aklın ve evrensel düzenin simgesi olarak öne çıkan önemli bir örnektir.

19. yüzyılın mimari ve şehircilik gündemi, modern mekân, modern endüstri kenti ve ideal kent ütopyalardır. Endüstri devrimi ile bir çekim merkezi haline gelen şehirler artan nüfus karşısında yetersiz alt yapıları nedeniyle yaşanmaz hale gelmiştir. Şehirleşmenin sürdürülemez olan bu durumuna bir çözüm önerisi olarak üretilen bu ideal kent ütopyaları, modern hayatı ve modern mekânı kurgulayan modellerdir. Bu modeller endüstri temalı mimari konseptler altında geliştirilen, kentsel plan şemalarından oşulmaktadır (Sekman, 2017; Türkmen ve Tekkanat, 2018; Baba, 2022). Bu dönemde; Robert Owen'ın (1771-1858) New Lanark, Charles Fourier'in (1772-1837) Falenster, J.B. Andre Godin'in (1817-1888) Familistere, isimli kent dışına kurulmuş endüstri yerleşkeleri, ideal kent ütopyası olarak ön plana çıkmaktadır (Baba, 2022; Mattelart, 2000).

Dönemin ütopya tasarımcılarının ortak kaygısı ütopik sosyalizmdir. "World-Menders" (dünyayı onaranlar) olarak adlandırılan dönem ütopistleri; sosyal adaletin sağlandığı eşit ve adil bir yaşamı tasarlamayı amaçlamıştır (Mattelart, 2000). Mevcut kentlerin artan nüfus karşısında uğradığı yıkıcı bozum, insanı doğadan koparmaktadır. Avrupa şehirlerinin yaşam kalitesi ve sürdürülebilirliğinin güvence altına alınması hedeflenen bu ütopyaların ortak amacı; mevcut kentlerin sağlıksız şartlarından kurtarılmış topluluklara, yeni çalışma ve barınma olanakları sunmaktır. İnsan ve doğa arasındaki ilişkinin yeniden inşa edildiği, herkesin mutlu olduğu, ortak bir yaşamın sürdürüldüğü, yeni üretim modelleri ile hayat standartlarının yükseltildiği, yüksek düzeyde yaşam kalitesi hedeflenen endüstri yerleşkeleri, şehir dışındaki alanlara kurulmuştur (Sekman, 2017; Türkmen ve Tekkanat, 2018).

20. yüzyıl, kentsel biçim, kapitalist sanayi ekonomisi ve kentsel reform hareketlerinden oluşan iki bileşenin yükselmesi ile değişim göstermektedir (Baba, 2022). Kentler, üretim odaklı işlevlerin

yoğunlaştığı, endüstriyel merkezlere dönüşmeye başlamıştır. 1920'lerin Almanya'sında yükselen modernistler, Walter Gropius öncülüğünde kurulan Bauhaus ekolü aracılığıyla modernizmin tüm dünyaya yayılmasında etkili olmuştur. Avrupa kentlerini bir çekim merkezi haline getirmiştir. Çalışmak için kente gelerek yerleşik hayata geçen nüfusun ihtiyaçlarını karşılamaya yetecek barınma kapasitesi aşılmıştır. Hızlı yapım tekniği ile inşa edilen toplu konutlar, başlangıçta modernizasyon hareketinin barınma konusunda önemli hamlesi olsa da zamanla insanları doğadan uzaklaştırmıştır. Henüz bu yüzyılın başlarında yaygınlaşan ulaşım sistemleri, demiryolu ağları, elektrikli tramvaylar, otobüsler ve artan özel otomobil sayısı, kentlerin kırsal alanlara doğru yayılmasına yol açmıştır (Fishman vd., 2016; Baba, 2022).

Amerika'da yaygınlaşan Fordizm, bant üretimin sürdürülebilirliği için çalışma koşullarını iyileştirmiştir. Bu durum şehirleri daha kalabalık hale getirmiştir. Londra'nın şehirleşmesindeki keşmekeş, büyük Amerikan kentlerinin yaşanmaz hale gelmesi, kentsel yoğunluğun azaltılması fikrini zorunlu kılmıştır. Modern kentlere dair iki eleştirel söylemden ilki bu dönemde ortaya çıkmıştır. İkinci söylem ise 1969'larda postmodernizm etkisi ile gündeme gelecektir.

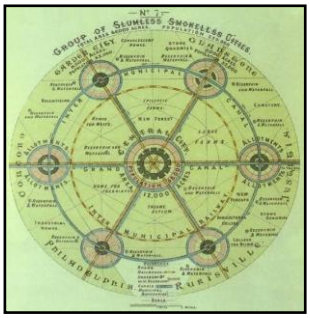
Bu dönemde ortaya çıkan ilk eleştirel söyleme göre şekillenen ütopyacı anlayış, tasarım konsepti olarak, kentsel yoğunluğu seyreltmek için konut alanlarını kent dışında kırsal alanlara taşımayı benimsemiştir. Tony Garnier, Ebenezer Howard ve Raymond Unwin'in temsil ettiği şehircilik ekolü, banliyöleşme ve uydu kent gibi ütopyacı yaklaşım konusunda öncülük etmektedir. Kentsel literatüre bu dönemde giren uydu kent ve banliyö kavramları; kent dışına kurulan, betonlaşma yerine doğaya uzamlanan, insani yaşam koşullarını sağlayan yerleşim alanlarıdır. Ulaşım vasıtalarının yaygınlaşması ve bireysel taşıt edinim kültürünün yerleşmesi, banliyö ve uydu kent yaklaşımlarını güçlendirmiştir. Banliyöler ve uydu kentler; kentsel yoğunluğu seyretlmenin yanında, insanları kalabalık şehirlerden özlem duyulan kırlara kaçıran bir vaha gibi kentsel tarihteki rolünü almıştır.

II. Dünya Savaşı öncesinde Avrupa'da modernleşme hız kazanırken, mimarlık ve şehircilik alanında, dönemin en kapsamlı eleştirel yaklaşımı, 1928 yılında toplanan Uluslararası Modern Mimarlık Kongresi (CIAM) ile ortaya çıkmıştır. Le Corbusier ve ekibinin öncülük ettiği bu kongrelerde, dönemin düzensiz, sağlıksız ve plansız kentleşme biçimleri eleştirilmiş; sanayi toplumunun ihtiyaçlarına uygun, rasyonel temellere dayanan bir şehircilik anlayışı geliştirilmesi önerilmiştir (Corbusier, 2009; Aras, 2016). CIAM'ın önerileri; sanayi sonrası kentsel sorunlara teknik çözümler üretmeyi amaçlamıştır.

II. Dünya Savaşı ve Atina Anlaşması 20. Yüzyıl içinde yaşanan önemli bir kırılma sürecidir. Hem savaşın yıkımı hem de barınma ihtiyacının acilen karşılanması, bütün Avrupayı etkisi altına almıştır. Avrupa ile paralel olarak, Amerika merkezli sürdürülebilir kentsel ekoloji söylemleri, bu dönemde ön plana çıkmaktadır. 1892'de Chicago Üniversitesi'nde Sosyal Bilimler ve Antropoloji bilim dallarına bağlı olarak kurulan, 'Chicago Okulu' olarak da bilinen Ekoloji okulunda, 1920'li yıllarda kent sosyolojisi alanında başlayan araştırmalar, kentsel bağlamda sürdülebilir, ekolojik söylemler üretmektedir. Kentsel ekoloji okulunun kurucularından sosyolog Robert Park, Ernest Burges, Homer Hoyt; Avrupa ve ABD'de sanayileşmeye bağlı artan şehirleşmenin meydana getirdiği negatif etkileri mercek altına alarak, yeni kent modeli önermelerinde bulunmuştur (Hall, 2012; Türkmen ve Tekkanat, 2018).

Uydu kent ve banliyöler, ilk etapta kent içi nüfusu seyreltmiş olsa da kentin bu alanlara doğru saçaklanarak büyüme eğilimi devam etmektedir. Bu nedenle ikinci eleştirel söylem ilk söylemin karşıtlığı olarak ortaya çıkmıştır. Kentten kaçışın bir çözüm olmadığını öne süren bu yaklaşım, aynı zamanda kentsel belleğin kültürel devamlılık için önemine dikkat çekerek, tarihin katmanlandığı kent merkezlerinin korunması gerektiği savunmuştur. İkinci yaklaşıma göre kent dışına taşınması gereken unsurlar; zamanla kent içine sızmış endüstri mekân pratikleridir. İlk eleştirel yaklaşımda kır kent, bahçe

kent gibi temalarla ortaya çıkan ütopya modelleri önerilirken, ikinci eleştirel yaklaşımda endüstri alanlarının kent dışına alınması önerilmiştir.



Cherry (1979) ve Lehman (2011); bu model önerilerine Ebenezer Howard'ın "Bahçe Şehir" (Şekil 2) ve Roymond Unwin'in "Uydu Kent" tasarımlarını örnek olarak göstermiştir. Ebenezer Howard'ın ve Raymond Unwin'in banliyöleşme konusunda farklı fikirler içeren kitapları, modern şehir planlama klasikleri arasında yer almaktadır. 20. yüzyılın başlarından itibaren Howard'ın İngiliz bahçe şehir yaklaşımı; şehirlerin dışında, insan yaşamı ve sağlığı için faydalı, bahçeleri ve güneş ışığı olan ideal evleri, yeşil alanlarda planlamayı önermektedir (Lehmann ve Lehmann, 2011; Miller, 1992).

Howard, bahçe-şehir fikrini oluştururken dönemsel eleştirilerden yola çıkmıştır. Endüstrileşme ile değişen gündelik hayatın getirdiği toplumsal sorunlara değinmiştir. Bu sorunları aşırılık, aşırı çalışma, sürekli endişe ve ezici yoksulluk olarak sıralamakta ve sorun tespitini yapmaktadır.

> *"İnsanları şehirlere çekecek şekilde etkisini gösteren, halen de göstermeye devam eden nedenler her neyse hepsini çekimler olarak özetleyebiliriz; dolayısıyla, insanlara ya da hiç olmazsa hatırı sayılır bir kısmına, bugün şehirlerimizin sahip olduğundan daha büyük çekimler yaratılmadıkça soruna etkin bir çare getirilemeyeceği apaçık ortadadır. Her kente bir mıknatıs, her insana da bir iğne olarak bakabiliriz; böyle baktığımızda da hemen görürüz ki, kentlerimizin sahip olduğundan daha kuvvetli mıknatıslar inşa etmenin bir yöntemi bulunmadığı sürece, nüfusu kendiliğinden ve sağlıklı bir şekilde yeniden tanzim etmek için ne yapsak fayda etmez." Howard, 2019, s:30-31.*

'Yarının Bahçe Kentleri' kitabından yapılan alıntıda Howard, dönemsel sorun tespiti ile bahçe-şehir tasarımının "Üçlü Mıknatıs" konseptini oluşturmuştur.

Şekil 2. Bahçe Kent, Ebenezer Howard

Kaynak: (Howard, 2019)

Le Corbusier'in "Işıyan Kent" ve Frank Llyod Wright "Broadacre Kent" tasarımları 20.yüzyılın, ikonik ütopya önermeleridir (Spreiregen, 1981; Sekman, 2017; Howard, 2019). Corbusier, "Işıyan Şehir" (Villa Radieuse) tasarımı; şehirlerin kurtarılmasının, eski şehirlerin yıkılması ile mümkün olabileceğini savununan ideolojisi ile mevcut kentlerin sürdürülebilirliğini reddetmiştir. Bu tasarım önerisinde; gelenekselliği kabul etmeyen, rasyonalist bir tasarım anlayışı ön plandadır (Fishman vd., 2016; Wakeman, 2019; Corbusier, 2022). Corbusier'in tasarım yaklaşımı, Fransız Devrimcilerin modernist siyaset anlayışı ile paralellik göstermektedir. Corbusier; artan irrasyonel şehirleşmenin Ortaçağ kentlerini hasta ettiğini ve modern gündelik hayatta işlevsizleşen geçmiş yapıların şehir planından kaldırılması gerektiğini savunmuştur (Corbusier, 2010; D Morgan, 2014; Baba, 2022). Le Corbusier'in 1925 'de "Çağdaş Bir Şehir" ütopyası ve 1935'de "Işıyan Şehir " ütopyası; hem geometrik ütopyadır hem de bütüncül bir şehircilik anlayışına sahiptir. Simetri, Le Corbusier tasarımlarının en belirleyici özelliğidir (Corbusier, 2022).

Frank Llyod Wrigt'ın 1932 yılında yayımladığı "Kaybolan Şehir" (The Disappearing City) kitabında önerdiği "Broadacre City" ütopyası, Howard'cı bir yaklaşıma benzer bir biçimde kır kenti ön plana çıkarmıştır. Broadacre, sürdürülebir kentleşme bağlamında Courbuiser'in geçmişi reddeden yıkıcı fikirlerinin karşısında duran radikal bir tasarım örneğidir. Wright'a göre kendi tasarımı olan Broadacre'nin sınırlarındaki belirsizlik, kenti yok etmiştir (2015), (Mehta, 2012; Wright, 2015). Bu bağlamda Wright, tasarımında kent dışı tekil bir banliyö tasarlamak yerine, mevcut kentle birleşerek ekolojik yaklaşımı tüm şehirde yaygınlaştırmayı hedeflemiştir. Ancak sınırları net olmayan tasarım önerisi, mevcut kentin dinamikleri arasında temel konseptini yitirmiştir.

1960'lar modern mimari ile postmodernizm söylemlerinin ve avangard mimarinin yükselişte olduğu dönemdir. Artan teknoloji geleceğin şehirleri için fütürist ütopya önermelerini ortaya çıkarmıştır. Mevcut şehirlerin endüstrileşme etkisi ile kaybolan unsurları, eleştirel gündemlerin odağındadır. Peter Cook öncülüğünde bir grup mimar tarafından kurulan Arcigram (Achitectural Telegram) oluşumu, modernitenin ortaya koyduğu statükoyu sorgulamıştır. Geleceğin kentleri konusunda; teknoloji tabanlı, Plug-in City ve Walking City gibi kinetik kabiliyetlere sahip, ütopyalar üretmektedir (Ertan, 2019; Sekman, 2017; Türk, 2015; Yücel, 2020). Kenti parça parça ele alan grup, kentsel mekânları fonksiyonlarına göre bir arada bulunduran mega yapılar tasarlamıştır.Teknoloji konseptli tasarımlar, geleceğin kentlerindeki toplumsal dinamikleri irdelerken, bunlar için en çağdaş çözümleri önermeyi hedeflemiştir (Baba 2022; Özkuş 2006).

Bu dönemde modernitenin ilkelerine bağlı katı yapısı, postmodernite ile yapı söküme uğratılırken, mimari ve kentsel mekân, anlam bakımından, yeniden yorumlanmaktadır. Kentin işlevsel parçaları haline gelen endüstriyel mekân pratiklerinin kentin dışına çıkarılması suretiyle boşaltılan alanlar, yeni çağın işlevlerine yönelik kentsel mekanların tasarlanacağı yerlere dönüşmektedir. Postmodernizm, modernizmin ürettiği ütopya algısını kırmıştır (Fishman vd., 2016; Baba, 2022). Bu dönemde, illüzyon ütopyaları ve ekolojik ütopyalar ön plana çıkmaktadır. Bauldrillard'a göre düş ile gerçek arasındaki farkın kaybolduğu, kenti bir eğlence parkına dönüştüren ütopyalar, illüzyon yaratan yerlerdir (Baba, 2022; Foucault, 2020; Yıldırım, 2017). Bauldrillard'a göre; bu tarz ütopyalarının başında, 1955 te kurulan Disneyland gelmektedir (Baba, 2022). Disneyland gibi illüzyon mekânlar üreten bu ütopya yaklaşımı, Antik dönem ütopya anlayışı ile 1960'lar sonrası ideal kent ütopya anlayışı arasında, büyük bir uçurum oluştuğunu göstermektedir (Baba, 2022).

1970'li yıllar özgürlüklerin yeniden gündeme gelmesi ile liberal görüşün tozlarının alınarak parlatıldığı ve çağa uyarlandığı neoliberalizm ile canlanmaktadır. Neoliberal politikalar, modernitenin katı kurallarının; dönemin ekonomik, siyasal ve sosyolojik yapısına göre esnetilmesi gerekliliğini savunmaktadır. Özgürlük fikrinin, kendi anlamına tezat oluşturan bir şekilde, modernizmin kalıpları arasına alınması, neoliberal çevrelerce bu konuyu tartışmaya açmıştır. Aynı zamanda sitemin mevcut düzenin de tartışılmıştır. Neoliberalizm, özgürlük ve denetim ikilisi üzerine kurulmuş bir yapı sunar. Bu yapı; bireysel özgürlükleri vurgularken, aynı zamanda piyasa ekonomisi ve sermayenin serbest dolaşımını denetim altında tutmayı amaçlar. Ancak, burada bahsi geçen özgürlük; genellikle sermaye özgürlüğüne hizmet eden, geniş kitleler için adalet ve eşitlikten uzak bir dünya yaratmaktadır. Neoliberalizmin bu ikili yapısı, birey ve toplum arasındaki dengenin bozulmasına yol açmaktadır.

1980'li yıllar, kentsel krizlerin ana başlıklar altında toplandığı yıllardır. Artan nüfusun getirdiği güvenlik sorunu, salgınlara afetlere karşın dayanıksızlık, atıkların bertarafı, ulaşım ve iletişim ağlarının üretim tüketim zinciri ve her türden bilginin aktarımın kesintisiz sağlanabilmesi, kentlerin gerek çevresine ve doğaya gerekse insan doğasına uygun bir biçimde yaşanabilir olması bu başlıkları oluşturmaktadır. Bu başlıkların her biri için, yeni bir ütopya modeli yaparak kentten koparmak artık mümkün değildir. Bu nedenle her bir kriz başlığı, tematik olarak adlandırılabilecek modellerle giderilmeye çalışılmaktadır. 1980'ler sonrası; ekolojik, sürdürülebilir, akıllı, güvenli, dirençli gibi

kavramların temalaştığı görülmektedir. Günümüz dünyasında bu temalar, tek başına veya birbirleri ile kombinlenerek, çağın ruhunu ve kentsel gereklilikleri barındıran, ütopya tasarımlarının konseptini oluşturmaktadır.

21. yüzyılın post endüstriyel iklimi kentleşmeyi, endüstri odağından bilişim odağına doğru çekmektedir. Endüstriyel alanlar az gelişmiş ya da gelişmekte olan coğrafyalara kaymaktadır. 21. yüzyılın en önemli problemi, geçmişte olduğu gibi, kent merkezlerinde artan nüfus nedeniyle sağlıksız kentleşmedir. Kent dışında saçaklanan, banliyö tarzı ütopyaların, kentin zamanla bu yönlere doğru büyümesi sonucu kentle birleştiği görülmüş kentten banliyölerle uzaklaşmanın bir çözüm olmadığı görülmüştür. Günümüz ütopyacı çözüm arayışları, fütürist yaklaşımlar ya da kentlerin belirli bölgelerinde alınan önlemler, yapılan lokal çözümlerdir. Bu önlemler, kentleşme senaryolarının yeniden düşünülmesi ile türetilmiştir. Yeni kentleşme modelleri; sürdürülebilir, ekolojik, kompakt, akıllı, dirençli gibi temalar ile desteklenmektedir. Bu temalar ütopik yaklaşımlar oldukları kadar, ilerleyen teknoloji sayesinde, seçilen lokal bölgelerde denenmektedir.

21. yüzyılda küresel bağlamda kentleşme; kentsel refah, sosyal uyum, sağlık, çevresel verimlilik, iyileştirme ve var olan potansiyellerin öne çıkarılması konularına göre şekillenmektedir (Moir vd., 2014). Ulaşım, iletişim ve etkileşim alanlarında yükselen teknoloji trendleri, dünya tarihinde önemli bir kırılma oluşturmaktadır. 20. yüzyılda inşaat teknolojilerindeki gelişmeler, ortaçağın yükselen ihtişamlı katedrallerine benzeyen, kapitalizmin sembolik yapıları olan, iş merkezleri, ofis binaları ve gökdelen gibi yapıların kent merkezlerinde yükselmesini sağlamıştır. 21. Yüzyılın fütürist ütopyaları, bilgisayar programlarının, yapay zekanın esnekleştirdiği tasarım ortamlarında tasarlanmaktadır. Örneğin; RveSie tasarım stüdyosunun Vertical-Sky City (2005), Studio Lindfors'un Cloud Skippers (2009) ve Matsys Tasarım Stüdyosu'nun Desert City (2009) tasarımları, mimarlık ve teknolojinin birleşiminden ortaya çıkan 21. Yüzyılın fütürist ütopyalarına birer örnek teşkil etmektedir (Şensoy ve Özaslan, 2020).

Geleceğin şehri üzerine düşünebilmek için bugün şehirlerin karşı karşıya olduğu zorluklar irdelenmedilir. Gelecekteki şehirlerin; nüfus artışı, iklim değişikliği, teknolojik gelişmeler, insan hareketliliği, ekonomik ve demografik risklere uyum sağlaması gerekmektedir. Yaşlanan nüfus, eşitsizlik ve toplumsal gerilimler, yetersiz kaynaklar gibi sorunların azaltması için çalışmalar yapılması gerekmektedir. Bu nedenle, günümüz dünyasında ideal kent ütopya tasarım senaryoları; sürdürülebilir, ekolojik, akıllı, dirençli, kompakt gibi tematik bağlamlar ile ilişkili bir şekilde ön plana çıkmaktadır.

3.2. Sürdürülebilirlik Bağlamında Heterotopya Değerlendirilmesi

Foucault (2020), heterotopya kavramını verdiği örnekler üzerinden hem tarihsel hem de mekânsal bağlamda analiz etmiştir. Analiz yaparken kullandığı altı ilke ve bu ilkeleri somutlaştıran örnekler aracılığıyla kavramı açıklamıştır. Çalışmada heterotopya kavramı Foucault'nun altı ilkesinin örneklem alanının literatür araştırması ile zenginleştirilerek açıklanmıştır. Böylelikle heterotopyaların sürdürülebilirlik bağlamında önemi ortaya çıkarılmıştır.

Heterotopya kavramının etimolojisi, Yunanca "topos'un (τόπος) 'farklı/başka" kelimesinin ön ek olan "heteros" (ετερός) kelimesi ile birleşiminden oluşur. Türkçe 'de "diğer yer, başka yer, öteki yer, farklı yer" gibi anlamlara gelmektedir. Ütopya kavramının, gerçek dünyada durumsal karşıtlığı olarak ortaya çıkan distopyaların soyut ve gerçek dışı anlatısına göre heterotopya kavramı, kentte bütün gerçekliği ile var olan, somut dokudur. İlk kez tıp alanında kullanılan kavram, bir dokunun olmaması gereken bir yerde belirmesi anlamına gelen, heterotopi sözcüğünden türetilmiştir (Doğan ve Koçyiğit, 2023). Heterotopyalar, egemen otoritenin ve ekonomik yapının ürettiği planlı, öngörülebilir, homojen kent tasarımın karşısında, çeşitliliğin neden olduğu; öngörülemezliğin, kural dışılığın ve ötekinin mekânı olarak tanımlanmaktadır (Doğan ve Koçyiğit, 2023; Kenney, 2011; Topinka, 2010; Yıldırım,

2017) Bu nedenle heterotopya kavramını kapitalizmin modernizm eli ile ürettiği kurallı mekân pratiğinin bir ürünü olarak irdelemek gerekmektedir. Araştırma çalışmasında, heterotopya kavramı, Michel Foucault'nun heterotopya söylemi bağlamında açıkladığı altı ilkesinin yapı söküme uğratılması yolu ile açıklanmaktadır.

Michel Foucault heterotopya kavramını mekâna uyarlayarak, ötekinin mekânına dair düşünsel bir derinlik kazandırmıştır. "Kelimeler ve Şeyler" adlı eserinde ele almıştır. Daha sonra, 1967 yılında Tunus'ta kaleme aldığı ve 1984'te "Architecture, Mouvement, Continuité" dergisinde yayımlanan "Des Espaces Autres" (Başka Mekânlara Dair") adlı makalesinde, heterotopyayı zaman-mekân boyutuyla incelemiştir. Bu çalışmada, 19. yüzyıl zaman boyutuyla, 20. yüzyıl ise mekân boyutuyla heterotopya bağlamında değerlendirilmiştir. Foucault'ya göre heterotopya kavramı altı ilkeye dayanır: evrensellik, süreklilik, yan yanalık, zamansallık, açılma-kapanma ve işlevsellik. Bu ilkeler, Işık Ergüden'in derlediği "Foucault Özne ve İktidar Seçme Yazılar 2" adlı kitabın on yedinci bölümü olan "Başka Mekânlara Dair" konferans metninde aktarılmaktadır. (Foucault, 2020; Şevik ve Çalışkan, 2019; Toprak, 2018; Yıldırım, 2020).

Foucault'ya göre (1966); ütopyalar, "şeyler"in, bilinenin dışında farklı yerlere yerleştirilmesi ve de birbiri ile ortak bir yer tanımlaması olanaksız olan kelimeler aracılığıyla oluşturulmaktadır. Bir teselli aracı olan ütopyalar; olmayan yerleri, büyülü bir mekân tasviri ile geniş caddeleri olan, bakımlı bahçeleri olan kentler gibi hayali yerleri işaret etmektedir. Buna karşılık heterotopyalar is dilin bilinen sentaksını tahrip eden, türdeş olmayan mekânlardır (Foucault, 2001).

Foucault, söylemlerini tarihsel analizler ışığında temellendirerek mekân kavramının tarihsel süreçteki dönüşümüne vurgu yapmaktadır. Foucault'ya göre, Orta çağda mekân, mutlak hiyerarşiyle düzenlenmiş, belirli yerlerin ve bu yerlerin kesişimlerinin, bütüncül bir hiyerarşi ile belirlendiği bir yapıya sahiptir. Rönesans döneminde ise bu statik ve belirli mekân anlayışı sarsılmış, mekâna ilişkin kavramlar sorgulanmıştır. Günümüzde ise mekân, katı sınırların ortadan kalkmasıyla birlikte çok boyutlu, uzamsal çok katmanlı bir yapıya dönüşmüştür. Günlük yaşamda uzamsallık, yerler ve yerler arasındaki ilişkiler aracılığıyla deneyimlenir; yer, algılanabilen ve deneyimlenebilen, ancak birbirine indirgenemeyen mekânsal bir birim olarak tanımlanır. Foucault'a göre, ütopya ve heterotopya kavramları, mevcut mekânlardan farklılaşan, onları yansıtan ve aynı zamanda onların altını üstüne getiren mekânsal alanlar olarak ön plana çıkar. Bu yerler, mevcut yerlerin alternatif ve eleştirel yansımalarıdır (Çavdar, 2018; Shane, 2008; Topinka, 2010; Yıldırım, 2017).

Foucault, ütopyayı gerçek yeri olmayan bir mahal olarak ayna metaforu üzerinden tanımlar. Toplumun gerçek mekânı ile düz ya da ters bir analoji kuran ütopya, tıpkı aynanın yansıttığı mekân gibi gerçek dışı mekândır (Foucault, 2000a, s.10-11). Ayna ütopya gibi yersiz yerdir, fakat aynı zamanda fiziken var olan ve kişinin mekânsal konumunda karmaşa yaratan gerçek bir yerdir (Johnson, 2006).

Foucault'nun tarih çalışmaları tamamen mekânsaldır (Elden, 2001). Foucault'nun çalışmaları; mekânın iktidar kullanımı ve iktidara dair tarihsel araştırmalar için temel olduğunu ortaya çıkarır. Foucult'un mekânı zaman ile okuma anlayışı, günümüz dünyasındaki mekân anlayışının yeniden değerlendirilmesini sağlar (Elden, 2001; Hubbard ve Kitchin, 2018).

Heterotopya kavramı edebi anlamda bozmak, karıştırmak, inkar etmek gibi olumsuz anlam taşıyan kelimeler ile karşılık bulmaktadır fakat mekânsal anlamda kavram ayna tutmak, çelişmek, evirmek, ters yüz etmek, temsil etmek gibi çeşitli anlamlara gelmektedir (Toprak, 2018). Mekânsal bağlamda heterotopya, edebi anlamda heterotopya kavramına göre anlamsal çeşitliliğinden de anlaşılacağı üzere daha karmaşık özellikler barındırmaktadır.

Heterotopya, tarih boyunca her kültürde farklı biçimlerde ortaya çıkmıştır. Zaman içinde dönüşüm geçirebilen, zamansal birikim ya da zamansal kesintileri içeren mekanlardır. Uyumsuz veya

birbiriyle örtüşmeyen, farklı deneyim ve mekânsal özelliklerin tek bir mekânda bir araya geldiği yerlerdir. Dış dünya ile etkileşim kurarken kendi belirlediği kurallar çerçevesinde hareket eden ve kendi dışındaki mekânlar ile işlevsel bir bağ kuran farklılık mekânlarıdır (Çavdar, 2018; Foucault, 2020).

Foucault; heterotopyanın ilk ilkesini evrensellik/ heryerdelik olarak aktarır (Yıldırım, 2020). Bu ilkeyi, 'dünyada heterotopya oluşturmayan tek bir kültür olamaması' ve kendi içinde biçimsel değişimler gösterse de her yerde her kültürde var olmaları şeklinde açıklamaktadır (Foucault, 2020). Bu evrensellik içinde kriz ve sapma heterotopyalarını barındırmaktadır. Kriz heterotopyaları bireyi önceleyen bir yaklaşım ile yaşlıların, kadınların, ergenlerin vb., özel gereksinimlerini karşılamaya yönelik huzur evleri, yatılı okullar, kışlalar, balayı odaları gibi mekânlardır. Kriz heterotopyalarının biçim değiştirmesi sonucu ortaya çıkan sapma heterotopyaları, toplumsal normlara ya da toplumun genel düzenine uyum sağlamayan davranışları gösterenlerin mekânıdır. Akıl hastanesi, hapishane gibi mekânlar bu heterotopyalara örnek verilmiştir (Foucault, 2020; Yıldırım, 2020). Kriz ve sapma heterotopyaları, toplumsal gündelik yaşamın işlevsel ihtiyaçlarına göre şekillenmiştir. Zaman içinde bu işlevlere olan ihtiyaç giderek azalmış ya da tam tersi artmıştır.

"Kriz heterotopyaları" örneklem alanı incelendiğinde dönemsel olarak işleve hizmet ettikleri görülmektedir. Temel işlevlerini korumalarına rağmen zaman içinde işlev erezyonuna uğramışlardır. Örneğin geleneksel aile yapısının mahremiyet normlarına göre erkek ergenliğinin ev dışında geçirilmesi ya da balayınının aile konutunun dışına gerçekleşmesi beklenen olay evreleri günümüz dünyasında eski anlam derinliğine sahip değildir.

"Sapma heterotopyaları" olarak nitelendirilen hapishane, huzurevi, akıl hastanelerine olan ihtiyaç günden güne artmakta ve bunlara ek olarak günümüz sorunlarından biri olan çeşitli bağımlılıklar ile mücadele için rehabilitasyon merkezleri gibi mekânlar bu heterotopya örneklerine eklenmektedir. Bu durumda sapma heterotopyalarının artarak devam ettiğini söylemek mümkündür. Fakat sapma heterotopyaları toplumsal normlara göre belirlendiğinden her toplumda farklılık gösterebilmektedir.

Foucault evrensellik ilkesinin örneklem alanı zamanla çeşitli düşünürler tarafından genişletilmiştir. Sapma heterotopyaları kullanıcıları, toplumdaki pozisyonları bakımından incelendiğinde, toplumsal ayrıştırma-dışlanma gibi nedenlerle bu heterotopyalara gönderildikleri bilinmektedir. Günümüz dünyasında; artan kentsel eşitsizlikler, sosyal ve mekânsal ayrışma, büyük kentlerde artan sınıfsal ve statüsel farklar, mekâna yansımaktadır. Thorns, 20. Yüzyılın sonlarında ortaya çıkan sosyal dışlanma düşüncesinin şehir ve kentin yeniden yapılanırken; kutuplaşma, ayrışma ve dışlanma gibi konulara ilişkin sorunlar doğurduğuna vurgu yapar (Thorns, 2004).

Thorns'a göre dışlanma ve ayrışma modelleri, yoksulluk, evsizlik, sosyo-mekânsal ayrışma ve bu üçünün tam zıttı olarak mevkilenen soylulaştırma olarak dörde ayrılmaktadır. İngilizce'de 'gentrification' olarak kullanılan 'kentsel soylulaştırma'; Türkçe'de mutenalaştırma, seçkinleştirme, burjuvalaştırma gibi anlamlara gelir. Temel olarak, daha önce işçi sınıfı veya düşük gelirli grupların yaşadığı kentsel alanların, üst ve orta sınıf tarafından satın alınması ve yenilenmesi sürecini ifade eder. Bu bağlamda kentsel soylulaştırma yapılan bölgelerde, kentin toplumsal yapısından dışlanan gruplar, Foucault'nun sapma heterotopyası ile paralellik göstermektedir. Bu bağlamda; kentsel suçun arttığı kenar mahalleler, gettolar, kapalı konut yerleşkeleri ve soylulaştırma bölgeleri sapma heterotopyası olarak tanımlanır. Getto, kavramsal olarak belirli ırk, din, etnik kökene bağlı topluluğun bir arada yaşadığı bölgedir (Bilgiç ve Bilgiç, 2019). Kentin dışlanmış bölgeleri olarak tarif edilen gettolar bir sapma heterotopyasıdır.

Foucault'nun belirlediği ikinci ilke, sürekliliktir(Yıldırım, 2020). Foucault'ya göre tarih boyunca bir toplumda var olan ve olmaya devam eden bir heterotopya farklı biçimlerde işletilebilir. Heterotopyanın bulunduğu toplum içinde belirgin bir işlevi vardır ve kültürel eş zamanlılığa göre

işlevleri değişebilir (Foucault 2020). Foucault'nun süreklilik ilkesi ile aktardığı hetetoropya kavramını mezarlıklar ile örneklendirmiştir. Mezarlık örneği gerek Foucult'un yaptığı kabule göre, gerekse günümüz dünyasındaki konumlandırılışına göre süreklilik heterotopyasına bir örnek teşkil etmektedir. Mezarlıkların geçirdiği değişim, işlevselliğini ve uzamsallığını kaybetmesine neden olmuştur. Mezarlık, Endüstri Devrimi öncesi dini otoritenin bir sembolü şeklinde kilisenin uzamı olarak mevkilenen bir heterotopyadır. Endüstri devrimi ve akabinde gerçekleşen modernleşme hareketi gündelik hayatta dini sembolizmin etkisini azaltarak insanı özgürleştirmiştir. Soyutlaşan yaşamda, mezarlıkların kent merkezinde bulunması , anlam bakımından işlevini yitirmiştir. İnanç merkezi olan kiliseler, kent merkezlerinden taşınmasa da kiliselerin arka bahçelerindeki mezarlıkların kent dışına taşınması, modernleşmenin en önemli mekânsal değişimlerinden biridir. Başlangıçta inanç sisteminin hatırlatıcı bir mevkisi olan mezarlık modernite ile işlev değiştirerek soyut bir anlama bürünmüş, kentle uzamsal bağını kaybetmiş bir mekâna dönüşmüştür. Mezarlıklardan kalan yerler bir kentsel boşluk haline gelmiş ve sonrasında bu alanlar yeniden işlevlendirilmiştir. Kentsel boşluklar; heterotopyanın başka bir heterotopyaya dönüşmediği, işe yaramayan, atıl kalmış yerlerdir (Toprak, 2018). Kentsel boşluk, bir işlevin kent içinden tamamen alınması kapsamında da değerlendirilebilir fakat potansiyeli olduğu halde bir belirsizlik durumuna terkedilmiş yerler olarak, yenilenme peyzajının bir parçasını oluştururlar (Toprak, 2018).

Endüstri devrimi ile artan modernitenin kentleşme üzerindeki etkilerin tartışıldığı 1960'lı yıllar; radikal söylemler üreten postmodernitenin yükseliş yıllarıdır. 1964 yılında kabul edilen Venedik Tüzüğü'nün önem verdiği koruma kültürü canlanmıştır. Bu süreçte Endüstri devrimi ve modernitenin eski kentlerde yarattığı kıyımın durudurulması hedeflenmiştir. Venedik tüzüğünün imzalanması, Atina anlaşmasında konuşulmaya başlayan kentsel ekoloji konularının, tekrardan kentleşme, şehircilik, mimari ve sosyoloji disiplinlerinde tartışılmasına neden olmuştur. Endüstri alanlarının kent içinde oluşturdukları heterotopyalar tartışılmaya başlanmıştır. Kent merkezlerindeki endüstri alanlarının ekolojik kaygılarla desantralizasyona (merkezden uzaklaşma) uğratılması ile ortaya çıkan boş alanlar ve bu alanlarda kalan endüstri mekânları tıpkı Foucault'nun mezarlık örneği gibi süreklilik heterotopyalarına bir örnek oluşturmaktadır. Benzer biçimde II. Dünya Savaşı'nın ardından Avrupa kentlerinde oluşan çöküntü alanları temizlenirken bu alanlardan doğan boşluklar da süreklilik heterotopyası bağlamında değerlendirilir. 1960'larda ortaya çıkıp 1970'lerde iyice belirginleşmeye başlayan süreçte, kentsel yenilenmenin işlevi aslında gelecekteki yeniden yapılanma süreçlerine zemin hazırlamak yönünde olmuştur (Smith ve Williams,2015: 48-49). Kentsel korumaya verilen önemin artması, endüstri mirasının korunması için TICCIH, ICOMOS ve UNESCO gibi çeşitli kuruluşların çalışmaları başlatılmıştır (Karadağ ve İncedere, 2020). Örneğin Paris mezbaha alanın boşaltılması ile ortaya çıkan geçici boşluk 1984 yılında Bernard Tschumi tarafından tasarlanan "Parc de la Villette" kent parkı projesi ile değerlendirilmiştir. Bu bağlamda kent parkı kurulmadan önce bir endüstri pratiği olan mezbaha alanın işlev kaybederek şehir merkezinden taşınması ile ortaya çıkan boşluk, Foucault'nun süreklilik ilkesine güncel bir örnek oluşturmaktadır.

Heterotopyanın üçüncü ilkesi yan yanalık olarak kabul edilmektedir (Yıldırım, 2020). Birbiri ile uyuşmayan birçok yer, mevki ve mekânın tek bir yerde toplanması durumu ile açıklanabilir. Mimari anlam bütünlüğü bakımından bir uyum içinde mekânlar bütünüdür. Örneğin tiyatrolar, sinemalar, bahçeler heterotopyanın yan yanalık ilkesi ile açıklanabilir. Bir tiyatro ya da sinema sahnesi mekân içinde bambaşka bir mekân kurgular. Acem bahçesi örneği ise anlamsal bakımdan uyumsuzlukları temsil eder. Tiyatro ve sinema farklı zamanların farklı mekânlarda katmanlı bir biçimde gerçekleştiği heterotopyalara örnektir. Acem Bahçesi ise bir mevkide konumlanan, anlamsal bütünlüğünü dünyanın dört bir tarafından gelen örneklerle tamamlayan bir yeri işaret eder. Bu yönden Acem Bahçesi örneği kendine ait mevkisi bir olan ama bütüncül olarak uyumsuz mekânların birlikteliği ile kurgulanan bir heterotopya örneğidir.

Günümüz kentlerinde 'karma kullanımlı' yapılar, çeşitli işlevleri bir arada barındıran ve son zamanlarda büyük ölçekli kentlerde kapitalist emlak projeleri olarak ortaya çıkan yapılardır. Literatüre 1998 yılında yayımlanan ECTP'nin Yeni Atina Tüzüğü (1998) ile giren, "mixed use" veya "mixed-use urban enclaves" olarak adlandırılan bu mega ölçekli projeler, kentsel planlama stratejilerinin önemli bir parçası olup ve köklü bir tarihe sahiptir (Aslankan, 2019; Rowley, 1996). Bu yapılar, konut, ofis, otel ve eğlence gibi uyumsuz işlevleri içerdiği için heterotopya kavramı açısından tartışmalara neden olmaktadır. Ancak Hoppenbrouwer ve Louw'a göre (2005), karma kullanımlı yapılar kendi içinde uyum sağladıkları için heterotopya olarak değerlendirilmezler.

Shane (2011), kentsel düğüm noktalarının birer heterotopya olduğunu savurunur. Shane'nin heterotopya bahsi içinde geçen kentsel düğüm noktaları, metropolis niteliği taşıyan kentlerde farklı ölçekteki kentsel alanları birleştiren kompozit yapılardır (Shane, 2011). Kentsel düğüm noktaları, kentin merkezi veya belirli noktalarına ulaşım hattı ile uzamlanan nirengi noktalarıdır. Toprak (2018), bu konuda örnek olarak metro istasyonlarını verir. Metro istasyonları, içinde pasajlar bulunduran ve alışveriş merkezleri gibi yapılarla bağlantısı olan kentsel düğüm noktalarıdır. Metropollerin bir parçası olan kentsel düğüm noktaları farklı zamanlarda, farklı ölçeklerde çalışan kentsel mekânları birleştiren, belirsiz yapılardır. Bu bağlamda kentsel düğüm noktaları Foucault'nun yan yanalık ilkesine göre heterotopya olarak kabul edilmektedir.

Shane (2011), din, dil, ırk ve sosyo-kültürel farklılıklar nedeniyle mekânsal uyumsuzluklar gözlemlenen, farklı kültürel yansımaları ve farklı mimarileri bir arada bulunduran mahalleleri yanyanalık ilkesi açısından güncel örnek olarak değerlendirmektedir. Shane (2011), kayıtdışı küçük endüstri, ticaret ve konut yerleşimi gibi mekânları bir arada bulundurması nedeniyle 1994 yılında yıkılan Kowloon Duvarlı Şehri'ni (Kowloon Walled City) heterotopyanın yan yanalık ilkesine örnek olarak vermiştir.

Foucault, heterotopyanın dördüncü ilkesini zamansallık olarak belirtmiş ve üç farklı kategoride açıklamıştır. İlk olarak zamanın bölünmesine bağlı olarak ortaya çıkan heterokroni kavramından bahseder (Foucault, 2020). Heterokroni heterotopyası; zamanı biriktiren mekanları, zamanın kırılganlığını ya da geçiciliğini temsil eder. Zamanın dilimlenmesi ile ortaya çıkan heterokroniler, her dilimin bir diğerinden kopuşuna gösterge olmaktadır. Bu tür mekânlar, zamanın kırılarak kesintiye uğradığı, farklı zamanların bir araya geldiği ya da zaman kavramının kaybolduğu mekânlardır.

Zamansallık ilkesinin bir diğer özelliği de zamanın bir yığın halinde biriktirilmesidir.Foucault (2020), zaman biriktiren heterotopyalara örnek olarak müze ve kütüphaneleri verir. Müze ve kütüphaneler modern dünyada birikimin örgütlediği mekânlarıdır. Foucault (2020), zamansallık ilkesini açıklarken son bir durumdan daha bahseder. Zamanın önemini yitirdiği ya da zamanın herhangi bir dilimine çapalanamayan heterotopyalar olarak açıkladığı bu son duruma fuar yerleri, festival alanları ve tatil köylerini örnek olarak vermiştir.

Foucault'nun zamansallık ilkesini Lefebvre (1974) "yaşayan Mekân" kavramı ile genişletmektedir. Kentsel mekân, fiziksel olarak sınırları konulmuş bir boşluktur. Lefebvre ise bu soyut anlama derinlik katarak 'yaşanan mekân', 'tasarlanan mekân', 'algılanan mekân' tanımları ile mekânı toplumsal bir olgu olarak değerlendirmektedir (Al, 2011; Lefebvre, 2014). Lefebvre'ye göre kentsel mekânlar kent yaşamının kurucusu ve aynı zamanda ürünüdür (Lefebvre, 2014). Tarihsel örüntü; zaman dilimlerinin, yaşanmışlıklarla üst üste düşürülmesi ile simgelenmektedir (Toprak, 2018). Tarihsel örüntü kentsel mekânda; kollektif hafıza, kültürel çeşitlilik ve kişisel deneyimden oluşan bir doku oluşturur. Bu noktada palimpsest kavramından söz etmek gerekir. Yunanca , 'palin' (yeniden) ve 'psestos'(kazınmış) sözcüklerinden oluşan kavram yeniden yazılmış parşömen anlamına gelmektedir. Kağıdın zor bulunduğu dönemlerde el yazması kitapların kazınarak tekrar yazılması nedeniyle üst üste

binen izlerin katmanlaşmasına palimpsest denilmektedir. Palimsest eski ve yeninin iç içe geçtiği, izlerin aradan çekildiği, belleğin yeni bir deneyime dönüştüğü yerlerdir (Apaydın, 2019). Heterokronik heterotopyalar, anlamsal bakımdan sadece zamanı üst üste koyarak biriktirmezler. Bu birikim aynı zamanda birçok belleğin izlerini taşıyan mekânlara dönüşür (Toprak, 2018). Zaman içinde değişerek yeniden oluşan kentsel mekânlar da palimpsest olarak yorumlanmaktadır. Farklı zamanlarda, farklı yaşanmışlıklar biriktirmiş mekânların, bir araya gelmesi ile oluşan kentsel mekân, geçmişten kalma sabitleri ile birleşerek işleyen bir dokuya dönüşür. Bu tür mekânlar, kollektif hafızayı canlı tutan palimpsestler oluşturur. Tüm bu yorumlar eşliğinde palimpsestler heterokroni heterotopyalarıdır yorumunu getirmek mümkündür.

Foucault, heterotopyanın beşinci ilkesini açılma kapanma olarak belirtmektedir (Foucault, 2020). Kapanma heterotopyaları etrafından soyutlanmış, tecrit edilme ve aynı zamanda işlevin içe işlediği yerlerdir. Foucault bu heterotopyanın kapanma halini kriz heterotopyasına verdiği benzer örnekler ile açıklar. Hapishaneler, askeri kışlalar gibi girişin ve çıkışın denetim altında tutulduğu mekânlar kapanma heterotopyalarına da örnek olarak verilmiştir. Kapanma heterotopyalarına bir başka örnek olarak hamamlar, saunalar vermiştir. Bu arınma alanlarına giriş çıkış belli bir grubun üyesi olmaya tabi olmayı gerektirir. Örneğin Müslüman hamamları, İskandinav saunaları görünüşte arınma için olan mekânlar olmasının yanında herkesin giremediği belli giriş kalıpları olan heterotopyalardır. Foucault, açılma kapanma heterotopyalarının ikinci türü olarak, kolaylıkla girilen ama aidiyet barındırmayan mekânları işaret etmiştir. Bu tür heterotopyalarda birey mekâna dahil olur ama aidiyet hissetmeme halini yaşar. Bu tür mekânlar; bulanık sınıra sahip olan, ara mekân, çekişme mekânı olarak da adlandırılır. Foucault (2020), çiftlik evlerindeki konuk odalarını ve yol üstü motelleri bu türe örnek olarak vermiştir.

Foucault'nun açılma kapanma heterotopyaları giriş çıkışı kontrol altında olan ya da bir kurala tabi olan kapalı konut siteleri, dini kompleksler, çeşitli organizasyon ya da gruplara ait külüpler ile genişletmek mümkündür. Bu mekâna girilir ama mekânda nüfuz sahibi olunamaz. Bu nedenle bu mekânlar kolayca nüfuz edilemeyen mekânlar olarak tanımlanır.

Açılma kapanma heterotopyalarına güncel örnek olarak toplumsal düzeyde belirli marjinal grupların sahiplendiği mekânlar da verilebilir. Burada gruplaşma düzeyi; etnik köken, dini köken, siyasal görüş ya da daha genel anlamıyla görüş ayrılığı nedeni ile ortaya çıkabilir. Çatışma mekânları etnik kökenin hakim olduğu bir mahalle olarak kalıcı bir mevkilenme sağlarken, toplumsal dinamiklerle anlık oluşan eylem alanlarıda geçici bir çatışma heterotopyası olarak kabul edilmektedir. Stavrides (2016), "kentsel çatışma" örneğini 2008 yılında Atina'da gerçekleşen gençlik ayaklanması üzerinden vermektedir Stavrides'e göre (2016), kentsel çatışma alanları aynı zamanda birer özgürleşme mekânı olan heterotopyalardır. Kentsel adaletin yalnızca homojen mekânlarla kurgulanmış bir ideal kentte mümkün olması varsayının karşıtlığından doğan kentsel çatışma mekânları; gerçekte kentsel adalet arayanların bir araya geldiği üçüncü bir tür coğrafi mevkilenme canlandıran heterotopik mekânlardır (Stavrides, 2016a). Stavrides bu söylemini, 1960'lı yılların eleştirel düşüncesi savunan Lefebvre'nin gündelik hayat eleştrisi ile kastettiği şekilde, kentin üretim alanı olmaktan öte gündelik hayatın geçtiği, öz-farklılaşma, kişisel ya da kolektif direniş pratiklerini içeren, kentin içine dağılmış ötekilik mekânları olabileceği söyleminden türetir. Örnek olarak Certeau'nun (1984), "bir göçmen ya da metaforik bir kent, planlı ve okunaklı kentin açık metnine sızar" güçlü söylemini verir. Stavrides bu söylemlerini 2016 yılında yayımladığı "Müşterek Mekân, Müşterekler Olarak Şehir " adlı kitabında modernizm eleştrisi bağlamında genişleterek açmaktadır (Stavrides, 2016b).

> *"İdeal toplumu örgütleme sorunu ideal bir şehirdeki farklı mekânları etkili bir şekilde düzenleme sorununa doğru taşımak, bir şehrin ya da yerleşimin orada yerleşmiş insanları yansıtabildiğini örtük olarak varsayar. İdeal bir şehir net sınırlarla ve kentsel 'işlevler' için ayrılmış özel alanlara sahip, planlı ve üzerinde oynanamaz bir kent toprağı olarak tasavvur*

ediliyorsa o zaman bu şehrin inşasına sebep teşkil eden toplum da eşit derecede 'sonsuz', kendi dışarısından net bir şekilde ayrışmış ve hiç bir zaman tökezlemeyen bir makine olarak tasavvur edilecektir. Kendi kentine yeten ve kendi kendisini idame eden bir bütün olarak bu tür bir kurtarılmış, ahenk içindeki, özgürleşmiş, özerk vs. toplumun hayalini kurmak bahsi geçen ideal şehir imgelerini kullanan herhangi bir özgürleşme mücadelesini doğrudan etkileyecektir. Müşterekleşme, kapalı bir toplumun katı hudutlarıyla sınırlandırıldığından nasıl çitleme pratiklerine dönüşmeye yazgılı ise özgürleşmede sembolik olarak ya da gerçek anlamıyla barikatlarla çevrili herhangi bir mıntıkaya kapanmaya zorlandığında (ya da bunu seçtiğinde) karşıtına dönüşebilir." Stavrides, 2016, s:220

Stavrides'in yukarıdaki söylemi modernizm hayali olan ideal kent ütopyalarının oluşturduğu sınırların, kısıtların, tarihsel süreçte kentsel çatışmaları tetikleyeceği yönündedir. Bu bağlamda, kentsel çatışma mekânları, Foucault'nun örneklem alanını genişleten güncel örnekler olarak eklenmiştir.

Foucault'nun altıncı ve son ilkesi olan işlevsellik ilkesini, illüzyon mekânları ve ötekileşen mekânlar olarak iki farklı grupta ele almaktadır (Foucault, 2020). İllüzyon heterotopyaları dönemsel toplumsal ihtiyaçlar doğrultusunda ortaya çıkan ve hızla değişime uğrayabilen mekânlardır. Foucault (2020), İllüzyon heterotopyalarına örnek olarak gemi, genelev gibi bağlamsız ve zamanı unutturan mekânları örnek vermiştir. Ötekileşen heterotopyalara örnek olarak tüm işlevleri yerli yerinde olan ve dış dünya ile en az etkileşimde bulunan kolonileri vermiştir.

Shane (2008) illüzyon heterotopyaları kavramını, yanıltıcı olan bir gerçeklik duygusu yaratmak üzere inşa edilmiş yerler veya alanlar olarak ifade etmiştir. İllüzyon heterotopyaları, algı, kimlik, veya sosyal ilişkileri şekillendiren kurgusal, sembolik ortamlar olarak, çoğunlukla gerçek ile hayal edilen arasındaki sınırı bulanıklaştıran mekânlardır (Shane, 2008).

Baudrillard'ın (1997), batı toplumlarının bütün değerleriyle birlikte çöktüğü, hakikat (gerçek) ile sanal olanın arasındaki ayrımın ortadan kalktığı ve toplumun da bundan ayrı düşünülemeyeceği yeni bir döneme girildiğini savunmaktadır. Baudrillard (1998), 'Simularklar ve Simülasyon' adlı eserinde simülarklara örnek olarak Disneyland'ı işaret etmiştir. Shane (2008), Simülasyon Kuramı ile bilinen Baudrillard'ın simülasyon teorisine atıf yaparak; Disneyland gibi tematik parkların birer illüzyon heterotopyası olduğunu belirtmiştir. Disneyland, tüm iç içe geçmiş simülark düzenini anlatan bir modeldir. Bauldrillard'a göre (1997); Disneyland'ın bir illüzyon yaratarak çekim merkezi olmasının altında yatan en önemli neden Amerikan toplumunun minyatürize edilmiş zevkleri, kısıtlamaları ve sevinçlerinin aynı mevkide toplanmasıdır.

Bauldrillard tarafından 'Beauborg Etkisi' olarak literatüre kazandırılan kavram, kentsel dönüşüm ve soylulaştırma bağlamında öteki heterotopyaların güncel örneklem alanını oluşturmak için kullanılmıştır. 19. yüzyılda Beaubourg bölgesi "Paris'in bir numaralı istenmeyen adası" olarak kabul ediliyordu. Bölgede standartların altında kalan yapılaşma ve alt yapı yetersizlikleri nedeniyle sık sık hastalıklar görülmekteydi (Witec, 2014). 20. yüzyılın başlarında Paris'in merkezinde olmasına rağmen terk edilmiş gibi görünen bu alan bir süre otopark olarak kullanılmıştır (Witec, 2014). 1960'larda Başkan Georges Pompidou, Fransız kültürünü ve sanatını geliştirmek için çağdaş sanat mekânı olarak Beaubourg bölgesini seçmiş ve Pompidou Merkezi için büyük bir proje başlatmıştır (Witec, 2014). Proje için açılan yarışmayı 681 öneri arasından Renzo Piano ve Richard Rogers'ın Pompidou Centre projesi seçilmiştir. Projenin yapımı tamamlandığında bölgenin rantı yükselmiş, turizm değeri artmıştır. Bernard Tschumi'nin Paris mezbahasının taşınması ile açılan kentsel boşluğa yaptığı Parc de la Villet tasarımı da benzer etkilere sahiptir. İspanya'nın Bilbao şehrinin durgun ekonomisini kalkındırmak adına Frank Gehry'nin tasarladığı Guggenheim Müzesi'de şehri canlandıran etkisi ile benzer özellikler taşımaktadır.

Shane (2008); Beaubourg müzesi (Centre Pompidou), Bilbao gibi şehirlerdeki sanat ve kültür mekânları gibi örnekler ile canlandırılan kentsel mekânları, öteki heterotopyalarına örnek olarak vermektedir. Bu mekan oluşumlarını; kent içinde, kentin doku ve biçimlenişine aykırı olmaları nedeniyle birer heterotopya olarak nitelendirilmiştir. Fakat mimari üslupları, yapım teknikleri ve malzemeleri ile dikkat çekici özellikleri olan bu örnekler konumlandıkları bölgeleri dönüştüren ve canlandıran örneklerdir. Kentsel dönüşüm ile kentsel soylulaştırma bağlamında, kent içindeki bozulmuş dokuların yerine çağdaş mekânların tasarlanması, ekonomik anlamda kalkınmayı artırıcı etkiye sahiptir. Genellikle dikkat çekmek ya da rant elde etmek için yapılan bu uygulamalar, kendi içlerinde kusursuz örneklerken, kentle kurdukları dışsal ilişki bağlamında, koloni örneğinde olduğu gibi yerleşik tipolojiye aykırı, genel dokuya uyumsuz birer heterotopya örneği oluşturmaktadır.

Çalışmanın bu bölümünde Foucault'nun heterotpya tanımı yaparken kullandığı örneklem alanı, güncel yaklaşımlara göre genişletilmiştir. Günümüz kentlerinde süreklilik heterotopyası olarak mezarlık örneklerinin yanına endüstriyel pratiklerin kent dışına gönderilmesi ile ortaya çıkan kentsel boşluklar eklenmiştir. Yan yanalık ilkesi açıklamakta kullanılan tiyatro, sinema ve acem bahçesi örneklerinin yanına, kentsel düğüm noktaları, azınlık mahalleleri eklenmiştir. Zamansallık ilkesine kalıcılığı temsil eden müze, kütüphane örnekleri ve geçiciliği temsil eden fuar, panayır örnekleri verilirken bu örneklem alanına palimpsestler eklenmiştir. Açılma-kapanma heterotopyaları olan hapishane, kışla, sauna, motel gibi örneklerin yanına, kapalı konut siteleri, toplumsal çatışmanın gerçekleştirdiği sokaklar, meydanlar, parklar gibi kentsel çatışma mekânları eklenmiştir. İşlevsellik ilkesine; illüzyon heterotopyası bağlamında gemi ve koloni örneklerinin yanına günümüz kentlerindeki tema parklar, kentsel dönüşüm, soylulaştırma ve canlandırma alanları eklenmiştir. Böylelikle kentin bir parçası olan heterotopya kavramı genişletilmiştir.

3. Sürdürülebilirlik Bağlamında Karabük Kent Planlama Sürecinin Ütopya ve Heterotopya Değerlendirmesi

Araştırma, 20. yüzyıl Türkiye'sinde endüstri devrimin etkisi ile kurulan kentlerinden biri olan Karabük kentinde yapılmaktadır. Karabük kentinin önemi, genç Cumhuriyet Türkiye'sinde endüstrileşme ve modernleşme örneklerinden biri olmasıdır. Fındıkoğlu'na (1963) göre; 1930'lu yılllarda Karabük, Safranbolu İlçesi'nin Öğlebeli Köyü'ne bağlı 13 haneli bir mahalle yerleşimidir (Fındıkoğlu, 1962; Çabuk, 2016). Erken Cumhuriyet döneminin siyasal, sosyal ve ekonomik politikaları, Ankara'dan örgütlenen ulaşım ağının ülkenin her bölgesine ulaşabilmesidir. Bu yaklaşım ile 1923 yılında Cumhuriyet'in ilan edilmesi ile ilk hamlelerden biri demiryolu yatırımlarının 10 yıllık kısa bir zaman diliminde tamamlanması olmuştur. Karabük'ün içinden geçen Ankara- Filyos demiryolu hattı ilerde bölgede bir sanayi kenti kurulmasını sağlayacak önemli bir etkiye sahiptir (Ayten vd., 2010; Kalyoncu, 2010 Çabuk, 2016).

Ekonomik kalkınma, endüstri ile sağlanabilir fakat savaştan çıkmış genç Cumhuriyet Türkiye'sinde, özel sektör kalkınma yatırımı yapacak ekonomik güce sahip değildir. Bu durumun bilincinde olan ülke yönetimi, devletçilik ilkesine göre kalkınma yatırımlarının sistematik ve planlı bir biçimde yapılabilmesi için Sümerbank'ın kurulması ve ilk beş yıllık kalkınma planı hazırlanmasını sağlamıştır (Övgün, 2009; Yücel ve Bürken, 2015; Çabuk, 2016). 1934 yılında hazırlanan "Birinci Beş Yıllık Kalkınma" planındaki önerilen sanayi tesisleri beş yıl içinde tamamlanmıştır. Karabük'ün coğrafi konumu fabrikalaşmanın maliyetini artırıcı yöndedir. Fakat bölge, içinden geçen demir yolu hattı ve jeopolitik konumu ile ham madde taşıyıcılığı açısından ulaşılabilirdir. Bölge coğrafi bakımdan da korunaklı ve güvenli olduğundan demir çelik fabrikasının kuruluş yeri olarak seçilmiştir. 1936 yılında Atatürk'ün izni doğrultusunda, İngiliz sermayesi olan H. A. Brassert ve Co. Ltd. firmasının verdiği kredi, arazi kamulaştırılması ve Karabük Kardemir Demir Çelik Fabrikası (KDÇF) kuruluşunda

kullanılmıştır. 1939 yılında fabrika faaliyete geçmiştir (Ayten vd., 2010; Çabuk vd., 2016). Modernleşme konusunda Atatürk'ün daveti ile İstanbul şehrinin nazım imar planlarını hazırlamak için gelen Henri Prost, Karabük içinde çalışmalar yapmıştır. 1938 yılında Karabük kenti için bir dizi karar alınarak projelendirme süreci başlamıştır. Henri Prost, KDÇF çalışanları için Yenişehir Mahallesi'ni lojman yerleşkesi olarak tasarlamıştır. Henri Prost, Tony Garnier ile şehircilik disiplininin yeni yeni formüle edildiği bir dönemde ortak çalışmalar yapan, Fransız şehircilik ekolü ile yetişmiş bir tasarımcıdır. Bu nedenle Yenişehir Mahallesi bir endüstri kenti öneri modeli olarak önemli bir role sahiptir.

Karabük kentinin büyümesinde etken olan fabrikanın saçaklanma etkisinin kontrol altına alınması için Prost planından sonra 1948'de, 1968'de ve 1980'de üç defa kent için geniş kapsamlı master plan hazırlanmıştır. Ayrıca 1988 yılında Ülkü Barlas'a ve 1996 yılında Güntürkün Bükülmez'e yeni imar planları hazırlatılmıştır. Yenişehir lojman yerleşkesinin plan kararları, ilerleyen dönemde yapılan planlama çalışmalarında kısmen devam ettirilmeye çalışılmıştır. Karabük kentinin planlama sürecinde Prost planında kullanılan temel ilkeler, gerek dünya konjonktürü gerekse Türkiye'nin içsel dinamikleri nedeniyle devam ettirilememiştir. Böylelikle Henri Prost'un modern üslupla hazırladığı plan, zamanla bozuma uğramıştır. Kentleşmenin tarihi süreç içerisindeki gelişimi açısından Karabük kent planlama tipolojisindeki değişimler, Avrupa'da meydana gelen değişimlerden etkilenmiştir.

Çalışmada, Karabük Kentinin planlama süreci, Endüstri Devrimi etkisi ile Avrupa ve Amerika kentsel tipolojilerde değişime neden olan ideal kent ütopyaları üzerinden karşılaştırmalı olarak değerlendirilmektedir. KDÇF'na ait, mahalle ölçeğinde yapılan Yenişehir Lojman Yerleşkesi planlaması, Karabük'ün tarihselliği açısından başlangıç noktası olarak kabul edilmiştir. Yerleşke, Henri Prost tarafından, bahçe-şehir ütopyası olarak tasarlanan bir ideal kent örneğidir. Bu nedenle Yenişehir Mahalle'si Karabük'ün kentleşmesinde ve Türkiye'nin modernleşmesinde bir dönüm noktasıdır. Fabrikanın çekim etkisi, Karabük'ün nüfusunun hızla artmasına neden olmuştur. Endüstrileşme, bölgesel bakımdan bir göç hareketi başlatmış, Karabük'ün gelecek planlamasında önemli bir role sahip olmuştur. Lokal bir bölgenin kamulaştırılması ile hazırlanan lojman yerleşke planı, artan barınma ihtiyacı ve mülkiyet koşulları nedeniyle kentin genelinde uygulanamamıştır. Yenişehir yerleşkesi dışında planlı alanı olmayan bölgede çarpık kentleşme hızla yaygınlaşmıştır.

Çalışma kapsamında, Henri Prost tarafından tasarlanan Yenişehir Mahallesi bir ütopya aynı zamanda palimsest örneği olarak kabul edilmektedir. Yenişehir mahallesi dışında gelişen plansız dokular, heteropya bağlamında irdelenmektedir. Yenişehir mahallesi, Karabük'ün tarihselliğini başlatması açısından başlangıç noktası ve kentin katmanlaşması sırasında, bozulmadan korunması nedeniyle heterokroni başlangıcı olarak kabul edilmiştir. Karabük'ün planlama süreci araştırması, Yenişehir Mahallesi'nin planlaması ile başlatılarak ideal kent ütopyası ve heterotopya bağlamında literatürdeki örnekler ile karşılaştırak değerlendirilmiştir. Böylelikle kentin planlama süreci boyunca değişim gösteren tipoloji, planlama dönemleri üzerinden okunmuş, plan tipolojisini etkileyen değişikliklerin ütopya ve heterotopya kavramları ile ilişkisi ortaya çıkarılmıştır.

Çalışmanın bundan sonraki bölümünde Karabük kentinin şehir planlama süreci, ütopya ve heterotopya söylemleri bakımından literatür örnekleri ile karşılaştırmalı olarak değerlendirilmektedir.

3.1. Henri Prost Yenişehir Planı-1938

Karabük kentine dair ilk kentsel plan çalışması KDÇF'nın lojman yerleşkelerine ait kamulaştırılmış alanında mahalle ölçeğinde yapılan çalışmadır. Fabrikanın kuruluşu sırasında ve aktif hale gelmesinin ardından oluşabilecek barınma krizini çözmek amaçlı fabrika yakınında bulunan Kapullu Köyü arazileri, 1936 yılında lojman yerleşkesi kurulmak üzere kamulaştırılmaya başlanmıştır (Bükülmez, 1996; Çabuk vd., 2016; Sarıköse, 2020). Kamulaştırılan alanda; modern üslubun

benimsendiği, kullanıcıya modern hayatı sağlayan; işçi, memur, mühendis, yönetici gibi sınıflardan oluşan bir topluluğun tüm ihtiyaçlarını karşılayan mekânsal pratikleri içeren bir mahalle tasarlanması için Mimar- Şehirci Henri Prost ile anlaşılmıştır. Kentte meydana gelen bir sel felaketinde asıl nüshası kaybedilen Yenişehir planına; Bükülmez'in (1996) Karabük Belediyesi adına derlediği "Yenişehir Koruma Amaçlı İmar Planı Analitik Etütleri" kitabından ulaşılabilmektedir (Şekil 4).

Şekil 4. Yenişehir Lojman Yerleşkesi, Henri Prost (1938)

Kaynak: (Bükülmez, 1996)

Henri Prost, Paris bölge planını tasarlayan biri olarak, Fransız "Cite – Jarden" modeli ve Almanların 1930'lu yıllarda benimsediği "Siedlung" bahçe kent modellerini sentezleyerek, Yenişehir planını tasarlamıştır (Çabuk vd., 2016).

Planın ekolojik ve hümanist yaklaşımı benimseyen ana kararları, modern üslubun katılığını esnetmektedir. Kamulaştırılan arazisi üzerinde, ada bazında tasarlanan lojman yerleşkesi, bir kent yerleşimini var eden ve sürdürülebilir kılan tüm kentsel donatılar düşünülmüştür. Konut alanları sosyal statülerin temel ihtiyaçlarını karşılayan nitelikte olup sınıfsal ayrım yapılaşma geometrisi ile birleşerek yerleşkenin formu ve karakteri oluşturulmuştur.

Konut alanlarında tercih edilen sınıfsal statü ayrımı sosyal donatılar olan lokallerde, işçi ve mühendis kulüpleri gibi mekân pratiklerinde sürdürülürken; sinema, ibadethane, hastane, spor sahaları, okullar, otel, planlı rekreasyon alanı olan havuzlu bahçe gibi mekân pratiklerinde, bu sınıfsal ayrımdan kaçınılması, planın sosyal sınıflar arası geçirgen gözenekli yapıyı temsil ettiğini göstermektedir.

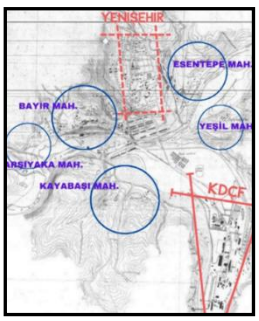
Planın sınırlı bir bölge ve toplumun sadece fabrika çalışanlarından oluştuğu düşünülerek lokal bir çözüm önerisi getirmesi, başlangıçta kullanıcı açısından bir ütopya yapmakla birlikte şehirleşmenin içsel dinamikleri karşısında bozuma uğrayan her ütopya gibi Yenişehir Mahallesi ütopyası da kentin gelişim sürecini oluşturan dinamikler karşısında yetersiz kalmıştır. Kentin büyüme ekseni okullar bölgesi yönündeki güçlü ama sınırlı bir aks doğrultusundadır. Kentle bağlantısı zayıf olan bu aks fabrika yönünde dik bir yamaçla sonlanmaktadır. Ayrıca mahallenin konumlandığı coğrafyanın kentten ayrışan bir bölgede olması (batı çeperinin yüksek eğimli dik bir yamaçla bitmesi), alanın tasarım ilkelerinin kent geneline yayılmasını sınırlandırmıştır.

Yenişehir modelinin kente yayılamamasının nedenlerinden biri de kamulaştırılmış bir alan üzerine yapılmış olmasıdır. Oysa ki kentin genelinde bireysel mülkiyet hakları söz konusudur. Bir diğer neden ise şehircilik çalışması olmasına rağmen KDÇF özelinde lojman yerleşkesidir. Bu nedenle söz konusu alan tasarlanırken kentin genel büyümesine dair bir öneri getirilmemiştir.

Yenişehir planının, başlangıçtaki ütopyacı tasarım hedefleri korunmuştur. Modelin kent bütününe yansımamasında, alanın büyümesindeki sınırlılıkların etkin bir rolü vardır. Zamanla gelişen kent dokusu içinde kendi üslup bütünlüğünü koruyan bir ütopya olsa da ilerleyen süreçte kentin bütündeki tipolojik biçimleniş karşısında kentin geneline hakim olan dokuya göre farklı bir doku olarak

kalmıştır. Yenişehir Mahallesi, bütün bu sınırlılıklara rağmen bir lojman yerleşkesi olarak Fabrika özerkliğinde olduğundan, kentin büyümesi karşısında en az değişim gösteren yerdir. Aynı zamanda, Karabük'ün planlama sürecindeki değişim izlerini takip etmekte mihenk taşı olan bir yer niteliğindedir.

Ütopyalar, geçmişin düşüncelerini içinde barındırarak, geleceğe dair yeni fikirlerin inşa edildiği, bir nevi palimpsest olarak düşünülebilir. Yenişehir Mahallesi'nin bir ütopya örneği olarak plan tipolojisinin korunmuş olması, kentin katmanlaşmasını açığa çıkarmakta etkin bir role sahiptir. Bu bağlamda kentin gelişmesi ile ortaya çıkan genel tipolojisine göre Yenişehir Mahallesi güncel heterotopya örneklerinden biri olan palimpsest örneği olarak da değerlendirilmiştir.



3.2. Nezihe ve Pertev Taner Planı-1948

Karabük KDÇF'nin kuruluşu ile bir çekim merkezi haline gelmiştir. Lojman yerleşkesi bir grup fabrika çalışanının barınma ihtiyacını çözerken yoğun göç karşısında yetersiz kalmıştır. Fabrika kurulduktan sonra 10 yıl içinde Yenişehir Mahallesinin etrafında plansız yapılaşmalar artmıştır. İstasyon bölgesinin yer aldığı Bayır Mahalle, fabrikanın batı çeperinde bulunan Kayabaşı Mahallesi ile Araç Çayı kıyısındaki Karşıyaka ve Yeşil Mahalle bölgelerinde, hızlı göç ve kontrolsüz yapılaşmanın etkisiyle düzensiz kent dokuları oluşmuştur. Karabük modernist ilkelere göre biçimlendirilmek istenen bir Cumhuriyet kenti olması nedeniyle, 1941 yılında Karabük'te belediye teşkilatı kurulmuştur. Gecekondulaşma nedeniyle artan çarpık kentleşme, acil müdahale gerekliliğini ortaya koymuş ve 1941 yılında başlayan resmi yazışmalar, 1945 yılında sonuçlanarak, kentsel planlama ile müdahale konusunda harekete geçilmesini sağlamıştır.

Bu kapsamda, İller Bankası tarafından Yüksek Mimar Mithat Yenen ve haritacı Avni Par, alanda tespit çalışmaları yapmak üzere görevlendirilmiştir. Kentin durumunun ortaya serildiği Mithat Yenen'in tespit raporu ve Avni Par tarafından hazırlanan haritalar ile halihazır haritalar oluşturulmuştur (Çabuk vd., 2016). Şekil 5'de Mithat Yenen ve Avni Par'ın çalışmaları sonucu oluşturulan halihazır harita üzerinde Yenişehir Mahallesi, fabrika ve kentin plansız büyüme gösteren mahalleleri işaretlenmiştir.

Karabük'ün imar planı hazırlanması ihalesi işi kapsamında Yüksek Mühendis Mimar Nezihe ve Pertev Taner ile anlaşmaya varılmıştır (Ayten vd., 2010; Çabuk vd., 2016). Karabük'e ait 1/5000 ve 1/2000, 1/1000 ve 1/500 ölçekli planlar ve "Kesin İmar Planı İzah Notu", 1948 yılında onaylanmıştır (Ayten vd., 2010; Çabuk vd., 2016). 1/5000 ölçekli imar planı incelendiğinde düzensiz yapılaşmaya ve Prost'un Yenişehir planına müdahaleler olduğu görülmektedir (Şekil 6). Kayabaşı ve Karşıyaka mahallerindeki gecekondu oluşumları yok sayılırken, Bayır Mahalle ve Yeşil Mahalle'deki plansız yapılar büyük oranda korunmuştur.

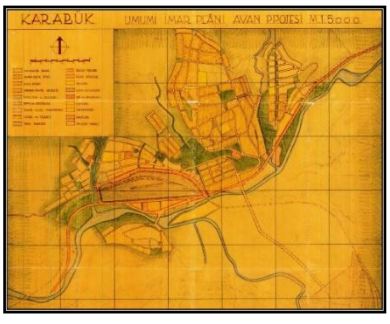
Şekil 5. 1946 Yılı Karabük Kenti:1/10000 Ölçekli Hâlihazır Harita

Kaynak: (Çabuk vd.,2016)

Karabük'ün imar planı hazırlanması ihalesi işi kapsamında Yüksek Mühendis Mimar Nezihe ve Pertev Taner ile anlaşmaya varılmıştır (Ayten vd., 2010; Çabuk vd., 2016). Karabük'e ait 1/5000 ve

1/2000, 1/1000 ve 1/500 ölçekli planlar ve "Kesin İmar Planı İzah Notu", 1948 yılında onaylanmıştır (Ayten vd., 2010; Çabuk vd., 2016). 1/5000 ölçekli imar planı incelendiğinde düzensiz yapılaşmaya ve Prost'un Yenişehir planına müdahaleler olduğu görülmektedir (Şekil 6). Kayabaşı ve Karşıyaka mahallerindeki gecekondu oluşumları yok sayılırken, Bayır Mahalle ve Yeşil Mahalle'deki plansız yapılar büyük oranda korunmuştur.

Prost Planı'nın genel hatlarıyla korunduğu ama adalardaki her boşluğa KDÇF'nin yetki ve iradesi ile yeni konutlar, kreş, park, çocuk bahçesi ve misafirhane, stadyum eklendiği görülmektedir (Çabuk vd., 2016). Sinema ve eğitime ayrılan alanların bir kısmının konut iskâna açıldığı bilinmektedir. Yüzevler ve Dereevler bölgesindeki konut adalarına 160 adet tek ve iki katlı bahçeli yapı ile 39 adet konut bloğu önerilmiştir (Çabuk vd., 2016). Bu konutlar, kentin büyüme potansiyeline bağlı olarak iki, üç ve dört odalı tipolojilerde tasarlanmış; her biri için 1/100 ölçeğinde plan, kesit ve görünüş çizimleri hazırlanmıştır (Çabuk vd., 2016).



Plan özellikleri bakımından konut tasarımında geleneksel Safranbolu konutu örnek alınmıştır. Bahçeli konut tipolojisi plan düzleminde Prost Planı'nı çizgilerini taşısada cephe biçimlenişi açısından Prost planına benzememektedir. Taner Planı'nda da "Bahçe Kent" konsepti devam ettirilmiş; ancak Yenişehir dışındaki bölgelerde kamulaştırma yapılmadığı için mevcut mülkiyet yapıları dikkate alınarak parselasyon yoluna gidilmiştir. Ayrıca, Yüzevler'de bir ilkokul, Dereevler'de ise bir kreş, park, çocuk bahçesi ve haftalık pazar alanı tasarlanarak sosyal donatı alanları artırılmıştır (Çabuk vd., 2016).

Karabük'ün hızlı büyüme potansiyeli dikkate alınarak hazırlanan planda ileride bir kent merkezi ihtiyacı doğacağı düşünülmektedir. Kamu binaları, hükümet meydanı olarak geçen bölge etrafında toplanmışlardır. Teknik hizmet binaları Araç Çayı kıyısına yerleştirilmiştir. Plan tasarımında mevcut fabrika dışında bir sanayi alanı önerilmemiş olup zanaatkarlar için küçük sanayi alanı olarak istasyon bölgesinin kuzeyi önerilmektedir. Küçük ölçekli yanıcı içerikli sanayi alanlarının, Eskipazar yolu üzerinde kent dışı bir alana önerildiği, plan raporlarında görülmektedir (Çabuk vd., 2016).

Çabuk vd. (2016), Taner Planı'nda ulaşım şemasının oldukça rasyonel düzenlendiğini belirtmiştir. Planda taşıt yolları üç kademeli olarak düzenlenmiştir. Kaldırımlarda yapılan ağaçlandırma, 1/1000 ölçekli plan üzerinde işlenmiş; yaya yolları, kaldırımlar ve merdivenli yollar düşünülmüştür.

Taner (1948), ana kararlarına göre kentte, biri ulaşım ve aktarma diğeri ise kamusal merkez olan iki meydan tasarlamıştır. "İstasyon Meydanı" ulaşım ve aktarma meydanı olarak tasarlanmıştır. "Cumhuriyet ve Hükümet Meydanı" nın, kentin gelecekte bir ilçe merkezi olacağı öngörüsü ile kamu hizmet binalarınca çevrelenen ve anıt alanı için yer ayrılan bir meydan olduğu görülmektedir (Ayten vd., 2010; Çabuk vd., 2016). Yenişehir planında büyüme aksı, mahallenin ortasından geçen birbirini kesen iki aks iken Taner planında bu aksın Zonguldak- Kastamonu karayolu boyuna taşındığı görülmektedir.

Şekil 6. Nezihe- Pertev Taner Planı

Kaynak: (Çabuk vd., 2016)

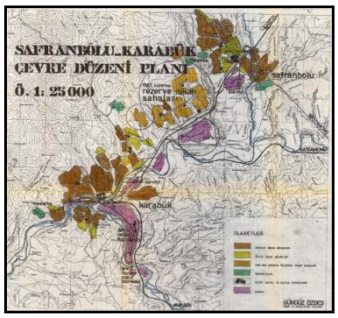
Taner Planının büyüme aksı, Yenişehir Mahallesi'nin sağında ve solunda bulunan bölgelere göre Zonguldak- Kastamonu yoluna paralel bir akstadır. Taner Planı'nda kentin gelecekte bir ilçe merkezi olacağı öngörülerek resmi binalar İstasyon Caddesi üzerinde "Cumhuriyet ve Hükümet Meydanı" etrafında konumlandırılmıştır.

Plan kararlarında İstasyon ve İnönü caddeleri üzerinde "yol boyu ticaret" işlevi işlenmiş, mevcut hal yapısı genişletilmiş ve istasyon karşısına bir toptancı hali eklenmiştir. Fakat kentte bir ticaret bölgesi oluşturulmamıştır. Kentin Safranbolu ve Eskipazar istikametinden gelen giriş noktalarına birer han yeri tasarlanmıştır. Kentin coğrafi sınırlılıkları, konut bölgelerinin birbirinden kopuk parçalı bir doku oluşturmasına neden olmuştur. Bu nedenle parçalı konut yerleşimlerine özel birer çarşı alanı ayrılmıştır.

Taner Planı'nda fabrika içinde bulunan spor sahası, bu alana yeni endüstri binaları eklenmesi gerekçesiyle, Yenişehir Mahallesi içine taşınmıştır. İstasyon bölgesinde yakın olan konumlar, malzeme taşıma işleri olan işlevleri, bu bölgeye çekmiştir. Bölgede plansız konumlanmış kereste fabrikası ve yerel baskı, özel işletmeler olan demir çelik haddehanelerinin bu bölgede konumlanmasıda etkili olmuştur.

1953 yılında ilçe statüsüne Kavuşan Karabük Belediyesinin sorumluluk alanı genişlemiştir. 50 yıllık bir vizyon ile yapılan Taner Planı, kentin hızlı nüfus artışına bağlı büyümesi ve yerel baskılar nedeniyle etkinliğini kaybetmiştir. 1962 yılında İller Bankası tarafından yeniden halihazır haritalar hazırlatılması kararı alınmıştır (Çabuk vd., 2016).

3.3. Gündüz Özdeş Karabük-Safranbolu Bütünleşik Planı-1968



1962 yılında İller Bankası tarafından, Karabük'ün son durumunu gösteren yeni halihazır haritaları yaptırılmıştır (Fındıkoğlu, 1963; Ayten vd., 2010). 1960'lı yılların modernizm eleştrileri, yerellik, ekoloji ve kültürel mirasın korunması gündemlerini canlandırmıştır.

1964 yılında ülkemizinde altına imza attığı Venedik Tüzüğü ile tarihi ve kültürel miras niteliğinde olan alanlar koruma altına alınmıştır. Çabuk, vd. (2016), 1960 yılında Türkiye'de gerçekleşen ihtilal sonrası 'Planlama' her alanda önceliği aldığını, İmar ve İskân Bakanlığı bünyesinde Bölge Planlama Dairesi'nin kurulduğunu ve "Zonguldak Bölgesi Ön Planı" çalışmasının 1964 yılında yayınlandığı belirtmiştir. Bu süreçle paralel olarak Karabük'ün komşuluğunda bulunan Safranbolu, Prof. Dr. Gündüz Özdeş'in hazırladığı 1/25000 çevre düzeni planı sınırları içine dahil edilmiştir (Şekil 7).

Bu kapsamda Karabük ve Safranbolu'nun zaman içinde bütünleşmesi ve Karabük'ün Safranbolu yönüne doğru gelişmesi hedeflenmiştir. Karabük'ün 1/25000 ölçekli çevre düzeni planı, 1/5000 ölçekli nazım imar planları ve 1/1000 ölçekli uygulama imar planları Gündüz Özdeş tarafından hazırlamıştır. Planın Karabük kısmı 1968 yılında tamamlanmıştır.

Safranbolu'nun sit sınırlarının belirlendiği bu planın oluşturduğu koruma vizyonu, ilerleyen yıllarda Safranbolu'nun UNESCO Dünya Mirası Listesi'ne kabul edilmesinin de temelini oluşturmuştur. Karabük Safranbolu bütünleşik planı aynı zamanda Karabük kentinin potansiyel büyüme aksının yönünü, Safranbolu'ya doğru çevirmiştir. Plan kararlarında, mevcut konut alanlarının imarı dondurulmuş, öneri konut alanları düşük yoğunluklu planlanmıştır. Öneri sanayi alanları, 100. Yıl Mahallesi hariç olacak şekilde uygulamaya geçirilmiştir.

Şekil 7. Prof. Gündüz Özdeş, 1968, Karabük- Safranbolu Çevre Düzeni Planı. Ö:1/25000

Kaynak: (Çabuk vd., 2016)

Planlama süreci 1962 yılında hâlihazır haritanın hazırlatılması ile başlamıştır. 1969 yılında planın uygulamaya geçirilmesine kadar süren ara dönemde, yol ve yeşil alan olarak ayrılması planlanan alanlarda gecekondulaşma devam etmiştir. Bu nedenle Özdeş Planı uygulama kabiliyetini yitirmiştir (Çabuk, vd., 2016). Sonuç olarak Özdeş Planı'nın gereksinimleri karşılayamaması nedeniyle 1974 yılı sonrasında revizyon ihtiyacı gündeme gelmiştir.

3.4. Baran İdil Karabük Şehir Planı-1980

Gündüz Özdeş tarafından hazırlanan 1968 tarihli plan, dönemin kentsel ihtiyaçlarına yanıt vermekte yetersiz kalmış; özellikle planın uygulanabilirliğine dair sorunlar nedeniyle revizyona ihtiyaç duyulmuştur. Bu doğrultuda, 1974 yılında İller Bankası, Karabük'ün yeni imar planının hazırlanması işini Yüksek Mühendis Mimar Baran İdil'e vermiştir. Hazırlanan revizyon planı, 1980 yılında onaylanarak yürürlüğe girmiştir.

Baran İdil Planı, "alan kısıtlılığı" nedeniyle genel hatlarıyla Özdeş Planı ile benzerlik göstermektedir. İdil (1980), hazırladığı raporunda plan kararlarının alternatifleri olduğu için kendi planını esnek olarak nitelendirmiştir. Plan raporunda Özdeş Planı'nında alt ve üst ölçekli plan kararları arasında bir bağlantı olmadığını vurgulamıştır. İki plan arasında benzerlikler kadar dikkat çekici farklar da bulunmaktadır. En temel farklardan biri, yoğunluğa göre bölgelenen alanların dağılımıdır. Özdeş Planı'nda kentsel gelişim, daha merkez odaklı bir strateji izlerken; İdil Planı'nda Safranbolu ve Yüzüncü Yıl Mahallesi çevresinin gelişimi öncelik kazanmıştır. Özdeş Planı'nda sanayi alanı olarak düşünülen, İdil Planı'nda konut alanı olarak değiştirilmiştir, (Şekil 8).

Şekil 8. Baran İdil Planı

Kaynak: (Çabuk et al. 2016)

Yüzüncü Yıl mahallesi yakınındaki "Yüksekokul Alanı" plana işlenmiştir. Böylelikle gelecekte kente bir üniversite kurulma ihtimali gündeme gelmiştir. Özdeş Plan'ındaki spor ve eğlence merkezlerinin yeri, İdil Planı'nda gelecekte üniversite olması beklenen alanların yakınına kaydırılmıştır. Özdeş Planı'nda mahalle ve semt ölçeğinde yetersiz olan sosyal donatımlar, İdil Planı'nda yeniden

düzenlenmiştir. Özdeş planın açıkları arasında planlanmayan konuların yönetmeliklerce düzenlenmesi varken, İdil planı yapılaşma kotlarına kadar değinerek plan kısıtlarını artıran plan notları düşmüştür. Özdeş planında kadastral durum göz ardı edilmiş olup, gelişme alanlarının gelecekte düzenlenmek üzere bırakıldığı görülmektedir, İdil planı kadastral mülkiyetleri dikkate alarak plan sınırının tamamını imar sınırları içine almıştır.

3.5. Karabük Planlama Sürecinin Tarihsel Açıdan Değerlendirmesi

Bir endüstri kenti olarak kurulan Karabük'ün şehir planlaması, şehircilik ekolünün dört önemli ismi tarafından, dört farklı dönemde yapılmıştır. Tarihsel süreçte meydana gelen önemli kırılmalar şehir planlama yaklaşımını etkilemiştir. Karabük kentin farklı dönemlerde yapılan şehir planlarının biçimselliği de tarihi kırılmalardan etkilenmiştir. Çalışmada, Karabük'ün Avrupa ve Amerika ile paralellik gösteren planlama süreci; dört faklı dönem etkisi ile yapılan şehir planları, tasarım üslübu ve plan kararları bakımından deşifre edilmiştir. Savaştan çıkmış genç Cumhuriyet ülkesi Türkiye'de modern şehirleşmeye önem verilmiştir. Karabük'ün geçirdiği planlama süreci ülkemizin batılı örnekler gibi modernize olmasını hedefleyen bir vizyonun eseridir. Bu nedenle Karabük Türk şehircilik tarihi açısından önemli bir yere sahiptir. Bu nedenle kentin kuruluşundan itibaren şehir planlaması önemsenmiştir.

Modern şehircilik ekolü temsilcilerinden biri olan, ünlü Şehirci Mimar Henri Prost, 1938 yılında, Yenişenir Mahallesi planını hazırlamıştır. Planda modern üslup, ütopik bir yaklaşım ile benimsenmiştir. 5000 kişi kapasiteli bir yerleşke olarak tasarlanan mahalle içerisinde ihtiyaç duyulan bütün işlevler bulunmaktadır. Konut dağılımları statü ayrımlarına dikkat edilerek yapılmıştır. Planın bütüncül yaklaşımı bir ütopya niteliğinde olduğundan bu ayrışma, yoğun rekreasyon alanları ve sosyal donatıların akılcı ve estetik dağılımı gibi özel dokunuşlar nedeniyle hissedilmemektedir. Henri Prost'un hazırladığı Yenişehir Planı, aynı dönemde Avrupa ve Amerika'da fordizm etkisi ile yaygınlaşan ütopik banliyöleşme, uydu kent ve bahçe- şehir örneklerinin ustaca harmanlandığı bir örnektir.

Prost Planı mahalle ölçeğinde tasarlanmış bir öneridir. Tasarım alanı önceden kamulaştırıldığından plan kararları kendi içinde tutarlıdır. Fakat bu örnek model kent geneline yayılmamıştır. Kentte artan gecekondulaşma sorunu yeni bir plan yapılmasını gündeme getirmiştir. Öncelikle mevcut doku halihazır haritalarda tespit edilmiştir. Nezihe ve Pertev Taner tarafından Karabük'ün alt ve üst ölçeklerde planları hazırlanmıştır. Kentin büyüme aksları üst ölçeklerde tayin edilirken, 1/100 gibi alt ölçeklerde konut önerileri de getirilmiştir. Taner Planında, kısmen Prost Planı sürdürülmeye çalışsada gerek coğrafi sınırlılıklar gerekse mülkiyet koşulları bu durum karşısında bir engel teşkil etmiştir. Taner planı hazırlandığı dönemde eş zamanlı olarak Avrupa gündeminde olan Atina Anlaşması ile modern planlamanın ilkeleri belirlenmiştir. Bu bakımdan Taner Planı, genel hatları ile modern planlama ilkelerini benimsemektedir. Plan kentsel büyüme hızı karşısında yetersiz kaldığından yeni bir planlama ihtiyacı doğmuştur.

1968 yılında yürürlüğe giren Gündüz Özdeş Planı, Karabük ve Safranbolu'yu birleştiren bir plandır. Karabük'ün büyüme aksını Safranbolu yönüne çevirmiştir. 1960'lı yıllarda dünya gündemine hakim düşünce modern dönem eleştrilerini içermektedir. Endüstrileşme etkisi ile yaşanmaz hale gelen kentlerin sorunlarına çözümler, toplum için insani şartlar sağlayacak mekânsal düzenlemeler tartışılmaktadır. 1964 yılında Venedik Tüzüğü'nün yürülüğe girmesi, tüzük altında imzası olan ülkemizi de etkilemiştir. Özdeş Planı Safranbolu'nun korunması bağlamında bu tüzüğün ilkelerini benimsemiştir. Genel hatları ile modern üslup benimsenen planda, konut alanlarının yoğunluğunun düşürülmesi, imarlı alanların imarının durdurulması, yeşil alanlara ve rekreasyon alanlarına yer vermesi bakımından dönemin ekolojik kaygılarını taşımaktadır. Taner Planı ile benzer şekilde plan kararının alınması ve uygulamanması sırasında geçen süreçte kent, kontrolsüz büyümeye devam etmiştir. Özdeş Planında

yeşil alan olarak tasarlanan alanlarda gecekondulaşmaya bağlı çarpık kentleşme olması planın uygulanabilirliğini sınırlandırmıştır. Böylelikle tekrardan bir revizyon yapılması gerekmiştir.

1980 yılında Baran İdil tarafından hazırlanan revizyon planı da dünya gündemi ile eş zamanlılık göstermektedir. 1970'lerin sonunda başlayan ekonomik durgunluk ve enerji krizleri, Avrupa ülkelerinde ekonomik yapıyı ve kent altyapılarını yeniden gözden geçirmeye zorlamıştır. Sanayileşmeden hizmet sektörüne geçiş ve küreselleşme, kentlerin ekonomik fonksiyonlarını değiştirmiş, yeni ekonomi odaklı planlama ihtiyacı ortaya çıkmıştır. 1980'li yıllarda Avrupa'da kent planlaması, ekonomik krizler, sosyal sorunlar, çevresel bilinç ve yeni planlama yaklaşımlarıyla şekillendi. Bu dönemde, sürdürülebilir, katılımcı ve bütünsel kent planlaması kavramları önemli hale geldi. Kent planlamasında geleneksel tekniklerin yanı sıra, ekolojik planlama ve sürdürülebilir kalkınma ilkeleri gelişti. Çevre duyarlılığı ve yeşil alanların korunması ilkelerini vurguladı. Bu bağlamda İdil Planı, esnek tasarım anlayışı ile dünya gündemi ile paralel bir çizgidedir.

Yapılan çalışmada, Karabük kent planlama süreci dünyada kent planlama anayışını etkileyen tarihsel süreçle karşılaştırılmıştır. Bu karşılaştırmanın özeti Tablo 1'de gösterilmektedir.

Tablo 1. Kentsel Tasarımda Endüstri Devrimi Etkisi ile Dünya ve Karabükte Gerçekleşen Değişimin İzleri

Kronolojik Kırılma	Kentsel Mekânda Uluslararası Ölçekte Meydana Gelen Değişim	Kentsel Mekânda Karabük Ölçeğinde Meydana Gelen Değişim
19. yüzyıl Endüsrti Devrimi ve Fordizm	*Artan endüstrileşme ile yoğun göç alan şehirler yetersiz alt yapı nedeniyle yaşanmaz hale gelmiştir. *Bu dönem Avrupa ve Amerika'da kentten kaçış etkisi hakimdir. *Uydu kentler, banliyöler kıra özlemi gideren, sağlıklı, güvenli, eşitlikçi bir yaşam anlayışı sunmaktadır. *Deneysel ütopik modeller ile ideal kent yaşamı hayali deneyimlenmektedir.	*1934 KDFÇ kurulması *1938 Henri Prost ile kentleşmeye dair ilk yerleşim planı *Plan ütopik özellikler taşımaktadır.
Atina Anlaşması 1941	Modern Planlama standartları oluşturulmuştur.	*1948 Nezihe-Pertev Taner Planı *Modern üslup benimsenmiştir.
Venedik Tüzüğü 1964	*Venedik Tüzüğü, yerel halkın ve yerel yönetimlerin demokratik haklarını güvence altına alır. Bu, korumacı yaklaşımın temelini oluşturur; çünkü yerel değerler, haklar ve özgürlükler korunmalıdır. *Tüzük, sürdürülebilir kalkınma ve doğal/ kültürel varlıkların korunmasını destekler.	1968 Gündüz Özdeş Planı *Bütünleşik Karabük Safranbolu Çevre Düzeni Planı Hazırlanmıştır. *Modern üslup ve korumacı yaklaşım bir arada benimsenmiştir.

	*Doğal çevre ve yerel değerlerin "korunması" anlamında korumacı yaklaşım benimsenmiştir.	*Safranbolunun yerel değerlerini koruma altına alan sınırlar belirlenmiştir.
Avrupa Kentsel Şartı 1992	*Avrupa Konseyi Yerel ve Bölgesel Yönetimler Kongresi tarafından 1992'de kabul edilmiştir. *Yerel yönetimlere kent planlaması ve yönetiminde rehberlik ederek, sürdürülebilir, demokratik ve uyumlu bir kentsel toplum oluşturmayı amaçlar.	1980 Baran İdil Planı *Alternatifler barındıran esnek planlama yapılmıştır. *Plan onay süreçleri yerel yönetime geçmiştir.

3.5. Karabük Planlama Sürecinin Heterotopya Bağlamında Değerlendirmesi

1930'lı yıllarda ıssız bir coğrafyada kurulan demir çelik fabrikası, bu bölgede bir endüstri kenti kurulmasına neden olmuştur. Fabrikanın sürdürülebilirliği için ilk etapta, Fordist üretim ilkelerine göre, fabrika çalışanlarının konfor alanı sağlanmıştır. Fabrika için modern dönem şehir planlama anlayışına örnek bir plan şemasına sahip, lojman yerleşkesi tasarımı yapılmıştır. Karabük kentinin tarihselliği kentteki bu ütopik lojman yerleşkesi ile önem kazanmaktadır. Kentin planlaması ve planların uygulaması, kentte olan göç hızının gerisinde kalmıştır. Plansız alanlarda ortaya çıkan oluşumlar, planlı alanlardaki karmaşa, kenttin katmanlı tipolojisi, heterotopya açısından araştırılmış ve Tablo 2'de özetlenerek gösterilmiştir.

Modelin benimsediği üslup bahçe-kent ekolünün devamı niteliğindedir. Henri Prost tarafından hazırlanan Yenişehir Mahallesi Planı, sınırlı bir alan için düzenlenmiş, kentin gelecekteki büyümesini esas alan bir plan niteliğinde olmadığından 1939–1948 yılları arasında kentin sınırları içersinde, fabrikanın çekim etkisi ile plansız konut dokuları ortaya çıkmıştır. Çoğunluğunu işçi kesimin oluşturduğu bu plansız doku bir heterotopya niteliğindedir.

Göçlerle birlikte artan sağlıksız yaşam koşullarını düzeltmek ve endüstriyel saçaklanma etkisi ile kentin gelişim bölgelerinde oluşacak kent dokularının biçimlenişini belirlemek bu planın öncelikli hedefi olmuştur. Yenişehir Mahallesi'nde örnek bir yerleşim alanı kurulmasına rağmen endüstrinin çekim etkisi, gecekondulaşma sonucu çarpık kentleşmenin belediye sınırları içinde hızla artmasına neden olmuştur. Nezihe- Pertev Taner planı endüstrinin çekim etkisi ile ortaya çıkan sorunlara bir çözüm arayışı olarak hazırlanmıştır.

Tablo 2. Foucault'nun Genişletilmiş Heterotopya Örneklem Alanının Karabük Kentinde Analizi

Tip	**Özellikler**	**Heterotopya Örneklem Alanı**	**Genişletilmiş Güncel Örneklem Alanı**	**Karabükdeki Örnekler**
Kriz Heterotopyaları	*Medikal geçiş evresi mekânlarıdır. *Coğrafi bağlamı yoktur.	Kışla Manastır Yatılı okul	Rehabilitasyon Merkezleri	*Yenişehir Mahallesindeki Huzur Evi

	*Her yüzyıla kolay uyumlanır.	Huzur Evi		
Sapma Heterotopyaları	*Normlara uymayanların kapatıldığı mekânlardır. *Kontrole tabi mekânlardır. Kişiyi toplumdan izole eder. *Toplumsal davranışlara ve inanışlara göre değişkenlik gösterir. *Zamanın dönüşümüyle paralel dönüşüm gösterir. *Birbiri ile çelişkili durumları yan yana getirebilir.	Hapishane Akıl hastanesi	Kapalı Konut Soylulaştırma Azınlık Mahalleleri Getto	*Bölgesel göçlerle gelen işçiler ve ailelerin düzensiz bir biçimde, plansız alanlarda oluşturduğu mahalle dokuları *Bayır Mahallesi *Hürriyet Mahallesi
Yan yanalık	*İşlevsel veya anlamsal bakımdan birbiri ile uyumsuz mekânlardır. *Bir mekânın içinde birden fazla mekânsallık barındırabili.	Tiyatro Sinema Acem Bahçe	Kentsel Düğüm Noktaları Azınlık Mahallesi	*Bayır Mahallesi *Hürriyet Mahallesi *Yenişehir Sineması
Zaman Biriktiren Heterokroniler	*İçerikleri çeşitli zaman dilimine ait bilgi aktaran mekânlardır. Tarihin katmanlaşmasını, bir arada tutulmasını ve sunulmasını sağlayan mekânlardır.	Kütüphane Müze	Palimpsest	*Yenişehir Mahallesi
Geçici Heterokroniler	*Belirli bir zamanda geçici işleve sahip mekânlardır. İşlevi yerine getirdikten sonra kentsel boşluğa dönüşürler.	Fuar Panayır Tatil Köyü	Kamp Alanı Pazar Yeri Konser Alanları	*Alışveriş ve ticaretin yapıldığı geçici alanları *Araç Çayı kıyısına kurulan sezonluk panayır alanı

Karabük planlama sürecinde ortaya çıkan heterotopik oluşumlar Foucault'nun altı ilkesi ve literatürdeki güncel örnekler açısından değerlendirilmiştir. Yapılan analiz aşağıda Tablo 2'de özetlenmiştir.

Taner Planı'nda, Prost Planı'ndaki bahçe-şehir yaklaşımı sürdürülmüş fakat konut alanlarında parselasyon yapılmıştır. Plansız alanlardaki gecekondu oluşumları büyük ölçüde yok sayılmıştır. Taner Planı genel hatları ile kentsel müdahaleyi sağlamış olsada işlevsel dağılım kendiliğinden oluşan doku yüzünden tam anlamıyla gerçekleşmemiştir. İstasyon bölgesinde plansız konumlanan kereste fabrikası, bu bölgenin zorunlu olarak, küçük ölçekli endüstri yapıları için, imara açılmasına neden olmuştur. Fakat kentin bu bölümü aynı zamanda ticaret aksının devamında ve bu aksla güçlü bir ilişki kurmaktadır. Bu bölgedeki boş alanların yerel baskılar da dikkate alınarak endüstri işlevleri ile değerlendirilmesi başka bir heterotopya oluşumuna neden olmuştur.

Taner Planı'nda farklı işlevlerde parçalı iki meydan düşünülmüştür. Bu nedenle kentin bütüncül bir merkezi yoktur. Planda ticaret işlevleri kentin belirli bir bölgesinde konumlanmamıştır. Mevcut caddeler ticaret aksı olarak kullanılmaya devam edilmiştir. Kentin merkez ihtiyacı ve ticaret bölgesinin olmayışı planın zayıf yönlerini oluşturmaktadır. Bu yaklaşımlar nedeniyle ilerleyen süreçte kamu yapıları dağınık yerleştirilmiş, güçlü bir kent meydanının biçimsel etkisi ile oluşması beklenen kent kimliği oluşmamıştır. Ticaret için özel bir bölge seçilmemiş ve ticaret işlevleri de kendi içinde sınıflandırılamamaştır. Ticaret aksı olarak kullanılan caddelerin yoğunluğu artırmıştır. Bu bölgelerdeki işlev karmaşası ve yoğunluk heterotopya oluşumlarını artırmıştır.

Özdeş Planı Karabük'ün potansiyellerini öne çıkarmayı hedeflemiştir. Karabük'ün büyüme yönünü Safranbolu'ya çevirmiştir. Safranbolu'nun korunmasına önem vermiştir. Konut alanlarındaki yoğunlukların azaltılmasını önermiştir, yeşil alanları artırmıştır. Çay kıyılarının rekreatif kullanımı, spor alanlarının bu bölgelerde konumlandırılması gibi plan kararları, ekolojik kaygıları olan bir plan olduğunu göstermektedir. Plan kentin çarpık yapılaşmış altlığının üzerine uygulandığı için bu bölgelerin yıkımı ve yeniden yapımı büyük bütçeler gerektireceğinden, yerinde uygulanamamıştır. Bu bölgelerin heterotopya durumu artmaya devam etmiştir.

İdil Planı, Özdeş Planı'nın statik bir plan olması ve kadastral durumu dikkate alınması gerekçeleriyle tasarlanmıştır. Bu planda Safranbolu ve 100. Yıl mahallesi ve çevresine önem verilmiştir. Plan kararları alternatifli olduğundan esnek ve dinamik bir yapıya sahiptir. Planda rakamsal değerler her açıdan yüksek tutulmuştur. Tüm bunlara rağmen İdil Planı da kentin artan nüfusu ile gerçekleşen

büyümeyi kontrol altına almakta yetersiz kalmıştır. Özdeş Planı ve Taner Planı'nda olduğu gibi halihazır altlıklardaki gecekondu yapılaşmasına dokunulmamıştır. Bu bölgeler hetertopya özelliğini korumuştur.

4. Değerlendirme ve Sonuç

Erken dönem modern şehir plancıları, ideal kent planının merkezine, kapitalist sistemin enstürmanı olan mekânları ve onlarla ilişkili kentsel pratikleri yerleştirmektedir. Kent merkezlerine yerleştirilen endüstri mekân pratikleri saçaklanma etkisi ile çeperlerinde konumlanan konut alanları oluşturmaktadır. Endüstrinin çekim etkisi kentlerin büyümesini kaçınılmaz hale getirmiştir. Bu büyüme kentlerin yaşanabilir yerler olmasını giderek zorlaştırmıştır. 19. yüzyıl endüstri odaklı yerleşkelerin kurulması ön plana çıkmıştır. Bu yerleşkeler büyüyerek endüstri kentlerini oluşturmuştur. 1940' lı yıllarda Avrupa şehirleri endüstrileşmenin etkisi ile kimliklerini kaybederken, kentsel sorunların artması, insanların kent dışına taşındığı ütopya önermelerini ortaya çıkarmaktadır. Mevcut şehirlerin yoğunluk yükünün seyreltilmesi için banliyöler, uydu kentler, bahçe kentler gibi tasarım önermeleri geliştirilmiştir. Bu ütopya önerileri, mekânsal bölgelemesi kendi içlerinde yapılmış olan ve ana kentten uzak konumlanan yerleşkelerdir. Fordizim'in etkisi ile bu kentlere ulaşım kolaylıkla sağlanmaktadır. Ana kentle ulaşımın tren ya da kara yolu ile sağlandığı bu modüller, saçaklanma etkisiyle zamanla ana kentle birleşmektedir. 1960'lar, modernizme karşı eleştrilerin arttığı bir dönemdir. Bu dönem post-endüstriyel ve post-modern dönem olarak bilinmektedir. Modern üslubun kentsel plan tipolojileri üzerindeki etkinliği giderek azalmaktadır. Hümanist söylemler, yaşam hakları, özgürlükler, eşitlik, adalet, kimlik, aidiyet, kirlilik, çevre sorunları gibi konular gündemde etkin bir biçimde tartışılmaktadır.

Modernizm ve Bauhaus ilkeleri ile konut alanlarının kent merkezinin dışına taşınmasını hedefleyen ütopyaların, kentin saçaklanarak büyümesine neden olmuştur. Bu ütopyalar bir çözüm aracı olma özelliğini yitirmiştir. 1960'ların tartışma konularına ortak çözüm kenti giderek yok eden endüstri alanlarının kent merkezlerinden uzaklaştırılmasıdır. Bu büyük deplase hamlesi kentin yeniden bölgelenmesinin önünü açmıştır. Kentsel boşluklar bir süre atıl kalsa da bu bölgeler zamanla dönüşüm geçirmiştir. Bu bölgelerde kenti canlandıracak tasarımlar yapılması hedeflenmiştir. Bu dönem kentsel krizlerin kentten kaçarak değil kentin içinde çözüldüğü bir dönemdir. Teknolojinin hızlı yükselişi fütürist ütopyaların üretilmesinin önünü açmaktadır. Tarihi mirasın korunması, ekolojik dengenin bozulmaması gibi söylemler, bu dönemin en önemli söylemleridir. Kentin doğal dokusu ve yapılı çevrenin silüetinin korunması, önemli dönemleri temsil eden yapıların ve dokuların korunması hedeflenmiştir. Kentlerin çarpık kentleşen bölgelerinin temizlenmesi, dönüşüme girmesi, bazı yapıların yeniden işlevlendirilmesi yoluyla kentsel mekânlara müdahalle yapılması önerilmiştir. Ütopyalar, kelime anlamından da anlaşılacağı üzere hayali yerlerdir. Ütopya tasarım önermeleri ise birer kent modeli kurgusudur. Bu nedenle ütopya tasarımlarının pek çoğu tasarıda kalmıştır. İçlerinden bazıları hayata geçirilse de ütopyaların tasarımsal sınırlılıkları büyüyerek yaygınlaşmalarının önünde engel olmuştur.

19. yüzyıl, endüstri devriminin dinamikleri ile kontrolsüzce kentleşme gerçekleşmiştir. 20. yüzyılın ilk yarısı bu sorunlara çözüm olarak kentten uzaklaşma fikri önem kazanmıştır. 20. yüzyılın ikinci yarısında kentsel sorunlar, kentlerin içinde alınan tedbirlerle çözülmeye çalışılmıştır. 21. yüzyıl ise 20. yüzyılın son çeyreğinde başlayan teknoloji hamlelerinin hızla gelişmesi ile şekillenmektedir. Bilgisayar teknolojileri, internetin bulunması ve yaygınlaşması, cep telefonu teknolojileri, nano teknolojiler, yapay zeka gibi kavramlar 21. yüzyılın sinerjisini oluşturmaktadır. Bu sinerji beraberinde hakikat arayışını getirmiştir. İçinde yaşadığımız yüzyıl günümüze değin koyulmuş bütün kuralların haliyle de bütün mekânların da sorgulandığı bir dönemdir. 21. yüzyılın ütopya arayışı çağın sorunları ile şekillenmektedir. Kirlilik, kıtlık, savaşlar, bölgesel göçler, afetler görünen en önemli sorunlardır. 19. yüzyılın sosyalist ütopistleri için özgürlük, adalet ve eşit şartların sağlanması tartışılırken; 21. yüzyıl dünyası salgınların, savaşların, ekonomik krizlerin etkisinde nasıl hayatta kalınır sorusu tartışılmaktadır.

19. ve 20. yüzyılda mekânın zamansallığı ve anlamsallığı tartışılırken, modernitenin mekânın anlam derinliğini eriterek soyutlaştırdığı kanısı ortaya çıkmıştır. Yeni anlam arayışları ile post-modernizm ortaya çıkmıştır. Modernite, gerek mimari gerek şehircilik bağlamında mekânı işlevsellikle ön planda tutmuştur. Bu durum bireyin topluluktan koparak yalnızlaşmasına neden olmaktadır. Oysa insan doğası gereği etkileşimde olması gereken bir canlıdır. İşlevlerin kusursuz işlediği bir dünyada gündelik yaşam her ne kadar kolay olsada oldukça sıkıcıdır. Hümanist söylemlerle gündelik hayata sızan modernizmin kuralcı yapısı postmodern süreçte tartışılmıştır.

Mimari ve şehircilikte, 1960'lı yıllarda başlayan eleştiriler ve teknolojik gelişmelerden etkilenmiştir. Modernitenin kalıplaşmış ilkeleri ve bilinen asal geometrik formlara sadık tasarım anlayışı yerini; kalıplaşmış düzen ve yapısından uzak, geleneksel geometrik kuralların dışına çıkan, düzensizlik ve organiklikle ilgilenen ve çeşitli bilgisayar programları aracılığı ile kolaylıkla modellenen amorf geometrilere bırakmıştır. 21. yüzyılda, uzak dünya kavramı giderek yok eden internet, erişimi sınırsız kılmış, gündelik hayata gerçek olmayan anlamına gelen "sanal" kavramı, yerleştirmiştir. Hizmet sektörü internet ile yön değiştirmiştir. Yapay zeka araçları düşünen insan modelinin yerine geçmektedir. Bilinen üretim ve tüketim pratiklerini değişmektedir. Bilinen mekân anlayışı, ekonomik, sosyal, politik itkiler ile dönüşmektedir. Bu değişim kentleşme anlayışına da yansımaktadır. Kentsel mekân pratiklerinde meydana gelen değişimler ideal kent ne olmalı sorusunu her daim gündemde tutmaktadır.

Her dönem ortaya çıkan ütopyalar kentlerin sürdürülebilirliğinde önemli bir rol oynamaktadır. Sürdürülebilirlik kavramı her ne kadar 1980'lerden sonra güncel literatüre girmiş olsa da kentsel krizlerin çözüm arayışı olarak ortaya çıkan ütopyalar, kentsel sürdürülebilirliği sağlamak konusunda deneysel birer alan oluşturmaktadır.

Heterotopya kavramı, Foucault'nun altı ilkesi ve güncel literatür örnekleri aracılığı ile araştırıldığında, kavramın katmanlı yapısı ortaya çıkmaktadır. Heterotopya kavramını ötekinin, farklı olanın mekânı olarak tanımlamak, kavramın anlamsal derinliğini sığlaştırmaktadır. Foucault'nun heterotopya tanımlamasındaki örnekler üzerinden ele alındığında kavramın üç temel olgu ile ortaya çıktığını söylemek mümkündür.

Heterotopya kavramını ortaya çıkaran ilk olgu, heterotopyaların kendiliğinden var olmasıdır. Bu heterotopya türü; öteki, farklı, azınlık, dışlanmış olarak tabir edilenlerin tek başlarına ya da türdeşleri ile birleşerek oluşturduğu mekânsallıktır. Bu mekânsallık, topluluğun normlarına uymayanların, topluluk içinde kendine yer tayin etme biçimidir.

Heterotopya kavramını ortaya çıkaran ikinci olgu, kapitalist sistemin sürdürülebilirliği için normlar çerçevesinde modernizm eliyle üretilmiş heterotopyalardır. Bu heterotopyalara örnek olarak hapishaneler, müzeler, tatil köyleri, gibi örnekler verilebilir. Bu örneklerin birbiri ile ilişkisi olmasa da mekânsal bakımdam tüketim toplumunun kurallı yapısını korumak için üretilmişlerdir.

Heterotopya kavramını ortaya çıkaran üçüncü olgu zamanın ruhuna göre işlevini yitiren anlamların/mekânların yerini alan/dolduran heterotopyalardır. Bu heterotopya oluşumları da kentsel sürdürülebilirlik için önemli rol oynamaktadır. Bir kentte işlevini yitirmiş bir mekânın yerine getirilen bir başka işlevsel mekân kentin sürdürülebilirliğini sağlarken, heterotopya olması da kaçınılmazdır.

Bu bağlamda, ortaya çıkış biçimi açısıdan değerlendirilen heterotopyaların ortaya çıkışındaki olgulardan ikisi kentsel mekânı doğrudan etkilemektedir. Modernite eliyle ya da işlev değişikliği gibi nedenlerle ortaya çıkan heterotopyalar sürdürülebilir kentleşme bağlamında oldukça büyük öneme sahiptir.

Çok katmanlı bir kavram olan heterotopya, zaman-mekân bağlamında; kentsel büyüme sonucu sürekli değişen kent planlarında da ortaya çıkmaktadır. Kavram kentsel mekânda; yan yanalığın,

aradalığın, üst üsteliğin mekânı olarak ortaya çıkmaktadır. Yan yanalık, aradalık, üst üstelik gibi kavramlar, fiziki mekân tarifi yapmanın yanı sıra zamansallıkta bildirmektedir. Tarihsel kırılmalar sonucu değişim gösteren kentsel plan tipolojilerinde bu durumlar gözlemlenebilmektedir. Tarihsel süreçte katmanlaşnan plan tipolojileri, mekânların, yan yana, üst üste, arada kalması gibi durumlarla palimsest özelliği göstermektedir.

20. yüzyılın başında Cumhuriyet ile tanışan Türkiye'de, Sümerbank ve İller bankası kalkınma projeleri geliştirerek batılı endüstrileşme ve modernizasyon hareketine dahil olmuştur. Sümerbank yatırımları aracılığı ile bir köy yerleşimi olan Karabük'te kurulan KDÇF, önemli bir bölgesel kalkınma hamlesidir. Başlangıçta, barınma alanları prefabrik konutlarda karşılanan fabrikanın, sürdürülebilirliği için 1938 yılında bahçe- şehir ekolünü temsil eden Şehirci Henri Prost davet edilmiştir. Henri Prost tarafından, lojmanlar için kamulaştırılan alana, bahçe- şehir tarzında ütopik bir yerleşke tasarlanmıştır. Yerleşkenin, modern üsluptaki tasarımının ilerleyen dönemde kentin gelişme ve büyümesinde, bir rol model olması beklenmiştir.

Mülkiyet hakları, kamulaştırma ve coğrafi sınırlılıklar gibi negatif etmenler Prost Planın sürdürülebilir olmasının önünde engel olmuştur. Fabrikanın çekim merkezi olması nedeniyle hızla artan nüfusun barınma ve lojman ihtiyacı konusunda yerleşkenin yetersiz kalması, fabrika çeperlerinden yayılan gecekondu alanları ile çarpık kentleşmeye neden olmuştur.

Karabük coğrafi olarak yüksek yamaçlarla çevrili bir bölgededir. Kentin konut dokusu bu yamaçlara dağınık biçimde yerleşmektedir. Yamaçlar arasındaki derin vadiler konut alanlarının bütünleşmeni engellemektedir. Yamaçlarla çevrili şehrin dik eğimli arazisi yapılaşmayı zorlaştırmaktadır. Kentin içinden geçen ve kentin beklenen büyüme aksına paralel giden Araç Çayı, coğrafi bir sınır oluşturmaktadır. Aynı zamanda bu çay taşkın riski nedeni ile yapılaşma için de sınır oluşturmaktadır.

Çalışma kapsamında incelenen endüstri kenti Karabük'ün planlama süreci dört dönemden oluşmaktadır. Bu dönemlerde batıda şehircilik anlamında gerçekleşen değişimlere paralel olarak planlama yapılmıştır. Fordizm etkisi ile ortaya çıkan banliyö ve uydu kent kültürünün etkisi, Karabük ölçeğinde kentin kuruluş aşamasında deneysel bir model olarak görülmektedir. Demir Çelik Fabrikası için mahalle ölçeğinde Henri Prost tarafından tasarlanan lojman yerleşkesi, Türkiye ölçeğinde önemli bir örnektir. Bu yerleşke 19. yüzyılın sonlarında ortaya çıkan ve 20. yüzyılın ilk yarısında etkili olan bahçe-şehir yaklaşımını temsil eden bir modeldir. Yerleşkenin tasarımında modern üslup benimsenmiştir. Bahçe-şehir yaklaşımı ile alçak katlı, ekolojik, sağlıklı, yeşile doygun bir tasarım olmasını sağlamıştır. Tarihsel açıdan Yenişehir Mahallesi'nin tasarımı Karabük'te ilk kentsel oluşumun izini oluşturmaktadır. Yenişehir mahallesi kendi içinde bir ütopyadır.

Demir çelik fabrikasının çekim potalsiyeli ile Karabük kenti yoğun göç almıştır. Lojman yerleşkesi sınırlı bir alanda, 5000 kişi kapasiteli olarak tasarlandığından, kente göçle gelenlerin barınma sorununu çözmekte yetersiz kalmıştır. Mahalle çeperleri, kentin tren istasyonuna yakın bölgeler ve kentin içinden geçen çayın kenarındaki alanlar hızla gecekondu bölgelerine dönüşmüştür. Bu gecekondu yerleşimleri; Yenişehir Mahallesi'nin tutarlı, ütopik tasarımı karşısında, bir heterotopya oluşturmaktadır. Hızlı nüfus artışı kentin 1941 yılında belediye statüsüne kavuşmasını sağlamıştır. Gecekondulaşmanın durdurulması için ilk tedbir bu dönemde alınmıştır. Kentteki bozuk dokuların tespit edilerek halihazır haritalara işlenmesi ve bundan sonra da kentin büyümesini öngören bir kent planı tasarısı için Nezihe ve Taner Pertev çifti görevlendirilmiştir.

Taner Planı olarak adlandırılan bu dönemde, Prost Planının izleri takip edilmeye çalışılmış fakat mülkiyet hakkı gibi nedenler ile imar düzenlemeleri parsel bazında yapılmak zorunda kalınmıştır. Taner Planı'nda 'İstasyon Meydanı' ve 'Cumhuriyet ve Hükümet Meydanı' şeklinde iki meydan tasarımı

olması belirgin bir kent merkezi olmasının önüne geçmiştir. Kentsel doku içerisindeki güçlü akslar ticaret aksı olarak tayin edilmiş, kente özgü bir ticaret bölgesi planlanmamıştır. Güçlü akslar üzerindeki konumlanan ticaret işlevleri, bu akslar üzerinde yoğunluğu artırarak, karmaşık bir doku oluşturmuştur. Bu bölgelerdeki düzensiz ticaret alanı dağılımı bir heterotopya oluşturmaktadır. Kent meydanı olarak tasarlanan bölgede kentin gelecek vizyonuna göre yeteri kadar kamu binası önerilmemesi ilerde kamu binalarının kent içinde farklı alanlara dağılmasına neden olmuştur. Bu durum da bir heterotopya oluşturmuştur. Göç yolu ile gelen işçilerin kendi imkanları ile oluşturdukları yerleşim alanları çarpık kentleşme bağlamında bir heterotopyadır. Fakat bu heterotopyalar fabrikanın sürdürülebilirliği için önem arz etmektedir. Lojmanların yetersizliği nedeniyle kalacak yeri olmayacan işçilerin barınma sorunlarını kendi imkaları ile çözmeleri istenilen bir durum olmasa da fabrikanın devamlılığı açısından bu heterotopik oluşumlara göz yumulduğu görülmektedir. Taner Planı, kentin büyüme hızı karşısında 10 yıl içinde geçerliliğini yitirmiştir.

1968 yılında kabul edilen Gündüz Özdeş Planı, Karabük ve Safranbolu'yu birleştiren ve Karabük'ün büyüme yönünü Safranbolu'ya çeviren bir plandır. Bu plan, 1960'larda dünya genelinde hakim olan modern kent eleştirilerini yansıtarak, hızlı sanayileşmenin kentler üzerindeki olumsuz etkilerine çözüm aramayı amaçlamıştır. 1964 yılında kabul edilen Venedik Tüzüğü'nün ilkelerine uygun hareket edilerek, Safranbolu'nun korunması ön planda tutulmuştur. Plan, modern mimari tarzı benimsemekle birlikte ekolojik unsurlar da taşımaktadır. Konut alanlarındaki yoğunluğun azaltılması önerilmiş, yeşil alanlar artırılmıştır. Özdeş Planı Karabük'ün potansiyellerini öne çıkarmayı hedeflemiştir. Plan; kentin çarpık yapılaşan altlığının üzerine uygulandığından, planda ayrılan bölgelerde de çarpık yapılaşma devam ettiğinden, yerinde uygulanamamış ve planda tekrar revizyon gerekmiştir. Çarpık kentleşen bölgelerin heterotopya durumu artmaya devam etmiştir.

Özdeş Planı'nın esnek olmayan katı yapısı, kentin büyümesini kontrol altına alamayışı, tasarı alanlarının gecekondulaşmaya devam etmesi, İdil Planı'nın hazırlanmasına neden olmuştur. İdil Planı'nın plan kararları alternatifler içerdiğinden plan esnek bir yapıya sahiptir. Geniş ölçekli bir kent planı olmasına rağmen mevcut gecekondu dokuları kaldırılmadığından, plan kısmen uygulamaya geçirilmiştir. Bu nedenlede çarpık kentleşmeyi önlemede yetersiz kalmıştır. Kentin plansız alanlarında ve de planlandığı halde uygulama başlatılamayan alanlarda, gecekondulaşma devam etmiştir.

Karabük'ün planlama dönemleri incelendiğinde, yapılan plan çalışmalarının modern üslubü benimsediği görülmektedir. Plan tasarıları kendi içlerinde tutarlı, uygulanabilirliği yüksek, iyi birer şehircilik örnekleri olmalarına rağmen kentin büyüme dinamikleri, bu planların uygulanmasına elverişli bir ortam sağlamamıştır. Planlar, plansız alanlarda kendiliğinden yapılaşan dokuların üzerine çizilen taslaklar ile oluşturulmuştur. Bu çarpık dokuların kent içinden kaldırılması; siyasal, ekonomik ve toplumsal nedenlerden ötürü mümkün olmamıştır. Üst üste katmanlanarak hazırlanan planlar, kısmen hayata geçirilse de Yenişehir Mahallesi dışındakiler hiçbir zaman tam anlamıyla kentin bütününe nüfuz etmemiştir. Bu nedenle de kentin en yoğun kullanımlı bölgelerinde heterotopya oluşumları ortaya çıkmıştır.

Endüstri Devrimi, kentleri yalnızca fiziksel anlamda değil, toplumsal ve kültürel anlamda da köklü biçimde dönüştürmüştür. Bu dönüşüm sürecinde, ütopyacı kent anlayışı ile yaşanabilir, sağlıklı ve dengeli kentler tasarlanmak istenmiş, ancak bu tasarımların birçoğu plan taslaklarından öteye geçememiştir. Michel Foucault'nun heterotopya kavramı, kentlerin içinde barındırdığı çok katmanlı, çoğu zaman çelişkili mekânsal örgütlenmeleri anlamak için güçlü bir araçtır. Ütopya ile heterotopya arasında kurulan bu bağlam, kentlerin yalnızca planlanan yapılar değil; aynı zamanda gündelik yaşam pratikleriyle şekillenen, çok yönlü ve dinamik alanlar olduğunu ortaya koyar.

Bugünün sürdürülebilir kent araştırmaları geçmişteki ideal kent ütopyalarının izlerini taşımakla birlikte, gerçekçi, çok aktörlü ve katılımcı bir yaklaşıma evrilmiştir. Sürdürülebilirlik artık yalnızca çevresel değil, sosyal ve ekonomik adalet boyutlarını da kapsayan bütüncül bir kent anlayışı sunmaktadır. Bu bağlamda, heterotopyaların sunduğu alternatif mekânsal örgütlenmeler ve geçici, deneysel çözümler, sürdürülebilir kent modellerinde yenilikçi yaklaşımlar için zemin oluşturmaktadır. Sonuç olarak, sürdürülebilir kentleşme modelleri, geçmişin ütopyacı ideallerinden beslenen; ancak çok katmanlı, esnek ve kapsayıcı yapısıyla heterotopik gerçekliklerle iç içe geçmiş modellerdir.

Çatışma Beyanı (Competing Interests)

Çalışmanın yazarları, herhangi bir çıkar çatışması olmadığını beyan etmektedir.

The authors declare that they have no competing interests.

Destek ve Teşekkür (Fundings and Acknowledgments)

Çalışma, kamusal, özel, ticari nitelikte ya da kar amacı gütmeyen herhangi bir kurumdan destek alınmadan hazırlanmıştır.

This research received no specific grant from any funding agency in the public, commercial, or not-for-profit sectors.

Etik Beyanı (Ethical Statement)

Bu çalışmanın hazırlanma sürecinde bilimsel ve etik ilkelere uyulduğu ve yararlanılan tüm çalışmaların kaynakçada belirtildiği beyan olunur.

It is declared that scientific and ethical principles have been followed while carrying out and writing this study and that all the sources used have been properly cited.

Araştırmacının Katkı Oranı (Author's Contributions)

Yazarlar çalışmaya eşit oranlarda katkı sağlamışlardır.

The authors contributed equally to the study.

Abstract

Fire risk management in historic buildings constitutes a critical challenge for cultural heritage preservation. The failure to adequately address fire risk, particularly in historic cities such as Safranbolu, may result in irreversible losses. This study addresses the research gap in quantitative fire load assessment methodologies for historic wooden structures by conducting an analysis on a heritage building in Safranbolu, Turkiye. The proposed methodology systematically quantifies both fixed and movable fire loads using established calorific values and mass calculations in accordance with BS 7974 and NFPA 557 standards. Fire load densities were determined for all combustible materials and subsequently compared against international risk classification standards. The results revealed a total fire load density of 6.713 GJ/m², placing the building in the "High Fire Risk" category (Level 6). Fixed fire loads (2.757 GJ) were predominantly associated with Scots pine ceiling beams (39.9% of fixed loads) and floor coverings (10.2% of fixed loads), whereas movable fire loads (1.567 GJ) were largely attributed to plastic chairs (74.1% of movable loads). Material-based interventions were estimated to potentially reduce fire load density by 1.2–1.6 GJ/m² through strategic replacement of selected furnishings. This research introduces a replicable quantitative framework for fire load assessment in heritage buildings, thereby contributing to evidence-based fire risk management strategies while ensuring the preservation of cultural authenticity.

1. Introduction

Historic buildings represent irreplaceable repositories of architectural and cultural heritage, embodying the aesthetic accumulation of societies and gaining value over time [1]. These structures are remembered not only for their physical presence but also for their symbolic significance as representations of history and identity. In Turkiye, the Cultural Heritage Preservation Board, established in 1986, has been responsible for developing inspections, regulations, and guidelines for the protection, restoration, and transmission of buildings with historical and cultural value to future generations.

Fire incidents in heritage buildings cause catastrophic losses that extend far beyond material damage, leading to the irreversible destruction of collective memory by preventing the transfer of cultural information and documents to future generations [2]. The widespread use of wooden materials with low fire resistance, combined with the presence of carpets, furniture, and flammable insulation products, increases fire risk and exacerbates potential losses [3]. Recent high-profile disasters, such as the 2019 Notre Dame

Cathedral fire, highlight the urgent need for proactive fire risk assessment in heritage sites.

Fire risk in historic buildings encompasses both the probability of fire outbreak and spread, as well as the material and intangible losses that may result. The necessity of safeguarding historic buildings and the artifacts they contain requires a fire safety approach that incorporates unique and innovative solutions tailored to their specific characteristics [4]. A fundamental step in fire safety is the determination of fire load density, which provides insight into the potential magnitude, rate of spread, and severity of a fire [5]. Fire load refers to the total potential energy of combustible materials within a given area of a building [6].

Depending on the flammability properties of these materials, the tendency of a fire to spread and intensify varies significantly [7]. In this context, the type, quantity, and distribution of combustible materials in historic buildings strongly influence the overall fire load, underscoring the need to balance conservation principles with fire safety strategies [8].

Current fire safety research predominantly emphasizes modern building typologies, with limited focus on the distinctive characteristics of historic structures. While general fire load assessment methodologies are available [6,9], their application to heritage buildings requires careful adaptation to account for traditional materials, historical construction techniques, and preservation constraints. The frequent occurrence of fires in historical buildings in Turkiye in recent years, coupled with the absence of specialized regulations tailored to heritage structures, underscores both the importance and urgency of addressing this issue [10].

Safranbolu, with its traditional urban fabric and cultural heritage, has been inscribed on the UNESCO World Heritage List since 1994. However, over the past 11 years, 58 fires have been recorded in the “Historic Bazaar” district, leaving many structures unusable. This alarming situation demonstrates that fire risk remains a serious and ongoing threat to historic buildings, emphasizing the necessity of implementing preventive and risk-reduction measures (Figure 1).

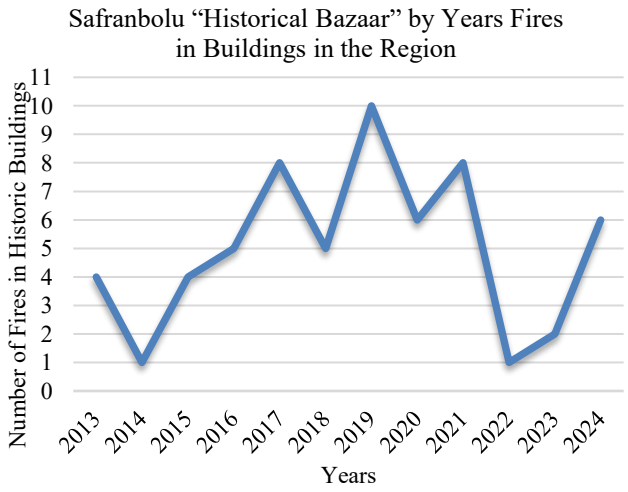

Figure 1. Annual distribution of fire incidents in historic buildings of the Safranbolu Historical Bazaar [11]

2. Literature Review

Fires in historic buildings frequently result in irreparable losses [12]. The extensive use of wooden materials in such structures substantially increases fire risk [13], leading not only to historical, cultural, functional, and economic damages but also to adverse psychological impacts on society. Even when historic buildings are restored in line with their original form after a fire, their authenticity and historical value inevitably diminish due to the replacement of original materials [14]. The Notre Dame Cathedral fire on April 15, 2019, stands as a prominent example of these challenges, where, despite comprehensive restoration efforts, the building’s original character was irreversibly compromised (Figure 2).

Figure 2. The Notre Dame Cathedral fire on April 15, 2019 [15] (above) and post-fire restoration works (below) (Personal archive)

The flammability of materials in historic buildings directly influences fire load and outbreak risk, thereby complicating fire risk management processes. This challenge is particularly critical in wooden structures, where traditional construction methods and materials generate unique fire behavior patterns that differ from those observed in modern buildings.

Fire load assessment in historic buildings requires specialized approaches that account for both traditional and contemporary materials. Gouveia and Andrade [16], for example, examined fire load density in 43 historic buildings in Ouro Preto, Brazil, reporting an average of 2.989 GJ/m². Their study highlighted the significant contribution of wood materials, particularly in commercial buildings where intensities reached up to ten times the Brazilian fire safety standard values. However, the Brazilian context differs considerably from Ottoman heritage buildings with respect to construction techniques, material use, and climatic conditions, thereby limiting direct comparability with Turkish heritage sites.

Material composition and spatial function are also critical factors in fire load distribution. Nayak and Subramanian [17] analyzed fire loads in educational, office, and library buildings, noting that the predominant sources were paper, wood, and furniture. Their findings showed that classrooms had lower fire loads compared to other spaces, while libraries and storage areas exhibited significantly higher values due to the concentration of paper materials.

The distinction between fixed and movable fire loads is another key parameter in risk assessment. Li et al. [5] separately calculated fixed fire load (FFL) and movable fire load (MFL) in historic wooden buildings in Beijing, identifying an average building fire load of 2.847 GJ/m². Most of the load originated from fixed elements such as roof panels, beams, and columns. Using K-means clustering, they observed that fixed fire load initially decreases with increasing building size but rises again beyond a certain threshold, whereas movable fire load varies depending on building function. While their study provides valuable insight into fixed versus movable fire load dynamics, differences in residential usage patterns and wood species between Chinese and Ottoman buildings indicate that fire load patterns remain highly context-specific.

Fire load values also depend on building size, function, and user density, beyond material content alone. Su et al. [12] investigated live fire loads in 21 historic Japanese buildings, demonstrating strong correlations between room fire load density, spatial dimensions, and intended use. Storage rooms showed the highest fire load density (0.431 GJ/m²), underscoring the importance of functional programming in risk assessment. Nevertheless, Japanese wooden buildings represent a different architectural and cultural tradition compared to Ottoman-era structures, where spatial organization and material selection follow distinct historical trajectories.

Beyond individual buildings, fire risks in historic environments extend to the urban scale. Geospatial analyses of hazardous facilities and their compliance with fire safety regulations provide essential insights for integrated urban risk management and public safety planning [18]. Neto and Ferreira [3], for instance, proposed six interventions to evaluate and mitigate fire risks in historic cities, considering building age, structural characteristics, narrow streets, and flammable material concentrations. Applying both the Fire Risk Index (FRI) and the Analise de Risco de Incêndio em Centros Antigos (ARICA) method to 269 historic buildings in Guimarães, Portugal, they found that more than 30% of the buildings presented moderate to high fire risk. Their findings led to recommendations for specific fire regulations and the use of fire-resistant materials in historic contexts. Although Mediterranean parallels exist with Safranbolu, the ARICA methodology emphasizes urban-scale analysis, contrasting with the building-level material quantification required for UNESCO heritage sites.

While existing literature establishes core principles of fire load assessment, several gaps remain in the context of heritage buildings. First, quantitative data on fire load densities in historic structures remain limited, as most studies prioritize modern building typologies. Second, the integration of modern furnishings into historic interiors creates hybrid fire load conditions that necessitate specialized analysis. Third, systematic methodologies for material-based fire load reduction in heritage contexts are still underdeveloped.

This study addresses these gaps by conducting a comprehensive quantitative fire load analysis of a representative historic building within a UNESCO World Heritage site. The research focuses on a material composition–based approach, considering both traditional construction materials and contemporary furnishings in its evaluation of fire risk. The methodology further encompasses maximum risk scenario modeling through complete combustion analysis of all combustible materials, thereby providing a conservative yet replicable framework for heritage fire safety planning.

3. Material and Method

Safranbolu, distinguished by its refined examples of wood and stone craftsmanship and its well-preserved traditional urban fabric, is renowned for its historic houses that exemplify classical Ottoman urban architecture [19]. Inscribed on the UNESCO World Heritage List in 1994, the city's residential quarters are designated as urban conservation areas, predominantly reflecting the architectural characteristics of the 18th and 19th centuries.

In this study, the Karabük University Prof. Dr. Fuat Sezgin Science, Culture and Art Academy building (commonly referred to as the "Stone Building"), one of the significant historical structures of Safranbolu, was examined. Located in the Safranbolu district of Karabük, the building was constructed in 1890 by Abdurrahman Pasha, then Governor of Kastamonu, as a Syphilis Hospital. The rectangular-shaped structure measures 17 × 25 m, covering a total area of 644.28 m². Its exterior walls consist of cut stone plaque cladding over a rubble masonry system. Scots pine timber, sourced locally, was extensively used in the construction, particularly for doors, windows, stairs, floor coverings, various structural components, and decorative details.

The Stone Building was selected as a representative case study due to its typical 18th–19th century Ottoman architectural features, particularly its reliance on regional timber and traditional construction techniques commonly found across UNESCO World Heritage sites. Its present mixed-use function illustrates the hybrid fire load conditions frequently encountered in heritage buildings, where traditional structural materials coexist with contemporary furnishings and operational necessities. This duality, combined with Safranbolu's documented fire history and the availability of detailed building records, enables the development of a replicable analytical framework applicable to heritage structures in similar contexts worldwide.

Historically, the building served as the Karabük University Fethi Toker Faculty of Fine Arts and Design between 2002 and 2015. At present, it is used for meetings and exhibitions. Furnishings include armchairs, tables, cabinets, curtains, and carpets, contributing to the overall fire load. Fire protection equipment currently installed in the building consists of a hand-held extinguisher containing dry chemical powder and a 30-meter-long fire hose (Figure 3).

Figure 3. The Stone Building selected as the case study area (above), and existing firefighting equipment (below) (Personal archive)

In order to assess the potential fire risk of the historic building, it is first necessary to determine the fire load densities of its spaces. For this purpose, data on the volume, calorific (unit heat) value, and density of combustible materials were collected, and fire loads were calculated separately for fixed (e.g., structural elements) and movable (e.g., furniture, carpets, curtains) materials. These two categories were then combined to obtain the total fire load of the building, which was normalized by the floor area to determine the total fire load density. The calculations were carried out using Eqs. (1) and (2)

$$FL = \sum_{i=1}^{N} M_i \, x \, C_i \quad (1)$$

$$FLD = \frac{\sum_{i=1}^{N} M_i x \, C_i}{A_f} \quad (2)$$

In these equations, FL represents the fire load (MJ), while M_i (kg) denotes the mass of the i-th substance in a space containing N substances, and C_i (MJ/kg) refers to its unit heat value. The fire load density (FLD) is defined as the ratio of the fire load to the floor area A_f (m²) of the space, expressed in MJ/m² [9]. For clarity, large-scale energy values in this study are presented in gigajoules (GJ), where 1 GJ = 1,000 MJ, while fire load density values are reported in MJ/m², in accordance with standard fire safety literature.

In the subsequent stage, the calculated fire load and fire load density values were compared with reference values reported in the literature, and the overall fire risk of the building (classified as low, medium, high, etc.) was determined (Figure 4).

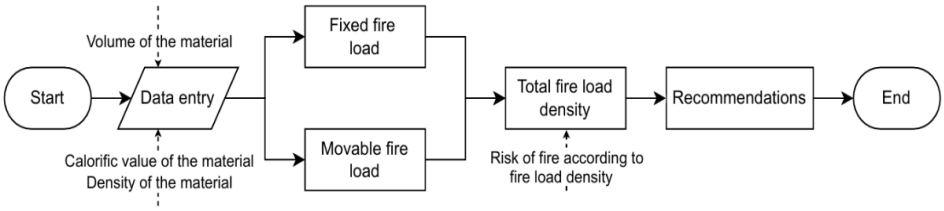

Figure 4. Flow chart of fire load and risk analysis process

All combustible building components and non-structural elements were included within the scope of this study. The materials considered in the analysis comprised wooden floors, ceiling and wall coverings, furniture, and curtains. According to Eurocode 1 [20], only combustible materials or fire dynamics that contribute to the fire load are taken into account, while natural stone materials are excluded from thermal effect calculations. In this context, the contribution of stone elements to the fire load was not considered in the present study.

The concept of Fixed Fire Load (FFL) refers to the fire load associated with elements that are generally immovable within the building, whereas Movable Fire Load (MFL) refers to the fire load originating from movable elements [12]. An initial on-site survey was conducted to identify combustible materials present in the building, and a comprehensive inventory was created. The type and quantity of materials were determined through direct measurements and supplemented with information obtained from available documents. For the calculations, the volume, density, and unit heat values of combustible components such as wooden floors, ceiling coverings, furniture, and textiles were utilized. These values were derived from previously published studies. The properties of the most frequently used materials in the building, as well as those with the highest calorific (unit heat) values, are presented in Table 1.

Table 1. Calorific values and density of materials used in the building [21-34]

Material Type	Calorific Value (Unit Heat Value) (c)(GJ/kg)	Density (d)(kg.m^{-3})
Wool	2.310E-2	1.72
Scots pine	1.843E-2	550
Plastic	4.37E-2	886
Hornbeam	1.654E-2	786
Walnut	2.321E-2	660
Polyester Fabric	1.13E-2	0.001

In determining the fire load, it was assumed that all combustible materials within the space were evenly distributed and completely combusted. Following this assumption, the total fire load of the materials on the roof and on each floor was calculated separately for fixed and movable components. The fire load density of each floor was then obtained by dividing the total fire load by the corresponding floor area, expressed in MJ/m², and subsequently converted to GJ/m² for consistency in presenting large-scale values. The resulting fire load density values were analyzed with reference to the risk classification table provided in the literature (Table 2).

Table 2. Fire outbreak risk according to fire load density [35]

Fire Risk Level		Fire Load Density (GJ/m^2)
Low	1	FLD ≤ 0.425
	2	0.425 < FLD ≤ 0.850
Medium	3	0.850 < FLD ≤ 1.275
	4	1.275 < FLD ≤ 1.700
	5	1.700 < FLD ≤ 3.400
High	6	3.400 < FLD ≤ 6.800
	7	6.800 < FLD ≤ 13.600
	8	13.600 < FLD

4. Findings and Discussion

The fire load analysis demonstrates that the Stone Building exhibits a significantly elevated fire risk due to the extensive presence of combustible materials, particularly Scots pine structural elements and modern plastic furnishings. With a total fire load density of 6.713 GJ/m², the building falls into the High Fire Risk category (Level 6), approaching the upper threshold of this classification.

4.1. Fixed Fire Load Analysis

The total fixed fire load was calculated as 2.757 GJ, accounting for 63.8% of the building's overall fire load (Table 3). Scots pine, with its relatively high calorific value (1.843×10^{-2} GJ/kg), represents the dominant contributor to the fixed fire load distribution. Among the individual components, ceiling beams constitute the largest single source at 1.102 GJ (39.9% of the fixed load), followed by door and window joinery at 0.628 GJ (22.8%). Floor coverings contribute 0.281 GJ (10.2%), while ceiling coverings add 0.087 GJ (3.1%). Additional contributions arise from ceiling cornices (0.323 GJ, 11.7%), roof structural elements (0.114 GJ, 4.1%), and other miscellaneous wooden components. Collectively, these elements create a concentration of fire load that facilitates rapid vertical fire propagation throughout the structure.

This distribution pattern indicates that ceiling and floor assemblies pose the greatest risk for fire spread due to their high concentration of combustible material. Because these structural elements are integral to the building's historical fabric, their replacement or modification poses particular challenges: fire risk mitigation strategies must therefore balance safety requirements with the preservation of heritage authenticity (Table 3).

Table 3. Total fixed fire load (TFFL)

Flammable Material	Material	Volume (V-m^3)			Density (d-kg.m^3)	Total Number (N)	Unit Heat Value (c-GJ.kg^{-1})	Fixed Fire Load (FFL- GJ)
		Length (L-m)	Width (W-m)	Height (H-m)				
Ceiling Coating	Scots pine	428.81		0.02	550	1	1.843E-2	86.813
Floor Coating	Scots pine	1384.62		0.02	550	1	1.843E-2	280.705
Ceiling Beaming	Scots pine	1552.68	13.00	0.17	550	1	1.843E-2	1101
Ceiling Cornice	Scots pine	417.94	3.80	0.02	550	1	1.843E-2	322.665
Roof Strut	Scots pine	0.20	0.20	28.62	550	1	1.843E-2	11.604
Roof Purlin/Pitch	Scots pine	0.15	0.20	85.45	550	1	1.843E-2	25.984
Roofing	Scots pine	431.77		0.02	550	1	1.843E-2	88.270
Treillage	Scots pine	1.00	0.10	0.90	550	47	1.843E-2	42.877
Window	Scots pine		0.36		550	93	1.843E-2	338.806
Door	Scots pine		1.50		550	19	1.843E-2	289.230
Staircase	Scots pine		16.67		550	1	1.843E-2	169.048
							Total Fixed Fire Load (GJ)	2.757

4.2. Movable Fire Load Analysis

The total movable fire load was calculated as 1.567 GJ, representing 36.2% of the building's overall fire load (Table 4). Plastic chairs were identified as the dominant contributor, accounting for 1.161 GJ (74.1% of the movable load) owing to their exceptionally high calorific value (4.37×10^{-2} GJ/kg). This result underscores the disproportionate influence of modern furnishing materials on the fire risk profile of historic buildings. Walnut furniture components represent the second most significant source, with closets contributing 0.202 GJ (12.9%) and tables 0.162 GJ (10.3%). Additional contributions arise from hornbeam sofa sets (0.042 GJ, 2.7%), wool carpets (0.053 GJ), and polyester curtains (6×10^{-5} GJ), although their overall impact remains minimal. The predominance of plastic furniture in the movable fire load clearly demonstrates how the integration of contemporary materials can substantially alter fire risk conditions in heritage contexts. Notably, the 417 plastic chairs alone contribute more energy than all wooden structural components combined in certain sections of the building (Table 4).

Table 4. Total movable fire load (TMFL)

Flammable Material	Material	Volume (V-m^3)			Density (d-kg.m^3)	Total Number (N)	Unit Heat Value (c-GJ.kg^{-1})	Movable Fire Load (MFL- GJ)
		Length (L-m)	Width (W-m)	Height (H-m)				
Carpet	Wool	2	3	0.008	1.72	28	2.310E-2	0.053
Table	Walnut	1.40	1.20	0.90	660	7	2.321E-2	162.132
Chair	Plastic	0.40	0.40	0.45	886	417	4.37E-2	1161

Curtain	Polyester		0.204		0.001	26	1.13E-2	6E-5
							Total Movable Fire Load (GJ)	1.567

4.3 Total Fire Load Assessment and Risk Classification

The combined fire load density of 6.713 GJ/m² places the Stone Building within the High Fire Risk category (Level 6) according to established classification standards [35]. This value lies within the range of 3.400–6.800 GJ/m² but is close to the upper threshold, indicating severe fire risk conditions that warrant immediate attention.

The fire load distribution highlights specific vulnerabilities: ceiling systems dominate the fixed fire load, while plastic furnishings overwhelmingly shape the movable fire load. This combination creates a compound risk scenario in which both structural fires and contents fires could propagate rapidly and with considerable intensity. Graphics 2 and 3 clearly illustrate this distribution, showing the concentrated accumulation of fire loads in particular building elements and furnishing categories. The building's proximity to the upper limit of Level 6 classification underscores the urgent need for mitigation strategies to reduce the total fire load and prevent escalation into the highest risk category (Level 7: 6.800–13.600 GJ/m²) (Figure 5).

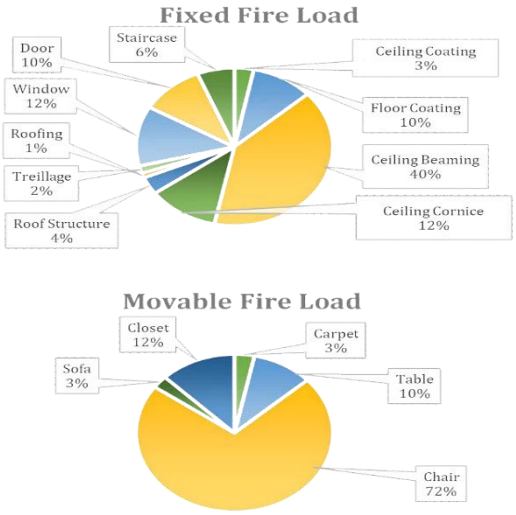

Figure 5. Fixed fire load (above), Movable fire load (below)

4.4. Comparative Analysis with Literature

Table 5 presents a comparison between the fire load density of the Stone Building and those reported for similar historic structures in previous studies. The Stone Building's fire load density of 6.713 GJ/m² substantially exceeds most comparable examples, which typically range between 3.096 and 5.297 GJ/m² [5,36]. This elevated risk profile can be attributed to two primary factors: the extensive use of Scots pine in structural components and the considerable presence of high-calorific plastic furniture.

A direct comparison with Qingyun Academy (5.297 GJ/m²) and various historic halls in China (3.096–4.336 GJ/m²) illustrates that, although wooden heritage buildings generally exhibit elevated fire loads, the Stone Building's values surpass the commonly observed range. This deviation highlights the critical role of material management strategies—particularly the reduction or replacement of high-calorific modern furnishings—in mitigating fire risk, while preserving the structural and historical authenticity of the building.

Table 5. Comparison of total fire load densities obtained from experiments and literature [5], [36]

No:	Building Type	Building Area (m²)	Total Fire Load Density (GJ/m²)
1	Qingchenggong Hall	414.53	4.223
2	Qifobao Hall	369.90	3.471
3	Daxiong Hall	341.00	3.788
4	Wuliang Shoufo Hall	254.82	3.848
5	Jingshan Park Side Hall	240.35	3.897
6	Shenchuzheng Hall	342.42	3.336
7	Hanyuan Hall	296.02	3.095
8	Bai Hall	595.89	4.335
9	Qingyun Academy	322.60	5.297
10	Stone Building (This Study)	644.28	6.712

4.5. Material Interventions

Based on the fire load analysis, material-based interventions could significantly reduce the building's fire load density while preserving its historical character. Plastic chairs were identified as the dominant contributor to the movable fire load (1.161 GJ, 74.1% of total movable load) due to their high calorific value (4.37×10^{-2} GJ/kg). Replacement with materials of lower unit heat values, such as hardwood chairs (1.6×10^{-2}–1.8×10^{-2} GJ/kg) or steel-frame alternatives, could reduce the total movable fire load by 67–88%, corresponding to a building-wide fire load density reduction of 1.2–1.6 GJ/m². The reduction potential was quantified through detailed calculations of plastic chair replacement scenarios. Under current conditions, 417 plastic chairs contribute substantially to the movable fire load, with each chair having a volume of 0.072 m³ (0.40 × 0.40 × 0.45 m), a density of 886 kg/m³, and a calorific value of 4.37×10^{-2} GJ/kg. This results in a total fire load of 1.161 GJ (417×0.072 m³ $\times$ 886 kg/m³ $\times$ 4.37×10^{-2} GJ/kg).

In Scenario A, replacement with hardwood chairs (oak, 1.7×10^{-2} GJ/kg calorific value, density 750 kg/m³) [37] yields a total fire load of 0.382 GJ (417×0.072 m³ $\times$ 750 kg/m³ $\times$ 1.7×10^{-2} GJ/kg). This represents a reduction of 0.779 GJ, corresponding to a 67% decrease in chair-related fire load and translating into a building-wide fire load density reduction of 1.21 GJ/m². In Scenario B, replacement with steel-frame chairs upholstered with polyester results in an estimated total fire load of 0.142 GJ (417×0.01 m³ upholstery $\times$ 30 kg/m³ $\times$ 1.13×10^{-2} GJ/kg). Although this calculation is based on an approximate calorific value for polyester, it suggests an 88% reduction relative to current plastic chairs, corresponding to a building-wide density reduction of 1.58 GJ/m².

These results demonstrate that strategic furniture replacement could reduce the building's overall fire load density from 6.713 GJ/m² to approximately 5.5–5.9 GJ/m². Such a reduction may shift the building closer to a lower risk classification threshold, thereby significantly improving its fire safety profile while maintaining functional requirements. With regard to fixed fire loads, Scots pine structural elements (1.843×10^{-2} GJ/kg) remain the dominant contributors, particularly ceiling beams (39.9% of the fixed load). While

replacement of these elements is not feasible due to heritage constraints, fire-retardant treatments could potentially lower effective calorific values by 15–25%. However, their application in heritage contexts is limited by concerns such as potential alterations to visual appearance, uncertain long-term durability, and increased maintenance requirements. In contrast, floor and ceiling coverings (13.3% combined) may offer greater flexibility for substitution with fire-resistant alternatives without compromising historical authenticity. Future material selection for heritage buildings should prioritize materials with calorific values below 2×10^{-2} GJ/kg in high-volume applications, provided that heritage compatibility is ensured. Nonetheless, these recommendations represent only theoretical fire load reduction potential. Practical implementation requires further specialized investigations, including structural performance analysis, heritage conservation assessment, fire dynamics modeling, and regulatory compliance evaluation. The interventions proposed here therefore establish a foundation for fire load reduction strategies, which must ultimately be validated through comprehensive multidisciplinary assessments before application.

4.6. Practical Implications and Fire Safety Strategies

The High Fire Risk classification (Level 6), with a fire load density of 6.713 GJ/m², necessitates immediate and comprehensive fire safety interventions extending beyond material replacement strategies. This classification not only triggers regulatory requirements but also provides critical baseline data for systematic risk management in heritage buildings. The building's proximity to the upper threshold of Level 6 highlights the urgency of proactive measures to prevent escalation into the highest risk category (Level 7: 6.800–13.600 GJ/m²) and to address vulnerabilities related to rapid fire propagation. Enhanced fire detection and suppression systems constitute the most urgent interventions for structures at this risk level. Given the concentration of fire loads in ceiling systems (39.9% of fixed load) and the potential for rapid vertical fire spread through wooden structural elements, early detection becomes essential to prevent catastrophic losses. The use of heritage-compatible suppression technologies—such as water mist systems designed specifically for historic buildings—could provide effective fire control while minimizing collateral water damage to irreplaceable cultural materials and architectural features.

The findings carry important implications for fire safety planning across Safranbolu's historic building stock, particularly considering the 58 fire incidents recorded in the Historic Bazaar area over the past 11 years. The quantitative methodology presented in this study enables resource prioritization based on empirical fire load analysis rather than subjective assessments. This approach supports the development of evidence-based fire safety protocols applicable not only in Safranbolu but also across UNESCO World Heritage sites with comparable fire risk profiles. Emergency response planning and building management protocols must also be reconsidered in light of these results. The combination of extensive wooden structural systems with high-calorific plastic furniture (74.1% of movable loads) creates compound risk scenarios that require specialized evacuation procedures and fire service strategies. Furthermore, the integration of quantitative fire load data into insurance risk assessments, regulatory compliance frameworks, and conservation planning represents a critical step in balancing cultural preservation objectives with public safety requirements.

4.7. Study Limitations

This study focuses exclusively on fire load quantification through material analysis and does not incorporate fire dynamics, structural performance, or the effectiveness of suppression systems. Several methodological limitations may affect the accuracy and generalizability of the findings. First, the reliance on literature-derived material property values rather than laboratory testing of building-specific samples introduces uncertainty in the fire load estimates. Calorific values vary considerably with material age, moisture content, treatment history, and local sourcing conditions, factors not fully captured by generalized literature values.

Second, the assumption of complete combustion provides conservative estimates of fire load but may overstate actual fire risk. In real-world conditions, combustion efficiency is significantly influenced by oxygen availability, ventilation patterns, compartmentalization, and suppression efforts. Building fires rarely achieve complete combustion; instead, efficiency typically ranges between 60% and 80% depending on ventilation and material configuration. Finally, this study does not account for spatial distribution effects of fire loads. The arrangement and density of combustible materials within rooms can substantially alter fire spread patterns and heat release rates. The assumption of uniform material distribution may therefore oversimplify actual fire behavior in heritage buildings, which often feature complex spatial configurations and heterogeneous material concentrations.

5. Conclusion

This study presents a comprehensive quantitative fire load assessment of a representative historic building in the Safranbolu UNESCO World Heritage site, thereby contributing empirical evidence to the limited database on heritage fire safety research. The systematic analysis of fixed and movable fire loads provides critical insights into material-related fire risk factors that affect historic structures. The Stone Building was found to have a total fire load density of 6.713 GJ/m², placing it in the *High Fire Risk* category (Level 6) and considerably exceeding comparative values reported for similar historic buildings (3.096–5.297 GJ/m²). Fixed fire loads (2.757 GJ) are dominated by Scots pine structural elements, with ceiling beams accounting for 39.9% and floor coverings 10.2% of the total. Movable fire loads (1.567 GJ) are overwhelmingly attributed to plastic chairs (74.1%), illustrating how modern furnishing choices can dramatically reshape the fire risk profile of heritage buildings. These findings underscore the decisive influence of material selection on fire safety, with high-calorific materials producing disproportionate hazards.

Material-based interventions demonstrate substantial potential for reducing fire risk while maintaining historical

integrity. Strategic replacement of plastic furnishings with alternatives of lower calorific value could reduce total fire load density by 1.2–1.6 GJ/m², potentially shifting the building toward a lower risk classification. This case study thus establishes a replicable methodology for fire load assessment in heritage contexts, offering a foundation for evidence-based risk management and informing preservation planning, insurance assessments, and regulatory compliance strategies. The results provide immediate practical implications for heritage fire safety management. Insurance institutions may utilize the findings to develop evidence-based premium models, while regulatory authorities can design heritage-specific fire safety codes. Furniture replacement emerges as the most technically and economically feasible intervention, offering reductions of 67–88% in chair-related fire load with moderate investment and minimal impact on heritage authenticity. From a cost–benefit perspective, such interventions present an effective strategy for catastrophic loss prevention, provided they are implemented in coordination with conservation specialists and fire safety engineers. The High Fire Risk classification further emphasizes the urgent need for enhanced detection systems, revised emergency planning, and the formulation of heritage-sensitive fire safety protocols for Safranbolu's broader building stock. Although based on a single case study, the Stone Building's representative features—its hybrid nature combining traditional construction with contemporary usage—ensure that the findings are broadly applicable to similar heritage sites undergoing adaptive reuse. Nevertheless, this research is subject to certain limitations. The scope is restricted to fire load quantification through material analysis and does not incorporate fire dynamics, structural resistance, or suppression system performance. The assumption of complete combustion, while providing conservative estimates, does not fully reflect realistic fire scenarios in which ventilation, compartmentalization, and suppression significantly influence fire behavior. In addition, the reliance on literature-based material property values, rather than laboratory analysis of building-specific samples, introduces uncertainty into the fire load calculations.

Future studies should expand upon this work by integrating fire dynamics modeling to evaluate realistic spread patterns in heritage structures, analyzing structural fire resistance of traditional materials, and assessing the compatibility of modern fire protection technologies with conservation requirements. Comparative analyses across a broader range of historic building typologies would further improve the generalizability of fire load assessment methodologies. Economic feasibility studies and the development of heritage-specific fire safety standards represent further priorities requiring interdisciplinary collaboration.

In conclusion, historic buildings necessitate specialized fire risk assessment approaches that account for their distinctive material compositions, construction techniques, and preservation constraints. This study demonstrates that systematic fire load analysis provides valuable insights into heritage fire safety, while establishing critical baseline data for future research. Effective fire risk management in heritage contexts requires not only recognition of material contributions and the impact of contemporary additions, but also the implementation of intervention strategies that preserve cultural authenticity while safeguarding human life and property.

Abstract

This study examines the effectiveness of integrating green roof and green façade systems as passive strategies to improve the thermal performance and environmental sustainability of a large-scale religious building—the Imam Al-Bukhari Mosque, located in Tripoli, Libya. The research addresses a significant knowledge gap concerning the application of green envelope technologies in mosques situated in hot Mediterranean climates. Three simulation scenarios were developed using DesignBuilder (v6), powered by EnergyPlus: (1) the existing building (baseline), (2) green roof combined with direct green façade (Sc-1), and (3) green roof combined with indirect green façade (Sc-2). The analysis covered energy consumption (kWh/m²), heating and cooling demands, and annual CO_2 emissions (kg/m²), based on hourly climatic data derived from the Tripoli Meteonorm weather file. The results demonstrate substantial energy and environmental gains with the implementation of green systems. Compared to the baseline, Scenario 1 achieved reductions of 11.1% in total energy consumption, 13.0% in cooling load, 86.2% in heating demand, and 10.5 kg/m² in annual CO_2 emissions. Scenario 2, featuring an indirect façade configuration, showed superior performance across all metrics with a 12.9% reduction in energy use, 15.2% in cooling load, 88.8% in heating demand, and 12.18 kg/m² in CO_2 savings. These improvements are attributed to the enhanced thermal insulation, evaporative cooling, and air buffering provided by the green envelope systems. This study underscores the significant potential of green roofs and façades to reduce operational energy use and environmental impact in religious buildings. Findings support their broader adoption in arid and semi-arid urban contexts, especially when indirect façade configurations are applied. The study also contributes to the literature by providing scenario-based evidence for mosque retrofits and the integration of green infrastructure in the Mediterranean region.

1. Introduction

The building sector is one of the major contributors to global energy consumption and environmental degradation. According to the International Energy Agency (IEA), buildings are responsible for nearly 30% of final energy use globally and emit a significant portion of carbon dioxide emissions associated with fossil fuel consumption [1]. The World Energy Council (WEC) further highlights that enhancing building energy performance, especially in hot climates, is crucial to achieving global sustainability targets [2]. In this context, the role of passive energy strategies has gained increasing attention. Unlike mechanical solutions, passive design strategies—including natural ventilation,

thermal mass optimization, and green envelope systems—offer low-cost and environmentally friendly approaches to improving indoor thermal comfort and reducing energy demand [3]. Among these, green systems—comprising green roofs and green facades—are increasingly integrated into building envelopes due to their capacity to act as thermal buffers, mitigate the urban heat island (UHI) effect, enhance biodiversity, and support stormwater management [4], [5].

The concept of integrating vegetation into architecture is not new. From the legendary Hanging Gardens of Babylon to the pioneering visions of Le Corbusier in the 20th century, nature has consistently played both symbolic and functional role in the built environment. However, the modern green roof typologies—categorized as extensive, intensive, and semi-intensive—have been systematically studied only in recent decades [6]. Extensive green roofs, characterized by shallow soil and drought-resistant vegetation, are lightweight and require minimal maintenance, making them ideal for retrofitting. Intensive green roofs, on the other hand, can support a wider variety of plant species, including trees but involve higher structural loads and maintenance requirements [7].

Green façades are another important typology of vertical greening systems, typically divided into two categories: direct greening, in which climbing plants grow directly on the façade, and indirect greening, which employs supporting structures such as trellises [8]. Both types provide shade and evaporative cooling, reducing heat gain on building surfaces and, consequently, decreasing cooling loads.

Numerous studies have demonstrated the performance benefits of green envelopes. For example, Bevilacqua [9] showed that green roofs can reduce indoor temperatures by up to 4–6°C in warm climates. Similarly, Florides et al. [10] highlighted the potential of green facades in shielding envelopes from solar radiation and decreasing thermal transmittance. In Mediterranean contexts, studies by Eumorfopoulou and Aravantinos [11] and Santamouris et al. [12] have emphasized the effectiveness of vegetated surfaces in enhancing thermal performance and occupant comfort during the summer months.

Despite the wealth of research on residential and commercial buildings, a significant gap remains in the literature regarding the application of these systems in religious structures—particularly mosques. Mosques are among the most frequently visited and symbolically significant buildings in Muslim societies. Given their large interior volumes, high ceilings, and typically continuous daytime use, mosques have high energy demands, especially for cooling in hot climates [13]. Moreover, their architectural constraints often limit the applicability of conventional energy retrofit strategies.

In Türkiye and other Islamic countries with hot and arid or Mediterranean climates, mosques represent a substantial portion of the urban architectural fabric. However, few studies have explored the potential of integrating passive design strategies, such as green roofs and facades, into mosque architecture. Research by Jim [14] suggested that integrating bioclimatic elements into buildings could enhance sustainability while preserving architectural integrity. Yet, mosque-specific studies remain rare.

To address this research gap, this study investigates the effect of green envelope systems—both green roofs and green facades—on the indoor energy performance of mosques located in hot climate regions. By selecting a representative case in a hot climatic zone and analyzing various envelope configurations through simulation-based methods, the study aims to assess energy savings potential and indoor thermal behavior associated with green system integration.

In addition to environmental benefits, green systems also have symbolic and socio-cultural relevance in the context of Islamic architecture, where gardens and vegetation are traditionally associated with serenity, paradise, and spiritual well-being [15]. Therefore, this research not only addresses an ecological imperative but also aligns with the cultural heritage of mosque design.

This study makes a unique contribution to the literature by combining architectural simulation with passive system evaluation specifically for mosque buildings—a typology largely overlooked in current energy research. The outcomes are expected to offer practical insights for architects, engineers, and decision-makers seeking sustainable retrofitting strategies in climate-sensitive regions.

2. Material and Method

2.1. Case Study and Climatic Context

This study investigates the application of green systems (GS) to the Imam Al-Bukhari Mosque, a prominent religious facility located in Tripoli, Libya (Fig. 1). As one of the largest mosques in the country, accommodating up to 2,400 worshippers, the building holds significant architectural and cultural value. Its large surface area, symbolic identity, and central location within a dense urban environment make it a valuable prototype for testing energy-efficient retrofitting strategies in similar religious structures across North Africa and the broader MENA region.

The selection of this mosque is motivated by the lack of green system integration in large-scale religious buildings in Libya, despite their substantial operational energy consumption. Previous studies have shown that mosques, due to their unique operational patterns—including continuous use throughout the day, high occupant density during prayer times, and large, often uninsulated domed spaces—consume more energy than comparable non-residential buildings [16], [17]. Therefore, introducing passive or semi-passive systems, such as green roofs and façades, into mosque architecture has the potential to significantly reduce cooling loads while maintaining indoor thermal comfort.

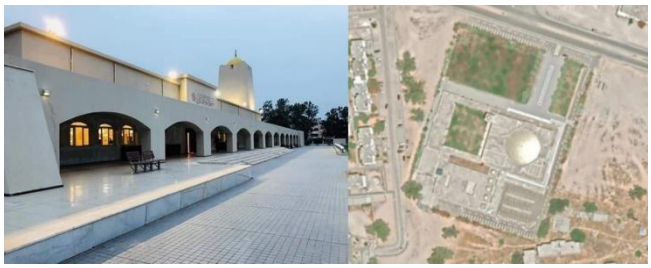

Figure 1. Imam Al-Bukhari Mosque and layout plan

Tripoli, the capital of Libya, is situated along the Mediterranean coastline and is characterized by a hot semi-arid climate (BSh) according to the Köppen–Geiger classification [18]. The city experiences long, dry, and extremely hot summers, with daytime temperatures often exceeding 35°C from June to September. Winters are mild and relatively wet, with average monthly temperatures ranging from 10°C to 18°C, and annual precipitation totaling approximately 370–400 mm, most of which falls between December and February [19]. Relative humidity during the summer months tends to be low (often below 30%), which increases evaporative cooling demands and contributes to higher indoor thermal stress (Figure 2).

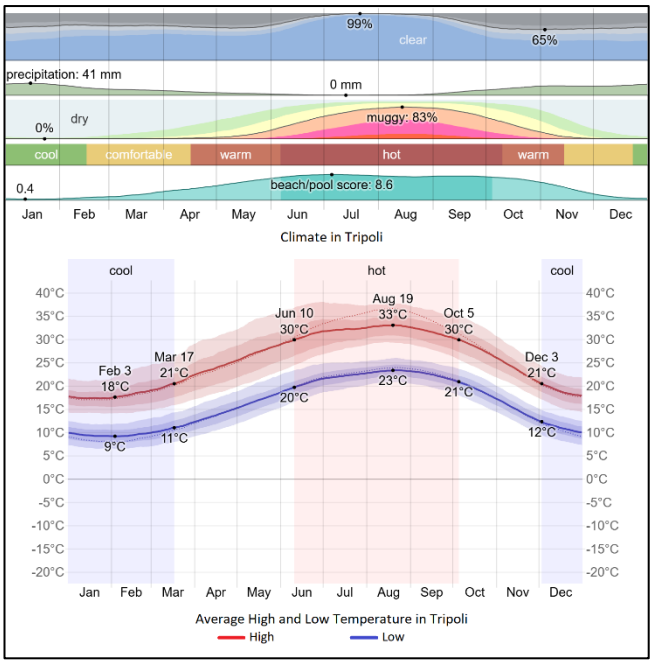

Figure 2. Tripoli climatic properties [20], [21]

Furthermore, natural ventilation is largely ineffective in such climates due to the weak prevailing winds and the massive, thermally inert envelopes of mosque buildings [22]. During winter, the prevailing winds come from the west and northwest, carrying some moisture from the Mediterranean Sea; however, their cooling effect is negligible during the peak summer period.

Given these environmental challenges, passive design strategies that incorporate vegetative systems are increasingly recognized for their ability to reduce rooftop solar gain, improve building envelope performance, and mitigate urban heat island effects [23], [24]. However, there remains a significant research gap regarding the integration of such systems in religious buildings—particularly mosques located in hot-arid and Mediterranean transitional climates. This study aims to address this gap by simulating the energy-saving potential of green roof and façade systems applied to the Imam Al-Bukhari Mosque, and by assessing their impact on indoor thermal conditions and annual cooling energy demand.

2.2. Simulation Tool, Approach and Parameters

The simulation was conducted using DesignBuilder V6, a widely recognized building performance simulation software that operates on the EnergyPlus engine. DesignBuilder is commonly used for dynamic building simulation, enabling detailed modeling of energy performance, including HVAC behavior, thermal loads, and passive systems [25]. This platform supports detailed dynamic thermal modeling by incorporating a range of building parameters, such as geometry, orientation, construction materials, occupancy schedules, lighting loads, and HVAC system performance. Its robust capabilities allow for both annual and seasonal assessments of energy consumption, making it a reliable tool for evaluating passive design interventions in complex building types like mosques.

As illustrated in Figure 3, the Imam Al-Bukhari Mosque was initially modeled in its current configuration to establish a baseline energy consumption profile. The model accurately represents the mosque's architectural form, spatial layout, and thermal properties of the building envelope materials. Following validation of the baseline model, two green system scenarios were implemented and simulated: (i) a green roof combined with a direct green façade, and (ii) a green roof combined with an indirect green façade. These scenarios were carefully developed to reflect feasible retrofit strategies that could be applied to the existing mosque structure without altering its functional or religious identity.

Each scenario was simulated under identical boundary conditions, including occupancy profiles and climatic inputs, to ensure a valid comparison of results. The integration of green systems was evaluated in terms of their impact on cooling and heating load reduction, CO_2 emission reduction, and overall annual energy demand. This modeling approach provides a robust understanding of how vegetative systems influence building energy performance, particularly in hot-dry climates such as that of Tripoli.

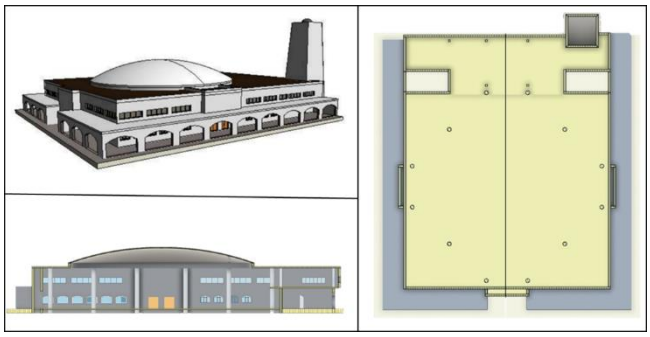

Figure 3. Model of the mosque

The internal loads, occupancy schedules, and HVAC configurations were customized to reflect typical mosque usage patterns in Tripoli, Libya's Mediterranean climate. Hourly weather data from the Climate.OneBuilding database [26] were used to simulate a full calendar year (8760 hours), capturing seasonal variations in solar radiation, temperature, wind, and humidity.
Key simulation parameters included:

Simulation period: Full year (8760 hours)

Weather data source: Tripoli_Meteonorm.epw [26].

HVAC setpoints: 22°C for cooling, 20°C for heating, following ASHRAE 55 guidelines [27].

Occupancy: Five daily prayer sessions, assuming full capacity (2400 people) during peak hours.

Lighting load: 5 W/m², scheduled around prayer and night usage [28].

Ventilation strategy: Natural ventilation in off-peak hours; mechanical ventilation during peak occupancy

Thermal zoning: Modeled as a single conditioned thermal zone.

Simulation timestep: 1 hour.

Envelop airtightness was set at 0.7 ACH, reflecting best practices for naturally ventilated spaces. Ground reflectance was assumed to be 0.2, while roof albedo was defined based on the green roofing materials used. Occupancy profiles were seasonally adjusted in accordance with local religious practices and daylight variability [29]. The electrical emission factor used for CO_2 savings calculations was 0.42 tonCO_2eq/MWh.

2.3. Green System Scenarios

Three simulation scenarios were developed to evaluate the thermal and environmental impacts of the green system interventions:

Baseline: The existing building configuration without any green interventions.

Scenario 1 – Green Roof + Direct Green Façade: A green roof combined with a vegetated façade, where plants are directly attached to the wall surface.

Scenario 2 – Green Roof + Indirect Green Façade: A green roof combined with green façades supported by a metal frame creating a buffer layer between the vegetation and building surface.

All exterior façades were subjected to greening treatments in Scenarios 1 and 2.

2.4. Green System Design Parameters

The green systems applied to the mosque model include an extensive green roof and two types of vertical green façade systems, each with a multilayer composition reflecting standard construction practices for vegetated envelopes. These layers were carefully integrated into the simulation to analyze their thermal behavior and energy performance under Tripoli's climatic conditions. The material properties, layer thicknesses, and thermal transmittance (U-values) of each component are detailed.

Green Roof Assembly

The green roof system—as it appears in Figure 4—consists of five main layers, each of which plays a role in enhancing the system's insulation, moisture retention, and drainage performance (Table 1).

Table 1. Simulation results

Material	Thickness (mm)	U-value (W/m²K)
Soil	100	1.28
Filter layer (Carpet	3	0.06
Drainage layer (PVC)	100	0.17
Protection layer (Polyethylene)	6	0.50
Waterproofing (Bitumen)	5	0.23
Roof (Concrete)	10	1.30

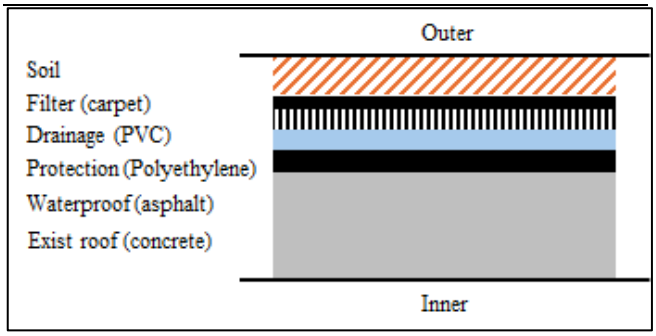

Figure 4. Green roof system used in the study

These layers are typical of extensive green roof systems, which are lighter and require less maintenance than intensive systems, making them suitable for retrofit applications on existing structures, such as the Imam Al-Bukhari Mosque.

Vegetation and Soil Characteristics

The vegetated layer was modeled using parameters that reflect dense, drought-tolerant plant species commonly used in arid and Mediterranean climates. Key parameters include:

- Soil thickness: 10 cm
- Vegetation thickness: 10 cm
- Leaf Area Index (LAI): 5
- Soil density: 1460 kg/m³

The LAI value—a measure of the total leaf area per unit ground area—plays a significant role in determining the solar shading effect and evapotranspiration capacity of the vegetative layer. A value of 5 is indicative dense foliage, which is capable of significantly reducing incident solar radiation and contributing to cooling through latent heat exchange.

Façade Greenery Configurations

Two vertical greening systems were simulated on the mosque façades as appear in Figure 5:

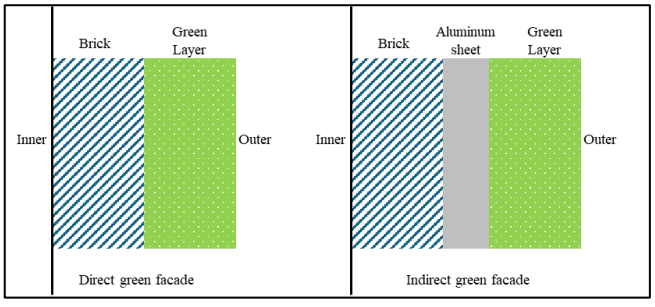

Figure 5. Green facade systems used in the study

Direct Green Façade: Climbing plants were modeled as growing directly on the building façade surface. This system lacks a ventilation gap and relies on the plant's direct attachment to the wall, which enhances solar shading but may limit convective cooling.

Indirect Green Façade: Vegetation was modeled as being supported by an aluminum subframe structure, creating an air cavity between the wall and the plant layer. This configuration promotes stack ventilation, reduces heat transfer through the façade by buffering temperature extremes, and enhances durability by keeping moisture and biological growth away from the main building envelope.

These systems were integrated with care to reflect constructability and climatic appropriateness for the Tripoli region. The differentiation between direct and indirect façade greening allowed for a comparative analysis of thermal buffering capacity, solar gain reduction, and impact on cooling energy demand.

3. Results

The data presented in Table 2 offers a comparative analysis of three design scenarios—an existing mosque structure and two intervention cases—focusing on their energy consumption, thermal loads, and associated CO_2 savings. The primary objective of the interventions is to assess the environmental performance of implementing green envelopes, specifically green roofs combined with either direct or indirect green façades.

The baseline (existing building) recorded the highest energy consumption at 225 kWh/m², with a cooling demand of 230 kWh/m² and a heating load of 16 kWh/m², resulting in no CO_2 savings. These values reflect the typical performance of unmodified buildings in hot-humid climates, where peak summer temperatures and insufficient thermal insulation significantly increase the energy demand for cooling.

Table 2. Simulation results

Scenarios	Energy consumption (kWh/m²)	Cooling Load (kWh/m²)	Heating Load (kWh/m²)	CO_2 Saving (kg/m²)
Existing building	225	230	16	0
Sc-1	200	200	2.2	10.5
Sc-2	196	195	1.8	12.18

3.1. Energy Consumption

The annual energy consumption results for the baseline and green system (GS) scenarios are presented in Figure 6. According to the simulation outcomes, the baseline case—which represents the existing mosque structure without any green system interventions—recorded an annual energy consumption of 225 kWh/m². In contrast, Scenario 1, which incorporates a green roof combined with a direct green façade, resulted in a consumption rate of 200 kWh/m², reflecting an 11.1% reduction compared to the baseline. Scenario 2, which employs a green roof in combination with an indirect green façade system, demonstrated the most significant improvement, achieving an energy consumption level of 196 kWh/m²—a reduction of 12.9% compared to the existing condition.

These results emphasize the effectiveness of green systems in moderating indoor thermal loads by enhancing envelope insulation and providing external shading. In particular, the indirect green façade configuration appears to be more efficient, likely due to the ventilated cavity between the vegetation layer and the wall, which facilitates evaporative cooling and reduces solar heat gain. This observation aligns with prior findings by Bevilacqua et al. [9] and Cirrincione et al. [30], who demonstrated that green envelope systems substantially lower cooling energy demands in hot climates by reducing surface temperatures and thermal transmittance.

In conclusion, both green system applications resulted in significant energy savings, with Scenario 2 outperforming Scenario 1. These findings suggest that integrating indirect vertical greening technologies with green roofs can significantly enhance building energy performance, particularly in hot-arid and Mediterranean climates such as Tripoli.

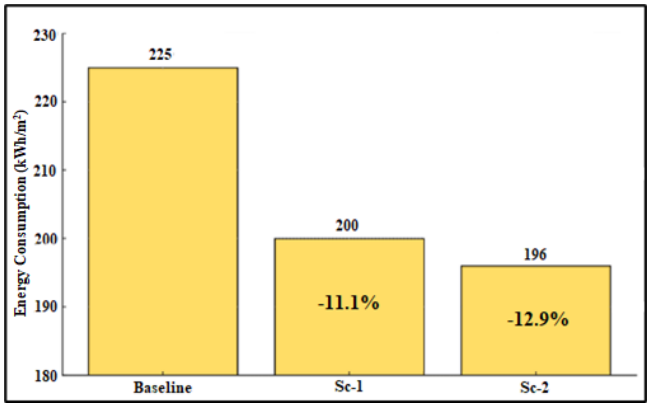

Figure 6. Comparison of annual energy consumption (kWh/m²)

3.2. Cooling Loads

Figure 7 presents the annual cooling energy demand for three simulation cases: the baseline mosque model without any green systems, Scenario 1 (Sc-1), which integrates a green roof and direct green façade, and Scenario 2 (Sc-2), which includes a green roof and indirect green façade. The baseline model exhibits the highest cooling energy requirement at 230 MWh annually. When green systems are applied, a noticeable reduction in cooling demand is observed. Sc-1 achieves a 13.0% decrease, reducing total cooling energy to 200 MWh, while Sc-2 provides the greatest reduction of 15.2%, bringing energy consumption down to 195 MWh.

These findings highlight the positive impact of green systems on thermal regulation in buildings located in hot, dry climates such as Tripoli, Libya. The slightly superior performance of Sc-2 is attributed to the use of an indirect façade system, which creates a ventilated air layer between the vegetation and the building wall. This buffer reduces solar heat gain and enhances passive cooling efficiency. These results are consistent with prior research. Bevilacqua et al. [9] emphasized that green façades can reduce wall surface temperatures by up to 10°C and significantly decrease cooling loads in hot climates. Similarly, Cirrincione

et al. [30] confirmed that green roofs improve thermal insulation and lower building surface temperatures through the combined effects of shading and evapotranspiration, leading to energy savings in Mediterranean climates.

In summary, both green roofs and façade systems effectively reduce cooling energy demand, with the indirect green façade offering slightly greater energy savings. This supports the integration of such passive design strategies into mosque architecture and other building types in regions with similar climatic conditions.

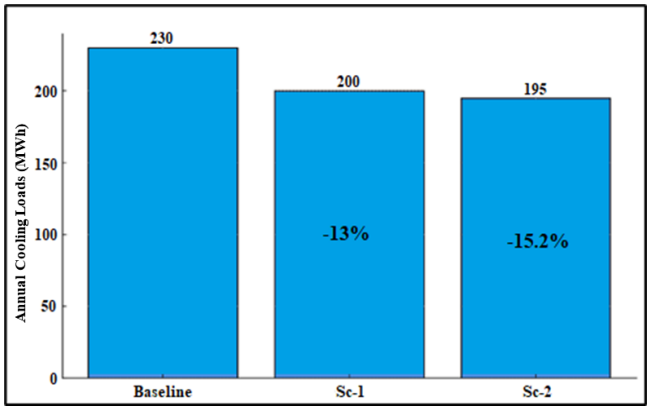

Figure 7. Comparison of total cooling load (MWh)

3.3. Heating Loads

Figure 8 presents the annual heating energy demand for three building configurations: the baseline mosque model without green system integration, Scenario 1 (Sc-1), which incorporates a green roof and direct green façade, and Scenario 2 (Sc-2), which applies a green roof with an indirect façade. The baseline model has the highest heating demand at 16.0 MWh/year. In contrast, Sc-1 and Sc-2 show significant reductions in heating energy use, with demands of 2.2 MWh and 1.8 MWh, representing decreases of 86.2% and 88.8%, respectively.

These results suggest that the implementation of green envelope systems—particularly those that combine green roofs with façade vegetation—significantly improves thermal insulation, leading to a substantial reduction in heat loss during the winter season. The indirect façade in Sc-2 performs slightly better, likely due to the ventilated air gap between the vegetation layer and the building envelope, which enhances thermal buffering by reducing heat exchange between the indoor and outdoor environments.

Previous studies support these findings. Bevilacqua et al. [9] reported that vegetative systems significantly enhance the thermal performance of buildings by acting as thermal barriers, reducing heat loss during cold periods. Morover, Ercan et al. [31] determined that green roofs avoid heat loss by 83% compared to the terrace roof. Similarly, Eumorfopoulou and Aravantinos [11] found that green façades contribute to lower heating energy demand by reducing conductive heat losses through walls. The combination of soil layers, vegetation, and protective membranes in green roofs also plays a key role in increasing the effective R-value of the roof system, thereby minimizing energy exchange with the outdoor air.

In conclusion, green systems, especially when implemented as a combined roof and indirect façade solution, offer substantial benefits not only for cooling but also for heating energy savings. This dual-seasonal performance strengthens the case for integrating green infrastructure into building designs located in Mediterranean and similar transitional climate zones.

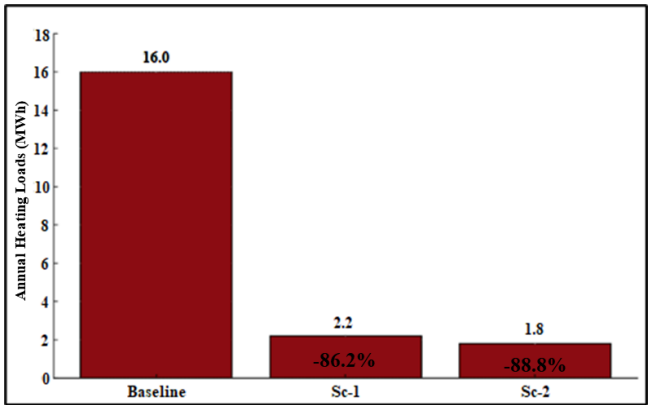

Figure 8. Comparison of total heating load (MWh)

3.4. CO2 Savings

Figure 9 compares the carbon dioxide (CO_2) emissions reduction across three building configurations: a baseline mosque model without green systems, and two intervention scenarios—Scenario 1 (Sc-1) with a green roof and direct green façade, and Scenario 2 (Sc-2) with a green roof and indirect green façade. As expected, the baseline model provides no emissions savings. In contrast, Sc-1 results in annual CO_2 savings of 10.50 kg/m², while Sc-2 achieves 12.18 kg/m², representing an additional 5.4% improvement over Sc-1.

The superior performance of Sc-2 can be attributed to the enhanced insulation and thermal buffering provided by the ventilated air cavity in the indirect green façade. This configuration limits heat exchange more effectively than direct greening systems, thereby reducing the reliance on mechanical heating and cooling, and leading to a greater reduction in fossil fuel-based energy use and associated carbon emissions.

The reduction in CO_2 emissions achieved by green envelope systems aligns with prior research. Perini and Magliocco [32] demonstrated that vegetated façades and green roofs can significantly reduce building-related carbon emissions in Mediterranean climates by improving energy efficiency and acting as carbon sinks. Additionally, Coma et al. [33] highlighted the ability of green building envelopes to not only lower energy consumption but also reduce the operational carbon footprint over the building's life cycle.

These results highlight the potential of green infrastructure as a passive design strategy that contributes to climate mitigation goals, particularly in urban environments with high energy demands. Implementing such systems in large-scale public buildings, including mosques, represents a strategic step toward sustainable development in hot-humid and Mediterranean climate zones.

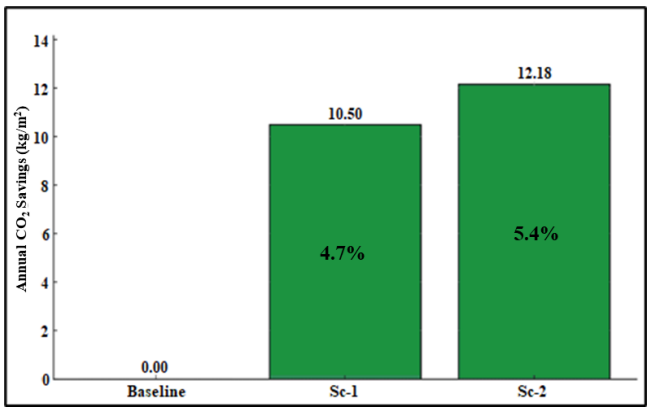

Figure 9. Comparison of CO_2 savings (kg/m²)

4. Discussion

The results of this study demonstrate the significant energy-saving and environmental performance benefits of implementing green roof and green façade systems in a mosque located in a hot Mediterranean climate. By analyzing three scenarios—baseline (existing building), green roof with direct green façade (Sc-1), and green roof with indirect green façade (Sc-2)—the study provides a comprehensive comparison in terms of total energy consumption, thermal loads, and carbon savings.

Overall, Sc-1 and Sc-2 resulted in energy reductions of 11.1% and 12.9%, respectively, compared to the baseline. These findings align with the work of Coma et al. [33], who found that green roofs significantly reduce thermal loads in Mediterranean climates due to their insulation properties and evapotranspiration effects. In this study, the green roof layers—including soil, drainage, filter, waterproofing, and vegetation—reduced heat gains through the roof, leading to notable improvements in cooling energy demand.

"In terms of cooling loads, Sc-1 reduced annual demand by 13.0%, and Sc-2 achieved a 15.2% reduction, highlighting the synergistic effect of combining green roofs and façades. The indirect green façade performed slightly better than the direct system, likely due to the ventilated air cavity, which reduces heat transfer by facilitating natural airflow—a finding consistent with previous studies emphasizing the role of air gaps in double-skin façade systems [8], [35]."

Perhaps the most striking result was the dramatic reduction in heating demand, with Sc-1 and Sc-2 showing decreases of 86.2% and 88.8%, respectively. Although the climate in Tripoli does not require extensive winter heating, the insulating effect of the green systems still contributed to reduced heat loss during cooler periods. The thermal buffering capacity of vegetated façades and roofs appears to stabilize internal temperatures, thereby decreasing the need for active heating [11].

Moreover, the CO_2 emission savings highlight the environmental potential of green systems. Scenario 1 (Sc-1) resulted in annual CO_2 savings of 10.5 kg/m², while Scenario 2 (Sc-2) achieved 12.18 kg/m², affirming the role of passive strategies in reducing greenhouse gas emissions. These outcomes reinforce the conclusions of Bevilacqua et al. [9] and Cirrincione et al. [30], who demonstrated that integrating green technologies into building envelopes can significantly decrease operational carbon emissions over the building's lifespan.

The comparative analysis between Sc-1 and Sc-2 reveals that the indirect green façade consistently outperformed the direct system, albeit marginally. This suggests that incorporating an air cavity and structural separation in façade greening systems enhances thermal performance—a finding previously reported by Mazzali et al. [34]. Additionally, although indirect façades may require more complex installation, their long-term benefits in terms of energy efficiency and carbon reduction justify the initial investment.

From a practical perspective, these findings hold significant implications for sustainable mosque design and retrofitting in warm climates. Mosques typically feature large, open prayer spaces with high occupancy during peak times, which increases internal loads. The adoption of green envelope strategies can help mitigate these loads without compromising indoor comfort. Furthermore, since mosques often serve as community landmarks, integrating visible green systems may also promote environmental awareness and act as demonstrative models of sustainability within the urban fabric.

Nevertheless, while the results are promising, future studies should explore the economic feasibility, maintenance requirements, and long-term durability of green systems in arid climates. Additionally, integrating photovoltaic panels with green roofs, as suggested by Tabares-Velasco and Srebric [34], may further enhance the energy performance of religious buildings.

5. Conclusion

This study assessed the energy performance and environmental benefits of implementing green roof and façade systems on a large-scale religious building—Imam Al-Bukhari Mosque—located in the hot Mediterranean climate of Tripoli, Libya. Using dynamic thermal simulations conducted in DesignBuilder (v6), powered by EnergyPlus, three design scenarios were compared: the existing baseline structure, a green roof combined with a direct green façade (Sc-1), and a green roof combined with an indirect green façade (Sc-2). The objective was to quantify reductions in energy consumption, cooling and heating loads, and associated CO_2 emissions, thereby providing evidence supporting the adoption of passive bioclimatic strategies in religious buildings.

The results demonstrate that green envelope interventions can significantly mitigate a building's environmental footprint. Compared to the baseline, Sc-1 reduced energy consumption by 11.1%, cooling load by 13.0%, and heating load by 86.2%, while Sc-2 achieved even greater reductions—12.9%, 15.2%, and 88.8%, respectively. Correspondingly, annual CO_2 savings reached 10.5 kg/m² in Sc-1 and 12.18 kg/m² in Sc-2. These findings confirm the capacity of green systems to improve thermal performance in warm climates, particularly when façade ventilation (as in indirect systems) is incorporated. The results support previous literature indicating the efficacy of vegetated systems in stabilizing indoor temperatures and reducing dependence on mechanical heating and cooling.

The indirect green façade scenario (Sc-2) consistently outperformed the direct system (Sc-1) across all performance indicators. This outcome aligns with prior findings highlighting the thermal buffering role of the air cavity in indirect systems. Furthermore, the significant reduction in heating loads—even in a warm climate—underscores the year-round benefits of passive envelope enhancements, particularly in buildings with large uninsulated volumes and intermittent occupancy, such as mosques.

From a design and policy perspective, these results advocate for the integration of green infrastructure into religious and community buildings in arid and semi-arid regions. Not only do green systems contribute to climate resilience by reducing urban heat island effects and promoting stormwater retention, but they also serve an educational role by demonstrating sustainable practices within culturally significant structures. While initial installation costs and maintenance requirements may pose challenges, the long-term energy and environmental benefits provide strong justification for such investments.

Future work should expand on these findings by incorporating economic feasibility studies, implementing real-time monitoring of green systems in religious buildings, and conducting life cycle assessments (LCA) that account for embodied energy and materials. Additionally, exploring hybrid strategies—such as integrating photovoltaic systems with green roofs—may yield even greater performance outcomes.

Safranbolu

ÖZET

Günümüzde artan kentleşme ile insanlar, sadece salgın hastalıklar ve doğal felaketlerin etkisiyle değil, aynı zamanda iklim değişikliği, çevresel bozulma, hava kirliliği, psikolojik stres ve sağlıklı yaşam koşullarına duyulan ihtiyaç gibi faktörler nedeniyle de doğaya ve biyofilik prensiplerle tasarlanmış yaşam alanlarına olan ilgilerini artırmaktadır. Bu eğilim, modern şehirlerde yapılı çevrelerin doğayla daha bütünleşik ve sürdürülebilir mekânlara dönüşmesine yönelik talebi artırmaktadır. Biyofilik tasarım da insanların yaşadığı çevrelerde doğaya ait özelliklerin yer almasının istendiği bir anlayışı yansıtmaktadır. Biyofilik tasarımlarla beraber insanların yaşam kalitesinin artacağı ve doğaya uyumlu yaşam alanları ortaya konulabileceği düşünülmektedir. Modern dünyada yeni bir kavram olarak değerlendirilen biyofilik tasarımın, Osmanlı şehircilik yapısında mevcut olduğu ve günümüze ulaşan tarihi dokular üzerinden görülebildiği tespit edilmiştir. Araziye uygun yerleşim, mülkiyet haklarının gözetimi, yerel malzemelerin kullanımı, doğal habitatlar ile ortak bir yaşamın sürdürülmesi gibi etkenler Osmanlı yerleşimlerinde etkin bir biçimde var olmuştur. Safranbolu geleneksel kent dokusunun tipik bir Osmanlı kenti olduğu bilinmektedir. Bu bağlamda Safranbolu geleneksel dokularından Bağlar, Kıranköy ve Çarşı bölgeleri biyofilik tasarım kriterlerine göre değerlendirilmiş ve her dokunun farklı biyofilik tasarım kriterlerinde öne çıktığı görülmüştür. Çalışmada Safranbolu geleneksel dokularının biyofilik tasarım ilkelerine göre incelenmesi ile sürdürülebilir kent anlayışının eski yerleşimlerde var olduğu ortaya konulmuştur. Sonuçta Osmanlı şehircilik anlayışında doğayla etkin bir bağın olduğu ve biyofilik tasarım kriterlerine göre kentleşmenin gerçekleştiği görülmüştür.

Evaluation of historical textures according to biophilic design criteria: case study of Safranbolu

ABSTRACT

In the context of increasing urbanization, interest in nature and biophilic-designed environments has grown, driven not only by pandemics and natural disasters but also by climate change, environmental degradation, air pollution, psychological stress, and the need for healthier living conditions. This trend highlights the demand for integrated and sustainable urban spaces aligned with biophilic principles. As cities expand, the focus on natural and ecologically adaptive environments has become essential. Biophilic design promotes the incorporation of natural elements into the built environment, aiming to enhance human well-being and foster a harmonious relationship between nature and urban areas. Although considered a modern concept, biophilic design principles have been present in Ottoman urbanism, as evidenced by surviving historical urban fabrics. Elements such as site-appropriate settlements, protection of property rights, the use of local materials, and coexistence with natural habitats were integral to Ottoman city planning. Safranbolu, a prominent example of Ottoman urbanism, exemplifies these principles. The Bağlar, Kıranköy, and Çarşı districts of Safranbolu were evaluated based on biophilic design criteria, and specific examples illustrate how these principles were applied in areas with different functions. This study investigates Safranbolu's traditional urban fabric through the lens of biophilic design to understand how sustainability has been maintained from the past to the present. The study concludes that Ottoman urbanism established a deep connection with nature, adhering to biophilic principles in its urban development.

I. GİRİŞ

Biyofili kavramı, 20. yüzyılın ikinci yarısından itibaren gelişen ve insanın doğa ile olan ilişkisini temel alan bir kavram olarak literatüre girmiştir. İlk kez 1964 yılında psikiyatrist Erich Fromm tarafından ortaya atılan bu kavram, canlı organizmaların yaşama karşı duyduğu içsel bağlılığı ve sevinci ifade etmek amacıyla kullanılmıştır. Fromm, biyofiliyi psikolojik bir temele dayandırarak bireylerin canlı varlıklar ve doğal ortamlarla kurduğu olumlu etkileşimler kurduğunu vurgulamıştır [1]. Ancak biyofili kavramı doğa bilimci Edward O. Wilson'ın 1984 yılında yaptığı çalışmalarla daha geniş bir perspektif kazanmış ve Wilson biyofiliyi insanın yaşam süreçlerini izleme ve bu süreçlerle bağlantı kurma eğilimi olarak tanımlamıştır. Wilson, 1993 yılında biyofili hipotezini geliştirerek, insanın tarihsel olarak doğayla iç içe yaşadığı evrimsel süreçlerden yapılı çevrelere geçiş yapmasına rağmen, doğaya ve canlılığa duyduğu bağın devam ettiğini ileri sürmüştür [2]. Bu hipotez, biyofilik tasarım anlayışının temellerini oluşturmuş ve doğanın yapılı çevre ile bütünleşik bir şekilde ele alınması gerektiğini ortaya koymuştur.

Günümüzde artan kentleşme, küresel ısınma, doğal afetler ve salgın hastalıklar, insanları yapay çevrelerden uzaklaşarak doğa ile daha güçlü bir etkileşim kurmaya yönlendirmiştir. Doğal çevreyle etkileşim kurma ve doğadan faydalanma arzusu, bireylerin fiziksel ve ruhsal sağlıklarını olumlu yönde etkilemekte, yaşam kalitelerini artırmaktadır. Modern kentlerde doğadan kopuk yapılaşmanın yarattığı olumsuz etkiler, biyofilik tasarım anlayışına duyulan ihtiyacı artırmış ve doğal unsurların yapılı çevrelere entegrasyonu, sağlıklı ve sürdürülebilir yaşam alanları yaratmak için önemli bir strateji haline gelmiştir. Biyofilik tasarım, insan-doğa etkileşimini güçlendirmek amacıyla doğal öğelerin mimari ve kentsel tasarımda etkin bir şekilde kullanılması üzerine kuruludur. Bu tasarım yaklaşımı, doğanın yalnızca görsel bir unsur olarak değil, aynı zamanda kullanıcıların psiko-sosyal iyileşmesine katkıda bulunan bir bileşen olarak değerlendirilmesini sağlamaktadır.

Son yıllarda yapılan araştırmalar, biyofilik tasarımın insanların öğrenme ve üretkenlik seviyelerinde artış sağladığını, stresi azalttığını ve iyileşme süreçlerini hızlandırdığını ortaya koymuştur. Sanchez ve ark. tarafından yürütülen bir çalışmada, biyofilik tasarıma dayalı iş yerlerinde kullanıcıların yaratıcılık, sağlık ve performans düzeylerinde olumlu değişiklikler gözlemlenmiştir [26]. Benzer şekilde Little, biyofilik şehir anlayışının kentlerdeki yeşil alanların insan sağlığı üzerindeki doğrudan ve dolaylı etkilerini incelediği çalışmasında, biyofilik tasarım yaklaşımının bireylerin fiziksel ve ruhsal sağlıklarını olumlu yönde etkilediğini tespit etmiştir [27]. Kellert, insanların yaşadıkları ve çalıştıkları yapılı çevrelerin sürdürülebilirlik ilkelerine dayalı olarak iyileştirici ortamlar sunması gerektiğini savunmakta, yapılı çevrede biyofilik öğelerin etkin kullanımıyla toplumsal refahın artırılabileceğini belirtmektedir [3]. Kellert, bu doğrultuda, psikolog Judith Heerwagen ve Betty Hase'nin biyofili üzerine çalışmalarını geliştirerek yapılı çevrede biyofili etkilerini derinlemesine incelemiştir [5]. Biyofilik tasarım kavramına yönelik çalışmalarda, güneş ışığından olabildiğince faydalanmak, bitki ve hayvanlarla sürekli etkileşimde bulunmak ve doğayla etkin bir uyum yakalamak gibi unsurların, biyofilik tasarım ögeleri olarak insan yaşamına önemli katkılar sağladığı ortaya konulmuştur. Bu ögelerin, insanların öğrenme ve üretkenlik seviyelerini artırdığı, iyileşme süreçlerini olumlu yönde etkilediği ve stresi azaltmaya yardımcı olduğu belirlenmiştir [6].

Biyofilik tasarımın temel hedefi, doğal sistemlerin kent içi alanlarda sürdürülebilir şekilde korunması ve kentsel çevrede biyofilik unsurların aktif olarak kullanılmasıdır. Bu doğrultuda, biyofilik tasarım kent içi ısı adası etkilerini azaltmakta, biyoçeşitliliği desteklemekte, hava kirliliğini minimize etmekte ve insan-doğa etkileşim alanlarını genişletmektedir. Aynı zamanda, yerel tarımın teşviki, erişilebilir yeşil ve mavi alanların oluşturulması gibi toplumsal faydalar da biyofilik tasarımın dolaylı etkileri arasında yer almaktadır [7]. Bu bağlamda, biyofilik

tasarım yalnızca bireylerin sağlık ve refahını değil, aynı zamanda çevresel sürdürülebilirliği de hedefleyen bir tasarım yaklaşımı olarak ön plana çıkmaktadır.

Tarihi kent dokuları ve geleneksel Osmanlı şehircilik anlayışı incelendiğinde, biyofilik tasarım unsurlarının bu dokuların doğal bir parçası olarak var olduğu görülmektedir. Osmanlı kentlerinde topografya ile uyumlu yerleşim planları, doğal malzemelerin yapılarda kullanımı ve doğayla iç içe bir yaşam biçiminin benimsenmesi, modern biyofilik tasarım ilkelerinin tarihsel kökenlerine işaret etmektedir [8]. Safranbolu şehri, Osmanlı döneminde biyofilik unsurları barındıran sürdürülebilir bir yerleşim dokusuna sahiptir. Şehirdeki yapıların topografyaya uygun bir biçimde ve birbirlerinin ışık ve manzaralarını engellemeyecek şekilde konumlandırılmaları, doğal malzemelerin kullanımı ve insan-hayvan-bitki etkileşimine olanak sağlayan açık alanların varlığı, Safranbolu'nun biyofilik tasarım açısından zengin bir örnek oluşturduğunu göstermektedir.

Çalışmada biyofilik tasarım kriterlerinin incelenmesi, değerlendirilmesi ve tarihi yapılar üzerinden analiz edilerek yorumlanması hedeflenmiştir. Safranbolu tarihi dokusu sürdürülebilir şehircilik anlayışına uygun, doğayla uyumlu mimarisi olan bir Osmanlı şehridir. Safranbolu tarihi dokusunun biyofilik tasarım kriterleri ile değerlendirilerek anlaşılması ve bu değerlendirmeler sonucunda öneriler sunulması amaçlanmıştır.

II. BİYOFİLİK YAKLAŞIMLAR ve TARİHİ DOKULAR

Osmanlı dönemi şehircilik anlayışına bakıldığında, doğaya saygılı ve doğal malzemelerden oluşan mimari yapılar öne çıkmaktadır. Cansever, Osmanlı şehirlerinde yaşayan ailelerin tüm fertlerinin doğayla doğrudan temas halinde olduğunu ve evlerin doğayla bütünleştiğini vurgulamaktadır [8]. Bu dönemde bahçelerin varlığı, doğayla olan organik ilişkinin bir göstergesi olarak ortaya çıkmaktadır.

Biyofili, günümüzde doğaya olan yönelimin arttığı bir ortamda ortaya çıkan güncel bir kavramdır. Ancak tarihi Anadolu şehirlerine bakıldığında, geçmiş dönemlerde insanların hâlihazırda doğaya uyumlu bir yaşam tarzı sürdürdükleri ve doğayla iç içe oldukları gözlemlenmektedir. Anadolu şehirlerindeki tarihi dokuların biyofilik tasarım ilkelerini barındırması, doğaya olan özlemi ve insanların doğal ortamlara duydukları ihtiyacı desteklemektedir. Bu tarihi dokular, insanlara doğal unsurlarla çevrili alanlar sunarak biyofiliyi tetiklemekte ve doğaya olan ihtiyacı karşılamaktadır.

Bu noktada, biyofili olgusunun tarihi dokularla ilişkisi, insanların doğa sevgisi ile tarihi çevreleri keşfetme arzusunu birleştirerek sürdürülebilir bir yaşam tarzını teşvik etmektedir. Tarihi dokuların korunması ve yeniden günümüze kazandırılması, biyofili olgusunun güçlenmesine katkıda bulunurken, aynı zamanda doğal çevrenin ve kültürel mirasın korunmasına da katkı sağlamaktadır.

Kellert, biyofilik tasarım kriterlerini genel olarak altı başlıkta toplamıştır [4]. Bu başlıkları çevresel etkenler, doğal şekiller ve formlar, doğal desenler ve süreçler, ışık ve mekân, mekâna dayalı ilişkiler ve insan doğa ilişkileri olarak sıralamıştır. Bu genel çerçevelerin içerisinde ise özel nitelikler belirleyerek biyofilik tasarım kriterlerinin tanımını genişletmiştir [9] (Tablo 1).

Kellert daha sonra biyofilik tasarıma dair kriterlerini tekrardan düzenlemiş ve bunları üç başlıkta sunmuştur. Doğanın doğrudan deneyimlenmesi, doğanın dolaylı deneyimlenmesi ve yer ve mekânın deneyimlenmesi şeklinde genel başlıklarını sunmuş ve bu başlıklar altında biyofilik tasarım kriterlerini değerlendirmiştir [9] (Tablo 2).

Tablo 1. Biyofilik tasarım kriterleri [4]

Çevresel Etkenler	Doğal Şekiller ve Formlar	Doğal Desenler ve Süreçler	Işık ve Mekân	Mekâna Dayalı İlişkiler	İnsan Doğa İlişkileri
• Renk • Su • Hava • Gün ışığı • Bitkiler • Hayvanlar • Doğal elementler • Manzaralar • Cephe yeşillendirme • Jeoloji ve peyzaj • Habitat ve ekosistemler • Ateş	• Botanik elementler • Ağaç ve sütunlu destekler • Hayvan motifleri • Kabuklar ve spiraller • Yumurta, oval ve tübüler şekiller • Kemerler, tonozlar ve kubbeler • Eğrisel formlar • Doğal özelliklerin simülasyonu • Biyomorfi • Jeomorfoloji • Biyomimikri	• Duyusal değişkenlik • Bilgi zenginliği • Yaş, değişim ve eskime • Büyüme ve çiçeklenme • Merkezi odak noktası • Desenli bütünler • Sınırlı mekanlar • Geçiş alanları • Bağlantılı seriler • Parçaların bütüne entegrasyonu • Tamamlayıcı zıtlıklar • Dinamik denge ve gerilim • Fraktallar • Hiyerarşik organize oranlar ve ölçekler	• Doğal ışık • Filtrelenmiş ve dağınık ışık • Işık ve gölge • Işığın yansıması • Işık havuzları • Sıcak ışık • Şekil ve form olarak ışık • Havadarlık • Mekânsal değişkenlik • Şekil ve form olarak mekân • Mekânsal uyum • İç-dış mekanlar	• Yere coğrafi bağlantı • Yere tarihi bağlantı • Yere ekolojik bağlantı • Yere kültürel bağlantı • Yerel malzemeler • Manzara yönelimi • Bina formunu tanımlayan peyzaj özellikleri • Peyzaj ekolojisi • Kültür ve ekoloji entegrasyonu • Yerin ruhu • Yersizlikten kaçınmak	• Manzara ve sığınma • Düzen ve karmaşıklık • Merak ve cezbetme • Değişim • Güvenlik ve korunma • Ustalık ve kontrol • Sevgi ve bağlılık • Cazibe ve güzellik • Araştırma ve keşif • Bilgi ve biliş • Korku ve dehşet • Saygı ve maneviyat

Tablo 2. Biyofilik tasarım kriterleri [9]

Doğanın Doğrudan Deneyimlenmesi	Doğanın Dolaylı Deneyimlenmesi	Yer ve Mekânın Deneyimlenmesi
• Işık • Hava • Su • Bitkiler • Hayvanlar • Peyzaj • Hava • Manzara • Ateş	• Resimler • Malzemeler • Doku • Renk • Şekiller ve formlar • Bilgi zenginliği • Değişim, yaş ve eskime • Doğal geometriler • Simüle edilmiş doğal ışık ve hava • Biyomimikri	• Manzara ve sığınma • Organize karmaşıklık • Hareketlilik • Geçiş alanları • Yer • Bütünü oluşturmak için parçaları bir araya getirmek

Bir diğer yöntemde biyofilik tasarım kriterleri üç ana başlıkta toplanmış ve bu başlıklar altında biyofilik niteliklerin özellikleri tanımlanmıştır. Bu başlıklar; mekânda doğa, doğal benzerlikler ve mekânın doğasıdır [10] (Tablo 3). Zhong vd., önceki çalışmalardan referansla biyofilik tasarım kriterlerini doğa birleşimi, doğa ilhamı ve doğa etkileşimi başlıkları altında değerlendiren bir çalışma ortaya koymuşlardır [7] (Tablo 4).

Tablo 3. Biyofilik tasarım kriterleri [10]

Mekânda Doğa	Doğal Benzerlikler	Mekânın Doğası
• Doğayla görsel bağlantı • Doğayla görsel olmayan bağlantı • Ritmik olmayan duyusal uyaranlar • Termal ve hava akışı değişkenliği • Suyun varlığı • Dinamik ve dağınık ışık • Doğal sistemlerle bağlantı	• Biyomorfik formlar ve desenler • Malzemelerin doğayla bağlantısı • Karmaşıklık ve düzen	• Manzara • Sığınma • Gizem • Risk

Tablo 4. Biyofilik tasarım kriterleri [7]

Doğa Birleşimi	Doğa İlhamı	Doğa Etkileşimi
• Su • Hava • Günışığı • Bitkiler • Hayvanlar • Peyzaj • Hava durumu • Zaman ve mevsimsel değişim	• Biçimler ve şekiller • Desenler ve geometriler • Resimler • Mekanizmalar • Malzemeler, doku ve renk	• Manzara ve sığınma • Karmaşıklık ve düzen • Cezbetme (tehlike ve gizem) • Yerle bağlantı • Mekanların bağlantısı

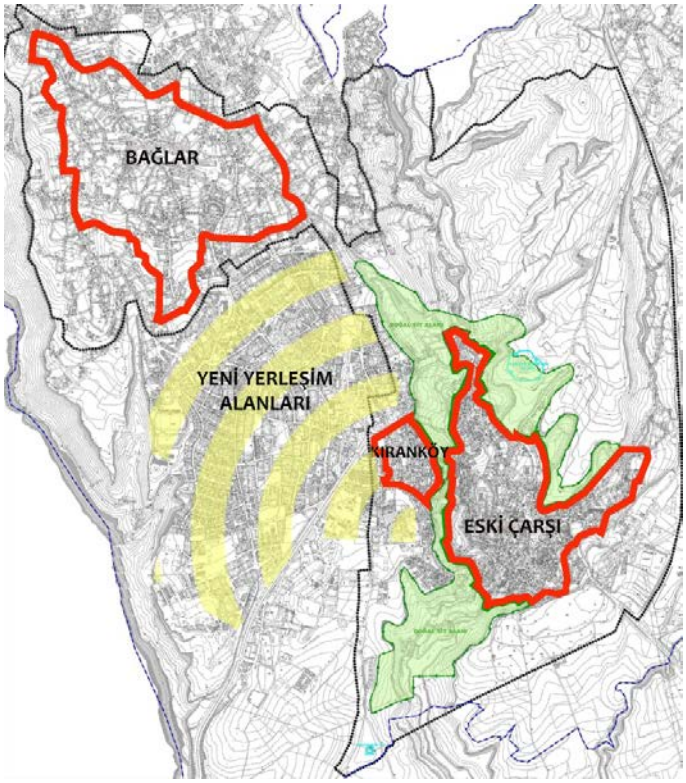
III. MATERYAL ve METOT

Literatürde yer alan makale, tez ve bildiriler incelendiğinde genel olarak biyofilik tasarımların güncel yapılarda veya dokularda değerlendirildiği görülmüştür. Tarihi yapıların biyofilik olarak değerlendirildiği çalışmaların ise genel olarak ülkemizdeki tarihi doku veya yapılar özelinde olduğu tespit edilmiştir. Tarihi dokular üzerinde yapılan bu çalışmaların 2015 yılından itibaren ele alındığı görülmüştür. Bu nedenle 2015-2024 yılları arasında tarihi dokular üzerinde yapılan çalışmalar incelenmiştir. Bu çalışmalarda tarihi dokular üzerinde biyofilik tasarım kriterlerinin değerlendirilmesinde en çok Browning ve Ryan'ın belirlediği ilkelerden faydalanıldığı görülmektedir (Tablo 5) [11, 12, 13, 14, 15, 16, 17]. Bu çalışmada da literatürde genel bir kabul gördüğü için Ryan vd.'nin belirlediği biyofilik tasarım ilkelerinden faydalanılarak değerlendirmeler yapılmıştır.

Çalışmada Osmanlı şehirciliğini yansıtan belirgin özellikleri sebebiyle Safranbolu tarihi dokuları ele alınmıştır. Safranbolu, Türkiye'nin Karabük iline bağlı bir ilçe olup, özgün bir tarihi dokuya sahiptir. Zengin kültürel mirası, Osmanlı dönemine ait tarihi evleri ve geleneksel Türk mimarisini koruyan sokaklarıyla, günümüzde de önemli bir yerleşim konumundadır. Bu çalışmada, Safranbolu tarihi dokusunu oluşturan Çarşı, Kıranköy ve Bağlar bölgeleri biyofilik tasarım kriterlerine göre değerlendirilmiştir. Bu bölgelerde yapılan teknik incelemeler neticesinde rastlanılan biyofilik tasarım ögeleri fotoğraflandırılarak sunulmuştur. Ryan vd.'nin belirlediği biyofilik tasarım kriterlerinin çalışma alanlarındaki somut karşılıkları kanıtlar olarak sunulmuştur. Sonuçta bu üç bölge üzerinde 14 biyofilik tasarım kriterinin varlığına göre 1-3 arası puanlamalar yapılmıştır.

IV. ÇALIŞMA ALANI

Safranbolu yerleşimini Bağlar, Kıranköy ve Çarşı bölgeleri oluşturmaktadır. Bu yerleşimlerden Çarşı bölgesi, Osmanlı döneminde halkın genel olarak yaşadığı alan olarak bilinmektedir. Bağlar bölgesi yazın sıcaklardan korunmak için kullanılan alandır. Kıranköy yerleşimi ise gayrimüslim halkın kullandığı bölgedir (Şekil 1).



Osmanlı şehirlerinde en önemli birim mahalledir. Mahalle içerisinde yer alan konutlar, camiler ve diğer yapılar bir ilişki içerisindedir. Bu alanlarda yaşam, dini inançlar üzerine inşa edilmiştir. Komşuluk ilişkileri, yapıların inşalarında dikkat edilen hususlar, bölgede var olan yapı malzemeleri, sokakların ve mahallelerin oluşumu gibi etkenler o şehrin kendine has kültürünün ve kent kimliğinin oluşmasına olanak vermiştir.

Genel olarak bakıldığında yapıların dış cephelerinde kullanılan malzemelerin renkleri ve dokularının doğayla uyumlu olduğu saptanmıştır. Bina cephelerinde ve çatı kiremitlerinde dış cephe malzeme kullanımlarında doku ve renklerin uyumu dikkati çekmektedir. Doğal desen ve örüntülerin özellikle yapıların iç kısımlarında süslemelerde yoğun olduğu göze çarpmaktadır. Bina cephelerinde ise genel olarak yoğun bir desen örneğine rastlanılmamaktadır.

Bu alanlarda inşa edilen yapılar genel olarak bölgede yoğun olarak bulunan ahşap malzemelerden üretilmişlerdir. Safranbolu ilçesinin Karadeniz bölgesinde bulunması ve ormanlık alanlarının çokluğu sebebiyle yapı malzemesi olarak ahşap sıkça kullanılmıştır. Bu nedenle iklim, topografya, bitki örtüsü gibi coğrafik özellikler Safranbolu tarihi kent dokusunun oluşumu için büyük önem arz etmektedir.

Safranbolu şehrinin tarihi dokusu fiziksel niteliklerinin ötesinde, insanlara doğayla bütünleşik bir yaşam sunarak, duygusal, sosyal ve zihinsel ihtiyaçlarını karşılayabilecekleri bir ortam da sağlamaktadır. Bu nedenle,

Safranbolu'nun tarihi dokusunun korunması ve değerlendirilmesi, insanların doğayla olan ilişkilerini güçlendirmek ve psikolojik refahlarını desteklemek için önemlidir.

Şekil 1. Safranbolu Bağlar, Kıranköy ve Çarşı yerleşim bölgeleri [18]

4.1 Çarşı

Safranbolu kentinin oluşumunda merkez nokta, günümüzde Çarşı bölgesi olarak bilinen alandır (Şekil 1). Bu bölgede, Osmanlı döneminden kalma tarihi dükkânlar, konutlar, anıtsal yapılar bulunmaktadır. Çarşı bölgesi, günümüzde de Safranbolu tarihi dokusunun merkezi olarak kabul edilmektedir. Safranbolu şehrinde XVI. yüzyıldan itibaren Cinci Hanı ve Hamamı, Köprülü Mehmet Paşa Camii gibi yapılar inşa edilmiş ve kent Osmanlı döneminde bu alanda gelişim göstermiştir [19].

Çarşı bölgesi Kıranköy ve Bağlar bölgelerine göre daha alt kotlarda yer almaktadır. Bu bölgede merkez noktalarda dükkânların ve vakıf yapılarının yer aldığı, konutların ise yamaçlara yayıldığı görülmektedir. Çarşı bölgesindeki konutlara bakıldığında topografyaya uyumlu bir yerleşim yapıldığı ve evlerin birbirinin manzarasını kesmeyecek biçimde yerleştirildikleri tespit edilmiştir (Şekil 2). Bu düzenleme, aynı zamanda bireysel yapılar arasında hava akışı değişkenliğini destekleyerek, kent içi rüzgâr koridorlarının oluşumuna katkı sağlamaktadır. Bu mekânsal organizasyon, güneşlenme sürelerini optimize etmekte ve termal konfor ile çevresel dengeyi artırarak biyofilik tasarım ilkelerine uygun bir mekânsal düzenleme sunmaktadır. Yapıların topografyaya uyumlu bir biçimde yerleşmesi, güneş ışığına ve manzaraya erişimi engellemeyecek şekilde düzenlenmiş olup, doğayla görsel bağlantıyı da güçlendirmektedir.

Farklı duvar örgüleri, sıralı pencerelerin yer alması ritmik bir düzen sunarak karmaşıklık ve düzen ilkelerini sağlamaktadır (Şekil 3, 4).

Şekil 2. Çarşı bölgesinde konutların yerleşimi (Yazarın arşivinden)

Şekil 3. Çarşı bölgesinde pencere örnekleri [20]

Osmanlı şehirciliği anlayışında planlanan şehirde sokaklarda genel olarak peyzaj ögelerine yer verilmemiş, ancak bahçelerde yeşil ögeler kullanılmıştır. Yaprak döken ve yaprak dökmeyen ağaçların varlığı doğal sistemlerle olan bağlantıyı kuvvetlendirerek farklı mevsimler arasında farklı dokular oluşmasına imkân tanımaktadır. Böylelikle her mevsim doğayla görsel bağlantı sağlanmaktadır (Şekil 5).

Şekil 4. Çarşı bölgesinde duvar örgüleri (Yazarın arşivinden)

Çarşı bölgesindeki topografik eğim nedeniyle istinat duvarları üzerinde inşa edilen yapılar, mekânsal güvenlik algısını zayıflatabilecek bir unsur olarak değerlendirilmektedir (Şekil 6). Bu yapısal düzenleme, biyofilik tasarımın risk ve korku kriterini sağlamaktadır. Bölgedeki kamu ve sivil yapılarda taş ve ahşap gibi doğal malzemelerin kullanımı, doğayla malzeme bağlantısı kriterini sağlamaktadır (Şekil 6). Bu özellikler, Çarşı bölgesinin biyofilik tasarım potansiyelini destekleyen önemli unsurlar arasında yer almaktadır.

Şekil 5. Çarşı bölgesinde farklı mevsimlerden görüntüler, a) kış mevsimi [21], b) bahar mevsimi (Yazarın arşivinden)

Şekil 6. Çarşı bölgesinde yapı örnekleri (Yazarın arşivinden)

Çarşı bölgesinde kanyonların arasından akan bir dere bulunmaktadır. Bu durum da bölgede suyun varlığını ortaya koymaktadır (Şekil 7). Dere şu an korunmaktadır ve su akışının sesiyle dereyle işitsel bir temas sağlamaktadır. Ayrıca derenin varlığı görsel olmayan bağlantı ve ritmik uyaranlar kriterlerinin sağlanmasına da imkân tanımıştır. Bunun yanı sıra şehir içerisinde birçok alanda bina duvarlarına bağımlı veya bağımsız olarak sokaklarda yer alan çeşmelere de sıkça rastlanılmaktadır. Bu durum da doğaya görsel olmayan bağlantı ve ritmik uyaranlar kriterlerini karşılamaktadır. Günümüzde bu çeşmelerden bazıları çalışır durumda iken bazıları ise çalışmamaktadır (Şekil 8).

Safranbolu tarihi dokusunda Osmanlı şehirlerinde olduğu gibi içe dönük bir plan düzeni mevcuttur. Genel olarak mahremiyet esaslı olan bu durum ile iç mekân ve dış mekân arasında bir ayrım yapılmıştır. Bu durum sığınma ve gizem ilkeleriyle bağdaşmaktadır.

Çarşı bölgesinde yer alan yapılarda kubbe, kemer ve tonoz gibi mimari elemanlar, strüktürel ögeler olarak öne çıkmakta ve aynı zamanda biyomorfik formlardan oluşmaktadır. Bu elemanlar, Osmanlı dönemi mimarlığının simgesel ifadeleri arasında yer almakta ve mekânsal organizasyonda bir süreklilik sunmaktadır. Bunun yanı sıra,

doğal formların yapı detaylarında kullanıldığı gözlemlenmektedir. Özellikle pencere pervazları, kapı girişleri ve cephelerde, bitkisel motifler, organik hatlar ve kıvrımlı desenler gibi biyomorfik unsurlar dikkat çekmektedir. Bu doğal formlar, mimarinin doğa ile bağını güçlendirmekte ve biyomorfik desen kriterini sağlamaktadır.

Yapılarda kullanılan gönye çıkma, köşe çıkma ve çıkma üstünde çıkma gibi çıkmalar yapılara çok yönlü manzaralar ve ışık kaynakları sağlarken aynı zamanda çıkmanın uzunluğuyla orantılı olarak risk ve gizem duyguları da uyandırmaktadır (Şekil 9).

Şekil 7. Çarşı bölgesinde suyun varlığı [22]

Şekil 8. Çarşı bölgesinde çeşme örnekleri [20]

Şekil 9. Çarşı bölgesinde farklı çıkma örnekleri [20]

4.2 Kıranköy

Safranbolu, tarih içerisinde farklı kültürlere, dil ve inanışlara ev sahipliği yapmıştır. Bu topluluklardan birisi de Rumlardır. Rumlar 18-19. yüzyıllarda Kıranköy'ü yaşam alanı olarak kullanmışlardır Safranbolu'da genel olarak

marangozluk, duvarcılık, kunduracılık, demircilik ve terzilik gibi işlerle uğraşan Rumlar için 19. yüzyıldan itibaren bağcılık önemli bir ekonomik kazanç yöntemi olmuştur [23]. Bağcılığın artmasıyla Rumlar, Kıranköy yerleşimindeki evlerinin alt katlarında şarap mahzenleri yapmışlardır [23], [24].

Kıranköy yerleşiminde konut yapılarının yakın konumlanması sebebiyle sokakların dar olduğu görülmektedir. Ulu Cami yakınlarındaki yapıların birbirine yakın olarak inşa edilmesinden dolayı bahçelerinin küçük olduğu, merkezden uzaklaştıkça ise konutların birbirlerinden daha uzak konumlanması sebebiyle bahçelerin genişlediği gözlemlenmiştir (Şekil 10). Yapıların birbirine yakın konumlandırılması ve dar sokaklar, kullanıcıların görüş açısını sınırlayarak mekânda bir gizem duygusu yaratmakta ve kullanıcıları mekânın henüz görülmeyen noktalarını keşfetmeye teşvik etmektedir.

Şekil 10. Kıranköy konut dokusunda yapılar (Yazarın arşivinden)

Kıranköy yerleşimindeki geleneksel yapılarda zemin katların taş malzemelerden diğer katların ise ahşap elemanlardan inşa edildikleri görülmektedir. Bu yapılar genellikle iki veya üç katlı olmaktadırlar. Kapı ve pencere pervazları da ahşap malzemelerden inşa edilmiştir. Sıvasız olan yapılarda hımış yapım tekniğinin gereği olan ahşap elemanlar da görülebilmektedir. Doğal malzemelerin kullanımı doğal malzemelerle bağlantının yanı sıra doğal sistemlerle bağlantı kriterine de uymaktadır (Şekil 11).

Şekil 11. Kıranköy yerleşiminde yapılarda doğal malzemelerin kullanımı (Yazarın arşivinden)

İncelenen alanda, yoğun yapılaşmanın bir sonucu olarak yeşil unsurların sınırlılığı, ritmik olmayan duyusal uyaranların yanı sıra, doğayla görsel bağlantı, doğal ışık kullanımı ve termal hava akışı değişkenliği gibi biyofilik tasarım kriterlerinin sağlanmasını da zorlaştırmaktadır. Bu durum, kullanıcıların doğal çevreyle etkileşim kurmasını sınırlandırarak, biyofilik tasarımın temel unsurlarının mekânsal bağlamda yeterince uygulanamamasına neden olmaktadır.

Bitişik nizamda inşa edilen yapılarda, giriş katlarındaki pencere sayısının az, üst katlardaki pencere sayısının ise daha fazla olması, iç mekânlarda hava akışında farklılıkların oluşmasına neden olmaktadır. Bu durum, özellikle alt ve üst katlar arasında mikroklimatik farklılıkların ortaya çıkmasına imkân tanıyarak, yapı içi doğal havalandırma dinamiklerine olumlu yönde katkı sağlamakta ve mekânsal konfor koşullarını doğrudan etkilemektedir. Kıranköy sokaklarında su ögelerinin varlığı oldukça azdır. Bölgede yer alan Ulu Camii'nin şadırvanında ve binaların sokağa cephe veren duvarlarında tasarlanmış olan az sayıda çeşme suyun varlığını göstermektedir (Şekil 12). Ancak, su ögelerinin sınırlılığı, biyofilik tasarım kriterlerinden biri olan suyla görsel, işitsel veya dokunsal bağlantının yeterince sağlanamaması nedeniyle olumsuz bir etki yaratmaktadır.

Şekil 12. Kıranköy yerleşiminde su ögeleri (Yazarın arşivinden)

Şekil 13. Kıranköy yapılarında farklı çıkma örnekleri (Yazarın arşivinden)

Şekil 14. Kıranköy yerleşiminde kapı girişlerinde bitkisel motifler (Yazarın arşivinden)

Yapıların yaşam alanı olarak kullanılan zemin üstü katlarında yer alan pencerelerden güneş ışığından faydalanmak üzere farklı çözümler sunulmuştur. Bu bağlamda, yapılar sokaklara farklı biçimlerde çıkmalar yapmış ve böylelikle farklı açılardan ışık almaları sağlanmıştır. Bu düzenlemeler, yalnızca doğal ışık kullanımını artırmakla kalmayıp, aynı zamanda termal ve hava akışı değişkenliği parametresiyle de doğrudan ilişkilidir. Aynı zamanda dar sokaklarda yer alan yapılar için de farklı bakış açıları ve manzaralar sağlanmaktadır (Şekil 13). Yamaçlarda yer alan ve önünde güneş ışığı almasını engelleyecek unsurların yer almadığı yapılarda da doğal ışık ve manzaradan etkin bir biçimde faydalanılmaktadır.

Yığma taş tekniğiyle inşa edilen zemin katlardaki giriş kapı açıklıkları genellikle kemerli biçimde tasarlanmıştır. Bazı yapılarda kemerli girişlerin bitki motifleriyle bezendiği görülmekte olup, bu durum biyomorfik form ve şekillerin kullanımını açıkça ortaya koymaktadır (Şekil 14). Bölgede yer alan cami ve hamamlar, özellikle kubbe, kemer ve tonoz gibi organik formdaki mimari ögeleri barındırarak biyomorfik form ve şekillerin kullanım kriterlerini sağlamaktadır. Geleneksel yapılardaki pencerelerin pervazlarında ise biyomorfik formların uygulandığı dikkat çekmektedir (Şekil 15). Bununla birlikte sıralı pencereler ritmik bir düzen oluşturmaktadır. Konutlarda kapaklı pencere uygulamaları, bu yapıların mevsimsel gereksinimlerle kontrollü olarak ışıklandırmalarının yapılmasına ve hava akışının sağlanmasına katkı sunmaktadır. Ayrıca güvenlik kaygıları sebebiyle de bu kapakların kontrollü olarak kullanıldığı düşünülmektedir [20]. Kapaklı pencerelerin varlığı, ışığın kontrollü olarak kullanılabilmesine katkıda bulunmaktadır. Aynı zamanda, bu pencereler doğal havalandırma sağlayarak termal ve hava akışı değişkenliğini kontrollü olarak artırmakta ve mekânsal konfor koşullarına katkıda bulunmaktadır. Bunun yanı sıra Kıranköy yerleşiminde bazı yapılarda küçük pencerelerin olduğu da tespit edilmiştir. Yapılardaki bu noktalar gizem uyandırmaktadır (Şekil 15). Ayrıca bölgede yer alan çıkmaz sokaklar da risk duygusunu ön plana çıkarmaktadır (Şekil 16).

Kıranköy yerleşim dokusunda gözlemlenen çıkmaz sokaklar, mekânsal yönelim kısıtlamaları nedeniyle kullanıcı algısında belirsizlik ve güvensizlik duygularını tetikleyebilecek bir unsur olarak değerlendirilmektedir. Bu durum, biyofilik tasarım kriterlerinden risk ve korku unsurlarıyla ilişkilendirilebilecek bir mekânsal özellik olarak öne çıkmaktadır. Ayrıca çıkmaz sokaklar, insanlardaki keşfetme arzusunu tetiklemektedir. Bu durum da gizem unsurunu desteklemektedir.

Şekil 15. Kıranköy yerleşiminde pencere örnekleri (Yazarın arşivinden)

Şekil 16. Kıranköy yerleşiminde çıkmaz sokak örneği (Yazarın arşivinden)

4.3 Bağlar

Safranbolu'nun tarihi dokusunu tamamlayan bir diğer önemli bölge Bağlar'dır (Şekil 1). Bağlar, adını bölgedeki üzüm bağlarından almaktadır. Bağlar, Kıranköy ve Çarşı bölgelerinden daha yüksek bir konumda bulunmaktadır. Bağlar bölgesi daha çok yaz aylarının sıcaklığından korunmak adına kullanılan bir sayfiye mekanıdır [25]. Bu bölgede, Osmanlı dönemine ait birçok tarihi konak ve ev bulunmaktadır. Bölgedeki konutlar genellikle iki veya üç katlıdır ve bu yapılar genellikle bahçe içinde yer alır. Tarihi evlerde kullanılan ahşap oyma süslemeler, geleneksel Türk sanatının bir örneği olarak dikkat çekmektedir. Bağlar bölgesi aynı zamanda Safranbolu'nun tarım ve bağcılık geçmişini de yansıtmaktadır. Doğayla iç içe olan bu bölgede doğayla görsel bağlantı kurulmaktadır (Şekil 17).

Bağlar bölgesinde yer alan konutlarda yapının tamamının ahşap olduğu örneklerle giriş katın taş olup üst katların ahşap malzemelerle inşa edildiği örnekler de bulunmaktadır. Yapıların sokağa bakan bahçe duvarları ise farklı örgülerde taş malzemelerden inşa edilmişlerdir. Bu durum da doğaya görsel olmayan referanslar sunmakta ve aynı zamanda doğa ile malzeme bağlantısı da kurmaktadır (Şekil 18). Bölgede yeşil alanlar yoğun olduğu için ritmik olmayan duyusal uyaranlara da sık rastlanmaktadır. Yaprakların esintileri, böcek ve hayvan hareketleri, kuş cıvıltıları gibi uyaranlar hissedilmektedir.

Şekil 17. Bağlar bölgesinde bahçeli ev örnekleri (Yazarın arşivinden)

Bağlar yerleşimindeki yapılar bahçeli olduğu için komşu yapıların güneş ışığı ve manzarasını genellikle engellememektedir. Doğal peyzajın içerisinde yer alan bu konutlarda yüksek rakımlarda yer almanın da getirdiği bir hava akışı sirkülasyonu sağlanmaktadır. Yapıların zemin katlarında daha az pencere açıklığı yer almakla birlikte üst katlarda pencerelerin artmasıyla doğal ışıktan mümkün olduğunca faydalanılmaktadır. Pencere pervazlarında ve yapıların giriş kapılarında doğal formlardan yararlanılmış, aynı zamanda kemerli açıklıklar da düzenlenmiştir (Şekil 19).

Bölgenin yerleşim planlamasında yapılar, Çarşı ve Kıranköy bölgelerine göre daha aralıklı konumlandırılmış olup, bu durum sokak algısında daha karmaşık bir görüntü sunmaktadır. Bunun yanı sıra, yapıların pencerelerindeki tekrarlayan düzenler ve cephelerde kullanılan geometrik desenler, şehir dokusundaki yolların, sokakların ve yapıların organik ve çok katmanlı yerleşiminden kaynaklanan ritmik tekrarlarla birlikte, karmaşıklık ve düzen ilkesiyle bağdaşmaktadır. Sokak boyunca devam eden ve mahremiyet sebebiyle yüksek yapılmış duvarlar da bir gizem kaynağıdır. Bu bahçe duvarlarının aynı zamanda sığınma güdüsünden de kaynaklandığı söylenebilmektedir. Bahçe duvarlarının bitki örtüsüyle zenginleştirilmesi, ritmik olmayan duyusal uyaranlar ve doğal sistemlerle bağlantı gibi biyofilik kriterlerin de somut bir yansımasını oluşturmaktadır (Şekil 20).

Şekil 18. Bağlar bölgesinde konut örnekleri (Yazarın arşivinden)

Bağlar sokaklarında su ögeleri az sayıdadır. Bölgede yer alan binaların sokağa cephe veren duvarlarında tasarlanmış az sayıda olan çeşmeler, suyun varlığını göstermektedir (Şekil 21). Bu çeşmelerden kullanılıp aktif olan ve hiç aktif olmayan örnekler bulunmaktadır.

Şekil 19. Bağlar bölgesinde pencere ve kapı örnekleri (Yazarın arşivinden)

Şekil 20. Bağlar bölgesinde bahçe duvarları (Yazarın arşivinden)

Şekil 21. Bağlar bölgesinde su ögeleri (Yazarın arşivinden)

V. BULGULAR ve DEĞERLENDİRMELER

Literatürde yer alan çalışmalar incelendiğinde biyofilik tasarım kriterlerinin tarihi dokular üzerinde ele alındığı örneklere az rastlanılmıştır. Tarihi dokularda biyofilik değerlendirmeler yapan çalışmaların da daha çok yapı özelinde ele alındığı görülmektedir. Osmanlı Dönemi şehir planlama anlayışının irdelenmesi günümüze kaynaklık edecektir. Bu bağlamda tarihi dokuların kıyaslanmasına yönelik bir biyofilik tasarım değerlendirmesi, çalışmanın özgün yanını ortaya koymaktadır.

Safranbolu tarihi dokusunu oluşturan Çarşı, Kıranköy ve Bağlar bölgeleri biyofilik tasarım kriterlerince değerlendirilmiştir. Buna göre doğayla görsel bağlantının Çarşı ve Kıranköy bölgelerinin merkez noktalarında

yoğun yapılaşmalar olması sebebiyle Bağlar bölgesine göre daha az olduğu tespit edilmiştir. Doğayla görsel olmayan bağlantıların ise benzer yapım teknikleri nedeniyle üç bölgede de benzer olduğu görülmüştür.

Ritmik olmayan duyusal uyaranların yine yapılaşmanın yoğun olduğu Çarşı ve Kıranköy bölgelerinde Bağlar bölgesine göre daha az hissedildiği gözlemlenmiştir. Termal ve hava akışı değişkenliğinin her üç bölge özelinde de etkisi benzer olarak değerlendirilmiştir.

Çarşı ve Kıranköy bölgelerinde su ögelerine daha sık rastlanırken Bağlar bölgesinde su ögelerine daha az oranda rastlanmıştır. Çalışma şehir dokusu özelinde incelendiğinden yapıların içerisindeki havuzlar değerlendirilmemiştir. Su varlığı açısından en yoğun bölge Çarşı bölgesidir. Çeşmelerin sıklığı ve yerleşim alanı içinden geçen derenin etkisi kendisini göstermektedir. Dinamik ve dağınık ışık etkilerinin, yapı yoğun bölgelerde sokakların dar ve eğimli yapısı ile cephelerdeki çıkmaların oluşturduğu ışık-gölge geçişleri sayesinde daha belirgin hale geldiği tespit edilmiştir. Bu mekânsal özellikler, ışığın günün farklı saatlerinde mekânda hareket etmesine ve farklı açılardan dağılarak mekânın algısal zenginliğini artırmasına olanak sağlamaktadır.

Doğal malzemelerin yapı elemanı olarak kullanılması sebebiyle doğal malzemelerle olan bağlantı da üç bölge özelinde eş olarak değerlendirilmiştir.

Çarşı ve Kıranköy bölgelerinin Bağlar bölgesine göre daha yoğun yerleşim alanı olarak kullanılması sebebiyle anıtsal ve sivil yapı çeşitlilikleri bu bölgelerde daha fazladır. Bu nedenle Çarşı ve Kıranköy yerleşimlerinde biyomorfik formlar ve desenler daha belirgindir.

Yapıların yerleşimleri, kapı ve pencere dizilimleri, bahçe duvarlarının örgüleri ve çatı örtüleri gibi etkenler karmaşa ve düzen kriterinin tüm bölgelerde varlığını ortaya koymaktadır.

Yapıların yoğun olarak yer aldığı bölgeler haricinde manzaradan etkin biçimde faydalanacak şekilde yerleşim planı yapıldığı görülmektedir. Topografyaya uyumlu yerleşim ile komşu yapıların güneş ve manzarasını kesmeyen yapılaşma biçimleri üç bölgede de kendisini göstermektedir. Bağlar bölgesinde, yapıların diğer bölgelere göre daha geniş bahçelerinin olması sebebiyle bu alanlarda manzara etkisinden daha fazla yararlanılmaya çalışıldığı görülmüştür. Ancak Çarşı ve Kıranköy yerleşimlerinde de manzaradan etkin biçimde yararlanıldığı görülmektedir. Dar sokakların olduğu yerlerde çıkmalarda sokağa açılan pencerelerle farklı bakış açıları sağlandığı görülmektedir. Yapıların kendi manzaraları haricinde yapının kendi varlığıyla oluşturduğu manzara da ayrıca önem arz etmektedir. Bağlar bölgesinde geniş bahçeler ve bu bahçelerin içerisinde yer alan bol yeşil alanlarla yapıların kendi manzaraları da farklı bir bakış açısı sunmaktadır.

Bahçeli yapılarda bahçe duvarları genel olarak mahremiyet sebebiyle yüksek olarak tasarlanmıştır. Bu durum da sığınma hissi uyandırmaktadır. Üç bölgede de bu durum gözlemlenmiştir. Ancak bahçeli yapıların oransal olarak daha çok olduğu Kıranköy ve Bağlar bölgelerinde bu durum kendisini daha çok göstermektedir.

Camilerin varlığı, çevresel bağlamda güven ve aidiyet hissini güçlendiren, toplumsal bütünleşme ve mekânsal süreklilik sağlayan önemli unsurlar arasında yer almaktadır. Çarşı ve Kıranköy'de merkezi noktalarda konumlanan anıtsal camiler, yalnızca dini işlevleriyle değil, avlularıyla oluşturdukları açık alanlar ve sosyal toplanma noktalarıyla da kullanıcılar için bir sığınma hissi yaratmaktadır. Kıranköy'de yer alan ve kiliseden camiye dönüştürülen Ulu Cami de tarihsel süreçte bölgenin sosyal ve mekânsal dinamiklerine entegre olmuş, bu bağlamda bireylerde mekânsal güvenlik ve aidiyet algısını destekleyen bir yapı niteliği taşımaktadır.

Kıranköy'de çıkmaz sokaklara rastlanmıştır. Bu durum da risk ve korku hissi uyandırabilmektedir. Bunun yanı sıra özellikle Çarşı bölgesinde eğimden dolayı oluşan istinat duvarları üzerine inşa edilmiş yapılar da risk ve korku unsuru oluşturabilmektedir. Bunun yanı sıra gizem kriteri de sağlanmaktadır.

Yapıların mahremiyet gözetilerek inşa edilmesi, lineer olmayan yerleşim düzenleri, pencere biçim ve yerleşimleri gibi unsurlar da üç bölgede de gizem unsuru oluşturmaktadır.

Bu çalışmada, Safranbolu'nun Çarşı, Kıranköy ve Bağlar bölgelerindeki tarihi dokular, biyofilik tasarım kriterlerine göre değerlendirilmiştir. Her bir bölge için biyofilik tasarım kriterlerine göre bir puanlama sistemi geliştirilmiştir. Puanlar, her kriter için 1 ile 3 arasında sıralanmış olup, 3 en yüksek başarıyı temsil etmektedir. 14 kriter üzerinden yapılan değerlendirmede maksimum 52 puana ulaşılabilmektedir. Her bölgenin kriterlere göre toplam puanı ve başarı oranı açıkça belirtilmiştir. Literatürden elde edilen veriler ve alan gözlemleri ışığında, Ryan vd.'nin belirlediği biyofilik tasarımın 14 temel kriteri değerlendirilmiştir. Her bir kriterin dokusal bağlamdaki somut karşılıklarını ortaya koymak adına temel kriterlerin açıklamalarından yola çıkılarak kanıtlar sunulmuş ve bu kanıtlar tabloda açıkça ifade edilmiştir. Bu yaklaşım, kriterlerin teorik çerçeveden uygulama bağlamına geçişini açıklamayı ve kriterlerin mekânsal düzeydeki yansımalarını daha sistematik bir şekilde ortaya koymayı amaçlamaktadır (Tablo 5).

Tablo 5. Biyofilik tasarım kriterlerine göre Çarşı, Kıranköy ve Bağlar bölgelerinin değerlendirmeleri

Kriterler	**Kanıtlar**	**Çarşı**	**Kıranköy**	**Bağlar**
Doğayla Görsel Bağlantı	• Doğa ile iç içelik (toprak, ağaç, bitki ögeleriyle etkileşim)	**2**	**2**	**3**
Doğayla Görsel Olmayan Bağlantı	• Rüzgâr ve gölgelikler • Yapı malzemeleriyle doğal doku oluşturulması	**3**	**2**	**2**
Ritmik olmayan duyusal uyaranlar	• Esintiler, yaprakların hareketlenmesi • Hayvan hareketleri • Gölge, ışık ve ısının değişimi	**2**	**2**	**3**
Termal ve hava akışı değişkenliği	• Mekân yönlenmeleri • Pencere açıklıklarının çokluğu	**3**	**2**	**3**
Suyun varlığı	• Çeşme ve cami avlularının varlığı	**3**	**2**	**1**
Dinamik ve dağınık ışık	• Farklı açılarda mekân yönelimleri • Çıkmalarla sağlanan ışık açıları	**2**	**2**	**3**
Doğal sistemlerle bağlantı	• Doğal malzemelerin varlığı • Süreçler içerisinde oluşan mevsimsel etkiler ve desenler	**3**	**3**	**3**
Biyomorfik formlar ve desenler	• Kapı ve pencerelerde doğal desenler • Yapı yüzeylerinde ve bina girişlerindeki doğal desenler • Cephelerde yer alan nazarlıklar	**2**	**3**	**1**
Doğal malzemelerle bağlantı	• Doğal malzemenin yapı strüktüründe kullanılması (taş, ahşap)	**3**	**3**	**3**
Karmaşıklık ve düzen	• Sokak dokularının yapıların yerleşimine bağlı olarak düzeni • Bahçe duvarlarında, çatı örtülerinde, cephe tipolojilerinde farklılıkların oluşturulması • Yapı yüksekliklerindeki farklılıklar	**2**	**2**	**2**
Manzara	• Yapıların doğa manzarasına bağlantısı • Yapıların oluşturduğu manzara etkisi	**2**	**1**	**3**
Sığınma	• Bahçe duvarlarının varlığı • Camilerin varlığı • Zemin katlarda yükseltilmiş ve küçük pencere açıklıkları	**3**	**2**	**2**
Gizem	• Yapı bahçelerine ve zemin katlara insan ölçeğinde görsel bağlantının azlığı • İçe dönük yapı tasarımı oluşturulması	**2**	**2**	**3**
Risk/Korku	• Çıkmaz sokakların varlığı • Cami ve meydanların azlığı	**1**	**2**	**3**
Toplam		**33**	**30**	**35**
Başarı Yüzdesi		%78,5	%71,4	%83,3

Değerlendirmede, biyofilik tasarım kriterleri ışığında bölgelerin genel özellikleri detaylı bir şekilde analiz edilmiştir. Her bölgenin farklı kriterlerde ön plana çıktığı görülmüştür. Bağlar bölgesi, biyofilik tasarım kriterlerine en yüksek uyumu göstermektedir. Geniş bahçeleri, doğal unsurların zenginliği ve manzara ile bütünleşen yerleşim dokusu, bu bölgenin güçlü yönlerini oluşturmaktadır. Ritmik olmayan duyusal uyaranlar, dinamik ışık düzenlemeleri ve doğal sistemlerle kurulan güçlü bağ, Bağlar'ı biyofilik kriterlere en iyi uyum sağlayan yerleşim haline getirmiştir. Ayrıca, yapıların doğal manzaralarla etkileşimi ve geniş yeşil alanların varlığı, bölgenin toplamda 35 puan alarak en yüksek başarıyı elde etmesine katkıda bulunmuştur. Bu özellikleriyle Bağlar, biyofilik tasarım kriterlerine %83,3 oranında uyum sağlamayı başarmıştır.

Çarşı bölgesi, toplamda 33 puan alarak ikinci sırada yer almıştır. Bu bölgede, doğal malzemelerin kullanımı, suyun varlığı ve termal hava akışı değişkenliği gibi biyofilik kriterler öne çıkmıştır. Özellikle suyun varlığı açısından zengin bir bölge olan Çarşı, doğal öğelerin kent dokusuna entegrasyonunu sağlayarak önemli bir başarı göstermektedir. Bununla birlikte, yoğun yapılaşma nedeniyle doğayla görsel bağlantı açısından sınırlı kalmış ve ritmik olmayan duyusal uyaranların azlığı nedeniyle daha düşük puanlar almıştır. Böylelikle Çarşı bölgesinin biyofilik tasarım kriterlerine %78,5 oranında uyum sağladığı görülmüştür.

Kıranköy bölgesi ise toplamda 30 puanla üçüncü sırada yer almıştır. Bölge, biyomorfik formlar ve desenler açısından öne çıkmasına rağmen, özellikle suyun varlığı ve manzara ile olan bağlantı konularında sınırlı kalmıştır. Yapıların daha yoğun bir yerleşime sahip olması, termal ve hava akışı değişkenliği açısından sınırlı bir başarı göstermesine neden olmuştur. Bununla birlikte, doğal malzemelerle olan bağlantı, gizem unsurları ve sığınma hissi gibi bazı biyofilik kriterlerde 2 veya 3 puan almıştır. Değerlendirmeler sonucunda Kıranköy bölgesinin biyofilik tasarım kriterlerine %71,4 oranında uyum sağladığı saptanmıştır. Genel olarak, yapılan değerlendirmeler sonucunda bütün dokularda biyofilik tasarım izlerine rastlanılmış olup her dokuyu ön plana çıkaran kriterler bulunmaktadır.

VI. SONUÇLAR

Bu çalışma, biyofilik tasarım kriterleri çerçevesinde Safranbolu'nun geleneksel kent dokusunu analiz ederek, biyofilik ilkelerin geçmişte doğal bir şekilde uygulandığını ve tarihi dokuların bu ilkeleri bünyesinde barındırdığını ortaya koymuştur.

Günümüzde, hızla artan kentleşme, doğayla olan bağın zayıflamasına ve insan sağlığı ile yaşam kalitesi üzerinde olumsuz etkiler oluşmasına yol açmaktadır. Bu bağlamda, Safranbolu gibi tarihi dokular, doğayla uyumlu ve insanın psiko-sosyal ihtiyaçlarına uygun bir yapılaşma biçiminin sürdürülebilirliği için önemli bir model sunmaktadır. Safranbolu'nun, doğayla görsel ve görsel olmayan bağlantı, ritmik olmayan duyusal uyaranlar, termal ve hava akışı değişkenliği, dinamik ve dağınık ışık, doğal sistemlerle bağlantı, doğal malzemelerle bağlantı, sığınma ve gizem gibi biyofilik tasarım kriterleri açısından genel olarak güçlü bir uyum gösterdiği tespit edilmiştir. Yapılan analizler, Çarşı, Bağlar ve Kıranköy bölgelerinin her birinin, farklı biyofilik kriterler bağlamında ön plana çıkan özgün mekânsal ve yapısal özelliklere sahip olduğunu ortaya koymaktadır.

Sonuç olarak Safranbolu, yalnızca tarihi dokuların korunması için değil, aynı zamanda çağdaş kent planlamasında biyofilik tasarım unsurlarının uygulanabilirliğine yönelik bir örnek oluşturmaktadır. Bu bağlamda, biyofilik tasarım kriterlerinin, restorasyon projelerinde mevcut biyofilik unsurların devamlılığını sağlayacak şekilde ele

alınması, tarihi dokuların doğal ve kültürel bütünlüğünün sürdürülebilir bir şekilde korunmasına katkıda bulunacaktır. Ayrıca, biyofilik tasarımın mimarlık ve şehir planlama disiplinlerinde yaygınlaştırılması amacıyla eğitim programları oluşturulmalı ve farkındalık artırılmalıdır. Yerel yönetimler de biyofilik tasarımları teşvik edici politikalar benimsemelidir. Gelecekte yapılacak araştırmaların, biyofilik tasarım unsurlarının çağdaş kentlerde nasıl uygulanabileceğine ve bu uygulamaların kentsel sürdürülebilirlik üzerindeki etkilerine odaklanması, alandaki bilgi birikimini derinleştirecektir. Bunun yanı sıra kentsel yaşam kalitesinin arttırılmasına yönelik stratejilerin geliştirilebilmesi adına biyofilik tasarım uygulamalarının sosyo-ekonomik boyutları da araştırılmalıdır.

Çağdaş Mimarlık Uygulamalarında Matematiksel Yaklaşımlar: Bakü Örneği

Dr. Öğr. Üyesi Nergiz AMİROV[1] ,Prof. Dr. Narmin AGHAYEVA[2]

Öz

Matematik, mimarlıkta soyut kavramların mekânsal gerçekliklere dönüştürülmesini sağlayan temel bir araç olagelmiştir. Bu çalışma, matematik ile çağdaş mimarlık arasındaki ilişkiyi, Bakü'de yer alan üç ikonik yapı: Mirvari Restoran, Bakü Kristal Salon ve Crescent Alışveriş Merkezi üzerinden nitel bir vaka analizi yöntemiyle incelemektedir. Bu yapılar, farklı işlevsel ve dönemsel özellikler taşımalarına rağmen, ortak biçimsel özellikleri olan kabuk yapı sistemleri, eğrisel geometriler ve parametrik tasarım yaklaşımları sayesinde seçilmiştir. Ayrıca, her biri Hazar Denizi kıyısında konumlanarak benzer çevresel dinamiklere maruz kalmaktadır. Bu bağlamda, parametrik geometri, yapısal optimizasyon ve çevresel simülasyon gibi matematiksel ilkelerin bu yapıların form ve performansında nasıl rol oynadığı araştırılmıştır. Literatür taraması, biçimsel-mekânsal analiz ve bağlamsal yorumlama yoluyla yürütülen çalışma, tasarım üretimi, malzeme verimliliği, iklimsel duyarlılık ve kültürel simgesellik olmak üzere dört ana tema etrafında yapılandırılmıştır. Bulgular, matematiğin yalnızca teknik doğruluk sağlamadığını, aynı zamanda estetik ifade ve kültürel anlamı da güçlendirdiğini ortaya koymaktadır. Seçilen örnekler üzerinden yapılan bu analiz, dijital çağda işlevsel, sürdürülebilir ve etkileyici mimarlığın inşasında matematiğin üretken ve bütünleştirici bir rol oynadığını vurgulamaktadır.

Anahtar Kelimeler: mimarlık, geometri, hesaplama, matematik, sürdürülebilirlik

ABSTRACT

Mathematics has long served as a fundamental tool in architecture, enabling the transformation of abstract concepts into spatial realities. This study explores the relationship between mathematics and contemporary architecture through a qualitative case analysis of three iconic structures in Baku: the Mirvari Restaurant, Baku Crystal Hall, and Crescent Mall. Despite differing in function and construction period, these buildings were selected for their shared formal characteristics such as shell structures, curvilinear geometries, and parametric design logic and their common placement along the Caspian Sea waterfront, exposing them to similar environmental dynamics. The research investigates how mathematical principles such as parametric geometry, structural optimization, and environmental simulation contribute to the form and performance of these structures. Conducted through literature review, formal-spatial analysis, and contextual interpretation, the study is structured around four key themes: design generation, material efficiency, climatic responsiveness, and cultural symbolism. The findings reveal that mathematics not only ensures technical precision but also enhances aesthetic expression and cultural meaning. This analysis underscores the productive and integrative role of mathematics in shaping functional, sustainable, and evocative architecture in the digital age.

Keywords: architecture, computation, geometry, mathematics, sustainability

INTRODUCTION

Architecture has always been deeply intertwined with mathematics, serving as a bridge between the tangible world of structures and the abstract realm of ideas. From the golden ratios of ancient Greek temples (Markowsky, 1992) to the complex geometries of modern skyscrapers (Williams, 2016), mathematical principles have underpinned architectural innovation throughout history. In modern times, the advent of computational tools and advanced modeling techniques has elevated the role of mathematics, enabling architects to push the boundaries of form, function, and sustainability (Kolarevic, 2003; Peters, 2013).

This paper delves into the symbiotic relationship between mathematics and modern architecture, with a particular focus on three iconic structures in Baku: Mirvari Restaurant, the Baku Crystal Hall, and Crescent Mall. These buildings not only stand as landmarks of contemporary design but also exemplify how mathematical approaches can transform conceptual ideas into functional and aesthetically striking realities. The selected buildings span different decades and represent a variety of architectural typologies, yet all reveal an intentional use of mathematical logic whether through geometry, structural reasoning, or environmental simulation (Oxman, 2008).

Figure 1 illustrates the geographic placement of the three case studies along Baku's coastal edge. Each structure occupies a distinct urban context, contributing to the waterfront's architectural diversity while responding to site-specific environmental and cultural dynamics.

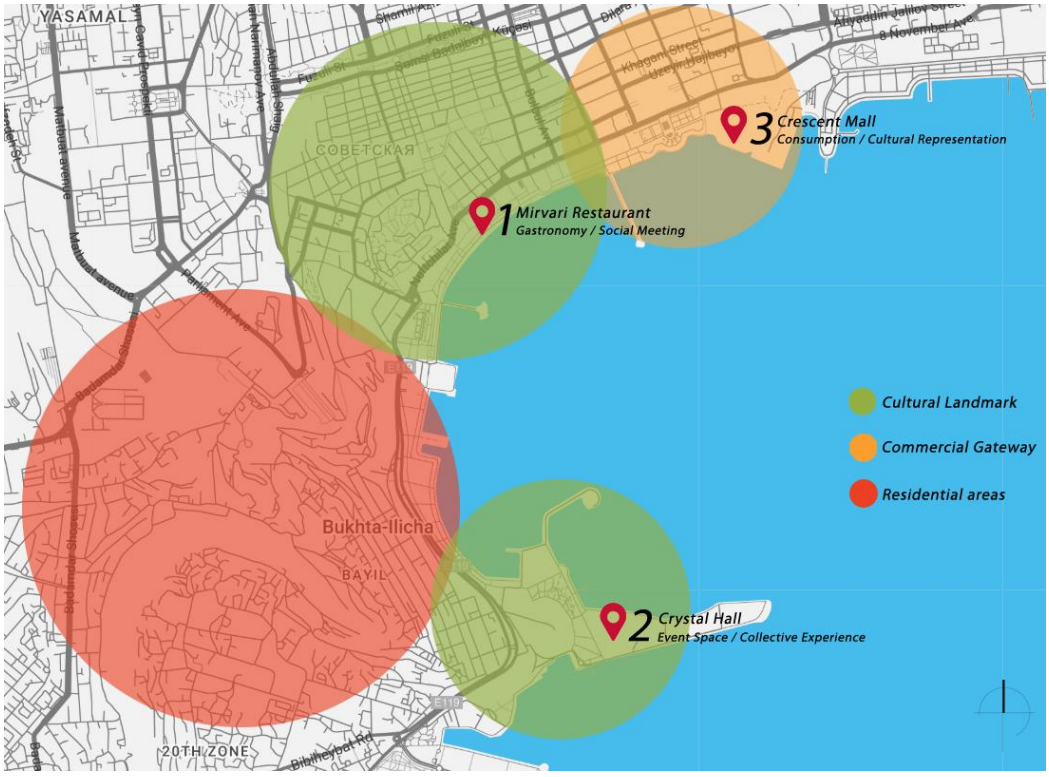

Figure 1. Urban placement map illustrating the spatial impact zones and coastal positioning of the three architectural case studies. Each colored area represents the primary functional influence of the buildings on their surrounding urban context, emphasizing their symbolic and performative roles within Baku's waterfront development.

This study aims to examine how mathematical principles shape architectural expression and performance across three main themes: (1) mathematics in design, (2) material science and structural optimization, (3) environmental control strategies and (4) cultural and symbolic interpretation is

included. The methodology follows a qualitative case study approach, incorporating literature review, formal-spatial analysis, and contextual interpretation. A simplified diagram illustrating the research strategy is also included in the methods section for additional clarity.

Mathematical shapes have always played a significant role in architectural innovation, inspiring forms that are both visually dynamic and structurally efficient (Kolarevic, 2003). Hyperbolic shapes, parametric curves, and three-dimensional spatial masses have become defining elements of modern architecture, allowing architects to achieve complex and organic designs. The Mirvari Restaurant reflects organic, wave-like shapes derived from sinusoidal curves and parametric modeling, evoking fluidity and natural rhythm. The crystalline geometry of the Baku Crystal Hall draws inspiration from triangular tessellations and polyhedral forms, showcasing the power of mathematical symmetry. Crescent Mall, with its distinctive crescent shape, pays homage to cultural symbolism while utilizing advanced computational geometry to create its smooth, arched form. These mathematical inspirations not only enhance the aesthetic value of these buildings but also ensure their structural stability and environmental performance (Peters, 2013).

The first theme explored in this paper is the role of mathematics in design. Architectural design today often relies on parametric modeling and computational algorithms, tools that allow for the creation of complex geometries and innovative forms. Mirvari Restaurant's organic wave-like structures, the Baku Crystal Hall's crystalline facade, and Crescent Mall's crescent-shaped form all showcase how geometry and parametric tools can manifest cultural symbolism and functional beauty in built environments.

Another crucial aspect is material science and structural optimization. Mathematics is indispensable in ensuring the efficient use of materials, calculating load distributions, and predicting structural performance. For example, finite element analysis guided the structural design of the Baku Crystal Hall to ensure stability and lightweight efficiency, while sustainable material choices in Crescent Mall highlight how mathematical modeling contributes to reducing environmental impact. The use of precise calculations in the design and fabrication of Mirvari Restaurant's innovative forms further emphasizes the importance of mathematics in achieving structural integrity and design excellence.

In addition to analyzing these themes, this paper traces the evolution of three-dimensional thinking in architecture. From the geometric foundations of ancient structures to the dynamic possibilities enabled by modern computational tools, the paper highlights how mathematical approaches have shaped architectural practice. These tools not only allow architects to envision bold designs but also ensure their feasibility.

Before proceeding to the individual case studies, the following section presents a brief theoretical overview of the historical and contemporary interplay between mathematics and architecture, establishing a conceptual foundation for the in-depth analysis that follows.

1. Methods

This study adopts a qualitative case study approach to explore how mathematical principles influence contemporary architectural design, material systems, and environmental strategies. Focusing on three significant structures in Baku; Mirvari Restaurant, Baku Crystal Hall, and Crescent Mall. The research investigates how mathematical thinking is embodied spatially, structurally, and environmentally within these examples.

Research Design

The research methodology is structured around a comparative, thematic analysis. Each selected building is examined through four consistent analytical themes:

- Mathematics in Design
- Material Science and Structural Optimization
- Environmental Control Strategies
- Cultural and Symbolic Aspects

This thematic structure ensures a systematic and comparable investigation across different cases and architectural periods.

Case Study Selection Criteria

The buildings selected for analysis were chosen based on the following criteria:

- Architectural and cultural significance within Baku's urban fabric
- Demonstrable use of mathematical principles in form, structure, or environmental performance
- Diversity in typology and design era (ranging from mid-20th century to contemporary works)

This selection aims to provide a representative yet focused exploration of mathematical applications in different architectural contexts.

Data Collection and Sources

Data for each case study was collected through:

- Academic literature and project reports
- Architectural daigrams and visual documentation
- Digital analyses and computational simulations where available
- Secondary sources such as interviews, project websites, and technical publications

All visual materials used for analysis have been clearly cited, and when necessary, architectural diagrams were created or adapted to support the evaluations.

Analytical Process

Figure 2 shows the analytical workflow of the study follows five sequential stages:

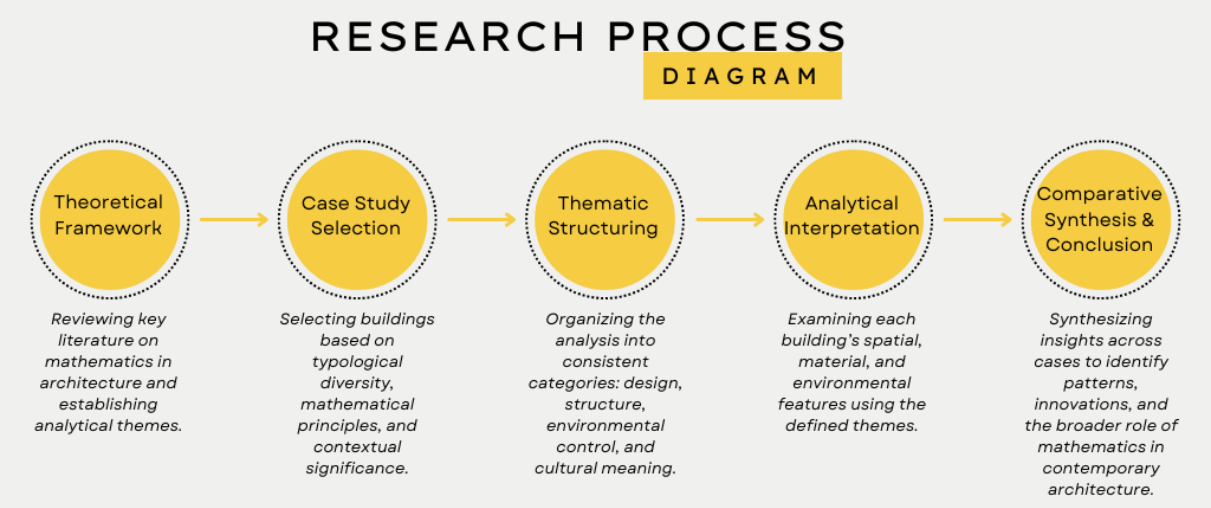

Figure 2. Research process diagram. (Visualized by the author, 2025).

The five stages of the research process include:

1. Reviewing theoretical literature on mathematics and architecture
2. Selecting and justifying the case studies
3. Structuring the analysis into defined thematic categories
4. Interpreting each building individually within these themes
5. Synthesizing the findings comparatively to reach broader conclusions

This methodological structure provides clarity and depth in examining the complex interplay between mathematical logic and architectural expression.

2. The Interplay of Mathematics and Architecture

Mathematics has been an integral part of architectural practice since the earliest human settlements. In its simplest form, mathematics provided a foundation for proportionality, measurement, and structural stability, enabling even rudimentary structures to serve their functional purposes (Burry & Burry, 2010). The use of basic geometry in ancient architecture such as the layout of circular huts or the precise alignment of the Pyramids of Giza illustrates how mathematical principles informed early design practices. The Great Pyramid of Giza, constructed around 2600 BCE, is often cited for its approximation of the golden ratio, believed to convey harmony and aesthetic perfection (Markowsky, 1992; Rossi, 2004). Similarly, Greek and Roman architecture employed mathematical proportions, notably those outlined by Vitruvius in De Architectura, to achieve balance and visual harmony in structures like the Parthenon (Vitruvius, trans. Morgan, 1914; Rowland & Howe, 1999). During the Gothic era, mathematical calculations were fundamental in designing soaring arches, ribbed vaults, and intricate stained glass windows. These innovations allowed for both greater structural efficiency and an enhanced interplay of light and shadow, emphasizing both spiritual and aesthetic aspirations (Scott, 2003).

In modern architecture, mathematics transcends its historical role as a tool for measurement and evolves into a medium for creative exploration. The introduction of computational design tools, such as Rhinoceros and Grasshopper, has revolutionized the field, enabling designers to manipulate complex geometries and develop novel architectural forms (Kolarevic, 2003; Peters, 2013). Zaha Hadid's Heydar Aliyev Center in Baku exemplifies how parametric design can facilitate the creation of fluid, organic structures grounded in advanced mathematical logic (Schumacher, 2011).

Beyond design, mathematics underpins computational simulations used to predict a structure's performance under various conditions. Tools like finite element analysis (FEA) enable precise modeling of load distributions, stresses, and deformations, thereby ensuring safety and efficiency in complex forms (Timoshenko & Goodier, 1970; Adeli, 2001). Santiago Calatrava's Turning Torso in Sweden, a twisting tower composed of mathematically calculated segments, exemplifies the balance between structural rigor and sculptural form (Jodidio, 2005).

One of the most fascinating aspects of mathematics in architecture is its dual function in both structural logic and aesthetic harmony. Proportions, symmetry, and visual rhythm all stem from mathematical rules that govern spatial relationships (Salingaros, 2006). The Sydney Opera House, whose shell-like geometry is based on sections of a sphere, exemplifies this synergy, achieving structural innovation through formal simplicity (Murray, 2004). Similarly, Buckminster Fuller's geodesic domes rely on tessellated triangulation to create lightweight yet resilient spatial enclosures (Fuller, 1975).

Mathematics also finds profound expression in decorative systems. Islamic architecture, in particular, is celebrated for its complex tilework and muqarnas, which are rooted in geometric logic and often explore infinite repetition and symmetry (Abas & Salman, 1995; Bonner, 2017). The Renaissance marked a pivotal shift in the application of mathematical knowledge to design, with architects like Brunelleschi and da Vinci integrating perspective and proportion into architectural drawing and construction (Kemp, 2012; Payne, 1999).

In contemporary practice, mathematical concepts such as fractals, topology, and non-Euclidean geometry challenge traditional design methods. For instance, the Eden Project in the UK, with its interlocking geodesic domes, draws on fractal logic and organic mathematics to create biomimetic forms (Grimshaw Architects, 2002). Meanwhile, sustainability imperatives have brought environmental simulation to the fore, enabling optimization in energy, daylighting, and ventilation. The Louvre Abu Dhabi's perforated dome uses geometric algorithms to blend solar control with symbolic expression (Nouvel, 2017).

The relationship between mathematics and architecture is deeply reciprocal: while mathematical discoveries inspire new design possibilities, architectural challenges stimulate mathematical innovation. Structural complexity in skyscrapers, for example, has led to breakthroughs in materials science and applied mathematics (Adeli, 2001). Conversely, architectural projects increasingly serve as platforms to visualize abstract mathematical ideas such as hyperbolic geometry, toroidal forms, and tessellations previously confined to theoretical domains (Senechal, 1990; Steinhardt & Ostlund, 1987). Frank Gehry's Guggenheim Museum in Bilbao illustrates this phenomenon by transforming computer-generated mathematical models into expressive, buildable structures (Jodidio, 2005).

Understanding this evolving relationship provides essential context for analyzing contemporary buildings. As computational technologies and climate-conscious design shape architectural priorities, mathematics emerges not only as a supportive mechanism but also as a generative force in shaping form, function, and performance.

Building upon this foundation, the following case studies; Mirvari Restaurant, Baku Crystal Hall, and Crescent Mall, exemplify the active application of mathematical principles in contemporary architectural practices. These examples are analyzed in terms of geometry, material logic, environmental responsiveness, and cultural symbolism. **Figure 3** illustrates key historical milestones where mathematics and architecture intersected, providing a conceptual backdrop for the detailed discussions that follow.

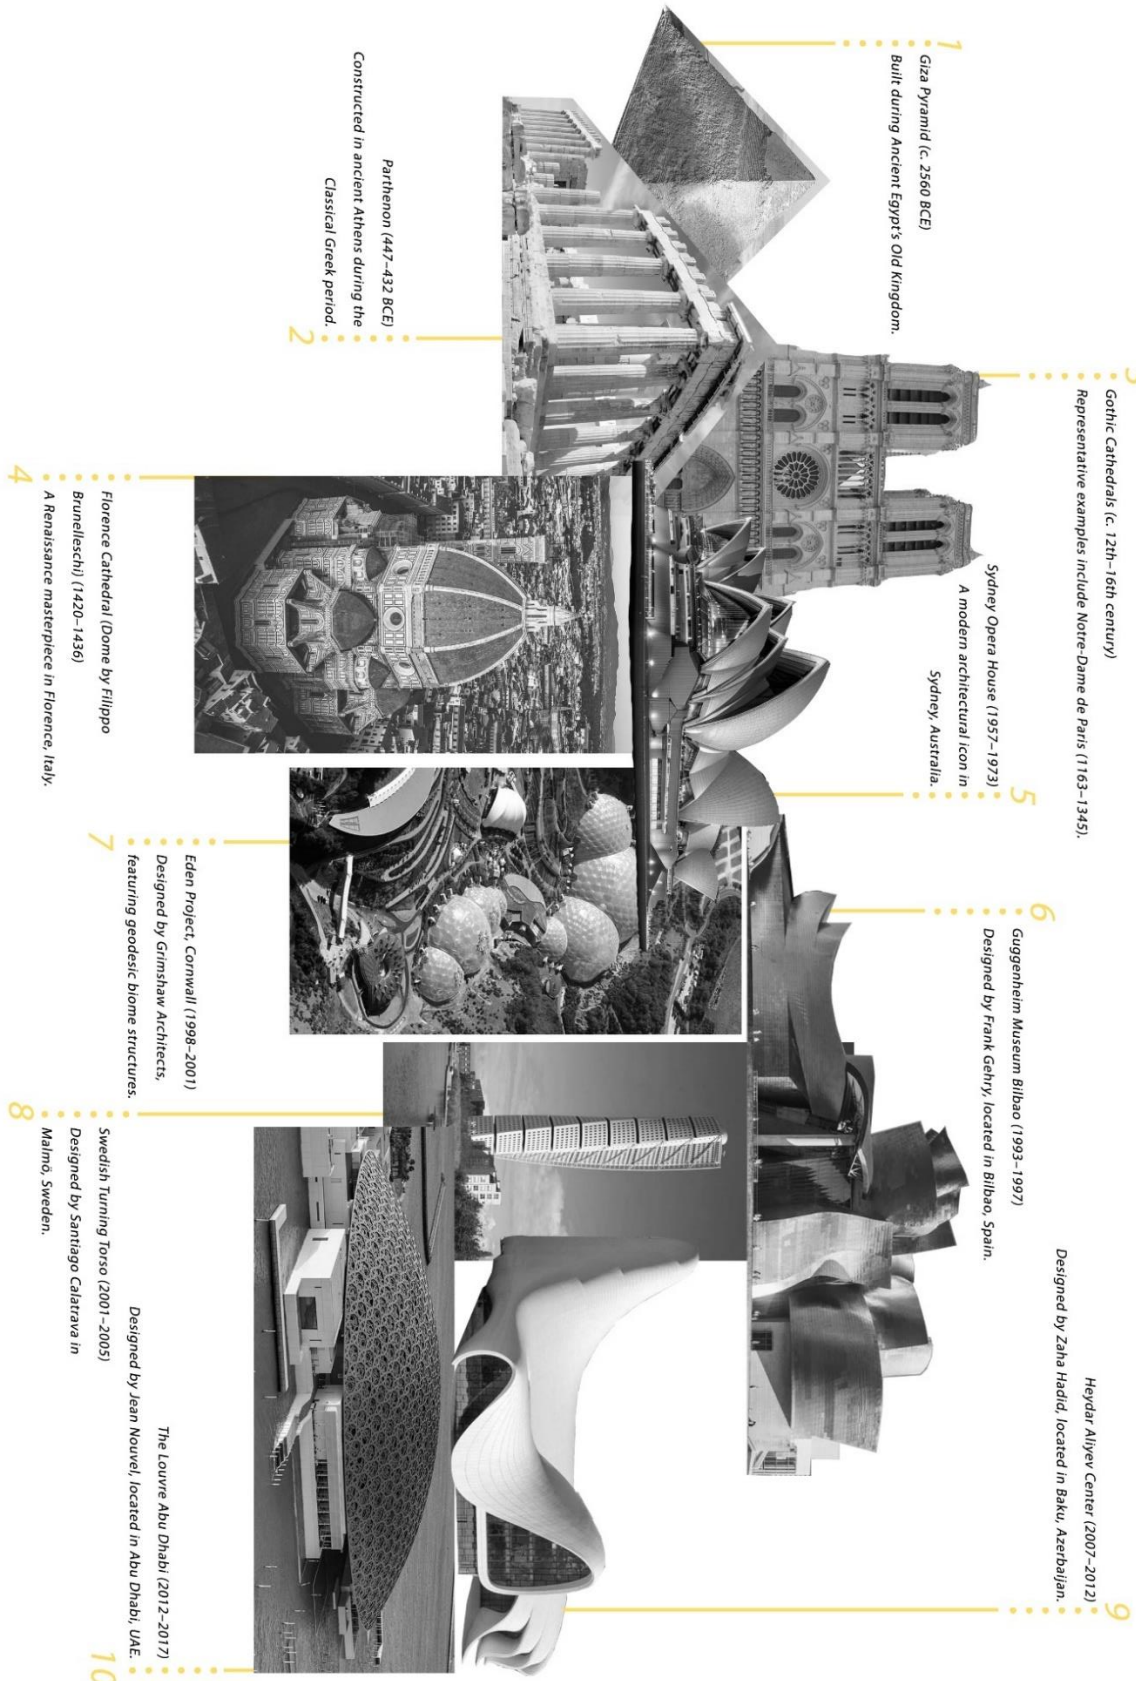

Figure 3. Chronological diagram of exemplified structures in the context of the interaction of mathematics and architecture. (Visualized by the author, 2024).

3. Mathematics in Contemporary Architecture: Case Studies

3.1 Mirvari Restaurant (1962)

The Mirvari Restaurant, located along Baku's Seaside Boulevard, exemplifies the integration of organic, wave-like forms with mathematical principles in architectural design. Completed in 1962, the structure reflects a mid-20th-century fascination with fluid geometries inspired by natural elements, particularly the undulating waves of the Caspian Sea.

3.1.1. Mathematics in Design: Organic and Wave-Like Forms

The Mirvari Restaurant's shell-like roof structure stands as a prime example of organic architecture, where mathematical precision is employed to emulate forms found in nature. The undulating roof resembles a hyperbolic paraboloid, a doubly curved surface mathematically defined by the equation:

$z=(x^2/a^2)-(y^2/b^2)$ **(Figure 4)**

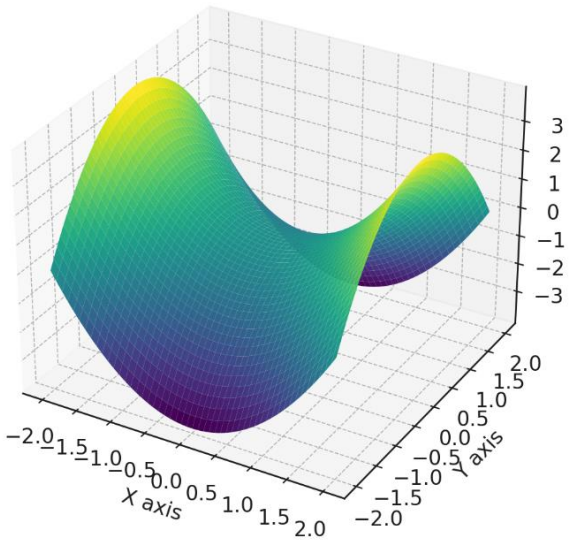

Figure 4. Visualization of a hyperbolic paraboloid surface defined by the equation $z = (x^2/a^2) - (y^2/b^2)$, illustrating the doubly curved geometry characteristic of structures such as the Mirvari Restaurant roof. (https://rabmcmenemy.medium.com/decoding-our-snacks-unveiling-the-hyperbolic-paraboloid-of-pringles-using-python-83c695e52515).

This geometry is renowned for its structural efficiency and aesthetic dynamism. Hyperbolic paraboloids allow architects to span large areas with minimal material thickness, ensuring structural integrity while achieving elegant, flowing forms (Seaside Boulevard Department, 2020).

It was precisely the hypar form that the Spanish architect and engineer Félix Candela exploited in the construction of the "La Jacaranda" hall in Acapulco **(Figure 5)**, a precedent that clearly influenced the design approach of V. Shulgin and R. Sharifov for the Mirvari Restaurant **(Figure 6)**. Positioned prominently on the elevated Seaside Boulevard terrace, the Mirvari pavilion initially had its base exposed directly to the Caspian Sea waves, forging a strong environmental and symbolic relationship with the fluid landscape.

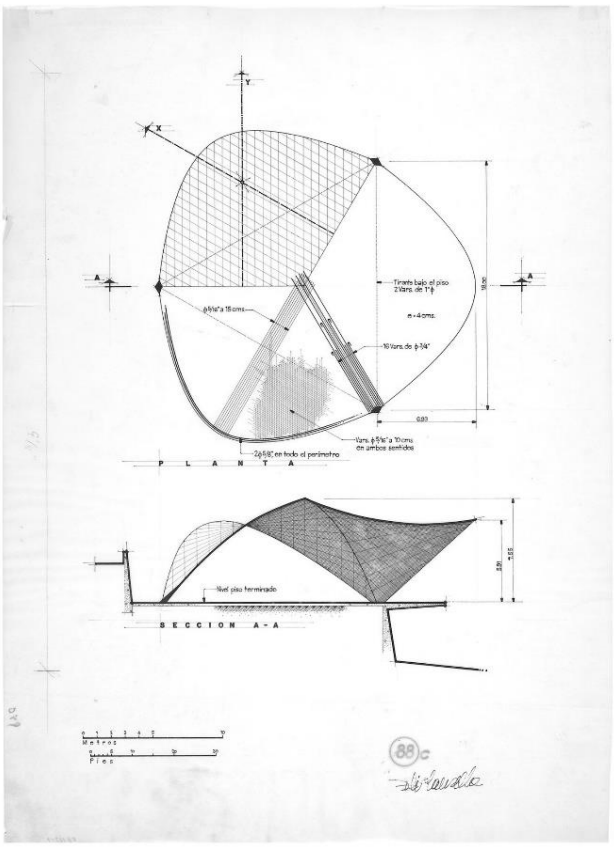

Figure 5. Nightclub "La Jacaranda", Acapulco, Felix Candela, 1957. (Flickr.com/photos/gallery400).

Figure 6. Mirvari Restaurant, Baku, 2016. (https://kobold-wizard.livejournal.com/793199.html).

What distinguishes the unique engineering of this slender reinforced concrete (6-8 cm) edifice is its absence of conventional walls; instead, the ceiling gracefully extends into the supports, unfurling skin to the petals of a flower. This wall-less pavilion design offers multiple advantages:

- Natural ventilation: Fresh air circulates freely, minimizing the need for mechanical systems.
- Enhanced daylight: Ample daylight penetrates the space, reducing reliance on artificial lighting and creating a luminous atmosphere.
- Flexibility: The open plan supports multiple functions, from casual gatherings to formal events.
- Psychological openness: The absence of barriers fosters a welcoming, inclusive environment.

The mathematical foundation of the hyperbolic paraboloid ensures even force distribution, with most stresses handled through compression, enabling lightweight yet resilient structures. This engineering logic symbolically ties the pavilion to its maritime context, with the form echoing the fluidity of ocean waves (Architecture Courses, 2010).

Building upon this structural logic, mathematical thinking also guided the form-finding process of the Mirvari Restaurant, even before the advent of contemporary computational tools (Oxman, 2006). While today parametric design is associated with digital tools such as Rhinoceros and Grasshopper, its foundational principles have existed in architecture for decades. In the Mirvari Restaurant, architects explored variations of key geometric parameters curvature, axis orientation, symmetry manually, in an early form of parametric thinking (Parametric Architecture, 2023).

This process involved:

- Defining key geometric relationships
- Adjusting parameters iteratively
- Testing structural performance through physical modeling

Such manual "parametric" adjustments optimized the curvature of the roof, balancing load-bearing capacity with light transmission and spatial rhythm. Had contemporary computational tools been available, the shell could have been digitally modeled by setting parameters like:

- Curvature radii (along x and y axes)
- Support span dimensions
- Targeted daylight penetration rates
- Structural stress distribution optimization (via Finite Element Analysis)

Nonetheless, the architects' mastery of mathematical relationships enabled the realization of a highly complex, performance-optimized form without computational assistance. The Mirvari Restaurant exemplifies how early architects achieved sophisticated parametric manipulations through geometric intuition, laying the groundwork for today's computational design methodologies.

This intuitive application of parametric logic not only shaped the restaurant's iconic form but also directly informed its structural behavior, where mathematical optimization played a crucial role in achieving material and load efficiency (Chilton, 2000).

The shell structure of the Mirvari Restaurant demonstrates advanced mathematical optimization. Shell forms work primarily in compression, minimizing tensile forces and allowing the structure to achieve remarkable strength with minimal material usage. Mathematical models were instrumental in distributing loads evenly across the surface, resulting in a lightweight yet robust roof that seamlessly integrates form and function (Seaside Boulevard Department, 2020).

The Mirvari Restaurant's thin shell operates primarily under compressive forces, minimizing tensile stresses that typically demand heavier reinforcement. This fundamental efficiency principle enabled the realization of a vast, unobstructed space with minimal material mass.

In comparison with other hypar shell structures of the era such as Los Manantiales in Mexico or the Valencia Exhibition Hall in Spain, Mirvari showcases:

- Minimal surface design for efficient material use
- Structural form derived directly from mathematical properties
- Resistance to external loads such as wind pressure and seismic activity

Mathematical load distribution analysis, though conducted manually at the time, ensured that stress paths followed the natural curvature of the shell, significantly reducing the risk of localized failures. By embracing the intrinsic strength of mathematically generated forms, Mirvari demonstrates a profound synergy between geometry, material behavior, and structural logic, prefiguring sustainable design strategies of later decades.

3.1.2. Material Science and Structural Optimization

The primary material used in the construction of the Mirvari Restaurant is reinforced concrete. This choice was strategic, as reinforced concrete offers the necessary compressive strength, moldability, and resilience to support complex architectural forms. Its plastic behavior is particularly advantageous in shaping thin, curved surfaces like the hyperbolic paraboloid, a geometry that defines Mirvari's iconic shell roof (Chilton, 2000). The adaptability of the material allowed the architects to create expansive, column-free interiors without sacrificing structural integrity. Moreover, the doubly curved surfaces of the shell were generated through straight-line elements, enabling a relatively simple yet cost-effective formwork system that reduced construction complexity and minimized material waste (Seaside Boulevard Department, 2020).

Building on these material advantages, the structural logic of the hyperbolic paraboloid further reinforced the efficiency of the design. As a doubly curved anticlastic surface — featuring opposite curvatures along orthogonal axes the hypar derives its strength primarily from form, not mass. This results in highly efficient load distribution, where internal stresses are transferred through compressive flow lines rather than tension. As a consequence, the Mirvari shell structure operates predominantly under compression, enabling thinner shell thicknesses (as low as 6–8 cm) while maintaining structural resilience (Billington, 1983).

Studies on thin-shell structures have demonstrated that this geometric form inherently resists deformation under various external forces, including wind uplift and seismic vibrations (Pottmann et al., 2007). The negative Gaussian curvature of the hypar not only prevents buckling under compression a failure common in flat or singly curved surfaces but also enhances overall shell stiffness. These structural advantages align with Félix Candela’s pioneering work, where form-driven strength became a defining characteristic of expressive concrete architecture (Pottmann et al., 2007).

To realize this geometry in practice, the Mirvari Restaurant’s construction employed prefabricated formwork and generative construction methods. By relying on ruled surfaces composed of straight-line segments, the builders achieved a high degree of precision in forming the shell’s curvature **(Figure 7).**

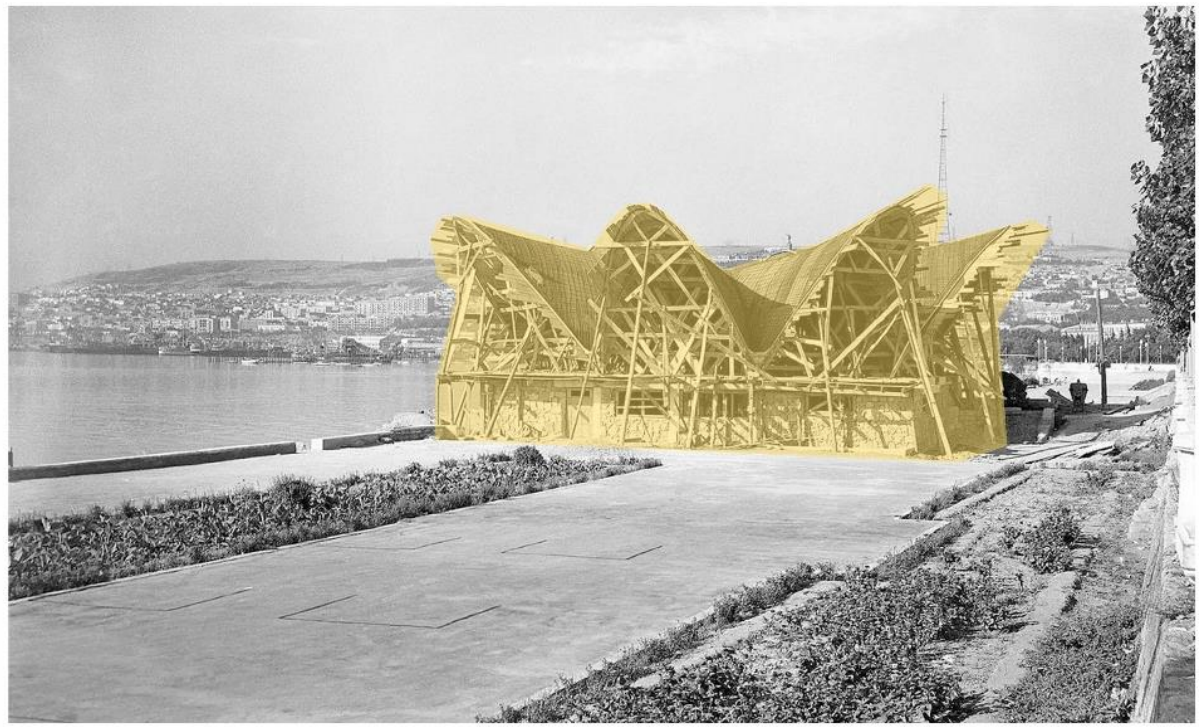

Figure 7. A visual of the construction process of the Mirvari restaurant, 1961. (From the archive of Parviz Polukhzada, https://jp.pinterest.com/pin/522276888038285399/).

This approach reduced construction time and material costs while ensuring the roof's structural efficiency and aesthetic quality (Chilton, 2000). The Mirvari Restaurant exemplifies how material science and structural efficiency can converge to create an architecturally and structurally significant building. Through the strategic use of reinforced concrete and the application of hyperbolic paraboloid geometry, the restaurant's design achieves a harmonious blend of aesthetic expression and functional performance. This project highlights the potential of innovative materials and geometric principles to shape modern architecture (Seaside Boulevard Department, 2020). The use of straight timber or steel formwork further reduced material waste and enabled faster fabrication and assembly on site.

This rationalization of geometry not only facilitated the shaping process but also enabled efficient reinforcement placement, further enhancing structural integrity. Today, this method could be modeled and validated using Finite Element Analysis (FEA) to simulate stress paths, deformation behavior, and optimization of material thickness across the shell. While the original designers worked intuitively, the outcomes align closely with current principles of form-finding and structural optimization often visualized in modern engineering software (Oxman & Oxman, 2010). The Mirvari Restaurant thus exemplifies how mathematical geometry and material innovation converge to realize an architectural form that is both expressive and performance-driven.

The Mirvari Restaurant thus represents a compelling convergence of material science, geometric logic, and efficient construction methodology. Through the strategic deployment of reinforced concrete and the deliberate use of hyperbolic geometry, the structure achieves a harmonious balance between expressive form and technical performance. It exemplifies how architectural innovation emerges from a deep understanding of both material behavior and mathematical form. The material and structural intelligence embedded in the Mirvari Restaurant's design showcases how a nuanced understanding of

geometry and construction can yield sustainable, resilient, and visually powerful architecture even without digital tools.

This seamless integration of material science and geometry supports both sustainability and aesthetic intent. By minimizing material usage while maximizing span and openness, the design reflects an efficient, contextually responsive, and mathematically disciplined approach. The result is not only a building that endures environmental stressors but also one that inspires through its lightness, clarity of form, and connection to the natural movement of the Caspian Sea.

3.1.3. Environmental Control Strategies

The Mirvari Restaurant, situated along Baku's Seaside Boulevard, offers a compelling example of architectural design that responds harmoniously to its environmental context. From the earliest stages of its conception, the building demonstrated a deliberate integration with natural forces leveraging wind, sunlight, humidity, and the surrounding landscape to enhance occupant comfort, functionality, and long-term performance.

One of the primary strategies employed was the building's spatial openness and orientation. The pavilion's positioning along the Caspian Sea was carefully considered to align with prevailing wind patterns, allowing the structure to operate as a naturally ventilated system. Its wall-less design ensures continuous cross-ventilation, effectively eliminating the need for mechanical cooling in Baku's hot summer months. This bioclimatic strategy not only reduces energy loads but also fosters a sensory connection between occupants and their coastal surroundings (Seaside Boulevard Department, 2020; Yeang, 1995). While such airflow patterns can now be modeled through Computational Fluid Dynamics (CFD), the intuitive grasp of local microclimate displayed by the architects was exceptionally forward-thinking.

In addition to ventilation, the design strategically maximizes daylight. The restaurant's undulating shell roof, formed by a hyperbolic paraboloid geometry, reflects and diffuses sunlight into the interior spaces. Unlike flat roofs that create harsh light and shadow contrast, the curved surface disperses light softly, producing ambient illumination that supports visual comfort and lowers the need for artificial lighting (Chilton, 2000). The building's site placement and openness further enhance this strategy by enabling southern light entry while blocking low-angle glare, creating a consistently well-lit interior throughout the day.

Another environmental challenge addressed by the building is the coastal climate itself. The Caspian shoreline is characterized by fluctuating humidity and high salt content in the air conditions that accelerate material degradation. To mitigate these risks, the architects specified reinforced concrete, enhanced by protective coatings and admixtures to resist chloride intrusion and chemical corrosion. This material choice contributes to the building's longevity and aligns with standard marine construction practices (Mehta & Monteiro, 2014). Additionally, the curved roof provides natural shading, reducing heat gain during peak sunlight hours and maintaining a comfortable indoor climate.

The restaurant's integration with the surrounding landscape is another defining feature. The low-profile shell structure allows the building to blend seamlessly with the waterfront setting, minimizing its visual impact on the natural environment. This approach reflects a sensitivity to the cultural and ecological significance of the site, aligning with principles of context-sensitive design (Billington, 1983).

The Mirvari Restaurant's environmental strategy is not confined to its form and materials; it extends to its relationship with the landscape. The low-profile geometry allows the structure to integrate seamlessly with the sloping terrain of the Seaside Boulevard, preserving views and reducing visual

impact. This context-sensitive positioning not only respects the natural topography but also provides passive thermal buffering by partially embedding the building in its site (Billington, 1983). Outdoor seating areas capitalize on these advantages, offering panoramic sea views while maintaining shaded, well-ventilated environments thus fostering a strong biophilic experience for users (Kellert, 2005).

In sum, the Mirvari Restaurant exemplifies early principles of passive sustainable design. Its ability to intuitively harness local climate conditions without reliance on mechanical systems or computational modeling underscores the timeless value of site-specific architectural thinking. By merging geometry, material resilience, and environmental logic, the building continues to stand as a reference point for climatically responsive design in coastal contexts. The environmental intelligence of Mirvari lies in its seamless blend of form and function demonstrating how local climate, material science, and architectural intuition can collaboratively shape resilient and inspiring public architecture.

3.1.4. Cultural and Architectural Significance

The Mirvari Restaurant stands as a cultural and architectural icon in Baku, reflecting the evolving identity of the city during the mid-20th century. Designed in 1962, its wave-like form and open-air character symbolized a new era of spatial experimentation and social openness in Soviet-era Azerbaijan. Its use of organic geometry derived from mathematical principles pays homage to its coastal setting while simultaneously expressing a spirit of optimism, futurism, and integration with the landscape (Luzuriaga, 2021) **(Figure 8).**

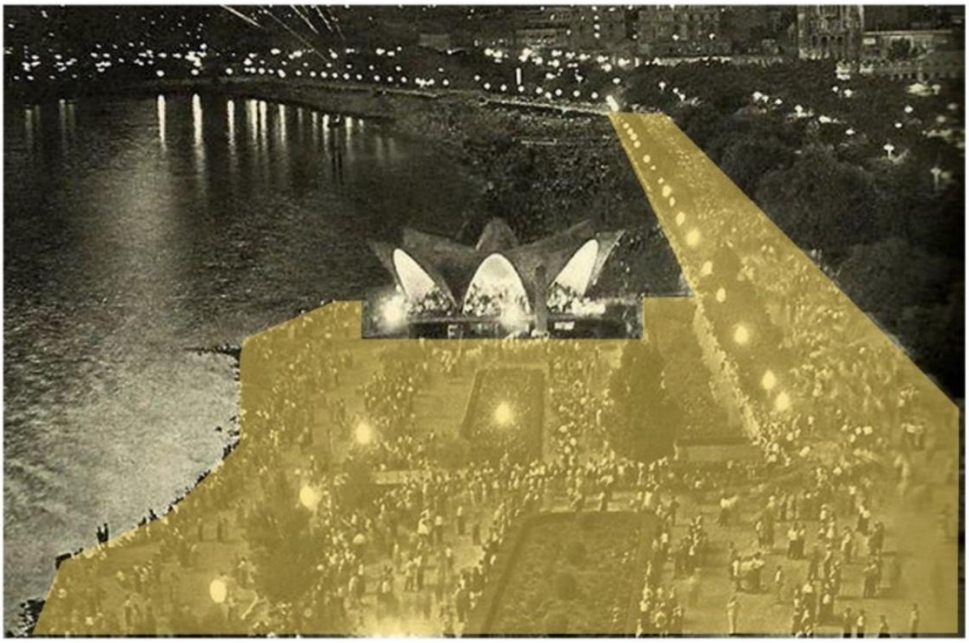

Figure 8. Mirvari Restaurant and its importance in public space, 1962. (https://www.trend.az/life/interesting/3109651.html).

The design is emblematic of a broader architectural movement in which mathematics, culture, and context coalesced. Inspired by global structural pioneers like Félix Candela, the architects V. Shulgin and R. Sharifov brought the language of modern structural expressionism to the local cultural stage. The result is a structure that embodies both international design discourse and local identity, highlighting Baku's historical role as a crossroads between East and West (Kuban, 1985).

More than an architectural achievement, Mirvari has served as a social landmark. Located at the heart of the city's seaside promenade, the pavilion has hosted civic ceremonies, performances, and

communal gatherings. Its open configuration, lack of interior boundaries, and transparency foster inclusivity qualities that have reinforced its role as a democratic public space over decades. These characteristics align closely with ideas of architecture as spatial agency, where built form becomes a catalyst for public interaction and shared memory (Awan, Schneider & Till, 2011).

The building continues to inspire contemporary architects and students, not only through its formal elegance but also through its enduring message: that mathematics and cultural expression need not be opposing forces, but rather collaborators in the making of resilient, meaningful architecture. As a result, the Mirvari Restaurant illustrates the timeless relevance of geometric thinking in achieving socially embedded design. Mirvari is not simply a mathematically inspired structure it is a cultural artefact embedded in Baku's collective memory. Its ability to merge public life, expressive geometry, and architectural innovation secures its place as a model for context-aware design in both historical and contemporary discourse (Luzuriaga, 2021).

3.2. Baku Crsytal Hall (2012)

The Baku Crystal Hall, designed for the Eurovision Song Contest in 2012, exemplifies the transformative role of mathematical geometry and parametric design tools in modern architecture. The building's distinctive crystalline facade showcases the interplay between aesthetics, structural stability, and computational precision, making it an iconic example of how mathematics shapes contemporary design practices.

3.2.1. Mathematics in Design: Geometry and Parametric Tools

At the core of Baku Crystal Hall's design is the use of triangular tessellation, a geometric approach that divides a surface into a network of interconnected triangles **(Figure 9)**. This method leverages the inherent stability of triangles, as they are one of the simplest and most robust geometric forms for distributing forces evenly. In the context of the Hall, the tessellated facade functions as a diagrid system, where the diagonal grid provides both structural efficiency and visual dynamism (Glymph et al., 2002).

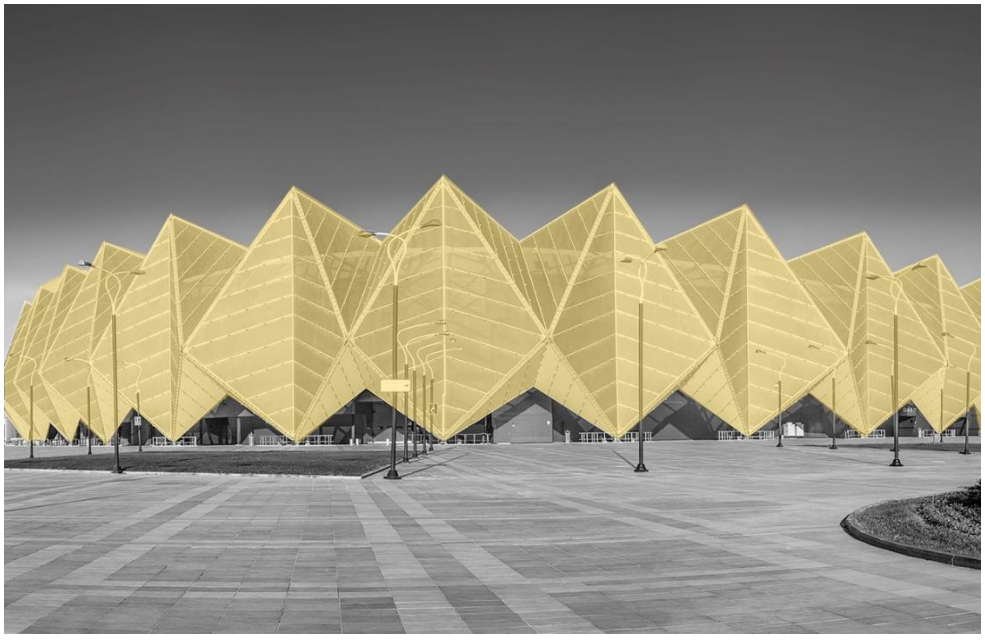

Figure 9. Structural and visual dynamism of Crystal Hall, Baku, 2013. (https://www.dezeen.com/2013/10/17/baku-crystal-hall-stadium-in-azerbaijan-by-gmp-architekten/).

The triangular panels vary in scale and orientation, echoing polyhedral geometry and creating a prismatic surface evocative of a cut gemstone. These tessellated surfaces inherently resist shear deformation and align with Delaunay triangulation principles, which maximize angular efficiency and minimize the risk of structural distortion (Pottmann et al., 2007).

The mathematical principles behind the Hall's form were brought to life through parametric design tools particularly Rhinoceros and Grasshopper which allowed architects to define and manipulate geometric relationships through adjustable parameters. These tools operate using parametric functions, where design elements (e.g., triangle size, angle, position) are generated from equations rather than manual drafting. For example, the tessellated facade may be described through functions such as:

P(x, y) = [x, y, sin(ax + by)]

where a and b are parametric coefficients controlling the surface undulation pattern **(Figure10)**.

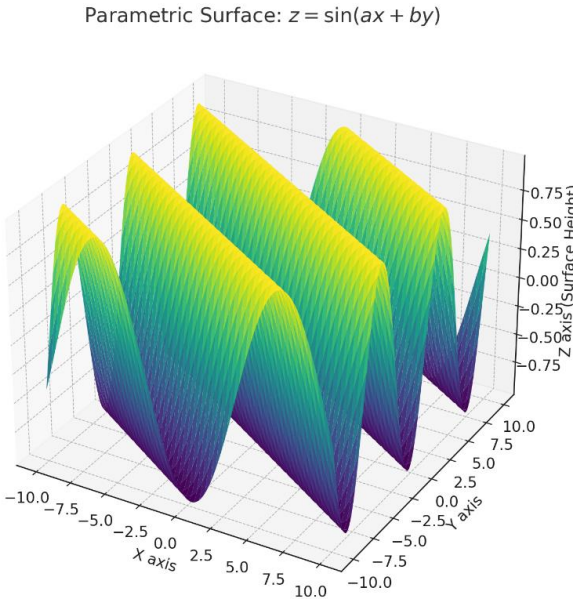

Figure 10. Parametric surface described by the equation z = sin (ax + by). The coefficients a and b control the frequency and orientation of the undulations, which are often used in architectural form generation to create wave-like facades or roofs. (Visualized by author, 2025).

The function P(x, y) = [x, y, sin(ax + by)] defines an undulating surface commonly used in architectural form generation. In this equation:

- x and y represent the coordinates on the horizontal plane,
- z = sin(ax + by) assigns a height value (z) to each point on that plane,
- a and b are constants that control the frequency and directional orientation of the wave pattern.

Such wave-like parametric surfaces are frequently employed in façade articulation or free-form shell structures, allowing designers to explore complex geometries derived from simple trigonometric relationships.

Figure 10 was generated using Python with the Matplotlib library, a widely used open-source tool for scientific visualization. The graph visualizes the equation z = sin(ax + by) on a meshgrid of x and y values,

illustrating how coefficients a and b influence the frequency and orientation of surface undulations. This type of 3D visualization is commonly used in computational architecture to simulate wave-like geometries and test the behavior of parametric surfaces prior to fabrication. The example here aims to conceptually represent how mathematical functions can inform architectural form generation.

Such models enable real-time form optimization, balancing aesthetic values with engineering constraints like wind pressure, material efficiency, and fabrication limits. The feedback loop created by simulation tools allowed designers to test geometric configurations under various environmental loads, including computational fluid dynamics (CFD) simulations for wind stress analysis and daylight distribution mapping (Oxman & Oxman, 2010). Beyond the geometric shell, the Hall integrates an advanced LED lighting system embedded into the facade's triangular modules. These lighting elements were placed based on parametric scripting, enabling dynamic light shows coordinated by algorithmic sequences. The color transitions and pulsations reflect both symbolic themes such as Azerbaijan's identity as the "Land of Fire" and practical functions such as wayfinding and ambient mood regulation. Crucially, this system was not appended post-design but developed in tandem with the facade geometry, ensuring seamless aesthetic and functional integration (Schumacher, 2009).

In addition to visual impact, the design process accounted for structural efficiency through digital fabrication coordination. The facade modules, each uniquely dimensioned, were prefabricated using CNC techniques directly informed by parametric models. This workflow minimized human error and allowed for precise alignment during on-site assembly. Through algorithmic rationalization, the number of unique triangle types was reduced while preserving geometric variation, demonstrating an advanced balance between formal complexity and buildability. In contemporary architectural practice, parametric design enables designers to define relationships between form, performance, and context using adjustable variables. These variables commonly referred to as parameters serve as the core components of computational design logic. They represent key design factors such as geometry, material properties, environmental responsiveness, or fabrication constraints. By altering these parameters, designers can simulate different scenarios, evaluate their impact, and iteratively refine architectural outcomes. This section introduces the conceptual framework of such parameters, highlighting how they were applied to the case of Baku Crystal Hall to guide both the formal articulation and technical optimization of its complex façade.

While the parametric terms referenced in this study such as triangle_size, panel_orientation_angle, and led_density_factor are not drawn directly from project-specific code, they are conceptually rooted in standard parametric modeling environments such as Grasshopper, RhinoScript, and Dynamo. These platforms enable designers to create and control geometric and performance-based relationships by defining adjustable input variables, often represented as sliders or numeric fields. Although expressed in symbolic form here, these parameters reflect the logical structure of algorithmic design workflows, providing a meaningful way to describe how parametric thinking guided architectural decisions. The goal is not to reproduce proprietary code but to clarify the types of variables that shaped form generation, environmental adaptation, and fabrication strategies **(Table 1)**.

Parameter	***Definition***	***Design Impact***
triangle_size	Length of sides for each tessellated panel	Affects material usage, geometric rhythm, and structural efficiency
panel_orientation_angle	Angular tilt of each triangular module	Controls light reflection, façade shading, and wind deflection

led_density_factor	Number of LEDs per square meter	Regulates façade brightness and animation smoothness
wind_pressure_tolerance	Maximum allowable wind load per panel (e.g., 2.4 kN/m²)	Ensures façade's resistance to environmental forces
solar_exposure_value	Average hours of sunlight per panel per day	Informs orientation for daylight optimization and passive solar gains
load_path_curvature	Degree of curvature for primary load-bearing lines in diagrid geometry	Guides structural performance and weight distribution
module_fabrication_code	CNC or digital tag identifying each panel's fabrication script	Enables precise manufacturing and minimizes on-site errors

Table 1. Parametric variables commonly used in architectural computational modeling environments. (Glymph et al., 2002; Pottmann et al., 2007; Oxman & Oxman, 2010).

These parameters were conceptually extracted to illustrate the mechanics of a typical parametric workflow as applied to a complex façade system. In practice, designers would script these relationships using visual node-based programming, with real-time feedback loops evaluating performance, manufacturability, and cost. Parametric environments also enable the interlinking of environmental simulations such as daylight and wind studies with form generation tools, ensuring that the final output is not only formally expressive but also optimized for real-world behavior.

The parameters outlined in the following table are derived from a synthesis of common practices in computational design environments such as Grasshopper, RhinoScript, and Dynamo, as detailed in the works of Glymph et al. (2002), Pottmann et al. (2007), and Oxman & Oxman (2010). These platforms employ variable-driven logics where design elements respond dynamically to input values, enabling rapid prototyping and real-time feedback. The listed parameters, though presented in symbolic form, reflect standard categories of control used in algorithmic modeling: geometric (e.g., size, curvature), performative (e.g., solar exposure, wind loads), and fabrication-specific (e.g., CNC codes). Such frameworks are widely applied in practice to rationalize complex forms, enhance structural logic, and ensure digital-to-physical fidelity in large-scale architectural assemblies. Their inclusion in this study is meant to conceptually illustrate the parametric rationale behind Baku Crystal Hall's design, in line with established literature on performative geometry and data-informed architecture.

By including this logic in the architectural narrative, this study aims to bridge the conceptual and technical aspects of design, offering clarity on how mathematical thinking operates within computational systems. This clarification also responds to concerns about the origin and function of the parameters listed, reaffirming that they are rooted in the conventions of current digital design practice and reflective of real-world applications.

Ultimately, Baku Crystal Hall embodies the fusion of mathematical geometry, digital computation, and cultural expression. It stands as a symbol of modern architecture's shift toward data-driven form generation, where algorithms guide spatial decisions and aesthetics arise as a natural byproduct of structural logic. As such, the building demonstrates how mathematical thinking once confined to static proportions now animates entire architectural ecosystems through dynamic, performative geometries.

3.2.2 Material Science and Structural Optimization

The primary structural framework of the building consists of high-strength steel, selected for its superior strength-to-weight ratio, ductility, and prefabrication adaptability. Steel enabled the realization of the hall's complex crystalline geometry and allowed for a modular construction approach essential for the project's compressed eight-month timeline (Architizer, 2012). The components were laser-cut and prefabricated off-site using CNC technologies, reducing on-site labor time and minimizing human error.

To optimize the performance of the envelope, the design employs a diagrid (diagonal grid) structural system a spatial network of interconnected triangular modules. This system efficiently channels loads across multiple axes, offering enhanced resistance to lateral forces such as wind and seismic activity (Glymph et al., 2002). The geometric rationale behind the diagrid lies in the inherent stability of triangles, which prevents deformation under asymmetric pressure and supports dynamic force redistribution. **Figure 11** showcases the steel diagrid framework of Baku Crystal Hall, highlighting the triangular modules that provide both structural support and aesthetic form. The system efficiently distributes stress throughout the structure, enhancing its ability to withstand lateral loads such as wind and seismic forces.

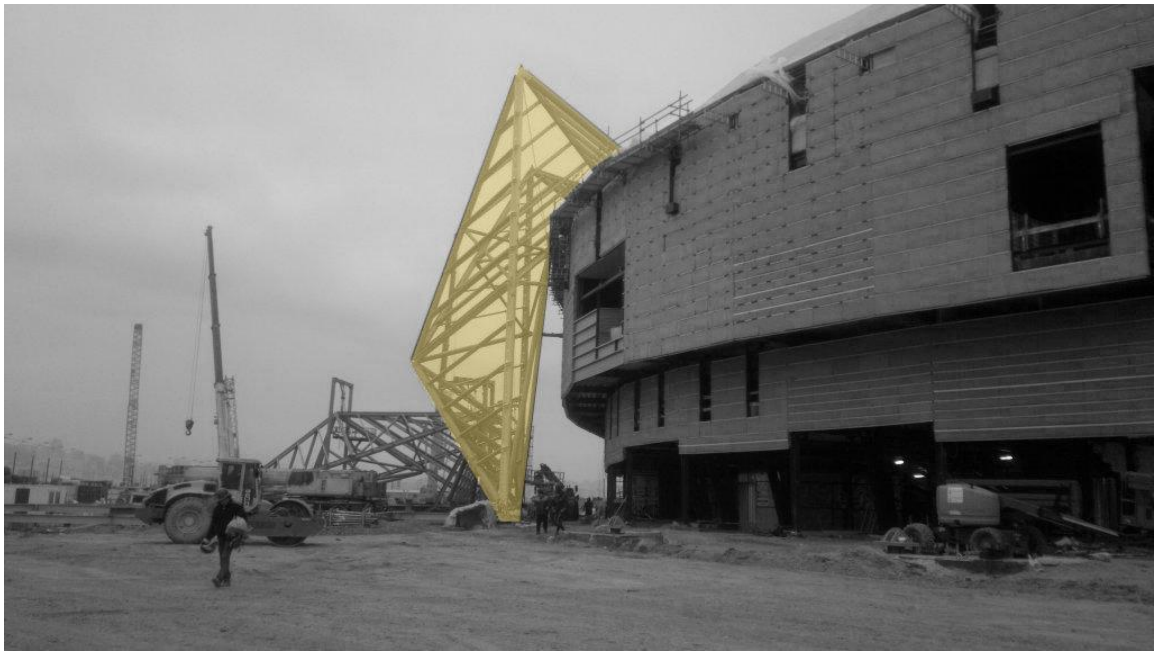

Figure 11. Structural photography of the diagrid system showing modular panel connections. (https://www.temsan.com.tr/stadyumlar/baku-eurovision-stadi-2012)(Adapted from Pottmann et al., 2007).

The structure is subdivided into three independent components: the central roof, the enveloping grandstand frame, and the outer membrane façade. This segmentation facilitated parallel construction workflows, enabling different teams to operate simultaneously on site. Each segment followed a modular logic, allowing for prefabricated steel frames and façade panels to be produced concurrently. This strategy significantly reduced construction time while ensuring consistent dimensional accuracy (Menges, 2012).

Moreover, advanced simulation methods such as Finite Element Analysis (FEA) were used during the early stages of design to test load performance and material behavior under varying environmental conditions. These simulations informed the optimization of steel member profiles and joint locations,

ultimately reducing material usage without compromising structural integrity (Oxman & Oxman, 2010). **Figure 12** illustrates a Finite Element Analysis (FEA) simulation applied to the actual facade geometry of Baku Crystal Hall, modeled with triangulated membrane panels. The analysis demonstrates how load distribution behaves across a folded diagrid surface, particularly under uniform static loads such as gravity and wind shear conditions typical for lightweight membrane architecture.

The color spectrum reflects varying stress intensities:

- Red zones correspond to high-stress concentrations—especially at panel intersections and support nodes.
- Mid-range tones show moderate loads transferred along the panel edges.
- Blue areas reveal low-stress regions—often found at mid-panel zones away from load entry points.

This type of analysis helps verify that triangulated diagrid systems are not only visually dynamic but also structurally advantageous, as they distribute loads efficiently and reduce redundancy (Kolarevic, 2003; Tam et al., 2022). Simulations like this are typically generated using Karamba3D or Ansys environments, which translate panel geometries and constraints into a mesh network of nodal interactions, supporting architectural decisions related to form-finding and material optimization. Such workflows exemplify performance-oriented design, where aesthetic geometry and structural logic converge (Oxman, 2010; Moussavi, 2006). This integrative approach is central to contemporary parametric design practices, ensuring both visual richness and mechanical efficiency.

Figure 12. FEA simulation illustrating stress concentrations across the triangulated façade of Baku Crystal Hall. Red zones indicate areas of high stress; blue zones show lower load impact. Modeled for representational purposes using Rhino + Karamba3D by author, 2025. (Adapted from principles in Tam et al., 2022; Kolarevic, 2003).

The hall's façade features a folded membrane structure spanning approximately 20,000 square meters, constructed from a high-performance PTFE-coated fiberglass textile. This material was selected for its lightweight properties, tensile strength, fire resistance, and capacity for dynamic lighting effects. Its translucency enables the integration of around 80,000 programmable LED lights, which illuminate the 32,000 square meter facade and provide adaptable visual performances (SSF Ingenieure AG, 2012). This membrane system not only enhances aesthetic expression but also contributes to the building's thermal and daylighting performance through its semi-permeable light diffusion capacity (Kolarevic & Klinger, 2008). Arena is lit by 1200 LED light points. Lighting rate at 1m height is 850 lux. The integration of natural and artificial lighting was meticulously planned to create an adaptable and energy-efficient lighting environment (ArchDaily, 2012). The lighting design in this iconic structure was inspired by the hyperboloid. A single-leaf hyperboloid is a surface formed by rotating a hyperbola symmetrically positioned with respect to one of the coordinate axes in a rectangular coordinate system around another axis in space. In the image, the lighting of the structure and a hyperbola symmetrical about the Y axis and rotating about the Z axis are emphasized **(Figure 13)**.

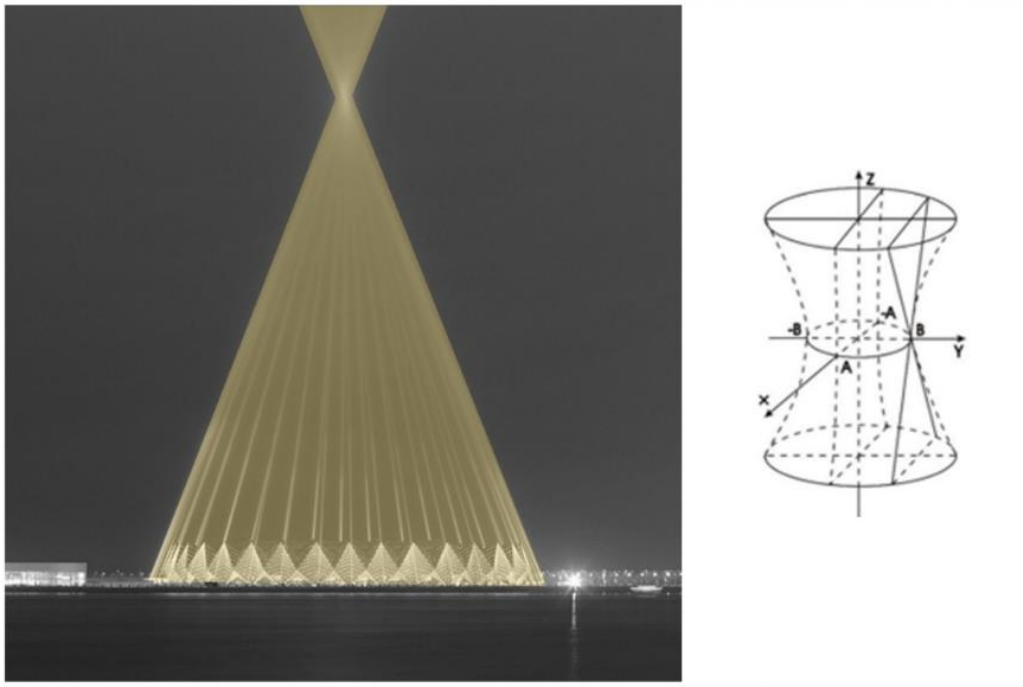

Figure 13. Lighting design of the Crystal Hall and its relationship to the hyperboloid shape, Baku, 2013. (https://www.dezeen.com/2013/10/17/baku-crystal-hall-stadium-in-azerbaijan-by-gmp-architekten/).

The lighting system of the Baku Crystal Hall exemplifies the integration of architectural expression and technological precision. Designed by Lichtvision Design, the façade features over 5,400 RGB LED nodes strategically embedded within the membrane panels to create dynamic night-time illuminations that enhance the crystalline geometry of the structure (Lichtvision Design, 2025). The use of a lightweight PVC-PES mesh membrane, developed by PFEIFER Structures, not only reduced the overall weight of the façade system but also enabled a seamless embedding of lighting elements without compromising the integrity of the envelope (PFEIFER Structures, 2024). According to ArcelorMittal (2024), the façade consists of approximately 180 prefabricated triangular panels, each equipped with programmable LED modules that allow for vivid, programmable light displays. This system contributes both to the visual identity of the venue and its symbolic representation as a cultural beacon during international events **(Figure 14)**.

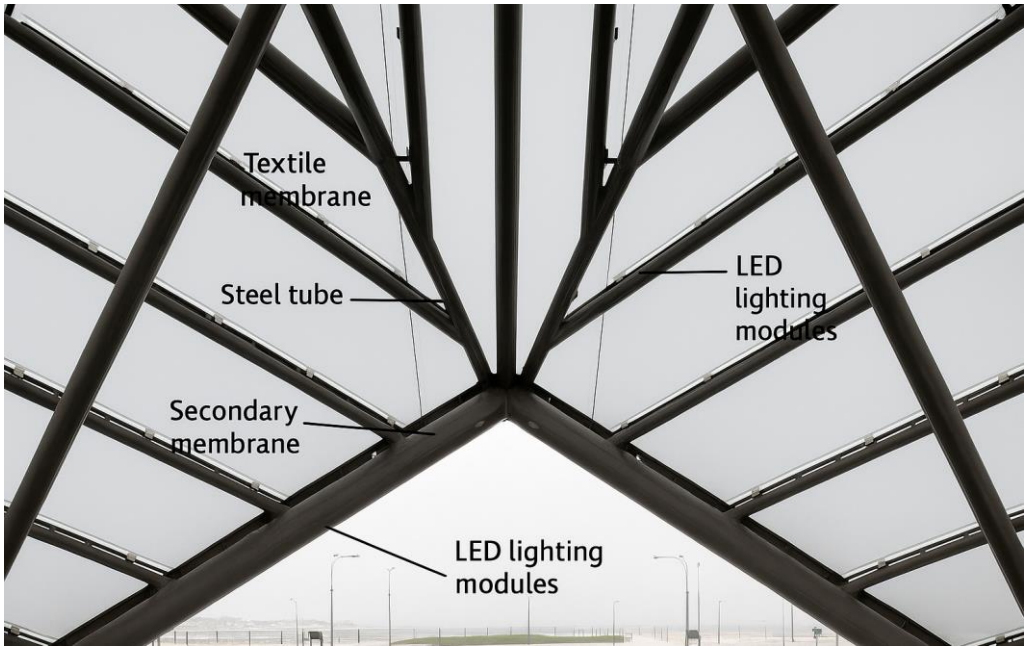

Figure 14. Diagram showing the layering of the textile membrane façade and integrated LED lighting modules. (Author's visualization based on SSF AG and Lichtvision Design technical documentation, 2025)

The project exemplifies the integration of material performance modeling and digital fabrication workflows in high-performance architecture. The use of parametric tools enabled the coordination between form generation and fabrication constraints, while material-specific design principles ensured structural soundness and expressive aesthetics. By leveraging the synergy between computational design, prefabrication, and structural engineering, the Baku Crystal Hall demonstrates how modern architecture can respond to both creative ambition and logistical efficiency.

3.2.3 Environmental Control Strategies

The Baku Crystal Hall exemplifies how architectural form and engineering logic converge to address complex environmental dynamics through mathematical modeling and performance-based design strategies. Situated on the Caspian Sea shoreline, the building is exposed to high humidity, intense wind loads, and seismic activity, all of which significantly influence its environmental control systems.

Due to Baku's geographic position (latitude ~40.4°N), the orientation and transparency of the Baku Crystal Hall façade played a critical role in daylighting strategy. The building was strategically aligned to maximize southern solar gain during winter months while minimizing glare and overheating in summer. The translucent textile membrane, with a visible light transmittance (VLT) estimated around 30–35%, filters harsh direct sunlight while allowing sufficient diffuse daylight to penetrate the interior (Kolarevic & Malkawi, 2005).

Parametric simulations were employed to evaluate solar angles, shading patterns, and daylight penetration across different times of day and seasons. These analyses enabled the adjustment of panel orientations and opacities to maintain optimal luminance levels inside the arena without excessive energy use for artificial lighting. **Figure 15** illustrates how the building's façade orientation and geometry were optimized to maximize solar gain during winter while minimizing heat ingress during summer, thereby enhancing passive thermal regulation and reducing HVAC dependency.

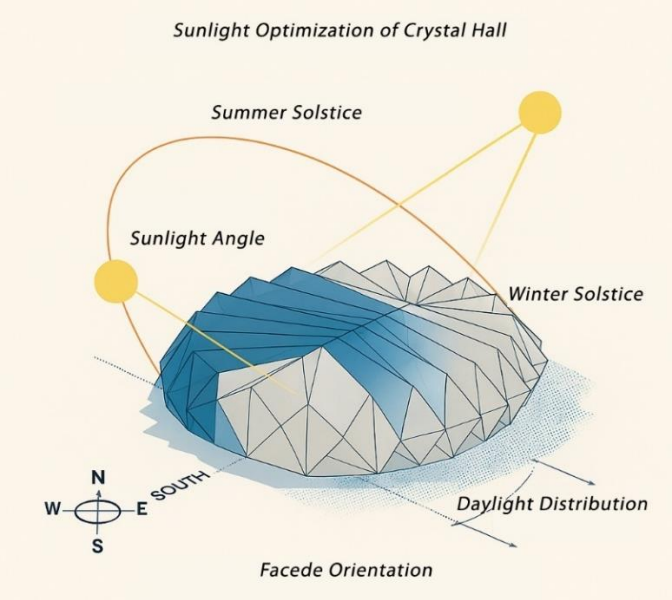

Figure 15. Sunlight angle simulation and daylight distribution diagram for Baku Crystal Hall, showing façade orientation and solar trajectory across seasonal variations. (Author's visualization based on location-specific solar studies, 2025).

Baku is famously known as the "City of Winds," with average wind speeds reaching over 10 m/s during winter months. To counteract these conditions, computational fluid dynamics (CFD) simulations were conducted to shape the building's form for aerodynamic resilience. The faceted geometry and lowered profile of the structure help reduce wind-induced turbulence and pressure zones by facilitating streamlined airflow around the façade, a strategy commonly adopted in aerodynamic architectural design to mitigate vortex shedding and uplift forces (Yadav & Roy, 2024). These simulations informed not only the orientation of openings but also the reinforcement of the membrane anchoring points **(Figure 16)**.

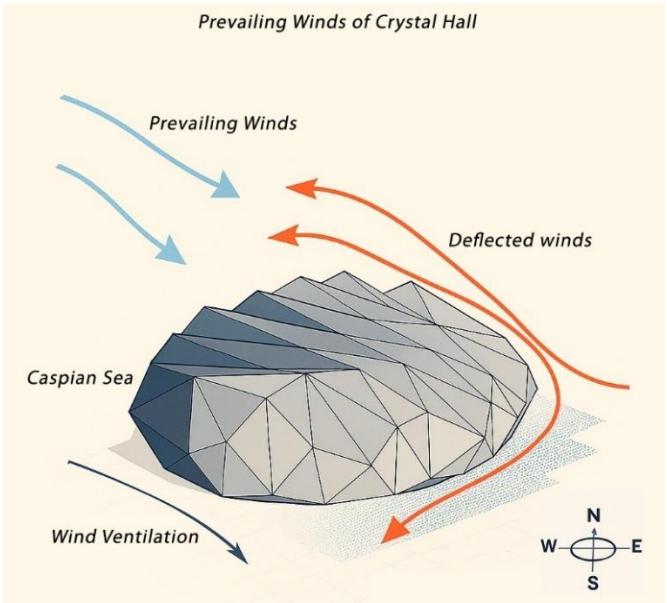

Figure 16. Diagram showing the aerodynamic response of the Baku Crystal Hall to prevailing wind directions from the Caspian Sea. The faceted envelope acts as a wind deflector, minimizing pressure differentials and reducing turbulence near pedestrian zones. (Adapted by author, based on environmental simulation concepts by Blocken, 2018).

High ambient humidity and salt-laden air posed challenges for the longevity of materials. The design incorporated corrosion-resistant steel alloys and specially treated textile membranes to ensure durability under constant exposure to marine air. Protective coatings and structural detailing were guided by hygroscopic performance modeling, which accounted for moisture accumulation and dissipation across the envelope system (González & Navarro, 2006).

Although not part of a major seismic fault line, Baku sits in a zone of moderate to high seismic risk due to tectonic interactions in the Caucasus region. Finite element analysis (FEA) and modal response simulations were used to evaluate structural behavior under seismic excitation. The diagrid system distributes lateral forces efficiently across the crystalline shell, providing inherent flexibility and redundancy in the load path (Dzenis & Jiang, 2006). The segmentation of the roof, façade, and stands into modular, decoupled systems allows for differential movement during seismic events, enhancing overall resilience.

By integrating performance simulations with site-specific environmental data, the Baku Crystal Hall achieves a highly adaptive design. It demonstrates how mathematics, when applied contextually, can support sustainability, occupant comfort, and long-term structural integrity in environments facing diverse natural stressors.

3.2.4 Cultural and Architectural Significance

Baku Crystal Hall represents a pivotal moment in Azerbaijan's efforts to reframe its national identity through contemporary architecture. Constructed in the context of hosting the 2012 Eurovision Song Contest, the building became a strategic tool of cultural diplomacy, reflecting the state's aspiration to align itself with Western modernity while asserting its presence on the global stage (Broers & Mahmudlu, 2022). As such, the Crystal Hall exemplifies how monumental architecture can function as both a medium of spectacle and a symbol of state-led nation branding.

The structure's expressive, futuristic form marks a distinct departure from Soviet-era architectural narratives, embodying Azerbaijan's post-independence ambitions and aesthetic liberalization. Positioned prominently along the Caspian Sea, the Crystal Hall plays a symbolic role in re-establishing Baku's identity as a cosmopolitan and modern capital. This spatial positioning is significant: it reinforces the city's historical connection to the sea while simultaneously enhancing the building's iconic visibility in the urban skyline (Bayrakdar, 2024).

In this regard, Baku Crystal Hall is not merely a venue for large-scale events; it is an architectural statement deeply embedded in the politics of urban image-making. The building aligns with broader post-Soviet transitions wherein architectural production is utilized as a means of consolidating political legitimacy and projecting national narratives (Guliyev, 2009). Through its distinctive form and strategic location, the Crystal Hall contributes to both the performative identity of the city and the symbolic vocabulary of the nation.

3.3. Crescent Mall (2022)

The Crescent Mall in Baku, Azerbaijan, exemplifies the fusion of mathematical design and cultural symbolism, drawing inspiration from the crescent a significant emblem in Islamic art and Azerbaijani heritage. This architectural approach not only enhances the mall's aesthetic appeal but also reinforces its cultural relevance within the urban landscape.

3.3.1 Mathematics in Design: Crescent Geometry and Cultural Inspiration

The crescent shape, characterized by its curved form, is a fundamental element in Islamic architecture, symbolizing progress and enlightenment. In the design of Crescent Mall, architects employed geometric principles to create a structure that mirrors this iconic form. The building's façade and overall layout incorporate sweeping curves and arcs, reflecting the crescent's geometry and creating a harmonious visual flow (HBA Architecture, n.d.). This design strategy utilizes mathematical concepts such as circular arcs and parabolic curves to achieve the desired aesthetic effect. Incorporating the crescent shape serves as a deliberate nod to Azerbaijani culture, where the crescent holds historical and symbolic importance **(Figure 17)**. By embedding this form into the mall's architecture, designers pay homage to national identity and cultural heritage. This approach aligns with the broader trend in contemporary architecture of integrating culturally significant symbols to foster a sense of place and community connection (DSA Architects International, 2024).

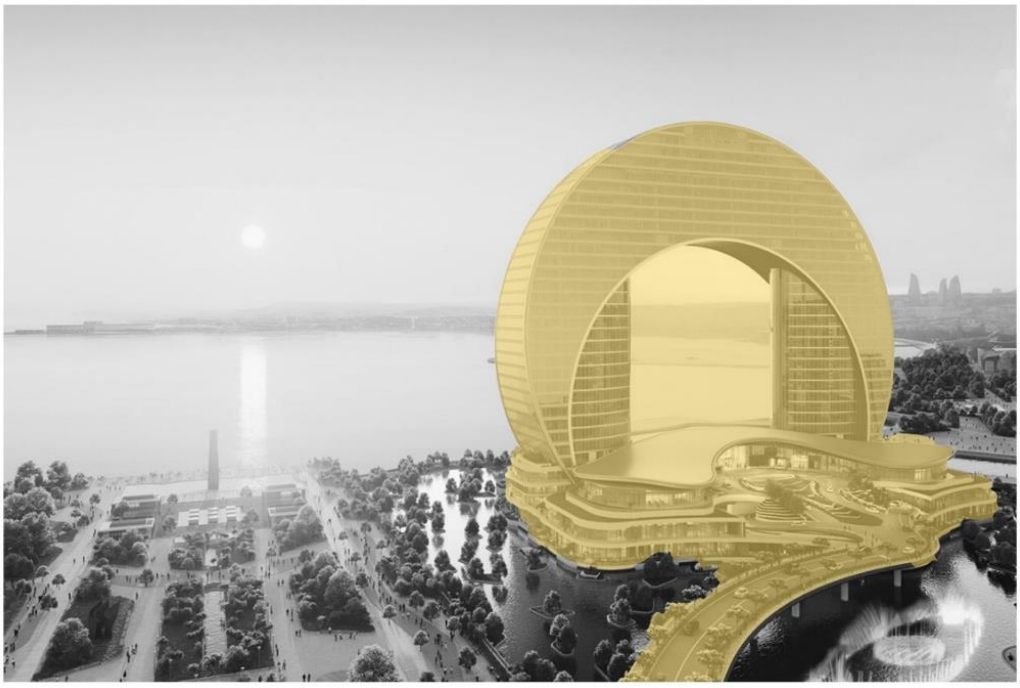

Figure 17. The building's design reflecting the crescent's geometry and creating a harmonious visual flow, Baku, 2024. (https://www.gillespies.co.uk/projects/the-crescent-development).

This formal strategy is grounded in mathematical concepts such as circular arcs, parabolic curves, and ellipses, all of which are essential for modeling the smooth transitions and curvature required by the crescent shape. These geometries are not merely symbolic but also structurally functional. The translation of such abstract forms into constructible elements necessitates a high degree of mathematical precision **(Figure 18)**.

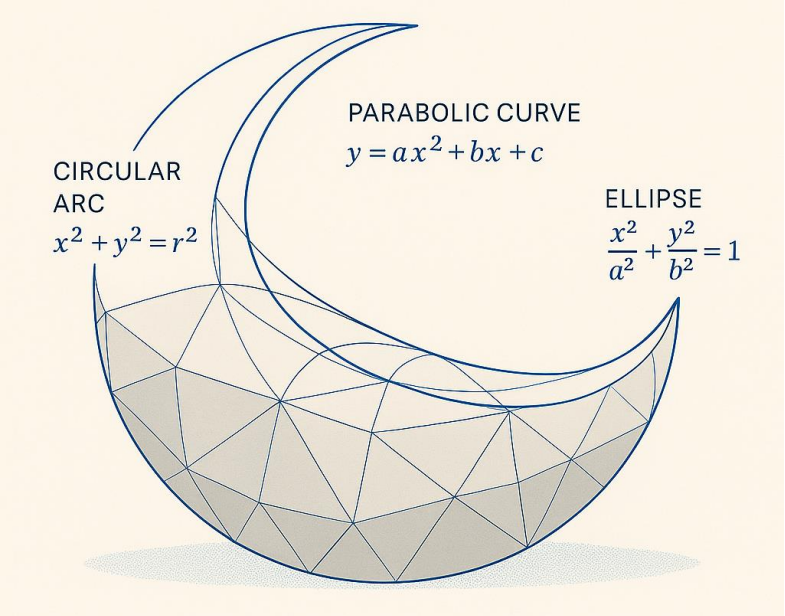

Figure 18. Diagram illustrating the primary crescent geometry applied to the building envelope of Crescent Mall, showcasing the use of arcs and curves derived from symbolic Islamic forms. (Author's visualization, generated in Adobe Photoshop and Rhinoceros 3D, 2025).

Architects and engineers rely on computational design platforms to digitally model these curves, ensuring that the expressive form aligns with technical feasibility **(Figure 19)**. Advanced geometry, vector calculus, and surface modeling techniques are used to simulate load-bearing behavior and optimize the distribution of structural stresses throughout the curved envelope (Architizer, n.d.).

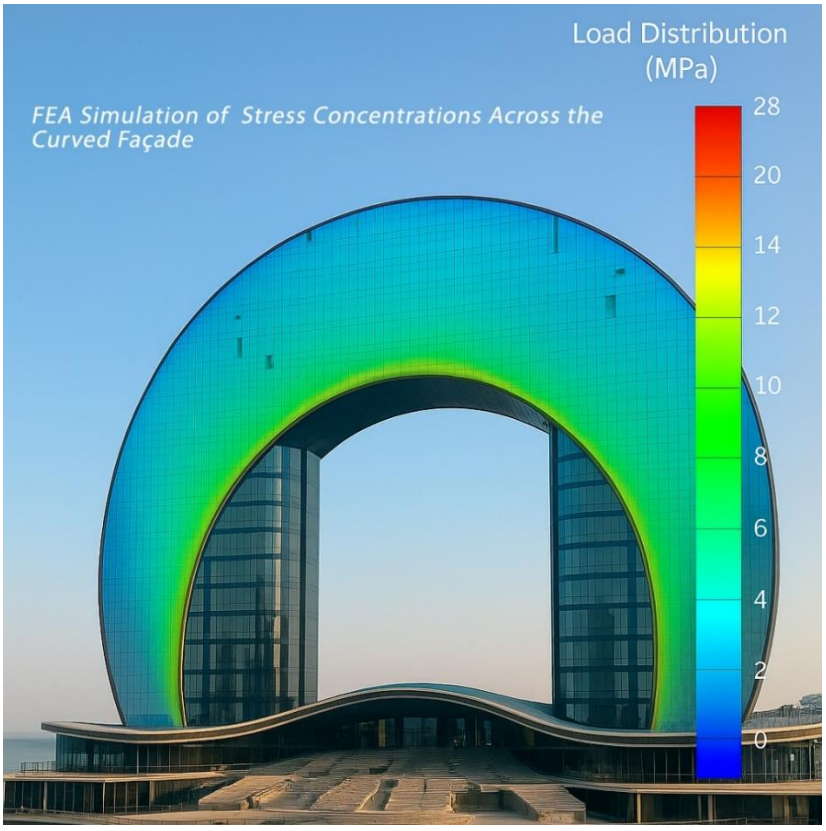

Figure 19. Load distribution simulation over the Crescent Mall structure. (Visualized by author, 2025).

The digitally enhanced image illustrates the distribution of structural loads along the crescent-shaped envelope. Warmer colors (red–orange) indicate areas of higher compressive stress, particularly concentrated around the vertical support cores and the lower arc of the structure. Cooler colors (blue–green) reflect regions of minimal stress, such as the apex of the arch. This visual analysis helps clarify how gravitational and lateral forces are redirected through the continuous curved geometry of the structure.

In addition to its cultural symbolism and structural rigor, the crescent form also responds sensitively to the mall's location along Baku's waterfront. The curved profile of the building complements the natural contours of the coastline, enhancing its contextual integration. By echoing the sinuous edges of the seafront, the architecture merges visually and experientially with the landscape, reinforcing a sense of environmental continuity. This alignment with natural topography and urban vistas elevates the mall's identity as a contemporary landmark. Furthermore, it contributes to user orientation and movement, guiding circulation intuitively along curved paths and open vistas (HBA Architecture, n.d.).

Ultimately, the design of Crescent Mall exemplifies the synthesis of culturally responsive symbolism and mathematically informed design. It demonstrates how geometry can bridge tradition and innovation, enabling an architectural language that is at once expressive, functional, and contextually grounded. The project offers a compelling case for integrating symbolic forms through advanced design methodologies to generate architecture that is meaningful, performative, and place-specific.

3.3.2 Material Science and Structural Optimization

The Crescent Mall in Baku exemplifies a sophisticated integration of material science and sustainable design principles, reflecting the city's dual aspiration for technological advancement and environmental stewardship. The architectural articulation of the building embraces both regional identity and global best practices in sustainability, serving as a prominent case of how commercial developments can embrace ecological consciousness without compromising aesthetic ambition.

At the core of its sustainable strategy lies the carefully curated façade system, which utilizes a hybrid approach combining unitized and stick curtain wall assemblies, metal cladding, fiber cement panels, laminated timber, and expanded metal mesh (Koltay Facades, n.d.). This material palette was selected not only for its visual richness and texture but also for its proven performance in terms of durability, insulation capacity, and low embodied energy. Each element contributes to the thermal regulation of the envelope, facilitating the minimization of unwanted heat gain or loss across seasonal transitions.

Building upon this foundation, the Crescent Mall incorporates a series of passive and active energy efficiency measures. High-performance low-emissivity glazing, combined with continuous insulation layers, limits thermal bridging and contributes to the reduction of operational energy demands, particularly for mechanical heating and cooling (HBA Architecture, n.d.). These measures align with current global benchmarks for energy-efficient commercial buildings and demonstrate the potential of integrated façade engineering.

Beyond energy, the building's infrastructure supports sustainable water usage practices. Rainwater harvesting mechanisms are embedded within the roof design and are supplemented by low-flow plumbing fixtures, collectively reducing the mall's dependence on potable water sources and mitigating urban runoff (DSA Architects International, 2024). This holistic approach reflects an understanding of water scarcity challenges increasingly relevant in global urban planning discourses.

Interior environmental quality also receives critical attention through the use of low-VOC materials and finishes, which enhance indoor air purity and contribute to occupant health. Coupled with

expansive openings and atriums that facilitate the penetration of natural daylight deep into the interior volumes, the design reduces reliance on artificial lighting during daytime hours and fosters a healthier indoor microclimate (Crescent Mall, n.d.). **Figure 20** illustrates the spatial distribution of natural light and the impact of material translucency on ambient quality.

Ultimately, Crescent Mall presents a compelling model for the integration of material science and sustainable strategies in commercial architecture. Through the thoughtful application of environmentally responsive materials, energy-efficient systems, and resource-conscious design decisions, the building not only achieves visual and functional excellence but also sets a precedent for sustainability in high-profile urban developments.

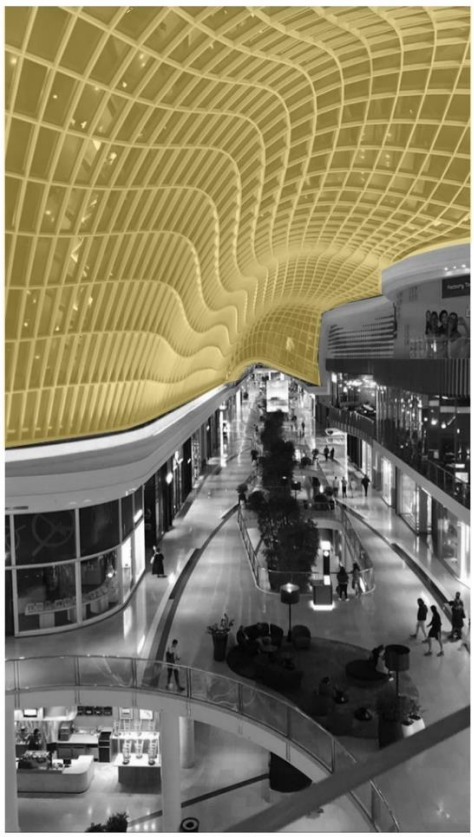

Figure 20. The design maximizes natural daylight penetration, reducing the need for artificial lighting, Baku, 2024. (https://jp.pinterest.com/pin/67272588177722300/)

Table 2 summarizes the key sustainable design strategies employed in Crescent Mall, showcasing how material selection, energy efficiency, water management, and environmental responsiveness were holistically integrated. These measures reflect a commitment to both architectural excellence and ecological stewardship, positioning the mall as a benchmark for sustainable development in the region.

Category	***Design Features***	***Sustainability Benefit***
Material Strategy	High-performance façade systems (unitized & stick curtain walls, metal cladding, fiber cement panels, timber laminates, expanded metal mesh)	Enhanced durability, thermal performance, and architectural identity
Energy Efficiency	High-performance glazing, insulation, optimized HVAC systems	Reduced energy consumption and improved thermal comfort

Water Conservation	Rainwater harvesting, low-flow fixtures, greywater reuse systems	Minimized potable water use and reduced burden on municipal infrastructure
Indoor Environmental Quality	Use of low-VOC materials, maximized natural daylight, improved air ventilation	Healthier indoor air quality, lower reliance on artificial lighting
Environmental Integration	Façade orientation responding to sun path and prevailing winds, site-specific landscaping	Passive solar control, enhanced microclimate responsiveness, ecological design harmony

Table 2. Key sustainable strategies applied in Crescent Mall's design, highlighting material, energy, water, and environmental considerations. (Prepared by the author, based on project analysis and design integration, 2025).

3.3.3 Environmental Control

The Crescent Mall in Baku exemplifies an integrative approach to environmental control, embedding site-specific climatic adaptation within its architectural and technological systems. As a coastal city subject to high wind velocities, solar radiation fluctuations, and humidity variation due to its proximity to the Caspian Sea, Baku poses distinctive environmental challenges for large-scale structures (Amirinia et al., 2017). The building's aerodynamic crescent-shaped geometry contributes to passive microclimatic regulation by mitigating wind-driven turbulence and minimizing eddy formation along pedestrian-level zones. Its form acts as a wind-deflecting envelope, dispersing pressure loads and reducing structural stress concentrations on the façade surface, which is particularly important in open coastal zones where wind speeds frequently exceed 20–30 km/h (Reiter, 2010). This streamlined geometry facilitates passive cross-ventilation by channeling prevailing breezes through recessed entryways and atrium voids, enhancing indoor air renewal while reducing mechanical ventilation dependency. As shown in **Figure 21**, the curved form and central void of the Crescent Mall create natural ventilation pathways that harness prevailing winds, while simultaneously offering unobstructed views and daylight access. This spatial configuration not only enhances passive cooling but also reinforces the building's environmental responsiveness.

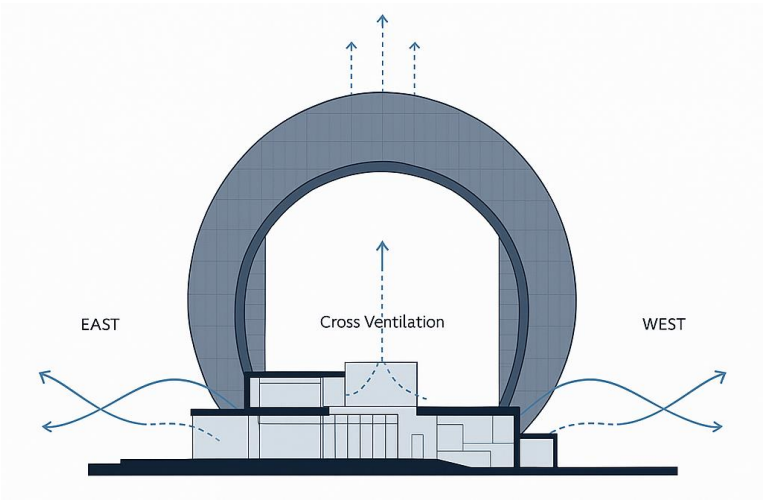

Figure 21. Ventilation and view analysis section diagram of Crescent Mall, showing passive airflow channels guided by building geometry and orientation. (Author's illustration based on environmental simulation principles, 2025).

In tandem with its aerodynamic modulation, Crescent Mall integrates a daylight-responsive lighting strategy. The structure's façade orientation and fenestration layout were informed by solar path simulations, optimizing the balance between visible light transmittance and heat gain. Solar shading coefficients were adjusted through material selection and horizontal louver placement, allowing the building to retain daylight quality while preventing overheating during peak summer insolation (Mardaljevic et al., 2009). Studies have shown that strategic glazing angles and translucent materials can reduce cooling demand by up to 35% in mixed-use commercial buildings located in temperate coastal climates (Matos et al., 2022).

Artificial lighting systems within the mall employ a layered luminance scheme incorporating daylight harvesting sensors and occupancy-responsive controls. High-efficacy LED arrays are deployed in a zoned network, adjusting luminous flux based on diurnal light levels and spatial activity patterns. This dynamic illumination protocol not only enhances visual comfort but also contributes to a 25-40% reduction in operational energy usage, aligning with recent findings on smart lighting integration in commercial infrastructure (Baharudin et al., 2021).

Table 3 illustrates how Crescent Mall integrates both natural and artificial lighting strategies to improve environmental quality and reduce energy consumption. These design decisions reflect a responsive architectural approach that adapts to climatic and spatial demands.

Lighting Type	***Design Strategies***	***Implementation at Crescent Mall***
Natural Light	Building orientation, daylight-responsive facade design, high-transmittance glazing	South-facing facades maximize solar exposure; glass curtain walls admit diffuse daylight
Artificial Light	LED technology, smart lighting control systems, energy-efficient fixtures	Smart-controlled LED systems adjust brightness based on occupancy and daylight availability
Integration Method	Combined modeling for daylight and electric light scenarios	Lighting simulations inform the placement and output of fixtures; synergy enhances user comfort

Table 3. Summary of Lighting Strategies Implemented at Crescent Mall. (Prepared by the author, based on project analysis and design integration, 2025).

The synergy between aerodynamic design and environmental lighting control reflects an advanced mode of sustainable architecture that integrates form, material, and technology. Rather than treating environmental systems as ancillary elements, Crescent Mall embeds them into its core design logic responding to wind vectors, solar geometry, and internal comfort metrics within a unified architectural language. This approach supports regional energy reduction goals while establishing a new paradigm for contextually responsive commercial development in the Caspian region (UN Habitat, 2024).

3.3.4 Cultural and Architectural Significance

The Crescent Mall in Baku stands as a contemporary icon symbolizing Azerbaijan's architectural ambition and cultural repositioning in the post-Soviet era. As part of the larger Crescent Bay development designed by DSA Architects International, the mall plays a pivotal role in reshaping Baku's urban and socio-cultural landscape. Rather than serving solely as a commercial hub, it emerges as an emblematic site of lifestyle transformation bridging traditional values with global consumerist aspirations (DSA Architects International, 2024).

Located along the Caspian shoreline, the mall's strategic placement reinforces a long-standing symbolic relationship between Baku and the sea, evoking themes of openness, prosperity, and cosmopolitanism. The design is intentionally expressive, characterized by sweeping curves and fluid forms that echo the maritime identity of the city while also referencing regional cultural motifs associated with movement and continuity. The mall's curvature complements the adjacent Crescent Tower, collectively forming a visual dialogue that dominates the city's evolving skyline and reflects the nation's aspiration to assert itself architecturally on a global stage (HBA Architecture, n.d.).

Internally, the mall blends high-end retail architecture with motifs derived from Art Nouveau, a style that resonates subtly with Baku's early 20th-century architectural heritage. This deliberate design decision by Hirsch Bedner Associates allows for a contemporary reinterpretation of past elegance, cultivating a space where modernity and nostalgia co-exist (HBA Architecture, n.d.). The interplay of natural light, layered textures, and fluid spatial organization within the interior aims to enhance experiential richness, aligning with global trends in immersive retail environments.

Culturally, Crescent Mall functions as more than a shopping destination. It has become a node for social interaction, cultural programming, and civic life. Hosting exhibitions, concerts, and seasonal celebrations, the mall contributes to the public sphere by offering accessible, curated cultural experiences—thus positioning itself not just as a passive consumer space but as an active cultural producer. These events foster urban engagement and help democratize cultural participation in a city where such spaces have traditionally been limited to state-controlled institutions (Vigo Visa, 2025).

In essence, Crescent Mall is emblematic of a broader urban strategy wherein architecture is leveraged not only for economic stimulus but also for nation-branding and soft power projection. Through its formal language, cultural programming, and symbolic coastal positioning, it encapsulates Azerbaijan's efforts to construct a modern identity that is at once rooted in tradition and forward-looking.

DISCUSSION

The architectural analysis of Mirvari Restaurant, Baku Crystal Hall, and Crescent Mall demonstrates that mathematical reasoning in architecture functions not only as a technical necessity but also as a catalyst for environmentally responsive, culturally embedded, and symbolically meaningful design. Across all three structures, geometry acts as both an aesthetic language and a performative logic, echoing contemporary discourse on biophilic, sustainable, and technologically advanced built environments.

The Mirvari Restaurant exemplifies an early form of bioclimatic design, where mathematical geometry specifically the hyperbolic paraboloid enabled passive ventilation, daylight modulation, and material efficiency. While modern computational tools were absent, the architects achieved outcomes aligned with current ecological design principles, such as natural airflow, minimal material use, and contextual integration. These design goals reflect strategies discussed by Kellert (2015) and Beatley (2016), where built environments foster sensory connection with the surrounding landscape. The building's openness and shell form, derived from mathematical principles, resonate with the restorative effects of natural geometry and spatial fluidity outlined by Ulrich (1984) and Tsunetsugu et al. (2010).

By contrast, the Baku Crystal Hall operates within the realm of digitally driven architectural production, integrating parametric design tools to coordinate geometry, structural logic, and facade lighting. The use of tessellated surfaces and LED systems not only enhanced visual performance but also responded to environmental stressors such as wind, daylight, and humidity. These strategies parallel findings by Chen et al. (2019) and Zellweger et al. (2020), who highlight the performance benefits of digital geometry in contemporary architecture. Moreover, the integration of programmable lighting and

responsive façade systems reflects Ryan and Browning's (2014) patterns of biophilic design, especially those related to dynamic light and visual complexity.

The Crescent Mall further deepens the symbolic and cultural dimension of mathematically informed design. The crescent geometry, derived from circular arcs and parabolas, is not only structurally efficient but also emotionally and culturally resonant. This formal language aligns with arguments by Kellert, Heerwagen, and Mador (2008), who emphasize that architecture can embody cultural identity while supporting ecological and psychological well-being. The building's orientation, façade porosity, and integration with prevailing wind patterns also support natural ventilation and energy efficiency, consistent with environmental control strategies discussed by Bakar et al. (2019) and Gregory and Andrews (2020).

All three buildings emphasize the intertwined role of geometry, material science, and environmental sensitivity reflecting Robertson et al.'s (2020) argument that wood and geometric modulation are powerful tools in enhancing sustainability. Although their construction periods and technologies differ, the underlying logic of using mathematics to reconcile formal ambition with environmental responsiveness remains constant. While the Mirvari Restaurant achieves this through analog experimentation, the Baku Crystal Hall and Crescent Mall realize it through advanced simulations and material modeling illustrating the continuity of biophilic principles across technological eras (Evans et al., 2020; Browning et al., 2014).

These findings collectively reinforce that mathematics in architecture is not a neutral abstraction but a method of embedding meaning, resilience, and ecological harmony into built form. Whether through structural shells, triangulated skins, or symbolic arcs, mathematical thinking facilitates design that is at once innovative and humane a principle at the core of biophilic and sustainable design theory (Burnard & Kutnar, 2015; Chang & Chen, 2020). As such, the case studies from Baku offer both historical insight and forward-looking strategies for contemporary practice.

CONCLUSION

The exploration of mathematics in architecture reveals a profound and enduring synergy between abstract principles and tangible design. From its historical roots in geometry to its contemporary applications in computational tools, mathematics has consistently served as both a foundation and a frontier for architectural innovation. The examples reviewed and analyzed in the article encompass a centuries-long era of the development of Azerbaijan's architectural heritage. This demonstrates that Azerbaijan, in its urban planning and interior design, has consistently kept pace with the times, adhering to the principles of parametric contemporary architecture and design. This article has examined how mathematical approaches shape modern architecture through three case studies in Baku: Baku Crystal Hall, Mirvari Restaurant and Crescent Mall. Each of these structures exemplifies the diverse ways in which mathematics underpins design, material optimization, and environmental performance.

The Baku Crystal Hall demonstrates the potential of mathematical geometry and parametric tools to realize complex and iconic forms. The tessellation of its facade, inspired by crystalline structures, not only embodies aesthetic precision but also ensures structural efficiency through computational modeling. This integration of form and function underscores how mathematics transforms abstract ideas into practical realities, setting a benchmark for contemporary architectural practice.

Mirvari Restaurant offers a contrasting perspective, where mathematics is used to craft organic, wave-like forms that harmonize with their natural surroundings. The hyperbolic paraboloid roof exemplifies how geometric principles and material science combine to create lightweight, durable, and visually

dynamic structures. Furthermore, the restaurant's sensitivity to its coastal context highlights how environmental control, informed by mathematical simulations, can enhance occupant comfort and sustainability.

Crescent Mall reflects the cultural and symbolic potential of mathematics in design, drawing from the crescent geometry integral to Azerbaijani identity. This structure leverages computational tools to blend cultural heritage with modern urban demands, creating a space that is not only visually striking but also environmentally responsive. The aerodynamic design and energy-efficient lighting systems demonstrate how mathematics drives innovation in sustainable strategies, contributing to the building's functional and ecological performance.

Expanded comparative **Table 4** synthesizes the design intentions, mathematical foundations, analytical processes, and urban implications of the three case studies. The selection of Mirvari Restaurant, Baku Crystal Hall, and Crescent Mall reflects distinct architectural typologies (public, event, and commercial) integrated into Baku's coastal fabric. Each project exemplifies how mathematical thinking informs not only form but also performance, spatial quality, and cultural resonance.

Structure	***Design Dynamics***	***Mathematical Approach***	***Types of Analysis Used***	***Key Architectural & Environmental Outcomes***	***Urban Role / Contextual Contribution***
Mirvari Restaurant	Organic, shell-like geometry; wall-less openness; inspired by marine elements and natural fluidity	Hyperbolic paraboloid surface ($z = x^2/a^2 - y^2/b^2$)	Form-finding simulations, geometric modeling, material optimization	Lightweight and sculptural concrete shell; passive ventilation and light play via openness	Public recreational spot along the boulevard; spatial openness enhances coastal interaction
Baku Crystal Hall	Crystalline, modular expression; event architecture; LED-integrated kinetic façade	Triangulated diagrid geometry; FEM simulations; parametric logic	FEM structural analysis, CFD, lighting optimization, parametric rationalization	Structural efficiency under time pressure; dynamic LED-integrated facade; airflow-responsive form	Urban-scale performance venue; iconic identity in Baku's skyline and cultural branding
Crescent Mall	Crescent symbolism; cultural narrative; commercial typology blended with fluid coastal aesthetics	Circular and parabolic geometries; surface simulations	Lighting mapping, ventilation and wind analysis, sustainable water strategies	Culturally embedded design; passive ventilation; integration of sustainable material layering	Commercial and social anchor along the waterfront; mediates between built and natural context

Table 4. Comparative Matrix of Design Logic, Mathematical Approaches, and Urban Contributions of the Examined Structures. (Prepared by the author, based on project analysis and design integration, 2025).

Collectively, these examples illustrate the centrality of mathematics in modern architecture, where it acts as both a creative catalyst and a technical necessity. The evolution of three-dimensional thinking, from ancient geometric ratios to advanced parametric systems, highlights the expanding scope of mathematical applications. Today's architects not only use mathematics to solve structural challenges but also to push the boundaries of form, integrating cultural narratives and sustainability goals into their designs. Looking forward, the integration of emerging technologies such as artificial intelligence, machine learning, and immersive modeling platforms promises to further elevate the role of mathematics in architecture. These advancements will enable architects to design adaptive, resilient, and innovative structures that respond dynamically to environmental, social, and cultural contexts. The future of architecture lies in the continued exploration of this intersection, where mathematical precision meets creative imagination.

In conclusion, mathematics is not merely a tool for architectural problem-solving; it is a lens through which architects can reinterpret and reshape the built environment. By bridging theoretical abstraction with practical execution, mathematics empowers architects to create spaces that are not only functional and sustainable but also culturally and aesthetically resonant. As global challenges such as urbanization and climate change intensify, the partnership between mathematics and architecture will play an increasingly pivotal role in designing a built environment that balances innovation with responsibility.

Etik Standart ile Uyumluluk

Çıkar Çatışması: *Yazarlar, kendileri ve diğer üçüncü kişi ve kurumlarla çıkar çatışmasının olmadığını veya varsa bu çıkar çatışmasının nasıl oluştuğuna ve çözüleceğine ilişkin beyanlar ile yazar katkısı beyan formları makale süreç dosyalarına ıslak imzalı olarak eklenmiştir.*

The authors declare that they do not have a conflict of interest with themselves and/or other third parties and institutions, or if so, how this conflict of interest arose and will be resolved, and author contribution declaration forms are added to the article process files with wet signatures.

Tarihi kentlerde biyoçeşitlilik bağlamında peyzaj planlama ve tasarımı: Safranbolu kenti örneği

Ayşe Betül Çufalı[a,*], **Aysel Uslu**[b]

Öz: Kentsel peyzaj konusunda biyoçeşitliliğin korunması ve geliştirilmesi peyzaj planlama ve tasarımında öncelikli konular arasındadır. Kentleşme ile yapılı çevre oranı artmakta doğal alanlar ise azalmaktadır. Artan kentsel doku ile bitki ve hayvan toplulukları için habitatlar olumsuz etkilenmektedir. Böylece kentlerde biyoçeşitlilik oranının azaldığı gözlemlenmektedir. Buna rağmen, son yıllarda kentsel biyoçeşitliliğin iyileştirilmesine yönelik çabalar artmaktadır. Bunun sonucu olarak kent ile doğayı entegre ederek biyoçeşitliliğe destek olan kentsel peyzaj tasarımı ve planlamaları gündeme gelmektedir. Bu çalışmada UNESCO kültür mirası listesinde yer alan Safranbolu ilçesi (Karabük) üzerine bir çalışma yürütülmüştür. Makalede; tarihi ve doğal değerleri açısından son derece zengin olan bir kent örneğinde, biyoçeşitliliği destekleyecek peyzaj tasarımı ve planlamaya ilişkin somut öneriler geliştirilmesi amaçlanmıştır. İlk aşamada elde edilen uydu görüntüleri ve yerinde sörvey çalışmaları ile mevcut durum tespiti yapılmıştır. Bunun üzerine saptanan sorunlar için "koruma, bağlantı, yapı, döngüler, biyolojik etkileşimler ve yaban hayatı destekleyen tasarımlar" başlıkları altında çeşitli planlama ve tasarım çözüm önerileri oluşturulmuştur. Tarihi özelliğini korurken kentsel biyoçeşitliliği destekleyecek unsurlar arasında mevcut yeşil ağın güçlendirilmesi ön plandadır. Ayrıca bu durumu desteklemek amacıyla kent merkezinde ve yakın çevresinde yöresel ve doğal malzeme kullanımı önemlidir. Bunun yanı sıra, geleceğe yönelik öneri tasarı alanlarında bitki seçimi, doğal bitki örtüsü göz önüne alınarak yapılmalıdır.
Anahtar Kelimeler: Kentsel biyoçeşitlilik, Kentsel peyzaj tasarımı, Peyzaj planlama, Safranbolu

Landscape planning and design solutions within the scope of biodiversity in historical cities: A case study of Safranbolu city

Abstract: Protection and development of biodiversity in urban landscapes planning and design process is among the priority issues. By urbanization, the ratio of built environment increases, and natural areas decrease. Habitats for plants and animals are negatively affected by the increasing urban texture. Thus, it is observed that biodiversity in cities is affected negatively. However, in recent years, there have been increasing efforts to improve urban biodiversity. As a result, urban landscape design and planning that support biodiversity by integrating the city and nature are on the agenda. In this study, a study was conducted on Safranbolu district (Karabük), which is on the UNESCO cultural heritage list. The aim of the article is to develop recommendations for landscape design and planning to support biodiversity in a city that is extremely rich in historical and natural values. In the first stage, the current situation was determined with satellite images and on-site surveys. Various planning and design solutions have been proposed for the problems identified under the headings of "protection, connectivity, construction, cycles, biological interactions and designs that support wildlife". Among the elements that will support urban biodiversity while preserving its historical character, strengthening the existing green network is at the forefront. Additionally, to support this approach, it is important to use local and natural materials in the city center and nearby. Furthermore, in future design proposal areas, the plant selection should be done by considering the natural vegetation.
Keywords: Urban biodiversity, Urban landscape design, Landscape planning, Safranbolu

1. Giriş

Bir yaşam alanı olan kentler, kültürel ve doğal unsurların bir arada karşılıklı etkileşim içinde bulunduğu bir ekosistem olarak tanımlanmaktadır (Karadağ, 2009). Kentleşmeyle beraber tarımdan ve topraktan uzaklaşma gerçekleşmiş (Kıray, 1982), doğal alanlar azalarak yapılı çevrede artış gözlemlenmiştir. Kentleşmedeki artış ile belirli bir alandaki toplam tür çeşitliliğini ifade eden biyolojik çeşitlilik (Lovejoy, 1980) ya da biyoçeşitlilik genel anlamda olumsuz etkilenmiştir. Ancak kentler, birçok yaban hayatı için uygun olmayan habitat olarak kabul ediliyorken (Govil vd., 2024), günümüzde çeşitli yaban hayatı popülasyonuna ev sahipliği yaptığı görülmektedir (Müller vd., 2013). Bu durumda kentsel alanlarda biyoçeşitliliği hem engelleyen hem de destekleyen durumlar söz konusudur (Şekil 1). Bu durumdaki kentsel alanlar ve banliyölerde küçük ve orta ölçekli memeliler ve kuşlar gibi türlerin uyum sağlayarak yaşamlarını sürdürdükleri saptanmıştır (Müller vd., 2013). Biyoçeşitlilik kavramı güncel bir kavram olsa da doğayı kente dahil eden çeşitli peyzaj çalışmaları tarih boyunca olmuştur. Bunlara örnek olarak Olmsted'in Zümrüt Kolye-*Emarald Neclace* planı 19. Yüzyılda parkı kentin sisteminin bir parçası olarak yapılandırmıştır (Zaitzevsky, 1982). Yine Howard Bahçe Şehir-*Garden City* anlayışı kent ve kır ikilisini dengelemeyi amaçlamaktadır (Swaffield, 2005).

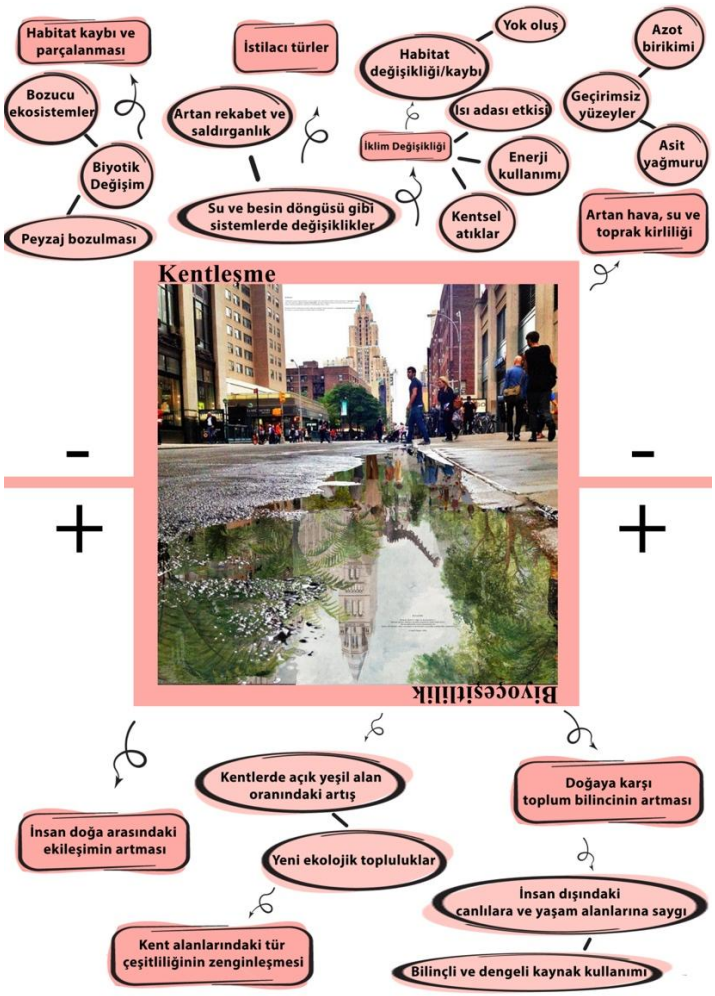
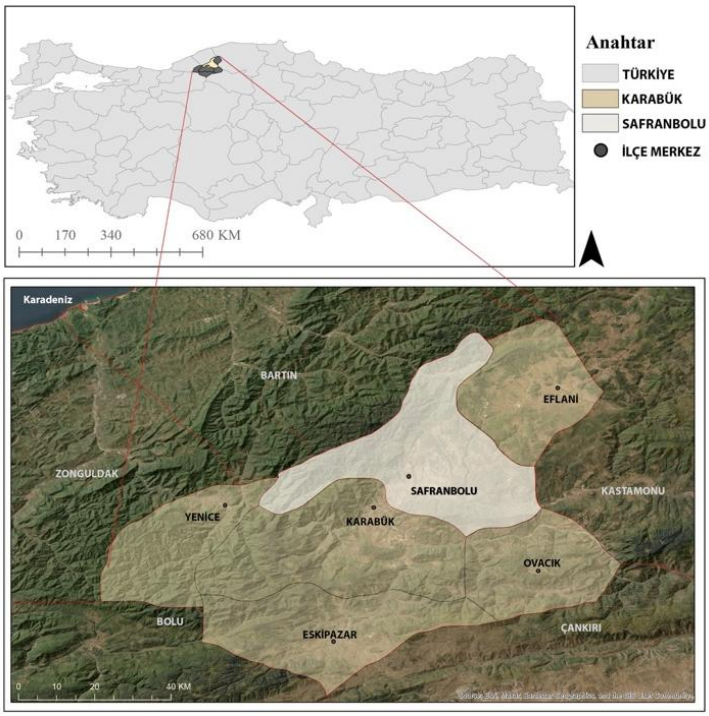
DOI: 10.18182/tjf.1607985



Ayrıca kentte ulaşım koridorları boyunca gelişim gösteren ancak bu koridorlar arasında açık yeşil alan tasarlayarak yeşile erişim kolaylığı sağlayan Kopenhag'ın Parmak Planı-*Finger Plan* kent merkezine yakın yeşil alanlar sunmuştur (Swaffield, 2005). Böylece kentsel biyoçeşitlilik kavramı yıllar içerisinde ivme kazanarak gelişmiştir. Bu kavram, disiplinler arası çalışılması gereken bir konu olmakla birlikte peyzaj mimarlığı, bu konuda birçok kesişim noktasında yer almaktadır (Norton vd., 2016). Arazi kullanımı ve habitat parçalanması gibi yerel, bölgesel ve küresel ölçeklere odaklanarak biyoçeşitlilik üzerine çalışmalar giderek daha önemli bir duruma gelmektedir.

Bu çalışmada mevcut kentsel biyoçeşitliliği desteklemek ve artırmak üzerine kentsel peyzaj planlama ve tasarım önerileri üzerine bir çalışma yürütülmüştür. Çalışma alanı olarak tarihi ve kültürel değerlerinin yanı sıra doğal peyzaj alanları ile de önemli bir yere sahip Karabük ili Safranbolu ilçesi seçilmiştir. İlçe sınırları içerisinde kentsel, arkeolojik ve doğal sit alanlarını barındırması ile koruma ve kullanma dengesi göz önünde bulundurulması gerekmektedir. Çalışma kapsamında uydu görüntüleri ile mevcut durum saptanarak geleceğe yönelik planlama ve tasarım önerileri sunulmuştur.



2. Materyal ve yöntem

2.1. Materyal

Çalışmanın ana materyalini Karabük ili Safranbolu ilçesi oluşturmaktadır (Şekil 2). İlçenin adı Safran bitkisinden gelmektedir (ÖzkuAçıkgöz, 2010). Yüzölçümü 1013 km² (Kara, 2021; Gümüşoğlu, 2006) olan ilçenin rakımı 581 m'dir (Tan, 2019).

Şekil 1. Kentsel alanlarda biyoçeşitliliği destekleyen ve engelleyen durumlar (Ayşe Betül Çufalı)
Figure 1. Enhancing and limiting factors on biodiversity in urban areas (Ayşe Betül Çufalı,)

Şekil 2. Safranbolu konumu
Figure 2. Location of Safranbolu

İlçe 1994 yılından beri UNESCO tarafından Dünya Mimari Miras kenti korumasındadır. İlçede tarihi süreç içerisinde kentsel yapının farklılaştığı üç bölge göze çarpmaktadır (Aktüre ve Şenyapılı, 1976; Ayvazpınarı, 2020). Bunlar Kıranköy, Çarşı (Şehir) ve Bağlar bölgesidir.

Kıranköy bölgesi, 1500'lü yıllarda Rumların yerleştiği bölge olarak bilinmektedir (Yazıcıoğlu, 2001; Deniz ve Ersöz, 2020). 1924 yılında ise Kıranköy bölgesini oluşturan mahalleler birleştirilerek "Misak-ı Milli" mahallesi adı verilmiştir (Eski, 2018). Ancak Safranbolu halkı bölgenin adını hala "Kıranköy" olarak kullanmaktadır (Deniz ve Ersöz, 2020).

Çarşı Bölgesi ise ticaretin ve kentsel dokunun yoğun olduğu tarihi kent bölgesidir (Aktüre ve Şenyapılı, 1976). Şehir bölgesinin çevresi, rüzgâra karşı alanı koruyan (Bozkurt, 2022) yüksek tepelerle çevrili bir biçimdedir. Söz konusu Çarşı bölgesi, Gümüş, Akçasu dereleri ve bu iki derenin birleşmesiyle oluşan Tabakhane Deresinin oluşturduğu vadi içerisinde yer almaktadır (Ayvazpınarı, 2020).

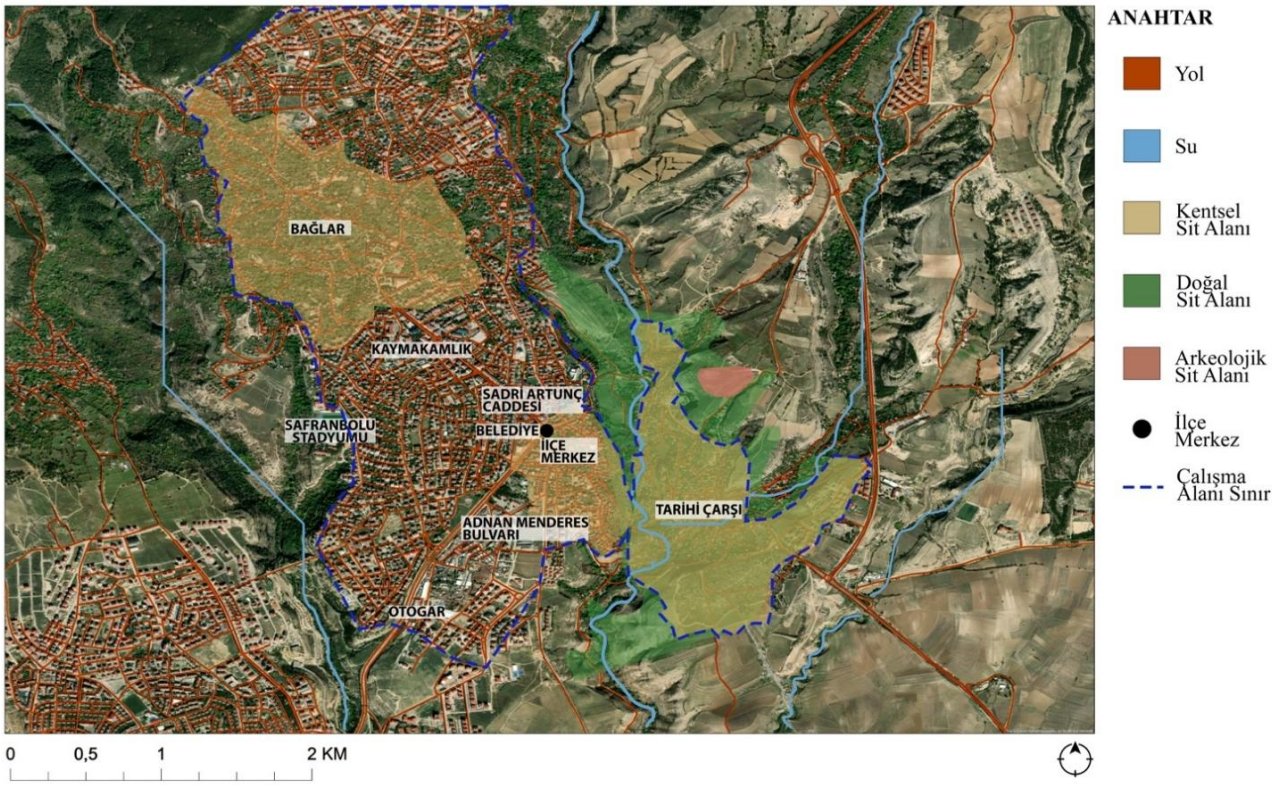
Daha serin ve yaylaların olduğu (Günay, 1989) Bağlar Bölgesi ise geçmişte Safranbolu halkı için yaz mevsiminde bir sayfiye alanı olarak kullanılmıştır (Bozkurt, 2022). Bağlar bölgesi de zamanla farklı mahallelere bölünmüştür (Deniz ve Ersöz, 2020). Mahallenin ismi verimli arazilere ve meyve bahçelerine sahip üzüm bağları merkezi olmasından gelmektedir (Ak, 2019).

2.2. Yöntem

Bu çalışma 3 aşamada gerçekleştirilmiştir:

1. Literatür Tarama: Küreselleşme sonucu son bilgiyi takip etmek bilimsel çalışmalar için önemli bir aşamadır. Bu sebeple öncelikle araştırma kapsamına faydalı olacak kuramsal çerçeve belirlenerek açıklamalarına yer verilmiştir.
2. Veri Toplama ve Bulgular: Alan hakkında veri elde etmek amacıyla Google Earth görüntüleri ile Copernicus uydu verilerinden yararlanılarak haritalar oluşturulmuştur. Ayrıca arazide yapılan yerinde sörvey çalışmaları ile bulgular desteklenmiştir.
3. Sonuç: Elde edilen haritalar doğrultusunda peyzaj koridor, leke ve matris verileri ile ilişkilendirilerek çeşitli öneriler sunulmuştur. Elde edilen haritalar doğrultusunda Parris vd. (2018), çalışmasında kullanılan kentsel biyoçeşitliliği destekleyen ilkelerden yararlanılarak alt başlıklar altında planlama ve tasarım önerileri sunulmuştur (Çizelge 1). Aşağıda bu makalede çalışma alanı için izlenen yöntem çerçevesinde, kentsel biyoçeşitliliği destekleyen 7 ilke başlıkları ve açıklamaları verilmiştir.

3. Bulgular ve Tartışma



Çalışma alanı sınırları dahlinde Safranbolu ilçesi irdelenmiştir. Alanda; kentsel karakterli peyzaj özellikleri ile arkeolojik ve doğal sit alanları yer almaktadır (Şekil 3). Böylece tarihi ve doğal koruma alanları ile beraber yeni gelişen kent merkezinde mevcut biyoçeşitliliği koruyarak ve potansiyel alanlarda artırarak ekolojik dengeye bütüncül bir yaklaşım ile katkı sunmak amaçlanmıştır.

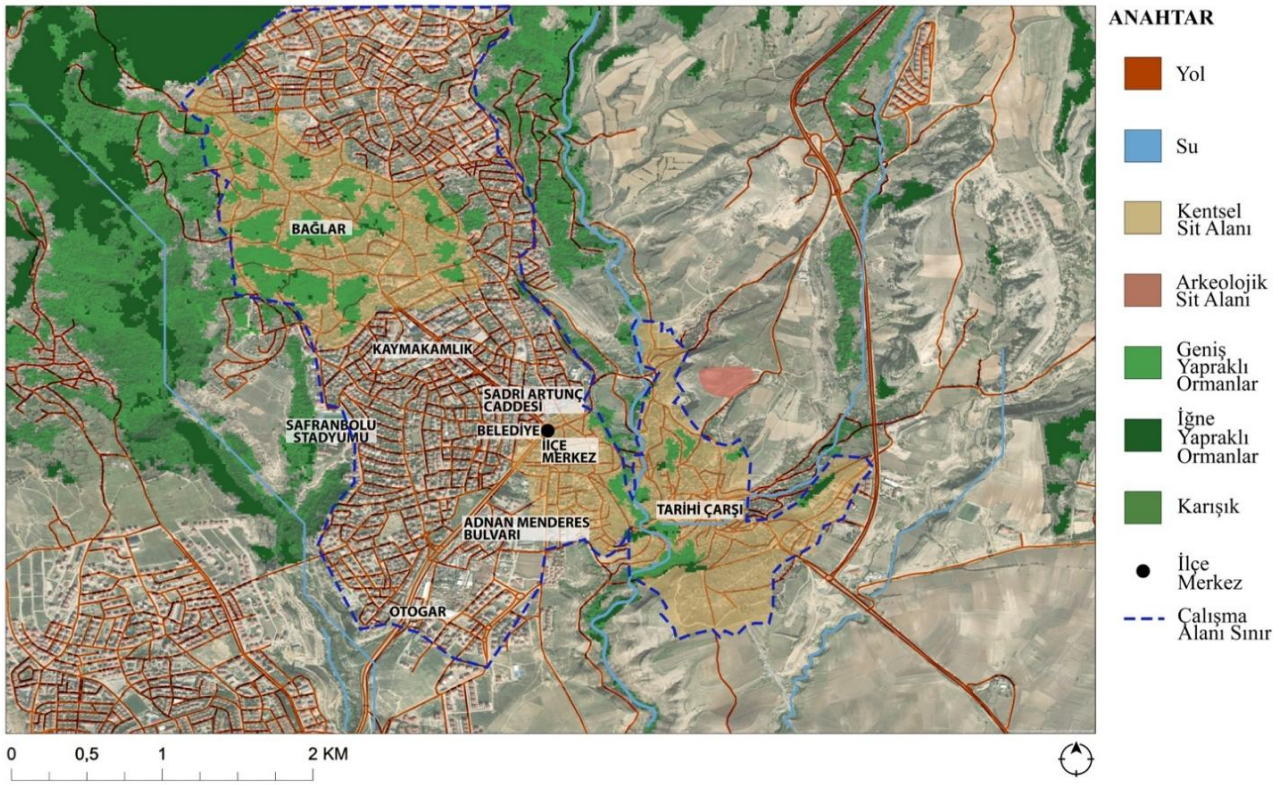
Şekil 3 'te sınırlı kentsel dokunun görüldüğü kentsel sit alan sınırları arası bağlantılılık koparak Çarşı bölgesi ve Bağlar bölgesi arası kuzeye doğru yoğun kentsel bir büyüme görülmektedir. Alanda biyoçeşitlilik açısından önemli bir yere sahip olan peyzaj koridoru niteliğinde 3 akarsu koridoru görülmektedir. Bu koridorda saptanan potansiyel biyoçeşitlilik rezerv alanlarına ait fotoğraflar Şekil 4'te yer almaktadır.

Alanda yer yer parçalanmış olarak görülse de kent çevresinde yoğun orman dokusu mevcuttur. Ancak özellikle koruma bölgesi dışında kalan kent dokusu içinde aktif yeşil alan eksikliği göze çarpmakladır (Şekil 5).

Çizelge 1. Kentsel biyoçeşitliliği destekleyen 7 ilke (Parris vd., 2018)
Table 1. The 7 principles (*lamps*) enhancing urban biodiversity (Parris et.al, 2018)

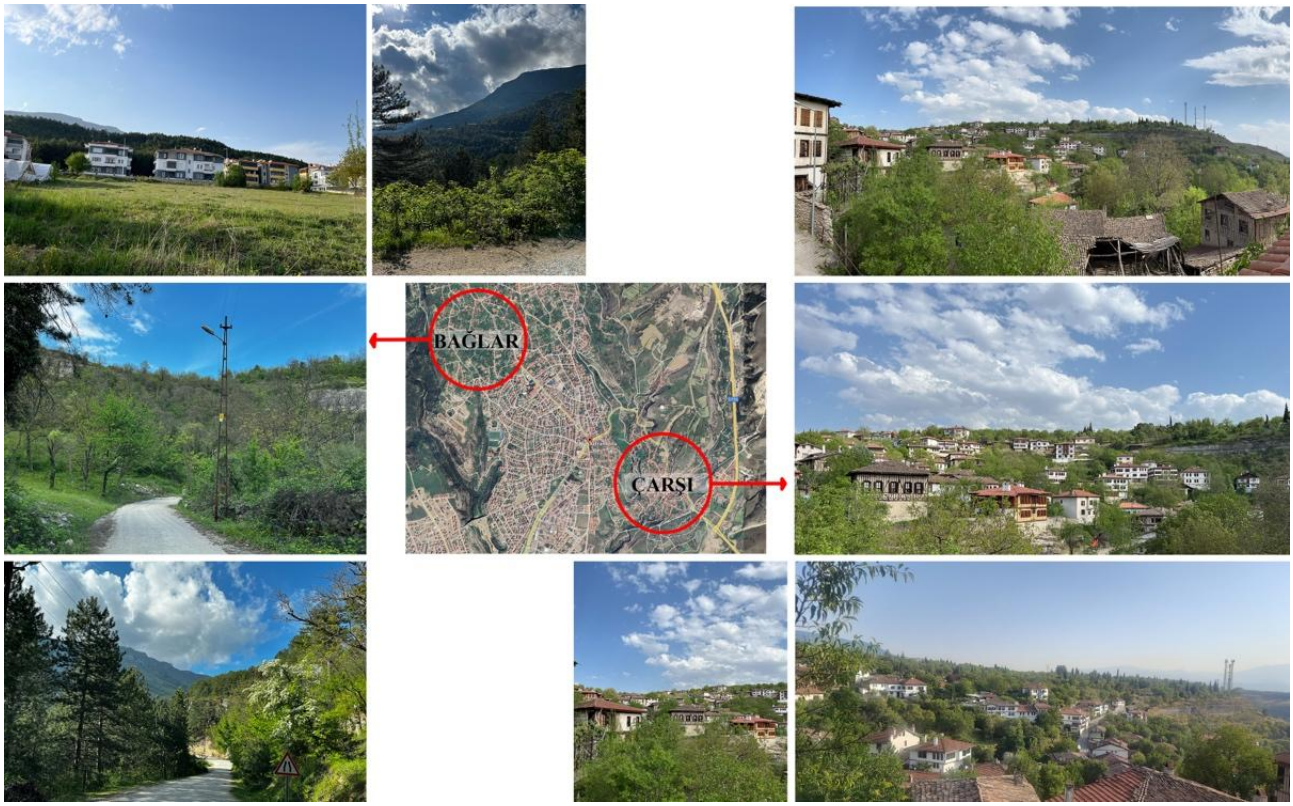
Koruma (*Protection*)	Şehirlerin içinde ve çevresinde yüksek biyoçeşitliliğe sahip (hem mevcut hem de potansiyel) alanların belirlenmesi ve korunmasıdır.
Bağlantı (*Connectivity*)	Kentsel biyoçeşitliliğin ikinci ilkesi, hayvanların, mantarların ve bitkilerin (sporlar, polenler ve tohumlar) yayılımının kentsel peyzaj boyunca hareket etmesini sağlamak için habitat alanları arasındaki bağlantıyı korumak veya yeniden kurmaktır.
Yapı (*Construction*)	Kentsel biyolojik çeşitliliğin üçüncü ilkesi, bir dizi bitki ve hayvan türü için yaşam alanı sağlayabilecek ekolojik özellikler inşa etmektir.
Döngüler (*Cycles*)	Su, besin ve enerji döngüsü, ekosistem hizmetlerinin ve biyolojik çeşitliliğin sürdürülmesi için kritik öneme sahiptir.
Biyolojik etkileşimler (*Biological Interactions*)	Kaynaklar için rekabet, simbiyoz, otçulluk, predasyon, tozlaşma ve parazitlik gibi biyolojik etkileşimler, belirli bir yerin biyolojik çeşitliliğini şekillendiren önemli süreçlerdir.
Yaban hayatı destekleyen tasarımlar (*Benevolence*)	Kentsel ekolojinin sıklıkla göz ardı edilen bir yönü, engelleyen bir kentsel formun önemidir. Kentsel altyapı, ölüm oranını artırarak (örneğin, yaban hayatı-araç çarpmaları veya binaların camlarına çarpan kuşlar yoluyla) biyoçeşitlilik üzerinde bariz olumsuz etkilere sahip olabilir.
Yenilik (*Novelty*)	Yeni ekolojik topluluklar ve yeni ekosistemler, tarihsel benzerleri olmayan yerli ve egzotik türlerin yeni kombinasyonlarının varlığı ile karakterize edilir (Hobbs vd., 2006; Kowarik, 2011). Biyolojik çeşitliliğin kentsel ortamlarda devam etmesi veya artması için, yeni ekolojik toplulukları destekleyen alanların, abiyotik ve biyotik koşulları kalıntı ekosistemlerinkinden farklı olsa bile önemli habitatlar olarak kabul edilmesi gerekir.

Şekil 3. Safranbolu sit alanları
Figure 3. Protected zones of Safranbolu



Şekil 4. Akarsu koridorlarında potansiyel biyoçeşitlilik geliştirme alanları (Ayşe Betül Çufalı)
Figure 4. Potential biodiversity enhancement areas in river corridors (Ayşe Betül Çufalı)

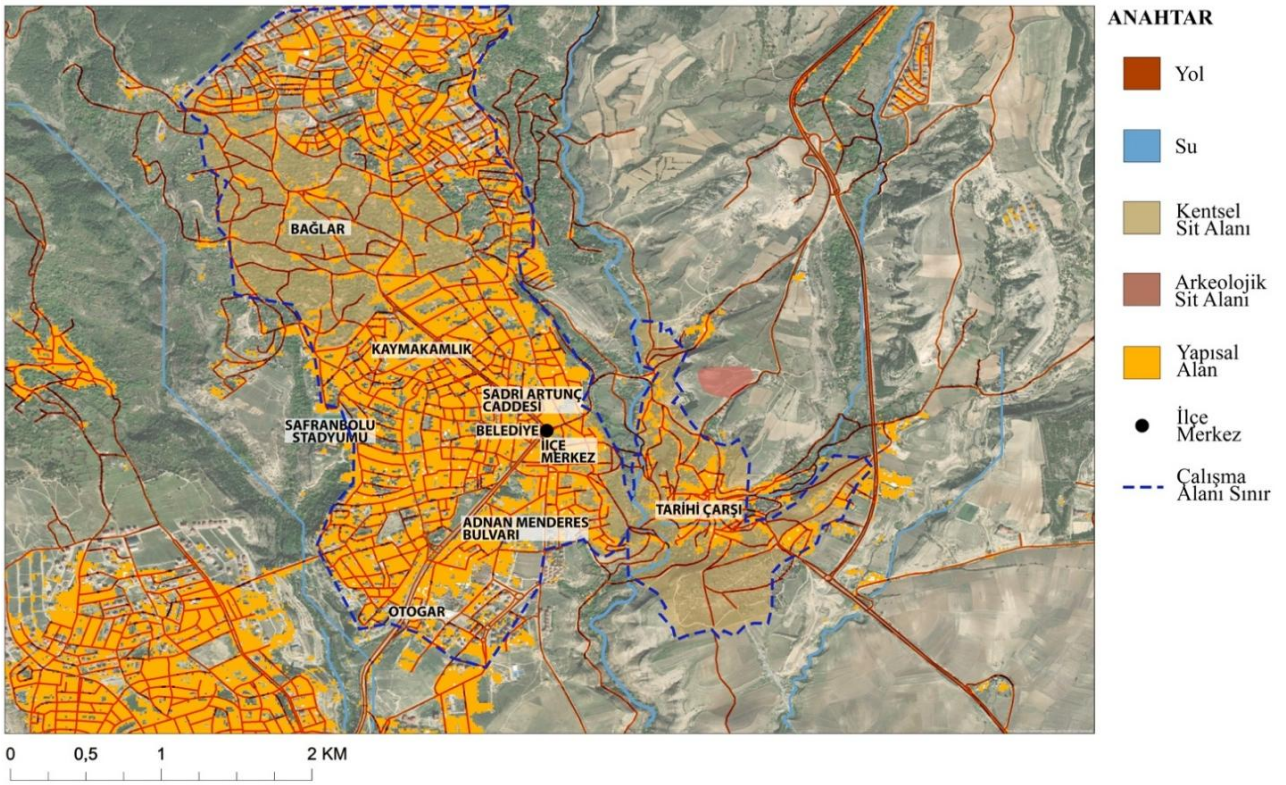
Mevcut yeşil alan yoğunluğu haritasında (Şekil 7) tarihi kent ve çevresinde, yeni gelişim gösteren bölgeye oranla yeşil alan fazladır. Tarihi alanlarda konut- yeşil alan birlikteliğinin dengeli olduğu görülmektedir (Şekil 6). Ayrıca ilçenin kuzeybatısında yer alan Bağlar bölgesinde de yer yer leke biçiminde yeşil alanların varlığı görülmektedir (Şekil 7). Ancak yeni gelişen kent bölgesinde yeşil alanlar arasında nicelik ve nitelik açısından bir bağlantı görülmemektedir. Ağaç örtüsü yoğunluğunun mevcut uydu görüntüsünde de azaldığı saptanmıştır.



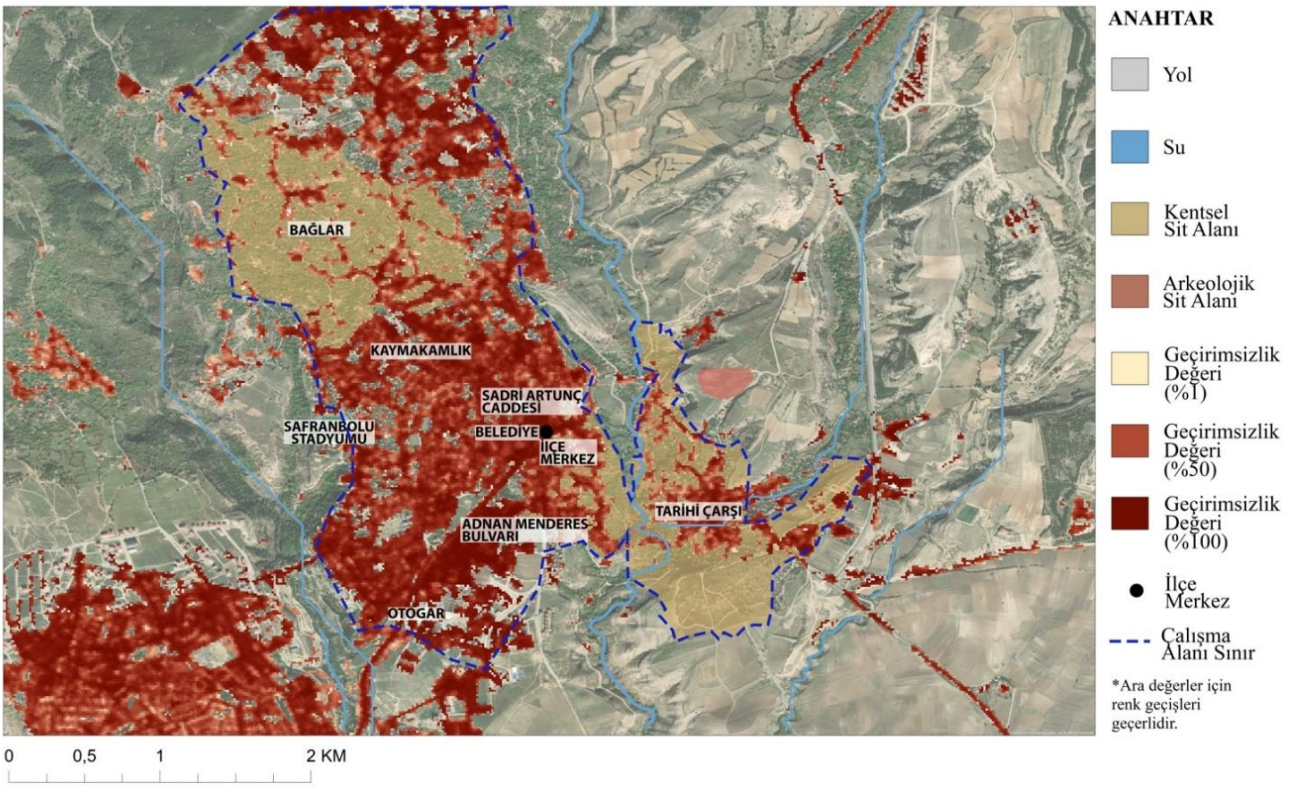
Bu haritaların yanı sıra çalışma kapsamında yapılı çevrenin daha net görülmesi amacıyla uydu görüntülerinden yapılı çevre analizi de yapılmıştır (Şekil 8).

Elde edilen harita doğrultusunda, kentsel sit alanları dışında yoğun yapısal alanlar mevcuttur. Özellikle tarihi kent merkeziyle kıyaslandığında yıllar içerisinde kentin önemli bir biçimde büyüdüğü görülmektedir.

Kentleşme, dünya çapında arazi kullanımının yoğunlaştırılmasının önemli bir biçimi olarak görülmektedir (Nguyen vd., 2023). Yol ve yapılı çevrenin yoğun olması sonucu zemin geçirimliliği düşerek, kentteki canlı çeşitliliğin önemli kaynaklarından olan hidroloji ağında olumsuz etkilere sebep olmaktadır. Safranbolu'da bu durumu saptamak amacıyla uydu görüntüler ile geçirimsizlik haritası da hazırlanmıştır (Şekil 9).



Şekil 5. Safranbolu ormanlık alanlar ve içerdiği ağaç tipleri
Figure 5. Forest areas and tree types in Safranbolu



Şekil 6. Tarihi bölgelerde konut-yeşil alan birlikteliği (Ayşe Betül Çufalı)
Figure 6. Building environment-green space coexistence in historical zones (Ayşe Betül Çufalı)

Şekil 7. Safranbolu yeşil alan ve ağaç örtüsü yoğunluğu
Figure 7. Grassland and tree cover density in Safranbolu

Şekil 8. Safranbolu yapılı alan
Figure 8. Built-up areas in Safranbolu

Şekil 9. Safranbolu zemin geçirimsizlik haritası
Figure 9. Imperviousness density in Safranbolu

Geçirimsizlik haritası doğrultusunda yeni gelişen kentsel alanda tarihi çarşıya oranla daha yoğun bir kentsel doku ile geçirimsizlik alanların çoğaldığı görülmektedir. Kentsel dokunun genişlemesi yüzey geçirimlilik oranını doğrudan etkilemektedir. Geçirimsiz alanların artması ile habitat parçalanmasında artış, döngülerin ve zincirlerin değişmesi gibi biyoçeşitlilik ve ekosistem işleyişi için tehditler oluşmaktadır (Filazzo vd., 2019). Habitat parçalanması sonucu ise tür kompozisyonları bozulmaktadır (Faeth vd., 2011).

Bu etkileri kısmen dengeleyen ve insan sağlığına fayda sağlayan yeşil altyapı uygulamaları mevcuttur. Örneğin, yağmur suyu, yeraltı suyu, geri dönüştürülmüş su, nehir, göl veya sulak alanlardaki sular koruma ve kullanım dengesi içinde planlı bir biçimde yönetilebilmektedir. Yeşil alan varlığı artırılarak geçirgen yüzey alanına katkı sağlanmaktadır. Böylece su tutma ve yeniden kullanma kapasitesi artırılmış olacaktır.

Safranbolu geneline bakıldığında Tarihi Çarşı ve çevresinde yüzey geçirimlilik oranı, yeni gelişen kent dokusundan daha yüksek olduğu görülmektedir. Yine Bağlar Bölgesi'nde de kentsel sit alanı konumunda olması sebebiyle yoğun kent dokusu ve dolayısıyla yüksek geçirimsizlik oranları görülmemektedir. Ancak ilçe merkezi ve kuzey bölgesine doğru artan kent dokusuyla beraber biyoçeşitliliğin olumsuz etkileneceği %50-100 oranında geçirimsizlik oranları görülmektedir.

Yürütülen çalışma doğrultusunda, Safranbolu ilçesinin arkeolojik, doğal ve kentsel sit alan varlığı ile önemli bir yere sahip olduğu görülmüştür. Ancak yeni gelişen kentsel doku ile artan yapılı ve geçirimsiz alanlar göze çarpmaktadır. Ayrıca bu sebeple yapılı alanlarda yeşil alanların azaldığı görülmektedir.

4. Sonuç ve öneriler

Çalışma kapsamında Safranbolu kenti için, kentsel biyoçeşitliliği destekleyen 6 ilke doğrultusunda saptanan mevcut durum ve buna yönelik planlama ve tasarım açısından çözüm önerileri sunulmuştur. Tarihi bölgelerde ve yeni gelişen kent bölgesinde biyoçeşitlilik açısından farklı durumlar söz konusudur. Tarihi bölgelerde su ögesi, yeşil alan varlığı gibi biyoçeşitliliği destekleyen alanlar görülmektedir. Ancak yeni gelişen kentsel alanda artan yapılaşma sonucu yeşil bantta kopukluklar, ekolojik döngüleri olumsuz yönde etkileyen geçirimsiz alanların artması, flora ve faunayı destekleyen alanların kısıtlığı gibi olumsuzluklarda artış görülmektedir. Bu sorunların çözümüne yönelik çeşitli kentsel peyzaj tasarım önerileri sunulmuştur. Çalışmayı kısıtlayan bir durum olarak, çalışma alanında kentsel, doğal ve arkeolojik sit alan mevcudiyeti olmasıdır. Bu sebeple çözüm olarak radikal değişikliklerden kaçınılmıştır.

4.1. Koruma

Kentsel alanlarda mevcut bitki ve hayvan türleri tespit edilip korunması ile habitat kaybı önlenebilir. Safranbolu kenti endemik bitki türleri açısından zenginliğe sahiptir. Özellikle adını aldığı safran bitkisi ilçede önemli bir yere sahiptir. Ancak geçmişte Safranbolu'nun 40 köyünde yetiştirilen safran bitkisinin tarımı, ilçede 7 köyde yapılmaktadır (Ayvazpınarı, 2020).

4.2. Bağlantı

Kentler, hızla genişlerken, biyolojik çeşitlilik açısından önemli alanları da tehdit etmektedir. Kent çeperinde özellikle kuzey bölgesinde yoğun yeşil alanlar mevcuttur ancak kentsel dokuda bu bağlantılar koparak yapılı çevre yoğunlaştığı görülmektedir. Örneğin; Tokatlı Kanyonu boyunca uzanan yeşil aksın, tarihi çarşı bölgesinde kentsel dokunun yoğunlaşmasıyla kesintiye uğradığı gözlemlenmektedir. Çalışma alanı sit alanı sınırları içerisinde yer aldığından çözüm için radikal değişiklikler yapılamamaktadır.

4.3. Yapı

Kentsel alanlarda bitki ve hayvanların yaşam alanlarını destekleyecek yapıların yapılması sayesinde biyoçeşitliliğe katkı sunulmaktadır. Örneğin tarih boyunca çeşitli kültürler tarafından önem verilen kuşlara yönelik, kent içi alanlarında özel alanlara yer verilmiştir. Osmanlı döneminde de önem verilen kuş evleri günümüzde de görülmektedir. Safranbolu kentinde de Osmanlı dönemine ait izlere rastlanılmaktadır. O dönemlerde yapı cephelerine tasarlanan kuş evleri örnekleri mevcuttur (Şekil 10).

Şekil 10. Safranbolu kuş evi örnekleri (Belder, 2024)
Figure 10. Bird house examples in Safranbolu (Belder, 2024)

4.4. Döngüler

Safranbolu ilçesi ve çevresinde yürütülen çalışmalar ve raporlar doğrultusunda ilçenin su kaynakları açsından zengin bir durumda olduğu görülmektedir (Bölükbaşı Ertürk, 2014). Ancak artan kentsel doku ile su döngüsünü olumsuz etkileyen zemin geçirimsizlik oranının yapılı çevrede arttığı saptanmıştır.

4.5. Biyolojik etkileşimler

Tozlaşmanın (polinasyon) büyük çoğunluğunu sağlayan arılar ve çeşitli böcekler (Calderone, 2012; Sarı, 2016), biyoçeşitlilik açısından önemli bir yere sahiptir. Peyzaj tasarımının estetik katkısının yanı sıra biyolojik etkileşimlere fırsat sunduğu, ekosistem dengesini koruduğu gözlemlenmektedir. Polinatör böcekler için tasarlanan, biyoçeşitliliği koruyan ve artıran böcek otelleri gibi tasarımlara alanda rastlanmamıştır (Şekil 11).

4.6. Yaban hayatı destekleyen tasarımlar

Çeşitli ulaşım ağları habitat parçalanmalarına sebep olarak biyoçeşitlilik üzerinde olumsuz etkilere sahiptir. Safranbolu'da, tarihi kent merkezi çevresinde ve ilçenin kuzey kesimlerinde yoğun kent dokusunun azaldığı ve doğal, bozulmamış alan varlığı ile potansiyel yaban hayata uygun alanların varlığı dikkat çekmektedir. Bu bölgede yaşamını süren yaban hayatını taşıt yollarının tehlikelerinden koruyan ekolojik köprülerin alanda eksikliği tespit edilmiştir.

Elde edilen sonuç doğrultusunda kentsel biyoçeşitliliği destekleyen ilkeler örnek alınarak Safranbolu genelinde kentsel peyzaj tasarım önerileri sunulmuştur (Çizelge 2).

Yürütülen bu çalışma ileride benzer çalışmalara örnek niteliğindedir. Fakat gelecekte yapılacak benzer çalışmalarda arazi çalışmaları ve yerinde gözlemlerin artırılması gerektiği düşünülmektedir. Böylece uydu görüntüleri üzerinden elde edilen veriler alan çalışmalarıyla desteklenerek doğruluğu tespit edilerek ilerlenecektir.

Çizelge 2. Kentsel biyoçeşitliliği destekleyen 6 ilkeye yönelik öneriler
Table 2. Recommendations for 6 principles enhancing urban biodiversitya

İlkeler	Öneriler
Koruma (Endemik Bitki Türlerinin Sürdürülebilirliği)	Mevcut biyoçeşitliliği korumak ve devam ettirmek için yerel ve yöreye özgü bitki türleri tercih edilmelidir. Safran bitkisi gibi yöreye özgü endemik bitkilerin üretim politikaları üzerinde çalışmalar artırılmalıdır. Böylece doğal bitki türlerinin yetiştirilmesi desteklendiğinde pestisit ve diğer zararlı kimyasalların kullanımını azaltılmış olacaktır. Bu durum sağlıklı ekosistem sunmak ve biyoçeşitliliğin artırılması açısından önemlidir.
Bağlantı	Özellikle yeşil banttın devamlılığını sağlamak amacıyla tarihi çarşıda bulunan yapıların bahçe, çatı ve cephelerinde yeşil alanların bağlantısı sağlanmalıdır. Ayrıca Karabük ile bağlantıyı sağlayan Adnan Menderes Bulvarı, Bartın yolu ile bağlantıyı sağlayan Mimar Sinan Caddesi ile Safranbolu'nun yeni yerleşim bölgesi için ana arter niteliğinde olan Sadri Artunç Caddesi gibi kent içi ana yollarda tasarım çözümleri ile yeşil ağın bağlantısı güçlendirilmelidir.
Yapı	Mevcut kuş evlerini koruyarak ve yenilerini tasarlayarak kent içerisinde kuşlara da yaşam alanı sunarak biyoçeşitliliğe katkı sunulabilir. Ayrıca yuvalama ve barınak alanları oluşturularak kent içi alanlarda yaban hayatını destekleyecek habitat çeşitliliği oluşturulabilir (Reynolds vd., 2019). Örneğin tarihi çarşıda mevcut durumda yaşayan hayvan türlerine yönelik yeni alanlar tasarlayarak kentleşme sonucu oluşabilecek tür kaybının önüne geçilebilir veya habitat alanı genişletilebilir. Ayrıca tarihi çarşı ile Tokatlı Kanyonu arası duraklama ve barınma alanları sunulursa habitat devamlılığı da sağlanmış olacaktır. Böcek otellerindeki gibi yeşil akslar üzerinde ve göç rotalarında da kuşlar için dinlenme alanları tasarlanmalıdır. Bunun için ölü ağaçlardan yararlanılarak kent içinde toplanma alanları ve meydanlarda heykeller tasarlanabilir. Örneğin ilçe merkezinde bulunan Misak-ı Milli Meydanı bu tasarımlar için uygundur.
Döngüler	Ekolojik döngüleri olumsuz etkileyen durumları önlemek amacıyla kentsel alanlarda yapılı çevre yoğunluğu azaltılarak kentsel yeşil alanlar oluşturulmalıdır. Bunun yanı sıra zemin malzemesi seçilirken geçirimli malzeme tercihi ile su döngüsüne katkı sağlanmaktadır. Geçirimli zemin kaplamaları doğru teknikle uygulanmalıdır. Böylece yer altı suyu beslenimi desteklenmektedir. Aksi takdirde yer altı suyu beslenimi engellenmiş olacaktır.
Biyolojik etkileşimler	Polinatör böcekler için özel alanlar önerilmektedir. Böylece üst ölçek kararlarının yanı sıra alt ölçek öneri tasarımlarla bütüncül bir biçimde biyoçeşitlilik desteklenmelidir.
Yaban hayatı destekleyen tasarımlar	Ekolojik koridorlar yaban hayvanlarının büyüklükleri, görüş açıları ve mesafelerine göre değişkenlik göstermektedir (Kintsch ve Cramer, 2011). Çalışma alanında sit alanları bulunması sebebiyle büyük ölçekli kararlar alınamadığı yerlerde 1,5 metre ve daha az boyutlarda açıklığa sahip küçük boy alt geçitler (Gülci vd., 2014) de tasarlanabilir. Ancak yaban hayvanlarının geçitleri kullanabilmesi adına doğru yer tespiti önemlidir (Ruediger, 2001; Özcan, 2021). Dolayısıyla kaynakları verimli kullanabilmek amacıyla alanda daha detaylı çalışmalara ihtiyaç vardır.

Çumra İrva ve İska İdaresi Yerleşkesinin Tarihsel Mirası

Mehmet Mutlu[1, 2]

ÖZET

Anadolu'nun coğrafi açıdan tarıma elverişli ve verimli bölgelerinden birisi olan İç Anadolu kesiminde yer alan Konya ili, aynı zamanda ülkemizin en kurak bölgesi olduğu için tarihin her döneminde sulama sorununa çözüm aramıştır. Bu sorunun çözümü için yapılan çalışmaların en kapsamlılarından birisi de 20. yüzyılın başlarında hayata geçirilen Konya Ovası Sulaması Projesi'dir. Beyşehir gölünden alınan suyun kanallarla Çumra'ya taşınması çalışmalarını içeren proje, Osmanlının son dönemindeki en önemli yatırımlarından birisidir. Dönemine göre iddialı ve büyük projenin idari yönetim binası da aynı ilçede oluşturulmuştur. Proje, bir Alman şirket tarafından hayata geçirilirken, yerleşke içerisine yine aynı firma tarafından inşa edilen idari bina ve lojmanlar adeta Almanların geleneksel konut anlayışının temsilcisi olarak inşa edilmişlerdir. Gerek tasarım ve gerekse estetik anlayış olarak dikkat çekici yapılar olan ve idari bina, lojmanlar ve atölye binasından meydana gelen yapılar, cephe özellikleriyle de birbiriyle uyum içindedirler. Yerleşkede yer alan idari bina çatı katı ile birlikte üç katlı olarak inşa edilmişken, başmühendis lojmanı çatı katı dahil 2 katlı olarak yapılmıştır. Mühendis lojmanları ise tek katlı olup, tüm lojmanlarda bodrum kat bulunmaktadır. Aynı zamanda ilçenin en eski yapıları olan bu binalar günümüzde de halen kullanılmaktadır. Bununla beraber bugüne kadar herhangi bir bilimsel çalışmada konu edilmemiştir. Çalışma, bu özel yapıların ilk kez literatüre kazandırılacak olması açısından önem arz etmektedir.

Anahtar Kelimeler: *Çumra, Alman evleri, Su idaresi.*

The Historical Legacy of the Irrigation Administration Settlement in Çumra

ABSTRACT

Konya province, located in Central Anatolia, one of the most fertile and geographically favorable regions of Turkey, has historically faced challenges related to irrigation due to its arid climate. One of the most comprehensive initiatives to address this issue was the Konya Plain Irrigation Project, implemented in the early 20th century. This project, which involved transporting

Makale Türü: Araştırma Makalesi

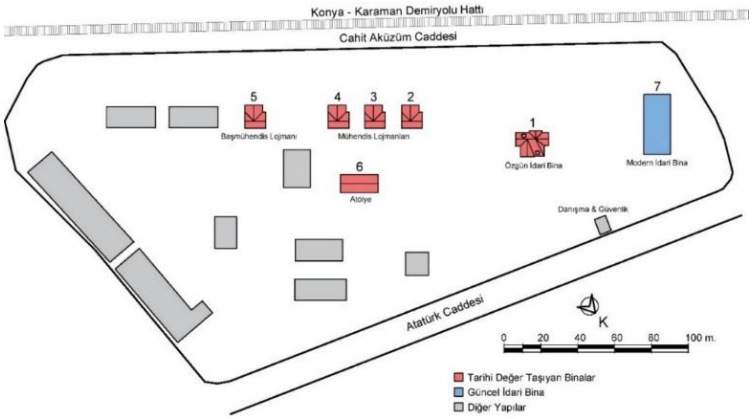
water from Lake Beyşehir to Çumra via canals, was among the most significant investments of the late Ottoman period. The administrative headquarters of this ambitious and large-scale project was also established in the same district. While the project was carried out by a German company, the administrative building and lodgings constructed within the project campus reflected the traditional German architectural approach to residential structures. These buildings, which include an administrative building, lodgings, and a workshop, are notable for their design and aesthetic coherence, exhibiting a harmonious facade composition. The administrative building was designed as a three-story structure with an attic, while the chief engineer's lodging was built as a two-story structure with an attic. The engineers' lodgings are single-story buildings, all of which include a basement. As the oldest surviving buildings in the district, they remain in use today. However, they have not yet been the subject of any scholarly research. This study aims to introduce these unique structures into the academic literature for the first time.

Keywords: *Çumra, German houses, Water administration.*

1. GİRİŞ

İlk çağlardan itibaren insanlar, su kaynaklarına yakın bölgelerde yerleşim kurarak, suyu hem içme hem de tarımsal faaliyetler için kullanmışlardır. Sulak alanların çevresinde tarım yapma arzusu, suya erişimin daha kolay olduğu göl ve nehir kenarlarında ilk tarımsal faaliyetlerin başlamasına neden olmuştur. Zamanla, suyun çeşitli kanallar aracılığıyla yerleşim birimlerine taşınması, tarımsal üretimde sürdürülebilirliği artırmıştır (Muşmal, 2015, s.12). Osmanlı Devleti'nde geniş ve verimli topraklar bulunmasına karşın, tarımsal faaliyetler bu alanların sınırlı bir kısmında gerçekleştiriliyordu. Buna rağmen, devletin ekonomisi büyük ölçüde geçimlik üretime dayalı tarımsal faaliyetlere bağlıydı (Güran, 1998, s. 67). Osmanlı Devleti'nin son dönemlerinde nüfusun yaklaşık %80'inin tarımla uğraşıyor olması, tarımsal alanlarda sulama sorununun çözümünü hayati bir mesele haline getirmekteydi (Muşmal, 2022, s. 10).

Karasal iklimin hüküm sürdüğü Konya Ovası'nda yıllık ortalama yağış miktarının yetersiz olması, tarımsal verimliliği sınırlamakta ve zaman zaman kuraklıkların yaşanmasına neden olmaktaydı (Altan, 1940, s. 131). Bu durumun sonucu olarak da Konya Ovası, su kaynaklarına duyduğu ihtiyaç nedeniyle tarih boyunca sulama projelerinin odağında olmuştur. Bölgenin tarımsal üretimini maksimize etmek amacıyla sulu tarım çalışmalarına ilk olarak 1819 yılında başlanmış, özellikle Sultan II. Abdülhamid döneminde proje çeşitli aşamalarda ele alınmış ve kanal açma gibi somut adımlar atılmıştır (Yılmaz, 2010, s. 5). Bu süreç, tarihsel olarak insanlığın su kaynaklarını yönetme ve tarımsal verimi artırma çabasının bir parçası olarak değerlendirilmektedir.



Avlonyalı Ferit Paşa, Konya valiliği görevini yürüttüğü dönemde bölgenin imarı adına çeşitli çalışmalar gerçekleştirmiştir (Tahsin Paşa, 1931, s. 66). 1898 yılında Konya valiliğine atanan Ferit Paşa, görevine başladıktan sonraki ilk yaz mevsiminde yaşanan kuraklık ve çiftçilerin karşılaştığı zorluklara tanık olmuş, bu durumun olumsuz etkilerini gidermek amacıyla çeşitli girişimlerde bulunmuştur (Kırmızı, 2014, s. 104). Konya valiliği sonrasında II. Abdülhamid zamanında Sadrazamlığa atanan Ferit Paşa, İstanbul'da da konu ile ilgisini sürdürmüş ve Konya Ovası Sulaması Projesi'nin ihalesini gerçekleştirmiştir

(Bildirici, 1994, s. 108-109; Turan, 1942, s. 54). Konya ovasını sulama projelerinin en kapsamlısı olan ve 1907 yılında ihale edilen bu proje (Yarıcı, 2010, s. 260), 1913 yılında tamamlanmıştır (Atam, 2020, s. 459). Proje, Türkiye'nin ilk modern ve o devirde dünyanın en önde gelen sulama projelerinden biridir (Yılmaz, 2010, s. 5). Proje kapsamında Beyşehir gölünden alınan su; üç ana isale hattı, buna bağlı kanallar ve taksim merkezleri (regülatörler) ile 217 kilometre uzaklıktaki Konya Ovası'na ulaştırılmıştır (Bildirici, 1994, s. 108; Yılmaz, 2010, s. 6).

Konya Ovası Sulaması inşaatı tüm fizibilite çalışmaları tamamlandıktan sonra ihaleye çıkarılmış ve % 4 tenzilatla Anadolu Osmanlı Demiryolu Şirketi'ne 19 Milyon 500 bin Frank, yani 850 bin Osmanlı altını keşif bedeli ile verilmiştir (Yılmaz, 2010, s. 5-6). Sözleşme 10 Kasım 1907 tarihinde İstanbul'da imzalanmıştır. Projenin yapımını üstlenen "Anadolu Osmanlı Demiryolu Şirketi" esasen Türkiye'de demir yolları inşa etmek amacı ile Alman ve İstanbul'daki iş adamları ortaklığında 1889 yılında kurulmuş bir şirkettir. Şirket hem yazışmalarda ve hem de projelerde Fransızca dil kullanmıştır (Mutlu, 2024, s. 571) (Şekil 10). Şirketin Fransızca olan ismi de "Societe du Chemin de Fer Ottoman d'Anatolie"dir (Bildirici, 1994, s. 112).

Sulama kanalları ve sanat yapıları da dahil olmak üzere bütün projeler müteahhit firma tarafından hazırlanmış ve Osmanlı Hükümeti'nce onanmıştır. Projelerde kullanılan dil Fransızcadır. Müteahhit firma iş sonunda bütün projelerin aydınger ve ozalitlerini, çalışma konumuz olan İrva ve İska idaresi yönetim binasının arşivine bırakmıştır (Bildirici, 1994, s. 126). Osmanlının bir kurumu olan Konya Ovası İrva ve İska İdaresi, çalışma sahası ve yapılarıyla beraber Cumhuriyet döneminde kurulan Devlet Su İşleri (DSİ) Çumra Şube Müdürlüğü'ne devredilmiştir (URL 1).

Şekil 1. Yerleşkede bulunan tarihi binaların alandaki konumları[3]

[3] Çalışma içerisinde kaynak gösterilmeyen tüm çizim ve fotoğraflar yazara ait olup, tamamı yapının 2024 yılındaki durumunu belgelemektedir.

DSİ Çumra İşletme Şefliği yerleşkesi içinde projenin idari merkezi olarak kullanılan bu merkez binasının dışında, bir adet başmühendis lojmanı, üç adet mühendis lojmanı ve bir adet de atölye binası olmak üzere altı farklı yapı yer almaktadır (Şekil 1). 3 adet mühendis lojmanı, aynı plan tipinde inşa edilmiştir. Günümüzde tescil edilerek koruma altına alınmış bulunan yapıların bazı kaynaklarda 1901 yılında inşa edildiği bilgisi bulunsa da (Karpuz, 2009, s. 1595; Durdu, 2011a, s. 376), çalışmamız esnasında bu tarihi veren herhangi bir bilgi ya da belgeye rastlanmamıştır. Bununla beraber, inşaatın yer tesliminin 1 Temmuz 1908 tarihinde, kesin kabulünün de 1913 yılı aralık ayında yapıldığı göz önüne alındığında (Mutlu, 2014, s. 456) en azından yerleşkedeki çalışmaların merkezi olan idari binanın bu tarihten daha önce, 20. yüzyılın başlarında yapılmış olduğu kesindir.

Şekil 2. İrva ve İska Projesinin idare ve lojmanlarının eski fotoğrafları

İdare binası
Kaynak: URL 2

İdare binası ve lojmanlar
Kaynak: DSİ Çumra Şube Müdürlüğü Arşivi

Yapıların bulunduğu alan, güncel tapu kayıtlarına göre, Baraj mahallesi, 241 ada ve 1 nolu parsel üzerinde yer almaktadır. Yerleşke, günümüzde 47.770 m²'lik bir alan üzerindedir. Çumra'nın 1926 yılında ilçe statüsüne kavuştuğu düşünüldüğünde (Durdu, 2011b, s. 363) bu yapıların hemen hemen çeyrek yüzyıl öncesinde inşa edilmiş olduğu anlaşılmaktadır. Yerleşkenin ilk fotoğraflarından anlaşıldığı kadarıyla alanda önce idare ve atölye binaları, daha sonra ise lojmanlar inşa edilmiştir (Şekil 2).

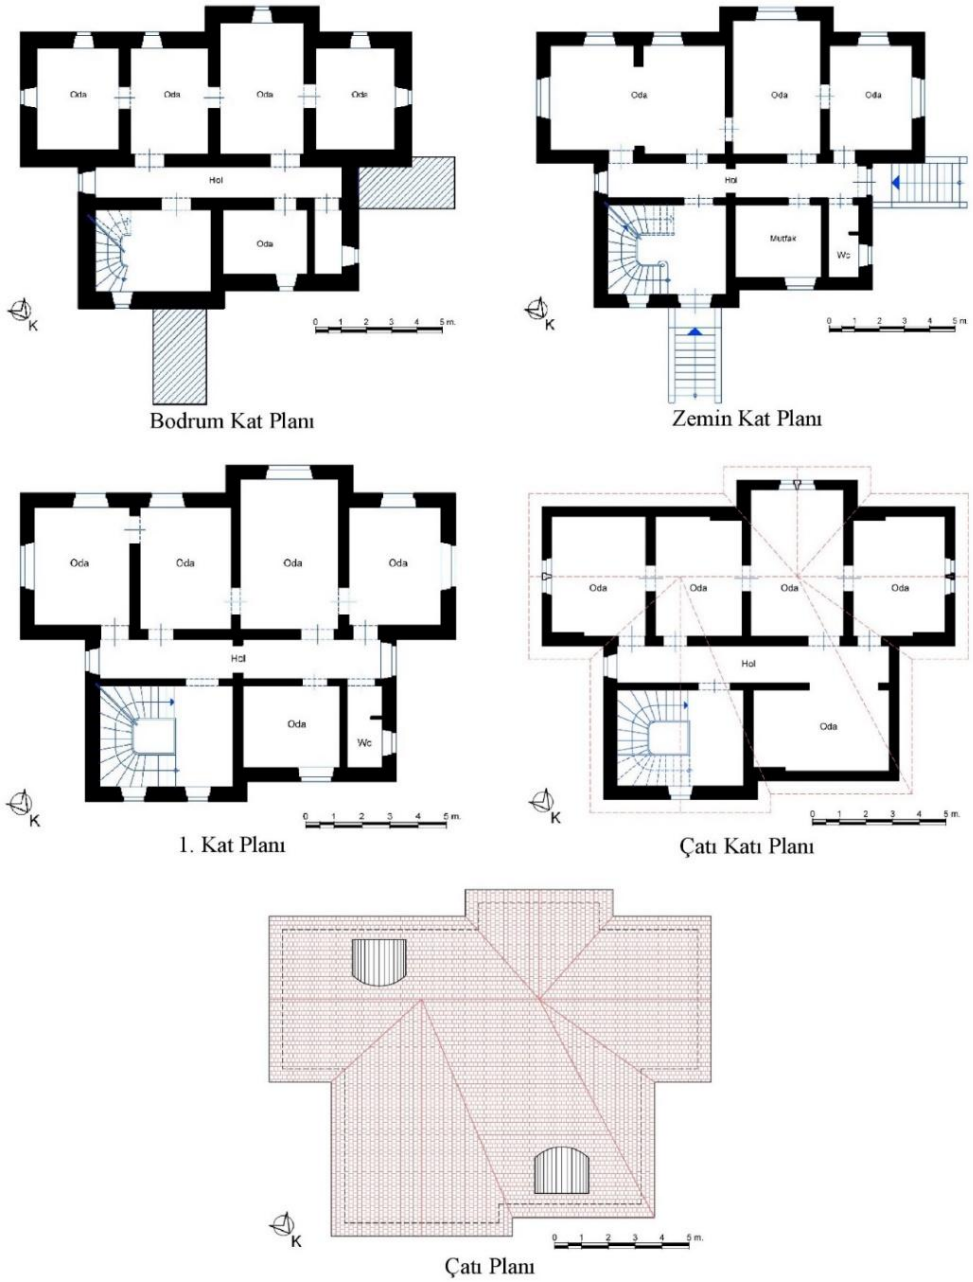
Tüm sulama projesinin maliyeti 19.500.000 frank olarak hesaplanmışken, bu bütçeden ne kadarlık kısmının İrva ve İska İdaresi yerleşkesinde bulunan yapılara ayrıldığı net olarak belli değildir. Başbakanlık Osmanlı Arşivi'nde kayıtlı 12 Şevval 1325 (18 Kasım 1907) tarihli ve İ.TNF. 17/35 sayılı belgenin 15. sayfasında proje bütçesinin harcamasınının öngörüldüğü iş kalemleri sıralanmıştır (Muşmal, 2022, s. 67). Burada ilgili yapıların maliyeti ile ilgili doğrudan bilgi bulunmazken, "Memur ve müstahdemlerin ikametine mahsus binalar" işine ait ayrılan 150.000 franklık bütçe dikkati çekmektedir.

2. YERLEŞKE ALANINDAKİ TARİHİ YAPILAR

2.1. İdari Bina

Konya Ovası İrva ve İska Projesi idari binası, günümüze ulaşak eski fotoğraflardan anlaşıldığı kadarıyla merkez çalışmaları kapsamında inşa edilen yapıların ilk ve en erken

inşa edilen binasıdır (URL 2). İdari bina, yerleşke içindeki tarihi yapılar arasında kuzeybatı tarafa konumlandırılmıştır (Şekil 1). Kullanılan çatı arasıyla beraber üç katlı olarak inşa edilen binada bodrum katta bulunmaktadır. Yapının kademelerle hareketlendirilen cepheleri, kullanılan çatı arasını kapatan örtü ile birlikte yapıyı dinamik bir görüntüye dönüştürmüştür. Kat yükseklikleri her katta değişkenlik göstermektedir. Bodrum katta 2,20 m olan yükseklik, zemin katta 3,30 m, 1. katta ise 3,50 m olarak alınmıştır. Bu değişkenliğe bağlı olarak üç kollu çeyrek döner merdivenle çözülen düşey sirkülasyonda merdiven ölçülerinde her katta değişiklikler söz konusudur. Çatı katı kullanım amaçlı planlandığı için eğim %120 gibi oldukça fazla tutulmuş ve bu şekilde alt katlarda kullanılan tüm hacimlerin çatı katında da aynı şekilde kullanılabilir olmasına olanak sağlanmıştır (Şekil 3).



İdari binanın zemin katına hem kuzeydoğu, hem de kuzeybatı cephesinden giriş sağlanmaktadır. Her iki merdiven de +2,00 m kotundaki zemin kat döşemesine ulaşmakta olup, kuzeybatıdaki merdivenle doğrudan koridora ulaşılırken, kuzeydoğudaki merdiven ise merdiven evine açılarak buradan bir kapı ile aynı koridora bağlanmaktadır (Şekil 3). Yığma sistem kurallarına göre inşa edilen yapıda bodrum katta dış duvarlar 60-80 cm arasında değişen kalınlıklarda, iç duvarlar ise yaklaşık 50 cm kalınlığında inşa edilmiştir. Zemin katta dış duvar kalınlıkları 60-70 cm'ye iç duvarlar ise 40 cm'ye düşürülmüştür. 1. katta ise dış duvarlar genellikle zemin kat ile aynı tutulurken iç duvar kalınlıkları 20-40 cm arasında değişen ölçülerde inşa edilmiştir. Çatı katı planında da 1. kat ile benzer kalınlıklarda duvarlar kullanılmıştır. Yapının doğu köşesine yerleştirilen üç kollu çeyrek döner merdiven, binadaki düşey sirkülasyonu sağlamaktadır.

İki farklı şekilde ulaşılabilen, güneydoğu-kuzeybatı doğrultusundaki holün kuzeydoğu ucunda binaya girişin sağlandığı kapılarından birisi yer alırken, güneybatı ucuna bir mazgal pencere yapılmak suretiyle holün aydınlatma sorunu çözülmüştür. Yaklaşık 13,35 m uzunluğa sahip hol, ortaya yakın bir kısımda dişler yapılarak iki bölümlü hale getirilmiştir (Şekil 3).

Zemin kat holünün güneybatı tarafında dört adet bağımsız oda bulunmaktadır. Odaların her biri koridora açıldığı gibi, aynı zamanda iç duvarlara açılan kapılarla birbirleriyle de irtibatlı hale getirilmiştir. Bu odalardan güneydoğu tarafta bulunan iki tanesi, aradaki taşıyıcı duvar büyük oranda boşaltılarak tek mekâna dönüştürülmüştür. Hem bitişiğindeki oda da güneybatı tarafa yaklaşık 50 cm taşırılmak suretiyle genişletilmiştir. Köşedeki odalar her iki yöne, aradaki odalar ise güneybatı yönlerine açılan birer adet mazgal pencere ile aydınlatılmaktadır (Şekil 3).

Holün kuzeydoğu tarafında, merdiven evi dahil üç mekân yer almaktadır. Merdiven evi, buraya açılan kapının güneydoğu tarafına açılmış bir mazgal pencere ile aydınlatılmaktadır (Şekil 5). Merdivenin bitişiğinde bulunan ortadaki oda günümüzde mutfak olarak kullanılmaktadır. Kuzeybatı taraftaki, yaklaşık 120 cm genişliğindeki mekân ise içten iki bölüme ayrılarak tuvalet ve lavabo olarak düzenlenmiştir. Bu bölüm kuzeybatı yönüne açılmış bir mazgal pencere ile, mutfak ise kuzeydoğu yönüne açılmış bulunan bir adet mazgal pencere ile aydınlatılmaktadır (Şekil 3).

Şekil 3. İdare binasının planları

Yapıdaki bu mekân düzenlemesi, bodrum ve çatı katı da dahil olmak üzere her katta çok küçük değişikliklerle tekrar edilmektedir. 20 adet rıhtla ulaşılan 1. katın merdiven evinde,

alt kata giriş kapısının izdüşümüne üst katta pencere yapılmak suretiyle pencere sayısı ikiye çıkartılmıştır. Aynı şekilde alt katta doğrudan koridora ulaşılan kuzeybatı tarafındaki kapının olduğu bölüm de bu katta pencere olarak düzenlenerek koridorun her iki taraftan da ışık alması sağlanmıştır (Şekil 3).

Duvar kalınlığının değişmesine bağlı olarak farklılık gösteren küçük ölçü değişikliklerinin haricinde bu kattaki göze çarpan önemli farklardan birisi, güneybatı taraftaki dört adet odanın birbirleriyle irtibatlandırılmalarının alt kata göre farklılık göstermesidir. Alt katta aradaki duvarın büyük bir açıklık olarak boşaltılmasıyla tek mekân haline getirilmeye çalışılan iki oda, bu katta tamamen ayrılmış ve birbirlerine bir kapı ile bağlanmıştır. Holün kuzeydoğu tarafında bulunan mekânlarda da zemin kattaki düzenleme aynen korunmuştur. Tüm mekânların ışıklandırılmasında da zemin katta kullanılan pencereler aynen tekrar ettirilmiştir (Şekil 3).

İdare binasının çatı katında da alt kattaki düzenleme büyük oranda benzerdir. Bu katta hol yine güneydoğu tarafta bulunan mazgal pencere ile aydınlatılmışken, alt katta, holün kuzeybatı ucunda kullanılan pencere çatı katında kullanılmamıştır. Yine bu kata çıkan merdiven evinin ışıklandırılmasında, altta kullanılan iki adet pencere yerine, bu iki pencerenin ortasına gelen tek pencere tercih edilmiştir (Şekil 3).

Çatı katında holün güneybatı tarafına dizilen mekânlarda da konum ve büyüklük olarak çok büyük farklar gözlanmazken çatı sisteminden kaynaklı zorunluluklar sebebiyle bu mekânların aydınlatmalarında teknik ve ustalık gerektiren çözümlemelere gidilmiştir. Bu katta çatının eğimli yüzeylerinin izdüşümünde bulunan mekânların dış duvarları yaklaşık 1 m yükseltilmek suretiyle çatı arasında çatı eğimi dolayısıyla sınırlanan yüksekliğin önüne geçilmeye çalışılmıştır. Alt katta her iki yönden pencereler açılmak suretiyle aydınlatılan köşe mekânlar, bu katta çatı eğimi sebebiyle tek cepheden ışık almak durumunda kalmıştır. Bu sebeple güneydoğu ve kuzeybatı yöndeki odalar, duvar izdüşümünde alın duvarları olarak düzenlenerek hem çatı kırma-beşik çatı kombinasyonuna dönüşmüş ve hem de çatı alanında kullanılabilecek alan artırılmıştır. Bu duvarlar üzerine daha dar çiftli pencereler yerleştirilmek suretiyle cephe görünümlerinde estetik düzenlemeye gidilmiştir. Aynı çözüm, bu yöndeki dışa taşırılan büyük odada da uygulanmıştır. Çatı eğiminden dolayı ışık alabileceği tek yön olan güneybatı yönü kullanım dışı kalmış olan güneydoğu yönündeki ikinci odanın ışık sorunu ise, çatı üzerine, izdüşüme yapılan bir kuş evi aydınlatması ile çözülmüştür (Şekil 3-4).

Holün kuzeydoğu tarafında, merdiven evinin dışındaki iki mekân bu katta birleştirilerek geniş bir odaya dönüştürülmüştür. Merdiven evinin, kuzeydoğu cephesinde kalkanduvar kullanılmak suretiyle çatı arası yüksekliği sorunu çözülmüş ve bu kısım tek pencere ile aydınlatılma yoluna gidilmiştir. Kuzey köşede bulunan, birleştirilerek genişletilen odanın ışık sorunu çatı eğimi sebebiyle cephede çözümlenemediği için burada da kuş evi sistemi kullanılmak suretiyle ışık sorunu çatıdan çözülmüştür (Şekil 3).

Zemin kattan 12 rıhtla ulaşılan bodrum katta üst katlara benzer şekilde, bir hol ile birbirine bağlanan altı adet birimden meydana gelmektedir. Güneydoğu-kuzeybatı doğrultusundaki

hol, güneybatı tarafına açılmış bir mazgal pencere ile aydınlatılmaktadır. Holün güneybatı yönüne sıralanmış dört birim içten birbirleriyle kapılarla irtibatlandırılmışken, sadece ortadaki iki mekânın holden bağımsız girişi bulunmaktadır. Birbirlerine yakın genişliklerdeki bu odalardan kuzeybatıdaki bağımsız girişli oda yaklaşık 50 cm dışarıya doğru genişletilmiştir. Bu kanatta köşelerdeki odalar her iki cepheye açılan pencerelerle aydınlatılırken, aradaki odalar ise güneybatı yöne açılmış birer pencereyle aydınlatılmaktadır. Kullanılan pencerelerin tamamı mazgal pencere şeklindedir (Şekil 3). Holün kuzeydoğu tarafında, merdiven haricinde iki adet bağımsız bölüm bulunmaktadır. Kuzeybatı tarafta bulunan küçük mekân yaklaşık 110 cm genişliğinde olup, yığma yapı inşa ilkeleri gereğince üst katlarda ıslak hacim olarak kullanılan birimlerin taşıyıcı fonksiyonlarını üstlenmek üzere ölçülendirilmiştir. Bu mekân kuzeybatı tarafına açılmış bulunan mazgal pencere ile aydınlatılmaktadır. Bu birim ile merdiven arasında bulunan oda da diğer odalarla benzer ölçülerdedir. Bu oda da kuzeydoğu tarafında bulunan mazgal pencere ile aydınlatılmaktadır (Şekil 3).

Şekil 4. İdare binasının cephe görünüşleri

Kuzeyden Görünüş

Kuzeydoğu (Giriş) Cephesi

Güneyden Görünüş

Güneydoğu Cephesi

İdari binanın genelinde cepheyi etkileyen pencere düzenlemesi ve çatının yapı üzerindeki etkisi tüm cephelerde hissedilmektedir. Yapının kat izdüşümleri cepheyi çevreleyecek biçimde profilli silmelerle tüm cepheyi çevreleyecek biçimde vurgulanmıştır. Yapının subasman seviyesini sınırlayan silmenin alt kısmı farklı ölçülerdeki altıgen kabayonu

taşlarla, köşe kısımlar ise bosajlı (suyolu açılmış) prizmatik kesme taşların bir miktar dışarı taşırılarak vurgulanması ile örülmüştür. Köşe taşlarında, pencere denizlik, söve ve kemerlerinde andezit, diğer kısımlarda ise kireçtaşı kullanılmak suretiyle bu seviyede bir kontrast meydana getirilmiştir (Şekil 3-4). Bodrum kat pencereleri hem genişlik ve hem de yükseklik olarak üst kat pencerelerinden daha küçük tutulmuştur.

Bodrum kat pencerelerinin denizlik kısmı, yekpare andezit taşından yapılmıştır. Her iki taraftaki söveler ise iki parçadan meydana gelmektedir. Söveler, alt kısımdaki parça sade görünümde iken, üst bölümde söve ile kemer geçişini sağlayan kısımda basık kemere üzengi noktası oluşturacak biçim ve ölçüde şekillendirilmiştir. 3 parçadan meydana gelen basık kemer, ortada alt ve üste taşırılarak vurgulanmış kilit taşının her iki tarafındaki bir çift kemer taşı ile oluşturulmuştur (Şekil 5).

Şekil 5. İdare Binası merdiven ve cepheden detaylar

Merdiven

Bodrum kat penceresinden detay

Zemin kat penceresinden detay

Binanın subasman üzeri, her kat ve cephede benzer teknikte yapılmıştır. Pencere üstleri, katları sınırlayan profillerle birleşerek sonlanmaktadır. Hafif basık kemer formuyla yapılan üst kısım, dışa taşırılmış ve ölçü olarak vurgulanmış kilit ve üzengi taşlarının arasına yerleştirilen profilli birer kemer taşıyla geçilmiştir. Söveler yekpare görünümde iken, parapetin kısmı ise alt kısmı profillendirilmiştir. Pencerenin parapet altında kalan kısmı da yine pencere ile aynı renk olarak alt kısımdaki kat silmesi ile birleşmektedir.

Yapının özgün tasarımında girişlerin üzerinde saçak bulunmamaktadır. Ancak günümüzde ana giriş kapısı olarak kullanılan kuzeydoğu girişinin üzrinde muhdes saçak yer almaktadır. Yapıldığı süreç içerisinde uzun yıllar Konya Ovası İrva ve İska İdaresinin idari binası olarak hizmet vermiş bulunan bina, günümüzde Devlet Su İşleri 4. Bölge Konya Ovası Sulaması (KOS) Şube Müdürlüğü tarafından kamuya ve personele açık misafirhane olarak kullanılmaktadır.

2.2. Başmühendis Lojmanı

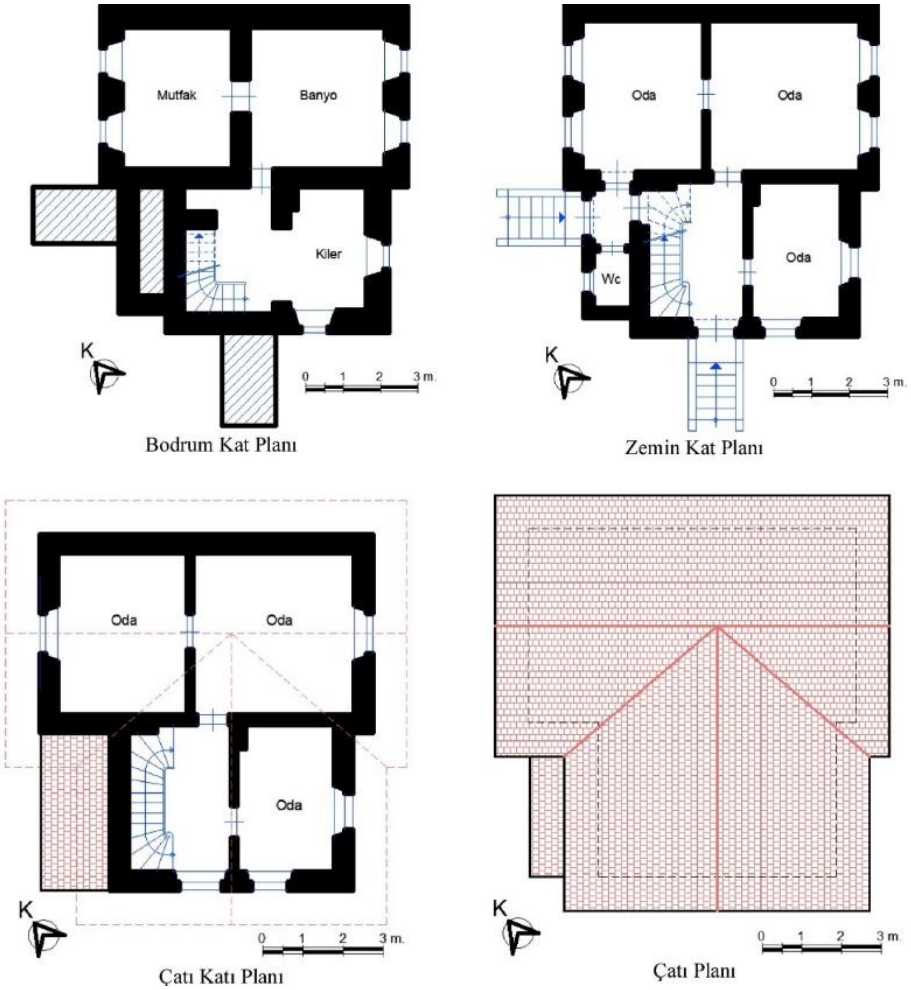
Yerleşkedeki tarihi yapı grubundan güneydoğu tarafta bulunan yapı başmühendis lojmanı olarak projelendirilmiştir (Şekil 1). Alandaki tarihi yapı gruplarından, mühendis lojmanlarıyla birlikte en geç inşa edilen yapılardandır. Yerleşkenin erken tarihli fotoğrafında (URL 2) idari bina ve atölye binası görünmekteyken ne başmühendis ne de

mühendis lojmanları görünmemektedir. Bu durum, Atölye binasının özgün projesinin üzerinde bulunan 1912 tarihi ile birlikte değerlendirildiğinde (Şekil 10), lojmanların 1912 yılından sonraki dönemde inşa edilmiş olduğunu göstermektedir.

Yapı, bodrum, zemin ve çatı katı olmak üzere üç kattan meydana gelmektedir. Konutun esas kullanım katı olan zemin kata kuzeybatı ve güneybatı cephelerinde bulunan iki ayrı merdivenden ulaşılabilmektedir. Bununla beraber konutun esas girişi, güneybatı cephede bulunan giriştir (Şekil 6).

Altı adet rıhttan meydana gelen merdiven aracılığıyla ulaşılan güneybatı girişi, tek kollu ve iki tarafı çeyrek döner olarak düşünülmüş merdivenin bulunduğu merdiven evine açılmaktadır. Burada bulunan üç adet kapıdan güneydoğu ve kuzeydoğudaki kapılar iki ayrı odaya açılmaktadır. Güneydoğudaki oda, yaklaşık olarak 3,65 x 2,40 m ölçülerindedir. Odanın güneydoğu ve güneybatı duvarlarına açılmış olan iki adet pencere bulunmaktadır. Kuzeydoğudaki oda ise yaklaşık 4,00 x 4,00 m ölçülerinde, kare planlı bir mekândır. Bu odayı aydınlatan iki adet mazgal pencere, güneydoğu duvarında yer almaktadır. Yapının kuzeydoğu cephesi tamamen sağır bırakılmıştır.

Zemin katın kuzey köşesinde bulunan odası daha müstakil bir işlev üstlenecek özellikte işlevlendirilmiştir. Bu oda bir taraftan bitişiğindeki oda ile arasında bulunan bir kapı ile irtibatlı hale getirilmişken, öte yandan dışarıdan da bağımsız bir şekilde ulaşılabilecek özellikte planlanmıştır. Merdiven evinde bulunan üçüncü kapı, merdivenin altından yaklaşık 1,00 x 1,50 m ölçülerindeki bir hole açılmaktadır. Aynı zamanda yapının kuzeybatı tarafında bulunan merdiven ile bağımsız olarak da ulaşılabilen bu holün kuzeydoğu tarafında, yaklaşık 3,20 x 4,00 m ölçülerindeki odaya geçilebilmektedir. Odanın kuzeybatı duvarında iki adet mazgal pencere yer almaktadır. Holün güneybatı tarafında ise wc bulunmaktadır. WC'nin kuzeybatı duvarına açılmış bir pencere ile havalandırılması sağlanmıştır (Şekil 6). Konutun bu bölümünü oluşturan ve bir hol ile bağımsız olarak dışarıya bağlantısı bulunan oda ve ıslak hacim, bu bölümün konut içinde ofis olarak da kullanılmaya uygun tasarlandığını göstermektedir.



Zemin kat merdiveni ile yapının üst katını meydana getiren çatı katına ulaşılmaktadır. Üst katta, çatı arasının rahat bir şekilde kullanılabilmesi için eğim yönündeki dış duvarlar yaklaşık 1,0 m yükseltilmiştir. Çatı, kırma-beşik çatı kombinasyonu ile tasarlanarak, çatı arasındaki mekânların çatı eğiminden mümkün olduğunca az etkilenmesi sağlanmıştır (Şekil 6).

Çatı katında, güneydoğuda bulunan oda alt kattaki oda ile hem ölçü ve hem de pencereler bakımından aynıdır. Alt kattaki hol ve ıslak hacim, tek kat olarak planlanmış olduğu için bu katta bu mekânların üzeri, çatı olarak yapılmıştır[4]. Bu sebeple alt katta bağımsız girişi

[4] Yapının özgün halinde böyle iken, bu kısım sonraki düzenlemelerde üst katta da ıslak hacim olarak düzenlenmiştir. Bu düzenlemenin sonradan yapıldığı, zemin ve çatı katını ayıran silmenin burada devam etmemiş olması, buraya açılan pencerelerin niteliğinin yapının diğer pencereleri ile uyumsuzluğu ve çatı düzenlemesinde görülen zorlama çözümlemeden de açıkça anlaşılmaktadır (Şekil 7). Çalışmamızda, yapının özgün niteliği dikkate alınmış, yapının özgününde bulunmayan bu kısımlar değerlendirilmeye alınmamıştır.

de bulunan kuzeydeki odaya ulaşım sorunu, doğu köşedeki oda ile aralarına açılan bir kapı ile çözülmüştür. Kuzeybatı ve güneydoğu yönden oda cephesini oluşturan kalkan duvarların yüksekliği dolayısıyla her iki odanın da dışarıya bakan cephelerine açılan birer pencere ile odalardaki ışık sorunu çözülmüştür.

Şekil 6. Başmühendis lojmanı planları

Zemin katta bulunan merdiven yardımıyla yapının bodrum katına ulaşılmaktadır. Yığma yapı inşa kuralları gereği bodrum katta iç duvarlarda kalınlık 50 cm olarak alınmıştır. Bodrum katta ıslak hacimlerin izdüşümünde bulunan kısım dolgu olarak geçilmiştir. Güney köşede bulunan oda, bodrum katta günümüzde kiler olarak değerlendirilmiştir. Kuzeydoğu yönde bulunan iki odanın ise günümüzde bir tanesi mutfak olarak kullanılmaktayken diğer oda ise yıkanma yeri (banyo) olarak değerlendirilmektedir (Şekil 6).

Başmühendis lojmanının cephe özellikleri, alandaki diğer tarihi yapılarla örtüşecek niteliktedir. İdari binada olduğu gibi başmühendis lojmanında da subasman kotuna kadar olan bölüm altıgen kabayonu taşlarla, köşe kısımlar ise bosajlı (suyolu açılmış) prizmatik kesme taşların bir miktar dışarı taşırılarak vurgulanması ile örülmüştür. Köşe taşları ve pencere denizlik, söve ve kemerleri bordo renge boyanmıştır. Pencerelerde kullanılan teknik ve biçim de idari bina pencereleriyle aynı şekildedir. Bodrum ve zemin katı ayıran hatta herhangi bir kat silmesi kullanılmamışken, zemin kat ile çatı katını ayıran kat hizası basit profilli bir silme ile vurgulanmıştır (Şekil 7).

Yapının her iki girişinde de özgün saçak bulunmamaktadır. Ancak günümüzde güneybatı giriş niteliksiz bir camekân ile kapatılmış, kuzeybatı giriş ise üzeri saçaklı ve yine niteliksiz ahşap bölme ile rüzgârlık olarak düzenlenmiştir. Geniş saçaklı çatının üzeri marsilya tipi kiremit ile kaplıdır. Yapı günümüzde Devlet Su İşleri 4. Bölge Konya Ovası Sulaması (KOS) Şube Müdürlüğü tarafından yapıldığı dönemdeki tahsis durumunda olduğu gibi başmühendis lojmanı olarak kullanılmaya devam etmektedir.

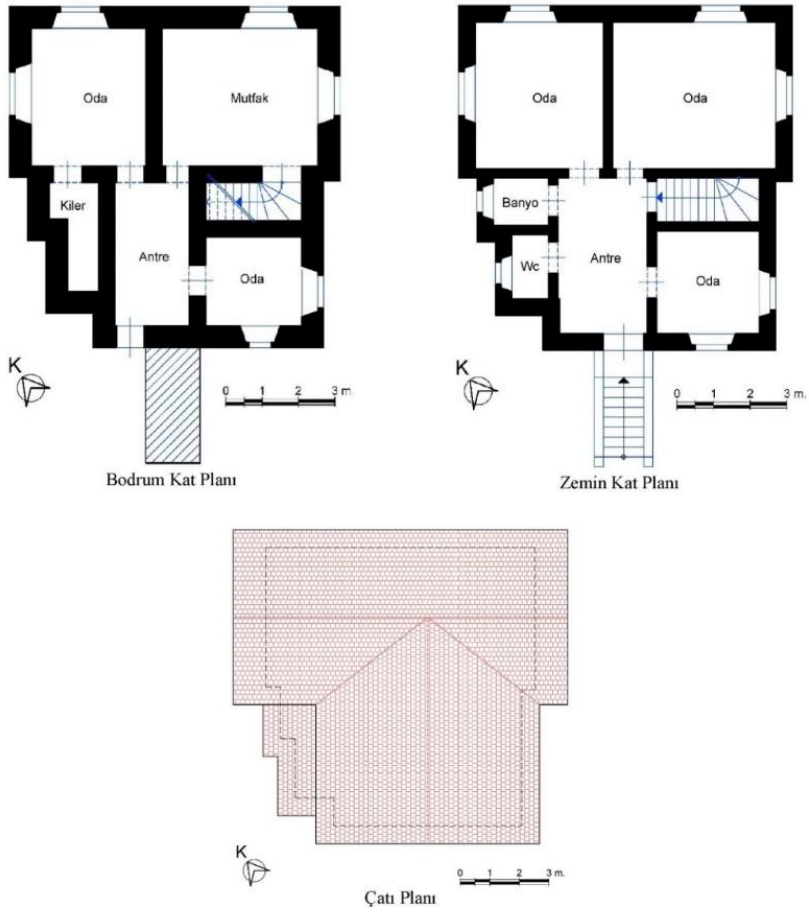
Şekil 7. Başmühendis lojmanı cephe görünüşleri

Batıdan görünüş

Doğudan görünüş

Güneybatı cephesi

Kuzeydoğu cephesi



2.3. Mühendis Lojmanları

Yerleşkede idari bina ile başmühendis lojmanının arasına inşa edilmiş üç adet mühendis lojmanı bulunmaktadır (Şekil 1). Mühendis lojmanları, başmühendis lojmanı ile birlikte 1912 yılından sonraki dönemde inşa edilmiş olması kuvvetle muhtemeldir.

Her üçüde aynı plan tipine sahip mühendis lojmanları, diğer yapılar gibi günümüzde hizmet vermeye devam etmektedir. Mühendis lojmanlarının da esas kullanım alanları zemin ve bodrum katlarıdır. Bu yapılarda çatı araları kullanım alanı olarak değerlendirilmemiştir.

Yapılara giriş, güneybatı cepheden sağlanmaktadır. Bu cephede bulunan dokuz rıhtlı bir merdivenle zemin kata ulaşılırken, yine aynı cephede bulunan alçak bir kapı ile yapının bodrum katına bağımsız giriş yapılabilmektedir. Ayrıca, bodrum katta, doğu köşede bulunan ve mutfak olarak kullanılan mekânda bulunan bir iç merdiven ile zemin kat ile bodrum katın birbiriyle bağlantısı sağlanmıştır (Şekil 8).

Şekil 8. Mühendis lojmanları planları

Güneybatıda bulunan merdivenle ulaşılan kapı, antreye açılmaktadır. Antrenin güneydoğu tarafında 2,80 x 2,80 m ölçülerinde, kare planlı bir oda yer almaktadır. Odanın güneybatı ve güneydoğu duvarlarından dışarıya açılan pencereler, mazgal pencere olarak düzenlenmiştir. Bu odanın hemen bitişiğinde bulunan bir merdiven, zemin kat ile bodrum katın irtibatını sağlamaktadır. Antrenin kuzeybatı tarafında ise ıslak hacimler yer almaktadır. Bu bölümde giriş kapısı tarafına wc konumlandırılmışken, hemen yanında ise banyo yer almaktadır (Şekil 8). Yapının kuzeydoğu tarafında, kapıları doğrudan antreye açılan iki adet oda yer almaktadır. Bu odalardan güneydoğu tarafta bulunanı yaklaşık 4,00 x 4,50 m ölçülerindedir. Odayı, güneydoğu ve kuzeydoğu duvarlarına açılmış bulunan iki adet mazgal pencere aydınlatmaktadır. Kuzey köşedeki oda ise bu odaya göre daha küçük olup, yaklaşık 3,50 x 4,0 m ölçülerindedir. Bu oda da kuzeydoğu ve kuzeybatı duvarlarına açılmış iki adet mazgal pencere yardımıyla aydınlatılmıştır (Şekil 8).

Binanın bodrum katına güneydoğu taraftaki iki odanın arasında bulunan merdivenin yanı sıra, güneybatı cephede bulunan bağımsız kapı ile doğrudan da ulaşılabilmektedir. Antreye açılan üç kapı, üç ayrı bağımsız bölüme ulaşmayı sağlamaktadır. Bodrum katta bulunan duvarların tamamı 50 cm kalınlığa sahiptir. Güney köşedeki oda, üst katta olduğu gibi güneydoğu ve güneybatı duvarlarına açılmış bulunan mazgal pencerelerle aydınlatılmaktadır. Antrenin kuzeydoğu tarafında yanyana bulunan iki kapıdan da iki ayrı odaya ulaşılmaktadır. Bunlardan kuzey köşede yer alan odanın içinden üst katta bulunan ıslak hacimlerin izdüşümünde bulunan mekân bağlantılı hale getirilmiş ve bu küçük mekân kiler, depo vs. olarak kullanılacak biçimde değerlendirilmiştir. Bu odanın aydınlatması, üst kattaki izdüşümünde bulunan odada olduğu gibi kuzeydoğu ve kuzeybatı duvarlarına açılmış mazgal pencerelerle sağlanmıştır. Bodrum katın doğu köşesinde bulunan oda, mutfak olarak kullanılmaktadır. Hem bu katta ve hem de üst katta yapının en geniş odası olarak dikkati çeken bu mekân, üst katın izdüşümüne yerleştirilmiş, kuzeydoğu ve güneydoğu duvarlarına yerleştirilmiş mazgal pencerelerle aydınlatılmaktadır. Bu mekânın güneybatı tarafında bulunan bir kapı ile ulaşılan merdivenle bu katın zemin katla bağlantısı sağlanmıştır (Şekil 8-9).

Mühendis lojmanları, cephe düzenlemesi olarak yerleşkede bulunan diğer binalarla tam bir uyum içindedir. Bu yapılar gerek idari bina ve gerekse başmühendis lojmanı ile benzer özellikler göstermesinin yanı sıra bazı önemli farklar da bulundurmaktadır. Mühendis lojmanlarının subasman seviyesine kadar olan bölümü, idari bina ve başmühendis lojmanı ile aynı tarzda, altıgen kesme taşlarla; köşe kısımlar ise bosajlı (suyolu açılmış) prizmatik kesme taşların bir miktar dışarı taşırılarak vurgulanması ile örülmüştür. Köşe taşları ve pencere denizlik, söve ve kemerleri bordo renge boyanmıştır (Şekil 10).

Mühendis lojmanlarının bodrum kat pencereleri, idari bina ve başmühendis lojmanının bodrum kat pencereleriyle aynı teknikte yapılmıştır. Ancak üst kat pencerelerinde tamamen farklı bir teknik kullanılmıştır. Üst katta (zemin katta) pencereler yine basık kemerli olarak yapılmışken, bu üç grup yapıda kemer, taş malzeme yerine tuğladan yapılmıştır. Bodrum ve zemin katı ayıran kat silmesi mevcutken, tek katlı yapıda üst kotta kat silmesi bulunmaması sebebiyle üst kottaki kat silmesi uyumunu ortaya koyabilmek için

pencerelerin üst kısımlarına yakın bir bölümlerinden tüm cepheyi çevreleyecek şekilde iki sıra tuğladan örülen bir silme, tüm yapıyı dolanarak yapıya hareketlilik kazandırmaktadır.

Şekil 9. Mühendis lojmanlarının iç mekânından görünümler

Mutfaktan 1. kata çıkış merdiveni

Şekil 10. Mühendis lojmanları cephe görünüşleri

Güneyden görünüş

Güneydoğu cephe

Kuzeyden görünüş

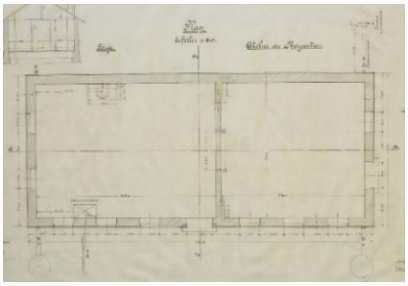
Doğudan görünüş

Yapıların çatılarında üçgen alınlıkla sonlanan cephelerde saçak mesafesi uzun tutularak bu bölümde yapılan uygulama ile cephelere hareketlilik kazandırılmıştır. Mühendis lojmanlarının cephelerinin en dikkat çeken yanı, o dönemde Osmanlı mimarisinde pek

rastlanmayan çıkıntılı saçakları ve alın süslemeleridir. Bu amaçla her iki tarafta saçak seviyesinde çiftli eliböğründe şeklindeki ahşap konsol elemanları tarafından desteklenen çıkmanın üst ve her iki yanda bulunan alt köşeleri ızgara şeklinde kapatılmıştır. Orta kısım ise eliptik bir ahşap parça ile sınırlandırılarak estetik bir görünüm elde edilmiştir. Bu uygulamanın yapıldığı her cephede bu düzenlemenin orta kısmında, çatı arasını aydınlatmak amacıyla elips formlu pencereler kullanılmıştır.

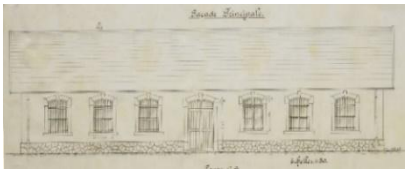
Mühendis lojmanları günümüzde Devlet Su İşleri 4. Bölge Konya Ovası Sulaması (KOS) Şube Müdürlüğü tarafından personel lojmanı olarak kullanılmaktadır.

2.4. Atölye Binası



Yerleşkede, kuzeydoğu tarafta bulunan tek katlı ve uzunca yapı, atölye binası olarak inşa edilmiştir (Şekil 1). Yapının niteliği ve inşa amacı hakkında farklı söylemler bulunsa da günümüzde işletmenin arşivinde bulunan özgün projesine göre (Şekil 10) bu yapının atölye binası olarak projelendirilmiş olduğu kesindir. Yerleşkenin eski fotoğraflarında da görüldüğü üzere, alanda ilk inşa edilen iki yapıdan (ilki idari binadır) birisi bu atölye binasıdır (Şekil 2).

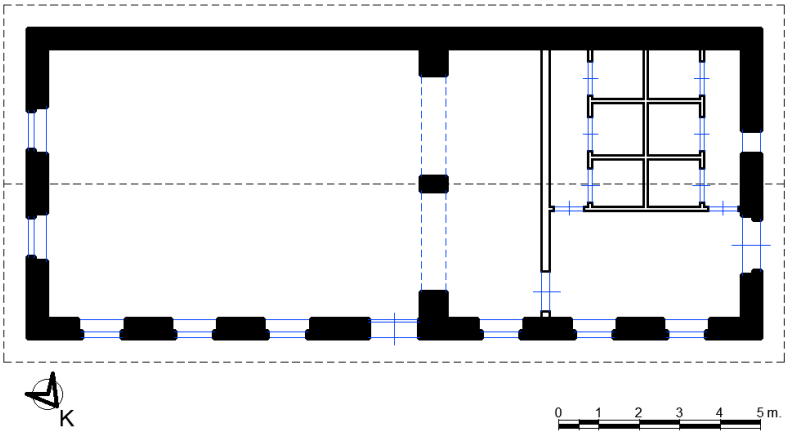
Yapı, dıştan dışa yaklaşık olarak 18,15 x 7,65 m ölçülerindedir. Yapının duvarları 45 cm kalınlığındadır. Yapı günümüzde tek yapı durumundadır. Ancak özgün planında birbiriyle irtibatı bulunmayan iki ayrı bağımsız bölüme sahip bir yapı olarak düzenlendiği görülmektedir. Özgün projesine göre kuzeybatı kanatta yer alan mekâna güneybatı duvarında bulunan; güneydoğu kanatta yer alan mekâna da güneydoğu cephede bulunan bir kapı ile girilmektedir (Şekil 10).



Şekil 10. 1912 tarihli orijinal projeden kapak sayfası, plan ve cephe görünüşü

Orijinal projenin kapağı

Orijinal projenin kat planı



Orijinal projenin cephe görünüşü

Kaynak: DSİ Çumra Şube Müdürlüğü Arşivi

Günümüzdeki durumunda, aradaki duvarın kaldırılmasıyla tek birime dönüştürülmüştür (Şekil 11). Yapının örtü sisteminde de zaman içinde önemli değişiklikler yapıldığı anlaşılmaktadır. Orijinal projesine göre yapıda tavan döşemesi bulunmayıp doğrudan beşik çatı ile örtülmüş durumdayken, mevcut durumunda ise tavanın betonarme döşemeyle geçildiği ve üzerine de sarkan saçaklı beşik çatı yapıldığı görülmektedir. İç bölümde yapılan düzenlemeler ve kapı ve pencerelerde orijinal projeye göre yapılmış olan köklü değişiklikler, yapının muhtemelen asıl işlevini tamamladıktan sonra, ihtiyaçlar doğrultusunda yeniden düzenlemeden geçirildiğini göstermektedir.

Yapının her iki bağımsız bölümü de içteki duvarın kaldırılmasıyla birleştirildikten sonra bina, iki girişe sahip bir yapı haline gelmiştir. Bu girişlerden ilki güneybatı cephesindedir. Bu cephede orta kısımda bulunan kapının her iki tarafına simetrik vaziyette üçer adet pencere yerleştirilmiştir. Yapının kuzeydoğu cephesi tamamen sağır bırakılmışken, kuzeybatı cephesinde alt bölümde iki adet standart pencerenin yanısıra, üst bölümde beşik çatının kalkan duvarına açılmış daha küçük ölçekli bir pencere daha bulunmaktadır (11-13).

Şekil 11. Atölye binasının mevcut planı

Kuzeydoğu ve kuzeybatı cephelerinde bulunan pencereler parapet, söve ve kemer olarak değerlendirildiğinde, orjinalinde daha büyük ölçüdeyken, mevcutta pencere boşluklarının alt bölümleri belli bir yüksekliğe kadar örülmek suretiyle üst bölümde iki kanatlı küçük ölçüde bir pencere olarak yeniden düzenlendiği anlaşılmaktadır (Şekil 12).

Yapının güneydoğu cephesinin üst bölümünde de kuzeybatı cephesindekiyle benzer biçimde bir tepe penceresi bulunmaktadır. Alt kısımda ise kuzeydoğu tarafta, kapı yüksekliğinde, içi duvar örülerek kapatılmış lento ve söve ile sınırlandırılmış kısım, buranın da bir zamanlar kapı olarak kullanıldığını göstermektedir. Bu kapının, atölyeye malzeme giriş çıkışına elverişli ölçüde düşünüldüğü anlaşılmaktadır (Şekil 13).

Şekil 12. Atölye binası iç mekân ve cepheden görünümler

Saçak

Pencerelerden detay

Atölye iç mekânı görünümü

Günümüzde yapıya girişler bu cepheden sağlanmaktadır. Bu kısımda yapılmış olan muhdes camekânlı bölme ile rüzgârlık oluşturulmuş ve buradaki kapı ile binaya giriş sağlanmıştır. Özgün planında bu kısım, 130 cm genişliğinde bir kapı olarak tasarlandığı görülürken, yapının kapı ve pencerelerinde görülen lento ve söve vurgularının bu kısımda bulunmaması, kapının özgün niteliğinin değiştirilmiş olma ihtimalini güçlendirmektedir (Şekil 10-13).

Şekil 13. Atölye binası cephe görünümleri

Kuzeydoğu cephe

Kuzeybatı cephe

Kuzeyden görünüş

Güneyden görünüş

Atölye binasının kuzeybatı mekânı, orinal projesinde 9,30 m uzunluğa sahipken günümüzde betonarme bir kirişle ayrılmış olan kısmın uzunluğu 9,50 m'dir. Buradan da yapının her iki bölümünü ayıran duvarın kaldırılarak, betonarme tavan inşa edildiği dönem, bu bölümün kiriş olarak geçildiği anlaşılmaktadır. Kiriş, ortada kısmında betonarme bir kolonla desteklenmiştir. Yeni düzenlemede bina, güneydoğu tarafından yaklaşık 4,80 m uzaklıkta bir duvar ile bölünerek bu kısma wc ve duşlardan müteşekkil ıslak hacimler oluşturulmuştur.

Çatısı marsilya tipi kiremitle kaplanmış olan yapı, günümüzde spor salonu olarak değerlendirilmektedir.

3. Değerlendirme ve Sonuç

Osmanlı İmparatorluğu'nun son döneminde gerçekleştirilen en büyük ve en önemli projelerden biri olan Konya Ovası İrva ve İska Projesi, dönemin teknolojik ve ekonomik olanakları çerçevesinde kapsamlı bir altyapı yatırımı olarak değerlendirilmektedir. Bu proje, özellikle tarımsal verimliliği artırmak amacıyla sulama sistemlerinin inşa edilmesini hedeflemiştir. Bununla birlikte, projenin etkin bir şekilde yürütülebilmesi için yalnızca sulama sistemleriyle sınırlı kalınmamış, idari ve teknik personelin koordinasyonunu sağlayacak idare binaları, lojmanlar ve atölyeler gibi destekleyici yapılar da projeye entegre edilerek inşa edilmiştir. Bu yapılar, yalnızca projenin başarılı bir şekilde yürütülmesine katkı sağlamakla kalmamış, aynı zamanda bölgedeki tarımsal ve ekonomik faaliyetlerin sürekliliğini temin eden idari merkezler olarak da fonksiyon görmüştür.

Günümüzde hala kullanımda olan bu yapılar, tarihsel ve kültürel miras açısından önemli birer belge niteliğindedir. Konya Ovası İrva ve İska Projesi, yalnızca sulama altyapısının modernizasyonuna katkı sunmakla kalmamış, aynı zamanda bölgenin sosyo-ekonomik gelişimine de önemli katkılar sağlamış ve Osmanlı tarım politikalarının somut bir örneği olarak tarih sahnesindeki yerini almıştır.

Osmanlı İmparatorluğu'nun tarımsal altyapıyı modernize etme amacıyla hayata geçirdiği bu projeye ait yapıların tamamı Almanlar tarafından inşa edilmiştir. Çalışmamıza konu olan yerleşkedeki yapılar, neo-klasik ve "heimatstil" olarak bilinen Alman yerel mimari tarzının bir kombinasyonu ile inşa edilmiştir. Dolayısıyla, bu yapılar ilçenin en eski yapılarından biri olmanın yanı sıra, 19. yüzyıl geleneksel Alman konut mimarisinin bölgedeki temsilcileridir (Bozkurt, 2012, s. 365).

Konya özelinde değerlendirilen bu yapılar, Anadolu'nun farklı bölgelerinde de benzer örneklerle temsil edilmektedir. Bağdat ve Hicaz Demiryolu projeleri kapsamında Osmanlı-Alman iş birliği sonucu, Alman mühendis ve işçileri için inşa edilen lojmanlar, Konya'daki yapılarla benzerlik göstermektedir. Bauhaus öncesi mimari anlayışın etkisiyle kırma çatılar, tuğla-taş kombinasyonlu cepheler ve ahşap detaylar bu yapıların ortak mimari unsurları arasında yer almaktadır. 1892-1920 yılları arasında inşa edilen Ankara Garı lojmanları (Sunay, 2020, s. 741-763), Eskişehir İstasyonu lojmanları (tuğla cepheli ve

yüksek tavanlı), Uşak (Gürsoy, 2016), Adana ve Mersin (Akpolat, 2004, s. 77-93) lojman yapıları, bu mimari ekolün Anadolu'daki önemli temsilcileridir.

Konya Ovası İrva ve İska İdaresi yerleşkesinde yer alan Mühendis Lojmanları, Konya il merkezinde aynı dönemde Almanlar tarafından inşa edilen Konya İstasyon yerleşkesi lojmanları (No: 37 ve No: 40) ile benzer mimari unsurlar taşımaktadır. 20. yüzyılın ilk çeyreğine tarihlenen bu yapılar, birebir aynı planlama anlayışını takip etmese de cephe düzenlemeleri açısından çarpıcı benzerlikler göstermektedir. Özellikle ahşap payandalarla taşınan saçakların tepe noktasında kemerle sonlandığı detaylar, Konya Envanteri'nde (2010, s. 561) ve diğer akademik kaynaklarda belirtilmiştir (Erdoğan, 2005, s. 132-137).

Bu yapılar, inşa edildikleri tarihten günümuze kadar kesintisiz hizmet vermeye devam etmektedir. Ancak, günümüzdeki değişen konfor standartlarına uyum sağlamakta güçlük çekmektedirler. Yapılarda zamanla kapı ve pencere doğrultusunda niteliksiz müdahaleler gerçekleşmiş, özellikle ıslak hacimlerde belirgin değişiklikler meydana gelmiştir. Buna ek olarak, binaların girişlerine eklenen rüzgârlıklar ve saçaklar, orijinal mimari dokuyu bozarak yapıların estetik bütünlüğünü olumsuz etkilemektedir. Bununla birlikte, yapıların 100 yıldan uzun süre boyunca korunarak günümüze ulaşabilmesi, büyük ölçüdé resmi kurumlar tarafından kullanılmasına bağlanabilir. Ancak, bu yapıların ihtiyaç duyduğu restorasyon çalışmaları için finansal kaynak bulma konusundaki sorunlar, sürecin en büyük engellerinden biri olarak karşımıza çıkmaktadır.

Araştırma ve Yayın Etiği Beyanı

Makalenin tüm süreçlerinde Manisa Celal Bayar Üniversitesi Sosyal Bilimler Enstitüsü Dergisi'nin araştırma ve yayın etiği ilkelerine uygun olarak hareket edilmiştir.

Anahtar Kelimeler:

Tarihi çevre, doğal çevre, koruma, mimari sürdürülebilirlik, malzeme iyileştirmeleri

ÖZ

Tarihi yapılar günümüz şartlarına uyum sağlayabilmeleri ve varlıklarını sürdürebilmeleri adına çeşitli müdahalelere ihtiyaç duyabilmektedir. Bu süreçte yapılarda tespit edilen sorunların yenilikçi bir çerçevede ele alınarak tarihi dokuya ve çevreye zarar vermeden giderilmesi gerekir. Bu çalışmada yıllar içerisinde tarihi yapılarda görülen aksaklıklar ve ihtiyaçlar ele alınarak bunların yapı malzemesi ölçeğinde giderilmesine yönelik çözüm önerileri sunulmuştur. Çalışmanın metodolojisine göre, nem sorunu, enerji performansı, termal konfor, çevresel etkiler ve iç mekân hava kalitesi olarak belirlenen beş farklı kategoride son on yılda literatüre kazandırılmış olan çalışmalar incelenmiştir. Bu çalışma, yeni malzeme ve teknoloji kullanımının tarihi çevre kadar doğal çevreye olan etkilerinin de incelenmesi açısından bilinçlendirici bir yaklaşıma sahiptir.

ABSTRACT

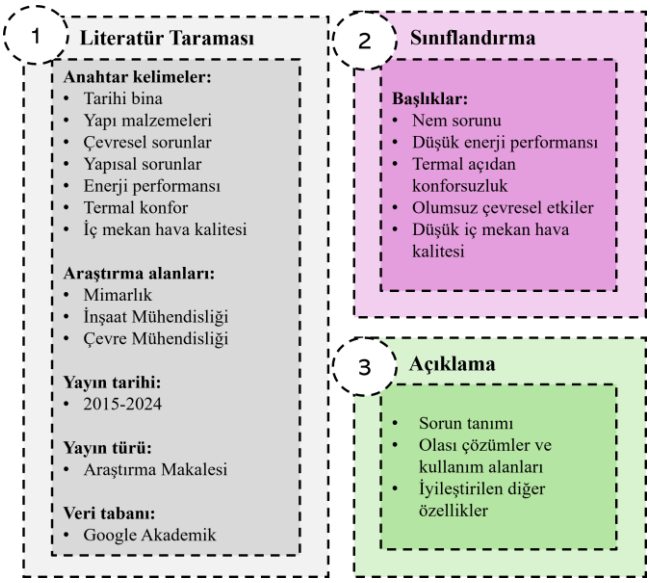
Historic buildings may need various interventions to adapt to changing conditions and maintain their existence. The problems identified in the buildings should be addressed in an innovative framework and should be eliminated without harming the historical texture and the environment. In this study, the problems and needs of historical buildings over the years are discussed and solutions are proposed to eliminate them on the scale of building materials. Recent studies in five different categories, namely humidity and dampness, energy performance, thermal comfort, environmental impacts, and indoor air quality, were examined. This study has an awareness-raising approach in terms of examining the effects of the use of new materials on the natural environment as well as the historical environment.

Giriş

İnşa edildiği döneme ait fiziksel özelliklerini bütüncül bir şekilde barındıran ve toplumsal, görsel veya tarihi açıdan bir değere sahip yapılar, tarihi bina kategorisinde değerlendirilmektedir [1]. Ayrıca kültürel mirasa ait olan bir yapının 100 yıl boyunca yıkılmadan ayakta kalması ona 'tarihi yapı' unvanı kazandırır [2]. Ancak bu kadar uzun süre tarihe tanıklık eden yapılarda yıllar içerisinde değişen çevresel koşullar, kullanıcı hataları veya yapı malzemelerinin ömrünü tüketmesi nedeniyle çeşitli deformasyonlar görülmeye başlar. Bu tür sorunların üstesinden gelinmesinde yeni malzeme ve tekniklerden faydalanılması, yapıların ömrünü uzatarak tarihi yapıların sürdürülebilirliğe katkı sunabilmektedir [3].

Tarihi yapıların koruma işlerinin yapının bütünlüğünü bozmayacak şekilde gerçekleştirilmesi gerekir. Ancak koruma işlemleri doğal kaynakların kullanıldığı, atık malzemelerin ortaya çıktığı, maliyetli ve özen gerektiren bir süreçtir. Bu sürecin doğal ve yapılı çevreye en az etki edecek şekilde yürütülmesi elzemdir. Tarihi binaların restorasyonunda kullanılan malzemeler, yapı ile uyumu, rengi, dokusu, işlevi ve özellikleri açısından dikkatle seçilmelidir [4].

Yöntem



Kültürel mirasın korunmasına yönelik alınması gereken önlemlerin gözler önüne serilmesi, güncel malzeme teknolojilerinin tartışılması ve tarihi yapıların korunması ile ilgilenen yetkililerin bilinçlendirilmesi çalışmanın temel amaçlarındandır.

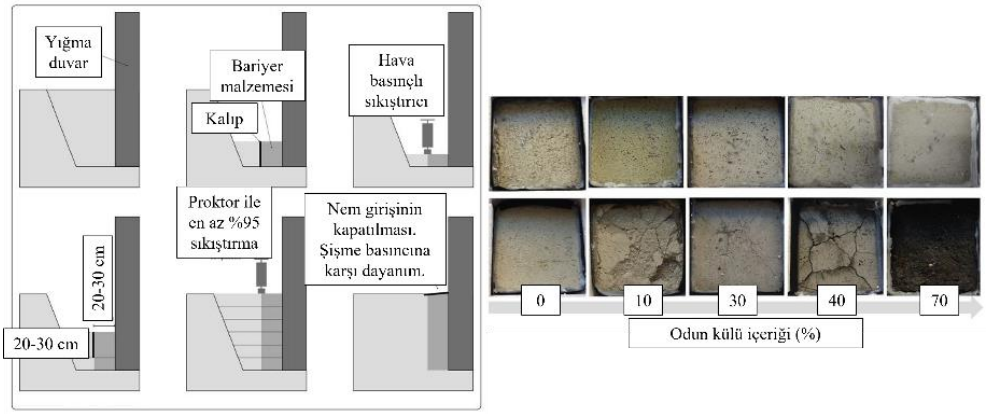
Bu çalışmada tarihi yapılarda sıkça görülen çeşitli sorunları ele alan ve son on yılda yayınlanmış olan çalışmalar incelenmiştir. Seçilen çalışmaların yapı malzemesi ölçeğinde bir yenilik sunmasına da ayrıca özen gösterilmiştir. Tarihi yapılardaki problemler nem sorunu, düşük enerji performansı, termal açıdan konforsuzluk, olumsuz çevresel etkiler ve düşük iç mekan hava kalitesi olmak üzere beş ana başlık altında toplanmıştır.

Her bir başlık altında açıklanan tarihi yapı sorunu; (1) ilgili sorunun tanımlanması, (2) olası çözümlerin ve yapıda kullanım alanlarının verildiği bir görsel ve (3) yapıda iyileştirilen diğer özelliklerin açıklamasını içeren bir tablo ile desteklenmiştir (Şekil 1).

Bulgular

Beş ana başlık altında incelenen çalışmalarda, nem sorunu için odun külü katkısı ve kil bariyeri; düşük enerji performansının artırılmasına yönelik olarak soğuk renk malzeme ve membran kullanımı; termal konforsuzluğun giderilebilmesi için termal kütle, faz değiştiren malzeme (FDM) ve çeşitli gölgelendirme elemanları; çevresel etkilerin düşürülmesinde atık malzemeden yararlanılması ve atık yönetimi; iç mekan hava kalitesinin iyileştirilmesinde ise yeşil yapı malzemelerinin kullanımına değinilmiştir.

Şekil 1. Çalışmanın metodolojisi.



Nem sorunu

Yapı malzemelerinde yıllar içerisinde meydana gelen hasar, topraktan gelen neme karşı yapıyı savunmasız hale getirebilir. Nem, yapı strüktürüne ve kaplamalara zarar vererek bina kabuğunda gerçekleşen ısı alışverişini artırır ve bu durum binanın enerji tüketiminin de artmasına neden olur. Ayrıca kullanıcılarda konforsuzluk hissine de yol açan iç mekanlardaki yüksek nem artışı, küf oluşumuna ve bina kullanıcılarında çeşitli sağlık problemlerinin gelişmesine neden olabilmektedir [5].

Tarihi yapılardaki nem artışı, yapının taşıyıcı sisteminin zarar görmemesi adına üstesinden gelinmesi gereken ciddi bir sorundur. Bu aşamada düşük maliyetli, tarihi dokuda en az etkiye neden olacak nem bariyerlerinden faydalanılabilir. Piyasada düşük hidrolik iletkenliğe sahip olarak satılan bentonit kil-kum karışımı ve buzul tortusu içeren farklı bariyerler tarihi bir bina kapsamında değerlendirilmiş ve test edilen toprak numunelerinin zeminden nem girişi ve buna bağlı gerçekleşen hasarı önlemede etkili olabileceği görülmüştür. Bahsi geçen kil karışımları birçok koruma projesinde uygulanmış ve laboratuvarda test edilmiştir [6].

Neme maruz kalmış tarihi binalardan nemin uzaklaştırılmasında kireç harcının içine katılan odun külü de etkili olabilmektedir [7]. Yapılan deneysel bir çalışmada kireç harcına %20 ila %40 oranında katılan odun külünün harç üzerinde puzolanik aktivite göstererek kılcal doygunlukta odun külü içermeyen harçlara göre daha fazla suyu emdikleri ortaya çıkmıştır (Tablo 1). Bunun nedeninin harç içeriğindeki gözenek sayısının artması olduğu bilinmektedir. Kullanılan biyokütle özelliğindeki odun külü, nemli ortamlarda bulunan yığma duvarların derzlerinin onarılmasında, belirtilen ideal oranlarda olmak kaydıyla, kullanılabilir. Bu oranların üzerine çıkılması durumunda ise kuruma aşamasında harçta büzülmeler gözlemlenmiştir [7].

Tablo 1. Nem sorunu ve olası çözümler

Sorunlar	Nemin bina strüktürüne zarar vermesi, dayanımı düşürmesi, kullanıcı konforsuzluğuna neden olması ve yalıtımı zedelemesi sonucunda binanın enerji tüketiminde artışa neden olması.
Olası çözümler ve yapıda kullanım alanları	Yığma duvarların toprakla temas eden yüzeyinde kil bariyerlerinin [6] ve kireç harcında odun külünün kullanımı [7].  Yukarıdaki görsellerde yığma duvara uygulanan kil bariyerin inşa edilme aşamaları (solda) ve farklı oranlarda odun külü içeren kireç harcındaki bozunmalar (sağda) gösterilmektedir.
İyileştirilen özellikler	Tarihi dokuya minimum müdahale, malzeme gözeneklerinin kapatılarak nem girişinin ve hasarın önüne geçilmesi.

Düşük Enerji Performansı

Tarihi yapıların enerji tüketimlerinin azaltılmasında genellikle içten uygulanan yalıtım katmanı ve bunun yeterli gelmemesi durumunda aktif olarak enerji tüketen cihazlarla iyileştirmelere gidilir. Yakın zamanda bu yöntemlere ek olarak etkin şekilde enerji verimliliği sağlayacak yenilikçi çözüm ve malzemelerin arayışına girişilmiştir.

Bu çalışmalardan biri İtalya'da gerçekleştirilen soğuk renkli cephe malzemelerinin kullanımıdır. Ilık veya sıcak iklimlere sahip bölgelerde termal konforun sağlanması ve soğutma yükünün düşürülmesi adına genellikle açık renkli elemanlar tercih edilmektedir. Ancak tarihi çevrelere hâkim olan renkler gri veya kırmızı tonlarındadır. Bu durum dikkate alınarak seçilen tarihi bir yapı üzerinden yürütülen çalışmada, enerji performansının iyileştirilmesi adına tarihi binaların dış görünüşüne etki etmeden yenilikçi, soğuk renkli, çimento bazlı malzeme kullanımı önerilmiştir. Laboratuvarda elde edilen çıktılar, dinamik simulasyonlarda vaka çalışması ölçeğinde kullanılmıştır. Harçlara renk pigmentleri eklenerek oluşturulan bu yeni cephelerin yüzey sıcaklıkları geleneksel cephelerle kıyaslandığında 8°C düşüş ve soğutmadan kaynaklı enerji tüketiminde %3 oranında azalma sağlandığı görülmüştür [8].

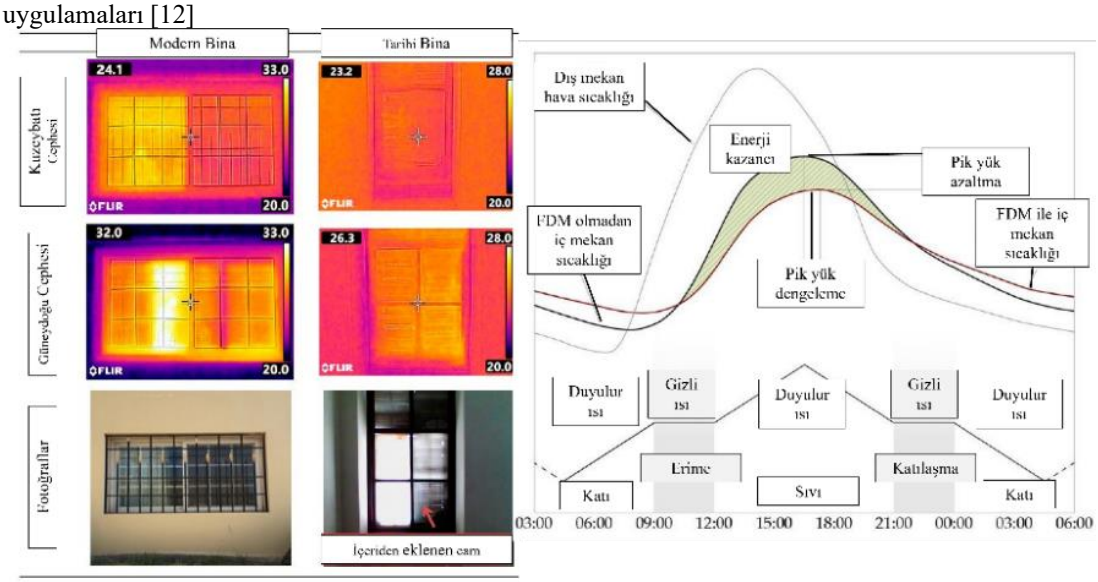
Gerilebilir membranlar, maliyet etkin ve sürdürülebilir bir şekilde binaların strüktürel performanslarını iyileştirmek için yaygın olarak tarihi binalarda uygulanmaktadır. Ancak bu tür membranların iç mekân konforuna ve enerji tüketimine olan etkilerini ortaya koymak önemlidir. Bu amaçla İtalya'da yer alan ve orta avluya sahip tarihi bir yapının orta avlusunun plastik bir polimer türü olan ETFE ile kaplanmasının binanın enerji performansına olan etkisi araştırılmıştır (Tablo 2). Enerji simülasyonlarının sonucunda, uygulanan membran sayesinde özellikle kış aylarında en yüksek enerji kazanımının sağlandığı görülmüştür. Yıllık karbon salımlarında sıcak aylarda %6, soğuk aylarda %10 düşüş gözlemlenmiştir [9].

Tablo 2. Enerji performansının iyileştirilmesine yönelik olası çözümler

Sorunlar	Enerji performansında düşüş, iklim değişikliği, geleneksel iyileştirme hamlelerinin yetersiz olması.
Olası çözümler ve yapıda kullanım alanları	Yapı kabuğunda soğuk renkli malzemeler [8] ve avlu üzerinde ETFE membran kullanımı [9].  Yukarıdaki görsellerde soğuk renk pigmenti eklenen harç karışımı (solda) ve tarihi bina avlusuna gerilen üst örtünün detayları (sağda) gösterilmektedir.

İyileştirilen özellikler	Termal konfor, enerji performansı, maliyet etkinliği, strüktürel performans, çevresel etkiler.

Termal Konfor Eksikliği



Küresel çapta gerçekleşen iklim değişikliği tarihi yapıların iç mekân sıcaklıkları ve dolayısıyla kullanıcıların termal konforu üzerinde olumsuz etkilere neden olabilmektedir. Bu nedenle mevcut binalar daha fazla aktif sistemlere bağlı kalmakta ve yeni binalara göre bu tür yapıların enerji tüketimleri artış göstermektedir. Neticede daha fazla karbon salımı gerçekleşmekte ve küresel ısınma artış göstererek iklim değişiklikleri de bundan payına düşeni almaktadır. Bu kısır döngüden çıkabilmek adına termal konforun sağlanması, konunun kilit noktasını teşkil etmektedir [10].

Termal konforun sağlanmasında aktif sistemlerin büyük rol üstlendikleri ve kullanımları süresince harcanan enerjinin tarihi binaların mevcut enerji tüketiminden daha az olduğu bilinse de [10], aktif sistemlerden önce pasif tasarım ilkeleri bağlamında malzemelerin sağladıkları avantajların irdelenmesi mimari sürdürülebilirliğin sağlanması açısından esastır.

Bu pasif ilkelerden biri olan termal kütlelerin kullanımının ısıl konforun sağlanmasında etkili olduğu bilinmektedir. Saha araştırmasına dayalı bir çalışmada doğru yönelim, cam seçimi, gölgelendirme elemanları ve havalandırma ile bu etkinin daha da güçlendirilebildiği görülmüştür. Özellikle sıcak iklimlerde konfor şartlarının sağlanmasında cam türü seçiminin termal kütleden daha etkili olduğu bilinmektedir. Tüm bu bahsi geçen yapı malzemelerinin ekstrem hava koşullarında ve gerekli görüldüğü durumda aktif sistemlerle desteklenmesi, ısıl konfor ve enerji performansı açısından etkili olacaktır [11].

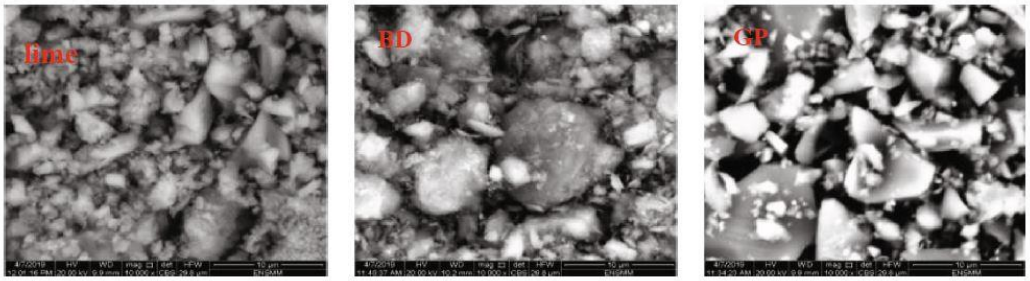
Diğer yandan tarihi binaların çoğunluğunda halihazırda termal kütle kullanıldığı bilinmektedir. Ancak termal kütlenin yeterli olmadığı durumlarda restorasyon aşamasında faz değiştiren malzeme (FDM) içeren harçların kullanımı, binaların termal ataletini iyileştirebilir ve bu müdahale aynı zamanda tarihi binanın dış görünüşüne etki etmez (Tablo 3). Kireç harcına granül parafin FDM'nin eklendiği deneysel ve sayısal simülasyonlara dayalı bir çalışmada, ağırlıkça %10 FDM harcı içeren numunenin referans numuneye göre enerji kullanımında %9-18 düşüş ve malzemenin termal iletkenliğinde %22,5 azalma sağladığı gözlemlenmiştir [12].

Tablo 3. Termal konforun iyileştirilmesine yönelik olası çözümler

Sorunlar	Termal konforsuzluk ve buna dayalı enerji tüketiminde gerçekleşen artış, küresel ısınma, karbon salımlarındaki artış.
Olası çözümler ve yapıda kullanım alanları	Yapı kabuğunda termal kütle kullanımı, uygun cam seçimi, gölgelendirme elemanları [11] ve FDM uygulamaları [12]  Yukarıdaki görsellerde 2020 yılı ilkbahar sezonunda saat 10:00-14:00 aralığında elde edilen tarihi ve modern binalara ait termal kamera görüntüleri (solda) ve FDM kullanımından kaynaklanan enerji kazanımı (sağda) gösterilmektedir.
İyileştirilen özellikler	Termal konfor, enerji performansı, maliyet etkinliği, aktif sistemlere olan bağımlılığın azaltılması, çevresel etkiler.

Olumsuz Çevresel Etkiler

Tarihi yapıların korunmasında kullanılan her yeni malzeme yeni ham madde ihtiyacını da beraberinde getirerek çevre



üzerinde bir yük oluşturur. Bunun çözümlerinden biri de atık malzeme kullanımına yönelmektir. Bu sayede yapı malzemelerinin mekanik ve fiziksel özelliklerinin geliştirilebilmesinin yanı sıra çevresel etkilerinin düşürülebilmesi de mümkün olabilmektedir.

Kuzey Cezayir'de gerçekleştirilen ve vaka çalışmasına dayalı olarak laboratuvarda gerçekleştirilen deneysel bir çalışmada kireç harçlarına eklenen %30 oranındaki seramik atığı ve cam şişelerden elde edilen cam tozu sayesinde puzolanik aktivitenin görüldüğü ve özellikle basınç dayanımında artış sağlandığı tespit edilmiştir. Sınanan numuneler arasında %30 oranında cam tozu içeren harçta, en düşük açık gözenekliliğe sahip olması nedeniyle suya karşı en yüksek direncin sağlandığı görülmüştür (Tablo 4). İyileştirilen özelliklerin yanı sıra ham madde ihtiyacının kullanılan atık oranınca düşürülmesi çevresel açıdan kayda değerdir [13].

Meksika'da saha araştırması ve sayısal hesaplamalara dayalı bir çalışmada atık yönetiminin önemine değinilmiştir. Koruma projelerinde inşaat atıklarının geri dönüştürülecek, yeniden kullanılacak ve atık sahasına gönderilecek yapı malzemeleri şeklinde tasniflenmesinin Toolkit gibi araçlarla basitleştirilebildiği ortaya çıktı. Bu yaklaşım kaynak verimliliğinin sağlanması yoluyla çevresel etkileri düşürebildiği gibi restorasyon maliyetlerinin azaltılmasında da önemli katkılar sağlanmıştır [14].

Ayrıca tarihi binaların kullanım aşamasında gösterdiği çevresel etkilerin yüksek olduğu düşünüldüğünde, uyarlanabilir yeniden kullanım süresinde yenilikçi ve enerji performansı yüksek yapı malzemelerinin kullanımı çevresel etkilerin düşürülmesinde etkili olabilmektedir [15]. Ancak yapı malzemelerinin üretim aşamalarında harcanan gömülü etki ile kullanım aşamasındaki operasyonel etkilerin birlikte ele alınması bütüncül bir yaklaşım için daha uygundur [16].

Tablo 4. Çevresel etkilerin azaltılmasına yönelik olası çözümler

Sorunlar	Artan karbon salımı ve ham madde ihtiyacı.
Olası çözümler ve yapıda kullanım alanları	Harçlarda atık taş, cam ve tuğla tozu kullanımı [13] ve yapı malzemelerinin tasniflenmesi yöntemiyle atık yönetimi [14]  Yukarıdaki görselde harçlara ait SEM (Taramalı Elektron Mikroskobu) görüntüleri yer almaktadır.
İyileştirilen özellikler	Malzemelerin fiziksel ve mekanik özelliklerinin iyileştirilmesi, çevresel etkilerin düşürülmesi.

Düşük İç Mekan Hava Kalitesi

Tarihi binalarda kullanılan yeni malzemeler, açığa çıkardıkları uçucu organik bileşikler nedeniyle iç mekanlarda çeşitli sağlık sorunlarını da beraberinde getirebilir. Bu nedenle tercih edilen yeni malzemelerin formaldehit gibi kansere yol açan madde içeriklerinin önceden tespit edilmesi, kullanıcı sağlığı açısından son derece önemlidir. İç mekân hava kalitesinin düşük olduğu ortamlarda hasta bina sendromu görülebilmektedir. Bu sendrom, alerji, astım, öksürük, yorgunluk, baş ağrısı, göz ve burunda tahriş gibi rahatsızlarla kendini belli etmektedir [17, 18].

Yeşil yapı malzemelerinin kullanımı ile iç mekanlarda istenen hava kalitesinin sağlanabilmesi mümkündür. Bu malzemeler, ekolojik, sağlıklı, geri dönüştürülebilen veya yüksek performansa sahip özellikte olup yaşam döngüleri boyunca çevreye ve insan sağlığına etkileri en aza indirgenmiş olan yapı malzemeleridir [19].

Tayvan'da yapılan ve yasal düzenlemeleri inceleyen bir araştırmada yasalarla güvence altına alınan iç mekan hava kalitesinin standartlarına ve yeşil malzeme özelliklerine değinilmiştir. 2000'li yılların başından beri sağlanan farkındalık ve denetimde sağlanan etkinlik nedeniyle piyasadaki ürünlerin %75'inin yeşil yapı malzemelerinden oluştuğu bildirilmiştir. Binanın iç yüzey alanının en az %45'i ve dış mekana bakan yüzey alanının en az %10'unun yeşil yapı malzemelerinden oluşmasının gerekliliği standartlarla belirtilmiştir. Bina Teknik Yasası'nda yer alan geri dönüştürülmüş plastik, kauçuk, tuğla ve ahşabın yanı sıra EPA tarafından belirlenen zehirli malzemeleri içermeyen ve Montreal Protokolü'ne uygun yalıtım ürünleri, su bazlı boya ve kaplamalar ve diğer sertifikalı malzemeler yeşil yapı malzemelerini oluşturur (Tablo 5). Bu tür malzemelerin çevreye ve insan sağlığına karşı zararsız olması ve ulusal standartlara uygun olması zorunludur [20].

Diğer yandan Steinemann vd. [21], yeşil binaların iç mekan hava kalitesi ile doğrudan bir ilişki kurabilmeleri için yapı malzemelerin emisyonlarının araştırılmasının yanı sıra kullanıcı beklenti ve görüşlerinin alınmasının gerekliliğine değinmişlerdir.

Sonuç ve Değerlendirme

Tarihi yapılar kültürel ve evrensel mirası oluşturdukları için geleceğe aktarılmaları son derece mühimdir. Bu hususta bu tür yapıların zaman içerisinde maruz kaldıkları sorunların giderilmesine yönelik çağdaş önlem ve metotlara ihtiyaç duyulmaktadır. Bu çalışma tarihi dokuya, bina kullanıcılarına ve doğal çevreye olumsuz etkileri olan beş farklı sorunun yapı malzemeleri üzerinden çözümlenmesine ve/veya etkilerinin azaltılmasına odaklanmaktadır. Sorunun öncelikle malzeme ölçeğinde ele alınması, tarihi binaların aktif sistemlere olan bağımlılığını azaltmak ve küresel iklim değişikliğine katkı sunacak yeni sorunların önüne geçilebilmesi adına önemlidir. Çalışma kapsamında okuyuculara sunulan öneriler şu şekilde özetlenebilir:

- Nem sorununa karşın doğal bir malzeme olan kil bariyerlerinin yığma duvarların önünde toprak seti olarak kullanımı önerilmiştir. Böylelikle suyun yapı kabuğu ile olan teması en aza indirilmiş; yapısal unsurlara ve kullanıcı konforuna zarar verebilecek nemin binadan uzaklaştırılması sağlanmıştır. Ayrıca odun külünün kireç harcına %20-40 oranında eklenmesi ile harçların su emme özellikleri iyileştirilebilir.
- Tarihi yapıların kabuğunda soğuk renkli malzeme kullanımı ile yüzey sıcaklıklarında 8ºC düşüş ve yazın soğutma için harcanan enerjide %3 azalma sağlanabilmektedir. Ayrıca avluların membran ile kapatılması, yıllık karbon salımını soğutmadan kaynaklı harcanan enerji üzerinden %6; ısıtmadan kaynaklanan enerji üzerinden ise %10 düşürebilmektedir.
- Kullanıcı konforunun sağlanması kaynak tüketimi ve çevresel etkilerin düşürülmesinde bir diğer kilit noktadır. FDM gibi yenilikçi teknolojilerin tarihi binalarda %10 oranında uygulanması enerji tüketimini %18'e kadar düşürebilmekte ve malzemenin termal iletkenliğini %22,5 oranında düşürebilmektedir.
- Yapılarda yeni malzeme kullanımı daha fazla ham madde ihtiyacı anlamına geldiğinden bunun yerine daha önceden kullanılmış malzemelere başvurulması, çevresel sürdürülebilirliğin sağlanmasında etkilidir. Yapılan çalışmalarda %30 oranında seramik ve cam atıkları içeren kireç harcının su direncinin artırıldığı ve basınç dayanımında artış sağlandığı görülmüştür.
- Yapılarda yeşil yapı malzemelerinin kullanımı, atık kullanımına teşvik etmesi, insan sağlığına olan etkileri ve malzeme onarımları açısından doğal ve tarihi çevre üzerinde olumlu etkilere sahiptir. Tayvan'da binanın iç yüzeylerinde %45 ve dış yüzeylerinde ise %10 oranında yeşil malzeme kullanım zorunluluğu bulunmaktadır.

Özetlenen çalışmaların önerdiği çözümler ve uygulama yöntemleri Tablo 6'da verilmiştir. Tüm bu önerilerin değerlendirilmesinde tarihi dokuya zarar verilmemesi, kullanıcı konfor ve sağlığının gözetilmesi ve doğal çevreye yönelik tahribatın öne geçilmesi elzemdir. Sonraki çalışmalarda yapılı çevrede karşılaşılan çeşitli sorunlara dair yenilikçi teknoloji ve sistemler sürdürülebilir mimari çerçevesinde kapsamlı olarak ele alınabilir.

ÖZ

Türk mimarlığında anıtsal camilerin yapımı, Mimar Sinan gibi bir dahi ile özel bir dönem yaşamıştır. İstanbul'un fethiyle imparatorluk mülkü haline gelen ve o zamana dek yapılmış en muazzam eserlerden biri olan Ayasofya'nın örtü sistemi, Sinan dönemi öncesinde bazı yapılar üzerinde denenmiş olsa da Sinan'ın uzun kariyeri ve özgün tarzıyla devletin ekonomik gücü birleştiğinde, yaklaşık 50 yıllık bir süreçte Türk mimarisinde anıtsal cami yapıları doruk noktasına ulaşmıştır. Sinan'ın tüm çabaları, mekân bütünlüğünü en üst seviyeye çıkarma amacına dayanmıştır. Bu hedef, statik ve estetik sınırlamalarla şekillenmiş olmasına rağmen, en net şekilde Şehzade Mehmet, Süleymaniye ve Selimiye camileri gibi üç anıtsal eserde görünür hale gelmiştir. Bu üç eser, Sinan'ın neredeyse yarım yüzyıl süren arayışlarının somut bir yansımasıdır. Sinan, sadece ideal bir mekân arayışına odaklanmakla kalmamış, aynı zamanda bu hedefe ulaşmasını en çok engelleyen örtü sistemini de mükemmel bir şekilde çözmüştür. Bu örneklerle, Sinan hâlâ mimarlık sanatının zirvesini temsil etmektedir. Bu çalışma, Sinan'ın mekân bütünlüğüne odaklı arayışlarının ve bu alandaki üstün başarısının en önemli üç örnek üzerinden incelenmesini amaçlamaktadır.

Spatial Integrity in Mimar Sinan's Monumental Mosques: Analysis of the Central Plan Scheme

ABSTRACT

The construction of monumental mosques in Turkish architecture experienced a special period with a genius like Mimar Sinan. Although the covering system of the Hagia Sophia, which became an imperial property with the conquest of Istanbul and is one of the most monumental works ever built, had been tried on some buildings before the Sinan period, the combination of Sinan's long career and unique style with the economic power of the state led to the culmination of monumental mosque structures in Turkish architecture in a period of about 50 years. All of Sinan's efforts were based on the goal of maximizing the integrity of space. This goal, although shaped by static and aesthetic limitations, is most clearly visible in three monumental works: the Şehzade Mehmet, Süleymaniye and Selimiye mosques. These three works are a concrete reflection of Sinan's almost half-century-long search. Sinan not only focused on the search for an ideal space, but also perfectly solved the covering system that most prevented him from achieving this goal. With these examples, Sinan still represents the pinnacle of the art of architecture. This study aims to analyze Sinan's search for spatial integrity and his outstanding success in this field through three of the most important examples.

1. Giriş

Osmanlı İmparatorluğu'nun muhteşem mirası içinde, Mimar Sinan'ın eşsiz mimari eserleri, dönemin estetik ve mühendislik harikaları arasında öne çıkar. Sinan'ın ustalığı, imparatorluğun manevi ve fiziksel kalbinde yer alan anıtsal camilerinde en görkemli şekilde sergilenir. Camilerde merkezi plan, caminin mimari düzenlemesinde ibadet alanının merkezinde genellikle büyük bir kubbenin yer aldığı, ibadet alanının bu kubbenin altına toplandığı bir plan tipini ifade eder. Bu tür plan düzeni, caminin iç mekânında bir merkezîlik ve bütünlük hissi oluşturmayı amaçlar. Merkezi plan tasarımı, Osmanlı cami mimarisinde özellikle 15. ve 16. yüzyılda zirveye ulaşmış ve Sinan'ın eserlerindeki iç mekânların düzenlenmesinde benzersiz bir rol oynamıştır. Anıtsal camilerin iç mekânlarında oluşan deneyimi, mekânın işlevselliği ve estetik değeri üzerinden anlamlandırmayı ve Sinan'ın bu yapıları tasarlarken kullandığı merkezi plan düzenlemelerinin bu mekânlara olan etkisi detaylı olarak incelendiğinde, Sinan'ın arayışının ipuçlarını bulmak mümkün olabilir.

Türklerin Anadolu'ya göçleri, Sanat ve mimari açısından zengin ve çeşitli bir kültürel mozaiğin oluşmasına neden olmuştur. Göçebe yaşam tarzından yerleşik düzene geçiş sürecinde, Türklerin sanatsal ifade biçimleri de gelişmiş ve çeşitlenmiştir. Bu gelişim, Selçuk Beylikleri ve ardından Osmanlı İmparatorluğu dönemlerinde önemli mimari yapılar ve sanat eserleri ile somut bir şekilde kendini göstermiştir. Selçuklu dönemindeki yapılar, özellikle Anadolu'nun coğrafi yapısına ve kültürel mirasına uygun olarak, o dönemin mimari tarzının örneklerini yansıtmıştır. Ancak, Türk mimarisinin zirvesi ve belki de en etkileyici dönüm noktası, 16. yüzyılda Mimar Sinan'ın eserleriyle gerçekleşmiştir. Osmanlı İmparatorluğu'nun en büyük mimarlarından biri, hatta birincisi olarak kabul edilen Mimar Sinan, kendinden sonrası için döneminin ötesinde bir miras bırakmıştır. Sinan, kendine özgü mimari tarzıyla yapıtlarında estetik, mühendislik ve fonksiyonelliği ustalıkla birleştirmiştir. Anıtsal camileri, köprüleri, sarayları ve diğer yapıları hem teknik açıdan çarpıcı hem de sanatsal anlamda muazzam örnekler sunar. Onun eserlerinde Türk kültürünün 16. yüzyıldaki bütün içeriğini bulmak mümkündür (Kuban, 1968).

Sinan'ın eserleri, Türk mimarisinin gelişiminde ve zenginleşmesinde dönüm noktalarından birini temsil ederken, aynı zamanda Anadolu'nun kültürel mirasının taşıyıcısı olarak da önemli bir role sahiptir. Sinan, imparatorluğun kültürel mimarisini kendi gözlem ve becerileriyle harmanlamış, özellikle de Ayasofya gibi çağları aşan bir mimari örnek, şüphesiz diğer mimarlara olduğu gibi ona da ilham vermiştir. Ancak Bizans'ın Osmanlının eline geçen mimari kültür mirası Sinan'ın sanatını yeterince tanımayan ya da tanımak istemeyen batılı mimarlık ve sanat tarihçileri tarafından uzun süre onun sanatının etki hatta taklit ile geliştiği şeklinde değerlendirilmiştir. Avrupalı ve Amerikalı arkeologlar ile sanat tarihçileri, Sinan'ın mimari ustalığının, Türk sanatının zirvesini temsil ettiğini çok sonra anlamış ve Türk sanatının evrensel önemini ve etkisini kabul etmek durumunda kalmışlardır. Sinan'ın yapıtları, uluslararası düzeyde sanat ve mimarlık açısından önemli bir referans noktası oluşturmuş, bu da Türk sanatının evrensel çapta tanınmasına ve değer görmesine katkıda bulunmuştur.

Sinan'ın inşa ettiği yüzlerce yapı, sadece mimari açıdan değil, aynı zamanda estetik zenginlikleri, teknik ustalığı ve işlevsel anlayışıyla da dikkat çeker. Bu yapılar, döneminin mimari anlayışını en üst düzeyde

temsil etmekte olup, olağanüstü bir estetik duyarlılıkla şekillendirilmiştir. Sinan'ın eserleri, çeşitli işlevleri olan dini yapılar, köprüler, hamamlar, saraylar ve askeri yapılar gibi geniş bir yelpazede kendini gösterir. Estetik açıdan, yapılarında kullanılan süslemeler, kubbe tasarımları ve detaylar, döneminin ötesinde zamanın testini geçmiş bir estetik anlayışın izlerini taşır. Bu estetik zenginlik, Sinan'ın yapıtlarını sadece yapısal açıdan değil, aynı zamanda görsel anlamda da göz alıcı kılar. Ancak onun sanat yaşamındaki en büyük arzusu, cemaati gök kubbe gibi büyük bir kubbe altında toplayan, mekân birliği tam, aydınlık ve ferah bir cami inşa etmek olmuştur (Benian, 2011). Sinan'ın cami inşası, aldığı mimari ve kültürel mirası dikkate alarak, merkezi planı kullanarak yüzlerce ton ağırlığındaki kubbeyi hem işlevsel hem de estetik bir biçimde zemine taşımayı amaçlayan bir tasarım sürecidir (Akyürek ve Kahraman, 2021).

Sinan'ın sanatının inceliklerini hamamlardan köprülere, su yollarından küçük ölçekli cami ve mescitlere kadar inşa ettiği her yapıda görmek mümkündür. Ancak söz konusu olan anıtsal yapılarsa, mekânın şekillenmesine etki eden unsurlar da farklılaşır. Örneğin mekân örtüden bağımsız düşünülemezken, yapının statiği ve mekân özellikleri de örtü ve destekleyici elemanları tarafından kısıtlanır. Özellikle merkezi planlama ile inşa edilen yapılarda mekân içerisinde taşıyıcıların ikinci plana itilmesi ve ayrıca örtü sistemi ile bunu destekleyen geçiş ögelerinin sorunsuzca çözülmesi problem haline gelir. Bu önemli sorunları çözüşteki ustalığı Sinan'ın mimari dehasının düzeyini gösterir. Sinan'a kadar geleneksel ve içe dönük cami yapısı, Sinan'la birlikte dışarıdan algılanan bir mimari düzene, alımlı cephelere kavuşarak Osmanlı mimarisinde yeni bir estetik anlayış ortaya koyar (Kuran, 1988).

İstanbul'un fethedildiği 1453 yılı ile 1535 yılları arasındaki dönem, mimarinin sanat alanında etkin olduğu bir dönemdir. Osmanlı İmparatorluğu'nun İstanbul dönemi mimarlık faaliyetlerinde önemli etkenler genellikle camilerin çevresinde şekillenmiştir. İstanbul'da Fatih, Beyazıt ve Sultan Selim camileri gibi fetihten sonra inşa edilen yapılar, Edirne Üç Şerefeli Camii gibi öncül prensipleri ortaya koyarak ve sağlam bir mimari anlayışı ilerleterek, Mimar Sinan'ın dönemine temel oluşturmuştur (Eker, 2016). Bu çalışmada Mimar Sinan'ın inşa ettiği camiler bağlamında değerlendirmeler yapılarak, özellikle Türk mimarisinin en seçkin örnekleri kabul edilen üç anıtsal yapısı, Şehzade, Süleymaniye ve Edirne Selimiye camilerinin merkezi plan şemaları analiz edilecek ve Mimar Sinan'ın mekânsal bütünlük anlayışı, kendi uygulamalarıyla ortaya konmaya çalışılacaktır.

2. Malzeme ve Metot

Bu çalışmada Mimar Sinan'ın üç önemli anıtsal camisi olan Şehzade, Süleymaniye ve Selimiye camilerinin CAD çizimleri temel materyal olarak kullanılmıştır. Bu çizimlerde, camilerin mimari planları ve yapısal elemanları detaylı bir şekilde yer almaktadır. Kullanılan CAD yazılımı, planların üç boyutlu olarak modellenmesine ve ışınların gönderilmesi sürecinin görselleştirilmesine olanak tanımaktadır. Öncelikle, Mimar Sinan'ın seçilen camilerinin CAD çizimleri temin edilmiştir. Bu çizimler, yapının mimari özelliklerini ve mekânsal organizasyonunu anlamak amacıyla detaylı bir

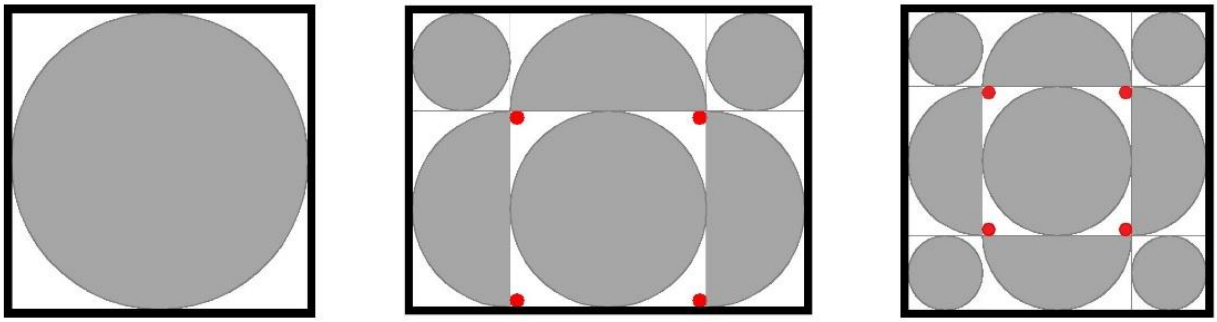
şekilde incelenmiştir. Her bir caminin planı, mimari tasarım ve fonksiyonellik açısından analiz edilmiştir.

İkinci aşamada, camilerin planlarının farklı noktalarından gözlem yapabilen bir kişinin perspektifinden analiz gerçekleştirilmiştir. Bu aşamada, caminin iç mekânındaki önemli noktalar ve sütunların konumları belirlenmiştir. Sütunlar, gözlemciye engel olabilecek unsurlar olarak değerlendirilmiştir. Sütunların ve diğer yapısal elemanların mekânsal etkilerini gözlemlemek amacıyla, her caminin planında belirlenen noktalardan ışınlar gönderilmiştir. Bu ışınlar, mekânın görünürlüğünü belirlemek ve gizli alanları tespit etmek için kullanılmıştır. Işınların gönderilmesi süreci aşağıdaki adımlarla gerçekleştirilmiştir:

- Nokta Belirleme: İncelenen her camideki kritik gözlem noktaları belirlenmiştir.
- Işın Çizimi: Belirlenen noktalardan cami iç mekânına yönlendirilmiş ışınlar çizilmiştir.
- Veri Toplama: Işınların kesişim noktaları ve cami içindeki görünürlüğü etkileyen alanlar kaydedilmiştir.

Toplanan veriler, gözlemlenen alanların sayısal değerlerini içermekte olup, bu değerler görsel grafikler ve rakamsal tablo formatında düzenlenmiştir. Elde edilen verilerin analizi, mekânsal bütünlük açısından yapıların performansını değerlendirmek amacıyla değerlendirilmiş ve mekânsal bütünlüğü etkileyen faktörler belirlenerek yorumlanmıştır. Son olarak, elde edilen bulgular, Mimar Sinan'ın cami tasarımındaki mekânsal bütünlüğü ve merkezi plan şemasının etkilerini ortaya koymak üzere tartışılmıştır. Camilerin mimari özellikleri ile mekânsal deneyim arasındaki ilişki ele alınarak analiz edilmiştir.

3. Bulgular



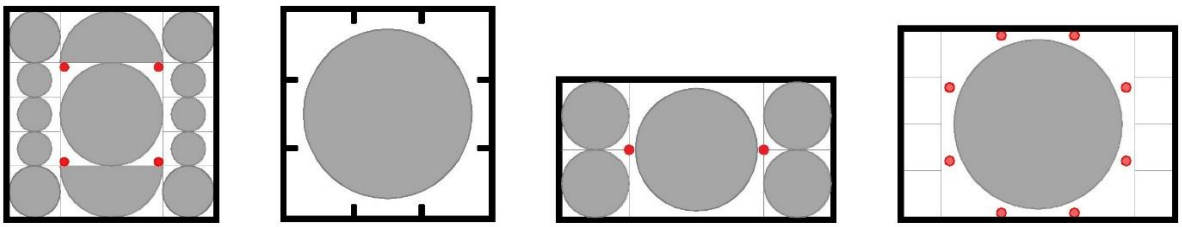
Türk sanatına yüzlerce eser vermiş olan Sinan'ın anıtsal yapıları olarak öne çıkan üç örnek, Şehzade Mehmet, Süleymaniye ve Selimiye camileridir. 1538-39 yıllarında inşa ettiği (Cansever, 2005; Doğan, 1997) ilk yapı olan Haseki Hürrem Camii ile başlayan Sinan'ın serüveni (Kuran, 1973), hemen iki yıl sonra 1540 yılında inşasına başladığı Üsküdar Mihrimah Sultan Camii ile devam etmiştir. Yedi yılda tamamlanan bu eserinin inşası devam ederken (Cansever, 2005; Orman, 2020), 1544 yılında ilk anıtsal camisi olan Şehzade Mehmet Camii'nin inşasına da başlamış (Orman, 2010) ve her iki eserini de 1548 senesinde tamamlamıştır.

Sinan'ın mekâna göre ideal örtü arayışları aslında bu üç eserle olgunluk seviyesine ulaşmıştır. Sinan'ın ilk yapılarından birisi olan Haseki Hürrem Camii, 11,30 m çapa sahip tek kubbeli ve tek mekânlı bir yapıdır (Şekil 1). Yapımından bir süre sonra yapının doğu duvarı iki ayağa taşıttırılmak suretiyle bu kısma ilave edilen mekânla özgün planında değişikliğe gidilmiştir (Kuban, 1968). Yine eş zamanlı olarak inşa edilen Halep Hüsreviye Camii de aynı örtü şemasına sahiptir (Eyice, 1999). Burada tek kubbeli cami fikri, birer bölümü yanlardan taşan beş kubbeli son cemaat yerinin arka köşelerine eklenen mekânlar, kanatlı camiler fikri ile birleştirilmiştir (Aslanapa, 1989). Sinan'ın yapı planını doğrudan

etkileyen örtü arayışları, bu yapılardan sonra inşasına başladığı eserlerde kendini çok açık olarak göstermektedir.

Türk mimarlığında harimin ana kubbeye eklenen yarım kubbelerle genişletilmesi uygulaması, İstanbul'un fethinden hemen sonra başlamıştır. Buradan, Ayasofya'nın örtü sisteminin sonradan inşa edilen eserlere doğrudan etkisinin olduğu sonucunu çıkarmak yanlış olmaz (Benian, 2011). Bu uygulamanın ilk örneği, 1470 yılında inşa edilen Eski Fatih Camii'nde karşımıza çıkmaktadır. Yapı, ana kubbenin güney tarafına eklenmiş bir yarım kubbe ile kuzey-güney yönünde genişletilmiştir. Sinan öncesi bir başka kubbe-yarım kubbe uygulaması ise 1505 yılında ibadete açılan İstanbul Beyazıt Camii'nde görülmektedir. Bu yapıda, Ayasofya'nın örtüsünden esinlenme çok bariz bir şekilde kendini göstermektedir. Beyazıt Camii'nde ana kubbe, kuzey-güney yönünde iki yarım kubbe ile; doğu-batı tarafları ise dörder küçük kubbe ile genişletilmiştir (Alioğlu, 2023).

Mimar Sinan'ın ilk yarım kubbe denemeleri, ne kendinden önce inşa edilmiş olan Eski Fatih ve Beyazıt Camii'nin ne de Ayasofya'nın kopyası ya da benzeri değildir. Sinan, Üsküdar Mihrimah Sultan ve Şehzade Mehmet camilerinde kubbe-yarım kubbe varyasyonlarının, o zamana kadar denenmemiş iki farklı uygulamasını gerçekleştirmiştir. Üsküdar Mihrimah Sultan Camii'nde kubbeye güney, doğu ve batı yönlerde eklediği üç yarım kubbe ile harimi genişleten Sinan; Şehzade Mehmet Camii'nde ise ana kubbeye dört yönden eklediği yarım kubbelerle harim mekânını genişletme yoluna gitmiştir. Burada dikkat çeken bir başka husus da hemen hemen aynı tarihlerde ibadete açılan bu iki yapının örtü sisteminin inşasının da yaklaşık olarak eş zamanlı yürütülmüş olması durumudur. Sinan inşasına daha önce başladığı Şehzade Mehmet Camii'nde ana kubbeyi dört yönde inşa ettiği dört yarım kubbe ile desteklemiştir. Yarım kubbe problemini ilk defa ele aldığı bu eserinde Mimar Sinan, Ayasofya ve Beyazıt Camii plan şemalarını aşarak dört yarım kubbeli ideal bir merkezi planlı yapı meydana getirip Rönesans mimarlarının rüyasını gerçekleştirmiştir (Aslanapa, 1988; 1989). Sinan'ın bu eseri, büyük kubbeli anıtsal camilerinin ilkidir. Sinan için, bu boyutta bir yapı gerçekleştirmek, o zamana kadarki eserleri içinde büyük bir meydan okumaydı. İlk kez böylesine büyük bir mimari kompozisyonu hayata geçirmek ve gerekli teknolojiyi öğrenmek, onun için şüphesiz büyük zorluklar barındırmaktaydı. Bu nedenle, Sinan'ın Şehzade Mehmet Camii'nde, daha sonra inşa edeceği anıtsal camileriyle karşılaştırıldığında kararlı bir yaklaşımla basit ve işlevsel bir yapı inşa ettiği görülmektedir. Sinan'ın bu ilk prestij eseri, diğer büyük camileri ile karşılaştırıldığında bazı özgün dokunuşlarına rağmen sadece işlevini yerine getiren, gösterişten uzak bir yapı olarak öne çıkmaktadır (Güngör, 1988).



Haseki Hürrem Camii | Üsküdar Mihrimah Sultan Camii | Şehzade Mehmet Camii

Şekil 1. Mimar Sinan'ın ilk inşa ettiği bazı camilerinin örtü şemaları

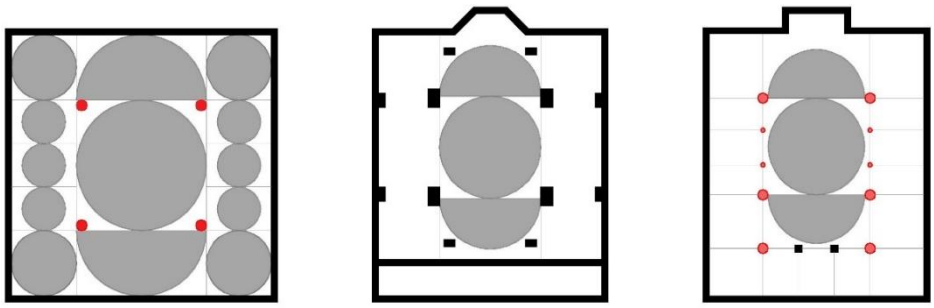
Sinan, Şehzade Mehmet Camii'nin iç mekânında, mimar Yakup Şah'ın II. Bayezid Camii'nin şadırvan avlusunda kullandığı çapraz eksenli planlamayı benimsemiş, bu yaklaşım, kare planlı bir mekânın doğasından kaynaklanan simetri gereksinimini karşılamak amacıyla dört yarım kubbeyle simetrik bir üst yapıya dönüştürülmüştür (Çamlıbel, 1998). 1547-48 yıllarında tamamladığı (Orman, 2020) Üsküdar Mihrimah Sultan Camii'nde ise ana kubbe doğu, batı ve güney yönlerinde yapılan yarım kubbelerle desteklenmiş, güney yönde mekân içindeki iki ayağa oturan ana kubbe, kuzey tarafta ise doğrudan duvarlara gömülü ayaklara taşıtılmıştır (Şekil 1).

Mimar Sinan, Şehzade Mehmet Camii'ni tamamladıktan kısa süre sonra, 1550 yılında, yine Türk sanatı için büyük önem taşıyan Süleymaniye Camii'nin inşasına başlamıştır (Mülayim, 2010). Sinan bir yandan bu eserin inşasıyla ilgilenirken, bir yandan da eş zamanlı olarak 1551 yılında tamamladığı Hadım İbrahim Paşa (Eyice, 2000); 1555-56 yıllarında tamamladığı Beşiktaş Sinan Paşa (Gündüz, 2009) ve 1561 yılında tamamladığı Rüstem Paşa (Tokay, 2008) camilerinin inşasını eş zamanlı olarak yürütmüştür. Bu süreç içerisinde inşa edilen yapılarının tamamı, örtü tekniği açısından birbirleriyle kıyaslandıklarında büyük farklılıklar göze çarpmaktadır (Şekil 2). Sinan bu süreçte Beşiktaş Sinan Paşa Camii'nde, kendinden çok önce Edirne Üç Şerefeli Camii'nde Mimar Muslihûddin ve Şehâbettin Usta tarafından (Çiçek Akçıl, 2012) uygulanmış olan bir şemayı küçük farklılıklarla tekrar kullanmıştır. Yapıda enine gelişen mekân, merkezde tek kubbe ile örtülmüş, kubbe kuzey-güney yönlerinde duvarlara, doğu-batı yönlerinde ise ana sahın ve yan sahınları ayıran eksenin ortasına yerleştirilmiş bir ayağa taşıtılmıştır. Eş zamanlı inşa edilen Hadım İbrahim Paşa ve Rüstem Paşa camileri ise, Edirne Selimiye Camii'nde en yetkin örneğini Sinan'ın elinde bulan, sekizgen taşıyıcılı sistemin farklı iki denemesi olarak karşımıza çıkmaktadır. 1551 yılında tamamlanan Hadım İbrahim Paşa Camii'nde mekânı genişletmek ve aynı zamanda tek kubbenin baskısını karşılayabilmek için giriş duvarının iç tarafında, ileri taşan ayaklar arasında küçük bölmeler meydana getirilmiştir (Eyice, 2000). Cami, mimari yapılanmada tek kubbe ile örtülü olan kübik bir yapıdan farklı olarak, kubbenin sekiz destek üzerinde taşındığı bir sistemde örnek olarak kabul edilmektedir. Bu yapı, Türk mimarlığının evrim süreci içerisinde önemli bir yer tutmakta olup, iç mekândaki duvar payelerinin oluşturduğu destekler aracılığıyla, sekiz destekli camilerin öncüsü olarak kabul edilmektedir (Denknalbant Çobanoğlu, 2019).

Sinan'ın, Süleymaniye ile eş zamanlı inşasını yürüttüğü bir diğer yapı olan Eminönü Rüstem Paşa Camii, 1561 yılında tamamlanmıştır (Tokay, 2008). Bu eser de Hadım İbrahim Paşa Camii gibi sekiz dayanaklı cami örneklerinden olup, Sinan bu yapıda deneyimlediği plan tipinin en gelişmiş örneğini daha sonra Edirne Selimiye Camii'nde uygulamıştır (Giray Küçük, 2020).

Süleymaniye Camii | Hadım İbrahim Paşa Camii | Beşiktaş Sinan Paşa Camii | Eminönü Rüstem Paşa Camii

Şekil 2. Süleymaniye Camii ve eş zamanlı inşa edilen bazı camilerin örtü şemaları



İnşası yedi yıl süren (İnan, 1968) Süleymaniye Camii, şüphesiz Mimar Sinan'ın en dikkat çekici eserlerinin başında gelir. Caminin odak noktasına yerleştiği külliye kompleksi, Sinan'ın sanat ve mimaride zirveye çıktığı bir büyük eser olarak kalmamış, Osmanlı Devleti'nin siyasi ve askeri anlamdaki ihtişamını taçlandıran bir sanat şaheseri ve bu topraklarda yükselen bir medeniyetin simgesi olarak kabul edilmiştir (Aksay, 2009). Sinan bu eserinde ilk defa iki yarım kubbeli planlamayı deneyerek, yeni eseri için en uygun oranları aramıştır (Aslanapa, 1989). Bu yapı kütle bakımından Sinan'ın inşa ettiği en büyük eseridir. Sinan, Şehzade'deki deneyimleri sayesinde büyük yapı tekniklerini tecrübe etmiş olmanın verdiği özgüvenle, Süleymaniye Camii'nin yapımına heyecanla başlamış, daha karmaşık bir düzenlemeyle, mekâna ve yapıya önemli estetik değerler katarak, üst düzeyde mesleki bir birikim ve teknoloji sergilemeyi başarmıştır. Zorlandığı noktalara rağmen çevreye uyumlu, etkileyici ve özgün bir kitle plastiğiyle Süleymaniye Camii, gelecekte Selimiye gibi önemli yapıların habercisi olmuştur (Güngör, 1988).

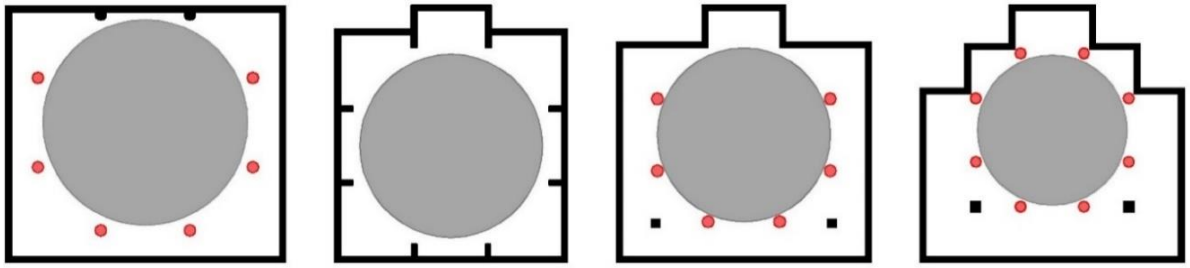
Bu yapıda merkezi kubbenin kuzey-güney yönünde yarım kubbelerle destekleniyor olması ve doğu-batı taraflarına eklenen yan sahınlar, eseri Ayasofya'nın üst örtüsüne benzer hale getirmiştir (Şekil 2). Bu tespit, ilk anda doğru gibi görünmekle beraber, aslında her iki yapının üst yapı sistemi arasında büyük bir fark söz konusudur. Ayasofya'nın üst yapı düzeni, alt yapısındaki tasarımın devamı niteliğindedir. Bu, kare planlı bir ana kütlenin içine yerleştirilmiş bazilika formuna uygun bir örtü sistemi anlamına gelir. Bu yapı, merkezi kubbeyi ve yan nefleri kapsayacak şekilde tasarlanmıştır. Diğer yandan, Süleymaniye Camii'nde, bütüncül bir yaklaşım sergilenmiştir. Burada, iç mekânın tamamını kapsayan ve güçlü bir şekilde tanımlayan bir üst yapı sistemi vardır. Yani, Süleymaniye'de üst yapı, yalnızca bir örtü değil, iç mekânın genel düzenini de biçimlendiren bir unsurdur (Çamlıbel, 1998).

Sinan, başta Ayasofya olmak üzere kendinden önce inşa edilmiş yapıları gerek statik ve gerekse estetik açıdan detaylıca incelemiştir. Ancak o, incelediği eserleri doğrudan taklit etmemiş, onlarda statik ve estetik açıdan gördüğü hata ve noksanları düzeltme yolunu yeğlemiş, tekrara düşmeyen sanat anlayışıyla Türk mimarlığını zirve noktasına ulaştırmıştır. Süleymaniye Camii'nin inşasını tamamladıktan sonra sarfettiği *"Direksiz kümbedin altında elhak Ayasofiyye gibi asla olubdur kubbesi andan muazzam bina*

oldu. Hüdanın lütfu rehber" diyerek strüktür açısından Ayasofya'dan daha muazzam bir eser meydana getirdiğini beyan etmesi, bu yapıyı detaylı olarak incelediğinin bir göstergesidir (Akmandor, 1968). İkisi de birer ibadet yapısı olmakla beraber, cami ve kilise olarak farklı mekân kurgularına ihtiyaç duyan bu yapıların zaten tam anlamıyla birbirinin kopyası olmaları imkânsızdır. İbadet yapısı olmasının yanı sıra, aynı zamanda bir tören yapısı da olan Ayasofya'nın yan nefleri, törenlerde izleyicilere tahsis edilen alan olarak değerlendirildiği için ana neften mekânsal anlamda bilerek ve isteyerek soyutlanmıştır. Süleymaniye'de ise, kubbe altında toplu namaz kılmaya daha elverişli bir plan arayan Sinan, yan sahınları merkezi sahına bağlayarak bu amaca daha iyi hizmet edecek toplu ve rahat bir mekân oluşturmuştur. Özetle Ayasofya'da üst yapı düzeni alt yapının bir devamı iken, yani karesel bir mekân içine yerleştirilen bazilikayı tamamlayan tabii örtü, Süleymaniye'de kendisi bir bütün olan iç mekânı örten bir üst yapı sistemine dönüşmüştür (Kuran, 1968).

Sinan, Süleymaniye Camii'ni tamamladıktan yaklaşık 22 yıl sonra inşa ettiği ve 1580 yılında tamamladığı Tophane Kılıç Ali Paşa Camii'nde (Eyice, 2012) Ayasofya ile büyük oranda örtüşen bir plan kullanmıştır. Son dönem eserlerinden olan bu eser, aynı plan şemasındaki Süleymaniye'den mekân anlayışı bakımından farklıdır (Şekil 3). Eser, bazı özellikleri dolayısıyla, örneğin yan mahfillerin orta mekâna kadar yanaşması bakımından Ayasofya ile büyük benzerlik ortaya koyar (Günay, 2005). Ayrıca, kuzey-güney yönünde yarım kubbenin örttüğü mekânın arkasına çapraz tonozlarla örtülü ikinci bir mekân eklenerek uzatılmış olması Ayasofya'nın narteksini hatırlattığı için, bu durum her iki yapının benzerliğini pekiştirir (Göknil, 1987).

Süleymaniye Camii Ayasofya Camii Kılıç Ali Paşa Camii



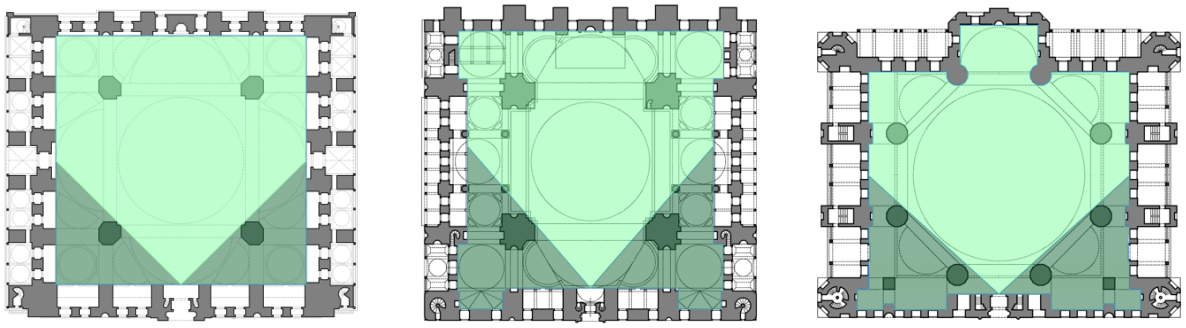
Şekil 3. Süleymaniye, Ayasofya ve Kılıç Ali Paşa camilerinin plan şemaları

Sinan Selimiye Camii'ni 86 yaşında iken, 1574 yılında tamamlamıştır (Mülayim ve Çobanoğlu, 2009). 1568 yılında bu eserin inşasına başladıktan bir süre sonra, başta İstanbul olmak üzere Bosna, Lüleburgaz, Hafsa, Payas ve Büyükçekmece'de Sokollu Mehmet Paşa adına birçoğunda cami yapılarının da bulunduğu külliyeler ve farklı eserler inşa etmesinin yanı sıra (Özcan, 1988), Piyale Paşa Camii (Tanman, 2007) gibi küçük ölçekli camileri de eş zamanlı olarak yapmış ve bu yapılarını Selimiye'den önce tamamlamıştır. Mimar Sinan en önemli eseri olan Selimiye'de sekizgen baldaken sistem ile sekizgen tabana oturan kubbe şeması kullanmıştır. Başta Anadolu Selçuklularının türbe yapıları olmak üzere camilerden çok önce küçük ölçekli yapılarda denenmiş olan bu sistem, Sinan tarafından bir cami yapısında ilk kez 1551 yılında tamamladığı Hadım İbrahim Paşa Camii'nde

kullanılmıştır. Yine Selimiye'den çok önce, 1553 yılında tamamladığı Rüstem Paşa Camii'nde sekizgen planlı tabana oturttuğu kubbede bu sistemi kullanmış ve iç mekânda birbirinden uzakta ve yan kısımlara yakınlaşmış dört ayak ile kubbe altı sahnının tüm mekâna olan hakimiyetinin artırılmasını amaçlamıştır (Şekil 2). Sinan bu öncü dememelerinden sonra Selimiye Camii'ni inşa etmiştir. Sinan, muhtemelen kubbe çapının genişlemesiyle ideal bir yük dağılımı için destek noktalarının artırılması gerekliliğinin farkında olduğundan, ilk olarak küçük ölçekli kubbe yapılarında testlere başlamış ve daha sonra Selimiye gibi büyük ölçekli bir projeyi gerçekleştirmiştir. Sinan'ın Selimiye'de elde ettiği iç mekân bütünlüğü Osmanlı mimarisinin ulaştığı en üst noktayı temsil eder. Mekâna hakim tek büyük kubbe, bu bütünlük duygusunu büsbütün vurgular ve eşi benzeri olmayan bir cami ortaya çıkartır (Aksay, 2009). Selimiye'de, iç mekânla dış görünüşün tamamen kaynaşmış olduğu muazzam kubbe, bütün dünyada kubbe mimarisinin gelişiminin en ileri noktası olarak görülebilir (Aslanapa, 1989). Sinan, geniş ve zengin iç mekânı arzuladığı için Selimiye Camii'nde, dikkatlice planlanmış bir yapı strüktürü kullanarak bu isteğini gerçekleştirmiştir. Ancak, büyük çaplı ana kubbe hem içeride hem de dışarıda tüm odak noktasını üzerinde toplamakta, mekânın tek başına örttüğü %37'lik bir oranına rağmen, sanki mekânın tamamının kubbenin altında gibi algılanmasını sağlamakta ve adeta tüm mekânı kaplamış gibi bir his uyandırmaktadır (Güngör, 1988).

Mimar Sinan'ın ilk cami tasarımı ile başlayan ideal mekân arayışı, Selimiye Camii'nden sonra da devam etmiştir. Sinan'ın, Selimiye gibi anıtsal bir eserde en mükemmel sonuca ulaşan sekizgen tabanlı örtü kullanımı bu yapı ile sınırlı kalmamış, daha sonra inşa ettiği küçük ölçekli yapılarında da bu sistemi en ideal çözüm olarak deneyimlemeye devam etmiştir. Örneğin Selimiye'den yaklaşık 10 yıl sonra, 1585-1586 yılları arasında inşa ettiği Fatih Çarşamba'daki Mesih Mehmed Paşa Camii'nde yine sekizgen tabana oturan örtü sistemini kullanmıştır (Şekil 4). Sinan'ın ideal mekân arayışında altıgen tabanlı örtü sistemi de önemli bir yer tutmaktadır. Türk mimarlığının erken örneklerinin ilki olarak Edirne Üç Şerefeli Camii'nde karşımıza çıkan altıgen tabanlı örtü sistemi Sinan tarafından farklı yapılarda denenmiştir. Örneğin Sinan 1555 yılında inşa ettiği Beşiktaş Sinan Paşa Camii'nde (Arslan, 2022) altıgen tabanlı örtü sistemini uygulamışken, sekizgen tabanlı örtü sistemine sahip Edirne Selimiye Camii'nden daha sonra 1583 yılında inşa ettiği Üsküdar Valide-i Atik Camii'nin (Tanman, 1991) örtü sisteminde yine altıgen tabanlı örtü sistemi kullanmıştır.

Mimar Sinan'ın sekizgen tabanlı baldaken sistemi kullandığı son yapılarından biri ise, 1577-78 yıllarında inşa ettiği Azapkapı Sokullu Mehmet Paşa Camii'dir. Bu yapıda, Sinan, Edirne Selimiye'deki gibi merkezi baldakeni oluşturan sekizgen ayaklara ek olarak, kuzeydeki iki payenin yanlarına, ana taşıyıcı işlevi gören kare kesitli ek ayaklar eklemiştir. Sinan'ın son dönemlerinde, bu kadar tecrübe ve deneyimlerinden sonra yenilikler denemeye devam ettiği birçok caminin sekizgen kaideli olması önemli bir noktadır (Erzen, 1981). Öte yandan, Sinan'ın son eseri olarak kabul edilen ve onun ölümünden sonra mimar Davud Ağa'nın tamamladığı düşünülen Karagümrük Nişancı Mehmet Paşa Camii'nde, yapının dış cephe kurulumunda klasik kompozisyonun monotonluğunu gidermek amacıyla kıble yönüne doğru yapısal bir değişiklik yapmıştır (Şekil 4).



Selimiye Camii | Mehmet Mesih Paşa Camii | Azapkapı Sokullu Mehmet Paşa Camii | Nişancı Mehmet Paşa Camii

Şekil 4. Selimiye Camii ve sonrasında inşa edilen bazı camilerinin örtü şemaları

Mimar Sinan'ın eserlerinde mekân bütünlüğü arayışı, mimari anlayışının temel taşlarından birini oluşturur. Sinan'ın anıtsal camilerinde, mekânın bütünsel denge içinde oluşturulması, yapıların iç ve dış mekânlarının uyumlu bir şekilde birbirine bağlanması büyük önem taşır. Bu bütünlük, cami avlularının planlamasından başlayarak ana ibadet mekânının tasarımına kadar uzanır. Sinan, yapılarında genellikle kubbe ve kemerlerin uyumlu bir şekilde bir araya geldiği bir mimari dille estetik bir bütünlük oluşturmayı hedefler. Büyük kubbe ve minareler, yapıların görsel simgeleri olmakla birlikte, bu yapı elemanları iç mekânın genişliği ve ışığın akışıyla da bir araya gelerek izleyiciye derinlik ve bütünlük hissi verir. Sinan'ın anıtsal camilerindeki bu mekânsal bütünlük arayışı, Osmanlı mimarisinin estetik ve işlevsel özelliklerini birleştirerek benzersiz ve etkileyici yapıtlar ortaya çıkarmıştır.

Sinan'ın anıtsal üç camisinin mekân bütünlüğü ve bu yapıların önemli bazı noktalarından mekâna hakimiyet incelendiğinde, bu analiz hem büyük ustanın yapılarında aradığı unsurların olumlu etkilerini ortaya koyar hem de bu anıtsal camilerin neden çıraklık, kalfalık ve ustalık eserleri olarak kabul edildiğine dair ipuçları sunar. Bu değerlendirme, Sinan'ın eserlerindeki mimari titizliği, mekân kullanımının dengesi ve mekânın çeşitli noktalarından algılanan hakimiyetin önemini açıkça göstermektedir.

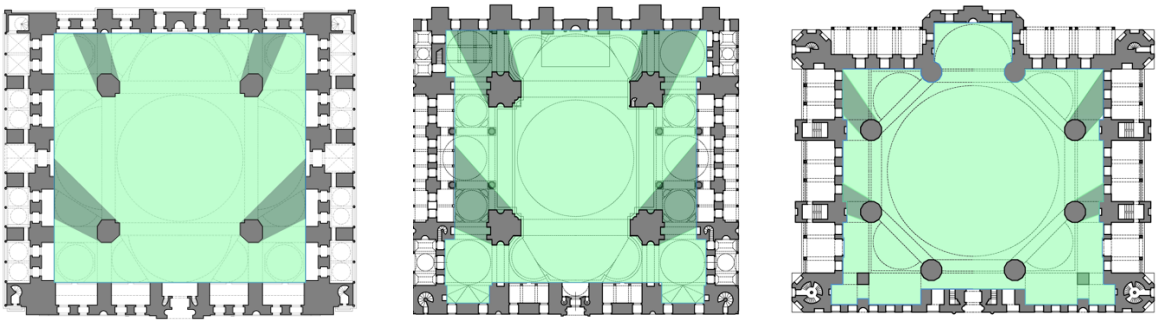
Şehzade Mehmet Camii | Süleymaniye Camii | Selimiye Camii

Şekil 5. Şehzade Mehmet, Süleymaniye ve Selimiye camilerinin girişlerinde mekân görüş açıları

Sinan'ın ilk anıtsal boyuttaki yapısı olan Şehzade Mehmet Camii, mekândaki fil ayaklarının kapladığı alanlar da dahil olmak üzere yaklaşık 1414 m²'lik bir alana sahiptir. Eserin iç mekânına girildiği anda, güneydeki iki fil ayağı mekânın görüş açısını etkileyen doğal ve kaçınılmaz engel olarak dikkati çeker. Giriş noktasına göre doğal görüş açısını sınırlayan bu iki fil ayağı, mekânın bütününün ancak yaklaşık 91°'lik açı ile algılanmasına izin verir (Şekil 5).

Sinan'ın en büyük anıtsal yapısı olan ve kalfalık eseri olarak değerlendirilen Süleymaniye Camii'nde ibadet mekânının net alanı yaklaşık 3560 m²'dir. Bu alana kubbeyi taşıyan devasa fil ayaklarının izdüşüm alanı da dahildir. Süleymaniye'de ana kubbeyi taşıyan fil ayaklarından kuzeydeki ana girişe yakın konumlanan ikisi, Şehzade'ye göre daha dar, yaklaşık 82°'lik bir açı ile mekâna bakış açısı sağlamaktadır (Şekil 5; Tablo 1).

Tablo 1. Mimar Sinan'ın anıtsal camilerinin giriş ve kubbe merkezinden mekân görünümlerine ait sayısal veriler

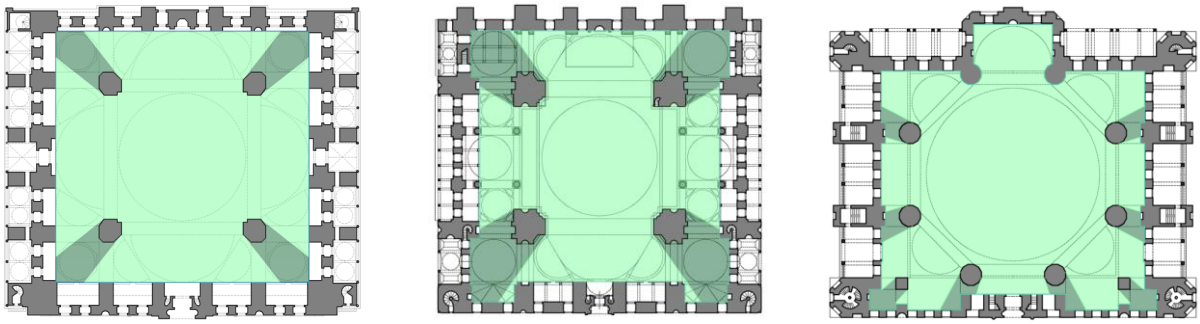


Özellikler	Şehzade Mehmet	Süleymaniye	Selimiye
Harim mekânının toplam alanı	1414 m²	3560 m²	2100 m²
Ana girişten mekânın görüş açısı	91°	82°	96°
Ana girişten mekânın görünmeyen alanı	164 m²	596 m²	100 m²
Ana girişten mekânın görünürlük oranı	%88	%83	%95
Kubbe merkezinden mekânın görünen alanı	1244 m²	2705 m²	1995 m²
Kubbe merkezinden mekânın görünürlük oranı	%88	%76	%93

Selimiye'de üzerine kafa yorulmuş örtü sistemi Sinan'ı sekiz sütunun taşıdığı sekizgen tabana oturan kubbe kullanmaya yönlendirmiş ve o da yaklaşık 2100 m²'lik ibadet mekânına olumlu yansımıştır. Sekizgenin geometrik özelliği olarak birbirinden uzaklaşan karşılıklı sütunlar, doğal olarak mekâna girişin sağlandığı kapıya yaklaşmış ve bu da girişteki görüş açısını 96° ile gerek Şehzade Mehmet ve gerekse Süleymaniye camilerine göre çok daha ideal bir değere çıkarmıştır (Şekil 5). Sinan, Şehzade Mehmet ve Süleymaniye camilerinde yan ve arka sahınları mekânsal kurgu içerisinde kendilerine özgü üst örtü ile birlikte bizzat kullanmışken, Selimiye de ise kubbe altı sahnının sınırları zorlayacak şekilde büyümesi ile yan ve özellikle de arka sahın tamamen ortadan kalkmıştır. Bu sebeple Selimiye'nin kuzeydeki iki sütunu ile kuzey duvarı arasında kalan boşluğu aktif ibadet alanı kurgusu dışında tutarsak, zaten çok iyi durumda olan görüş açısının 110°'nin üzerine çıkacağını değerlendirmek mümkündür (Şekil 5).

Mimari tasarım, bir mekâna giriş anında sağlanan ferahlık duygusunu ve görsel hakimiyetin önemini belirleyici bir şekilde etkiler. Mekânın giriş noktası, ziyaretçinin ilk izlenimi ve algısı açısından kritik bir role sahiptir. Bu noktada, mekânın ferah ve geniş bir hissiyat sunması, ziyaretçide hoş bir karşılama duygusu uyandırır. Ferahlık, genellikle mekânın düzeni, kullanılan renk paleti, ışıklandırma ve açık alanlar gibi unsurlarla ilişkilidir. Ayrıca, girişteki mekâna hakimiyet duygusu, ziyaretçinin mekânın genel yapısını ve düzenini anlamasına yardımcı olur. Bu hakimiyet, genellikle mekânın açık bir düzeni, odak noktaları ve görünürlüğü artıran bir tasarımı içerir. Bu unsurlar bir araya geldiğinde, ziyaretçinin giriş anında ferah bir hissiyat yaşaması ve mekânın görsel yapısını anlaması, mimari tasarımın mekâna girişteki önemini vurgular. Çalışmada bahse konu camiler bu çerçevede incelendiğinde Sinan'ın bu durum üzerine de özellikle yoğunlaşmış olduğu anlaşılır.

Şehzade Mehmet Camii'nin ana girişinde, 1414 m²'lik alanın yaklaşık 1250 m²'lik bölümü, mekâna ilk adım atıldığı anda doğrudan algılanabilir durumdadır. Bu durum, mekânın %88'lik bir kısmının girişten



itibaren doğrudan algılanabilir olduğunu göstermektedir (Şekil 6). Bu oran, Sinan'ın ikinci anıtsal yapısı olan Süleymaniye'de %83 iken, Selimiye'de ise %95 gibi inanılmaz bir değere ulaşır.

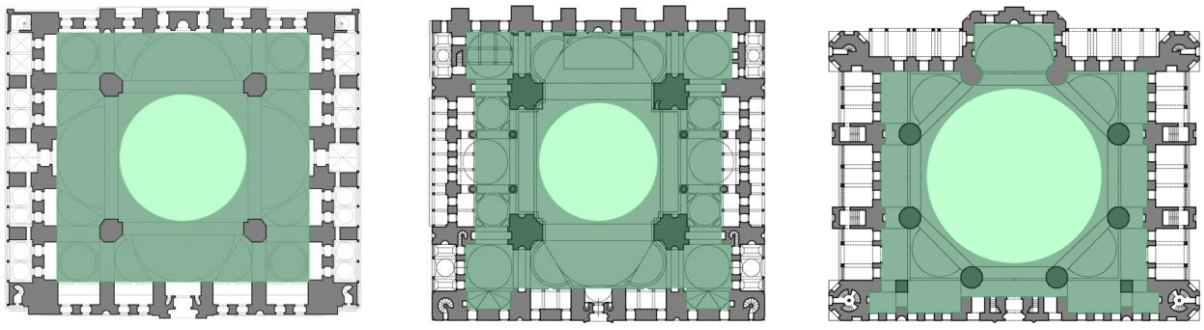
Şehzade Mehmet Camii | Süleymaniye Camii | Selimiye Camii

Şekil 6. Şehzade Mehmet, Süleymaniye ve Selimiye camilerinin girişinde mekân görünürlüğü

Aynı eserler ibadet mekânının kubbe izdüşüm merkezinin tüm mekâna hakimiyeti açısından değerlendirildiğinde de ortaya ilgi çekici sonuçlar çıkmaktadır. Özellikle kubbe altı olgusu, merkezi plan şemasına sahip camilerde ayrı bir önem kazanmış ve bu kısım, tüm mekânın işlevsellik açısından en değerli ve örtü bakımından da üzerinde düşünülmesi gereken bölümü haline gelmiştir. Bu bağlamda Şehzade Mehmet Camii'nin kubbe altı sahnının merkezinden iç mekân 360°'lik bir turla gözlemlendiğinde, kubbeyi taşıyan dört adet fil ayağının, 1414 m^2'lik mekânın yaklaşık 170 m^2'lik bir kısmının doğrudan görünmesine engel teşkil ettiği anlaşılmaktadır. Başka bir ifade ile böyle bir gözlemde mekânın %88'i görünür durumda iken, %12'lik bir kısmı ise statik sorunların çözümü amacıyla ortaya çıkan zorunlu sebeplerle "kuytuda" kalmaktadır (Şekil 7). Aynı gözlem Süleymaniye Camii'nin kubbe altında yapıldığında yaklaşık 206 m^2'lik bir alana oturan devasa fil ayaklarının, mekânın yaklaşık 596 m^2'lik bir kısmının, yani toplam alanın %17'sinin görünümünü engellediği, bir başka ifadeyle ancak %83'lük kısmının doğrudan görünmesine izin verdiği anlamına gelmektedir.

Şehzade Mehmet Camii | Süleymaniye Camii | Selimiye Camii

Şekil 7. Şehzade Mehmet, Süleymaniye ve Selimiye camilerinin kubbe altında mekân hakimiyeti



Selimiye Camii'nin kubbe altında mekân bir bütün olarak gözlemlendiğinde, yaklaşık 93 m^2 taban alanına sahip sekiz adet ayağın, mekânın sadece %4'ünün görünümünü engellediği, yani alanın yaklaşık %96'sının çok rahat bir şekilde görünür olduğunu ifade etmek mümkündür (Şekil 7). Bu sonuç, Selimiye Camii'ni Sinan'ın diğer anıtsal camilerinden farklı kılan en önemli özelliklerden birisidir (Tablo 2).

Örtü, bir yapıda konstrüksiyonunun çözülmesi gereken temel sorunlarının başında gelir. Çünkü sorunsuz kurgulanamayan bir örtü sistemi, işlevsellik sorunlarıyla ortaya çıkan mekânların ana sebebidir. Özellikle kombine örtü sistemlerinin kullanıldığı anıtsal yapılarda her bir örtü türünün hem kendisinin sorunsuz olarak sisteme katkı sağlaması hem de gerek teknik ve gerekse estetik anlamda birlikte kullanıldığı diğer örtülerle bir uyum ortaya koyması gerekir. Sinan'ın Şehzade'de ilk kez kullandığı dört yarım kubbe, ister istemez ön, yan ve arka sahınların ölçüsünü belirlemiş ve optimum sınırlar içerisinde ölçeklendirdiği bu eserinde, yarım kubbelerin ona sağladığı avantajı kullanarak merkezi kubbe çapını fazla zorlama ihtiyacı hissetmemiştir. Anıtsal üç eseri içinde 19 metrelik çapı ile en küçük kubbeye sahip Şehzade Mehmet Camii'nde merkezi kubbe, yaklaşık 284 m^2'lik izdüşümüyle ibadet alanının yaklaşık %20'lik kısmını tek başına örtmektedir (Şekil 8).

Tablo 2. Mimar Sinan'ın anıtsal camilerinin mekân ve ana kubbelerine ait sayısal veriler

Özellikler	**Şehzade Mehmet**	**Süleymaniye**	**Selimiye**
Harim mekânının toplam alanı	1414 m²	3560 m²	2100 m²
Ana kubbe çapı	19,00 m	27,50 m	31.30 m
Ana kubbe izdüşüm alanı	284 m²	594 m²	770 m²
Ana kubbenin tüm örtüye oranı	%20	%17	%37
Kubbe taşıyıcı ayak sayısı	4	4	8
Toplam taşıyıcı taban alanı	40 m²	206 m²	91 m²
Her bir taşıyıcıya düşen kubbe alanı	71 m²	148,5 m²	96,25 m²

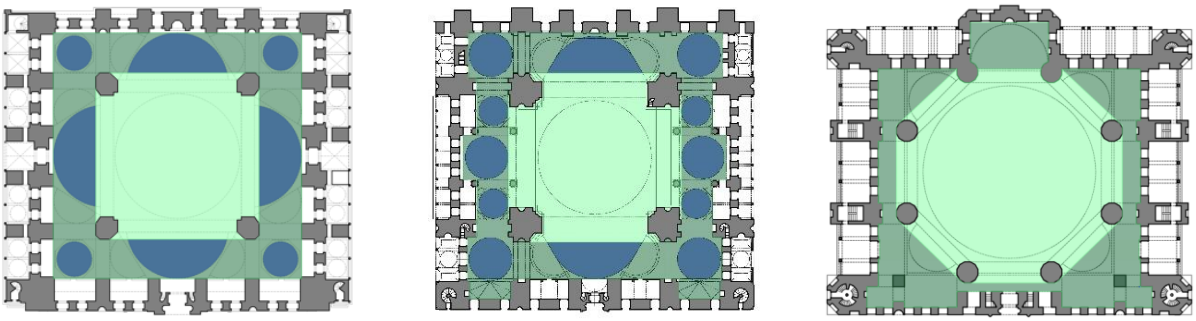
Süleymaniye Camii'nin kubbesi, 27,5 metrelik çapı ile yaklaşık 590 m^2'lik bir izdüşüm alanına sahiptir. Sinan bu eserinde daha önce Şehzade'de deneyimlediği anıtsal kubbe tecrübesini, kendi sınırlarını zorlayarak, örttüğü alan bakımından Şehzade'ye göre iki katından daha fazla artırmıştır. Bununla beraber, Süleymaniye'de merkezi kubbenin tüm mekân üzerinde örttüğü alan, oransal olarak yaklaşık %17'de kalabilmiştir (Şekil 8).

Şehzade Mehmet Camii Süleymaniye Camii Selimiye Camii

Şekil 8. Şehzade Mehmet, Süleymaniye ve Selimiye camilerinin mekân örtülerinde ana kubbenin katkısı

Selimiye Camii, 31 metreyi aşan kubbe çapı ile bütün örtü sistemini tek kubbe üzerinde odak haline getirdiği bir yapı olarak Mimar Sinan'ın tasarım ve mühendislik zekâsının bir ürünüdür. Her taraftan son sınırlarına kadar genişletilmiş tek kubbe ile örtülü mekân, girer girmez insanı adeta sihirli bir

kuvvetle sürükleyip, başka bir dünyaya yönlendirmektedir (Aslanapa, 1989). Kubbe, yaklaşık 770 m^2'lik izdüşüm alanı ile 2100 m^2'lik ibadet alanının %37'sine yakın kısmını tek başına örter. Bu özelliklere sahip kubbe, Selimiye Camii'nin içte dışta tek hakim öğesidir (Şekil 8). Sinan'ın Sâi Mustafa Çelebi'ye anlattığı anıları içinde, bu kubbeden bahsederken;



"Ayasofya kubbesi gibi bir kubbe devleti islâmiyyede bina olunmamışdır, deyu keferei fecerenin mimar geçinenleri müslümanlara galebemiz var derler imiş. O kadar kubbe durdurmak gayet müşküldür dedikleri bu hakirin kalbinde kalmışdır. Mezbur cami binasında himmet idüb biavnillâ hitaalâla sayei Sultan Selim handa izharı kudret idüb bu kubbenin Ayasofya kubbesinden altı zira' kaddin ve dört zira' derinliğin ziyade eyledim" (Refik, 1931)

cümleleri ile Ayasofya'nın kubbesini geçecek bir kubbe inşasının içinde ukde olarak kaldığı ve bunu kendisine amaç edindiği anlaşılmaktadır.

Mimar Sinan'ın tercih ettiği örtü sistemlerindeki farklılıklar, Selimiye Camii'nin tasarımıyla öne çıkmaktadır. Özellikle, daha önceki anıtsal camilerinde kullanmış olduğu dört ayağa oturan baldaken sistem yerine Selimiye'de merkezi kubbe için fazla sayıda ayakla taşıtılan bir örtü sistemini seçmesi, mekânın işlevi ve yapısal bütünlüğü açısından önemli bir değişimi beraberinde getirmiştir.

Mimar Sinan'ın sadece mükemmel bir tasarımcı değil, aynı zamanda olağanüstü bir yapı mühendisi olması, eserlerini dönemin diğer yapılarından önemli ölçüde farklı kılmıştır. Selimiye Camii'nde, o zamana kadar İslam dünyasında yapılmış en büyük kubbenin inşası, taşıyıcı elemanların mekân içindeki hacmini önemli ölçüde azaltmıştır. Bu durum, eseri sadece mimari açıdan değil, aynı zamanda bir mühendislik şaheseri olarak da öne çıkarmıştır. Sinan, taşıyıcı elemanların mekân içinde kapladığı alanı azaltarak geniş ve işlevsel bir merkezi mekân oluşturmayı amaçlamıştır. Ayrıca, kubbenin taşınmasında kullanılan ayaklarla beden duvarlarını kemerlerle bağlayarak, ayakların mekânın estetiğini bozmasının önüne geçmiş ve ideal bir denge elde etmiştir.

Öte yandan, Şehzade Mehmet ve Süleymaniye camilerinde kullanılan örtü çözümleri genellikle kubbe ve yarım kubbelerle sağlanmışken, Selimiye'de kullanılan sekizgen tabana oturan sistem, ekstra örtü detaylarını gerektirmemiştir. Sadece sekizgenin kareye dönüşümünde köşelerde oluşan alanların tonoz bingi ile geçilmesiyle bu sorun basit bir şekilde çözülmüştür (Şekil 9).

Şehzade Mehmet Camii | Süleymaniye Camii | Selimiye Camii

Şekil 9. Şehzade Mehmet, Süleymaniye ve Selimiye camilerinde baldaken taşıyıcı ve mekân ilişkisi

4. Tartışma

Mimar Sinan'ın anıtsal camilerinde mekânsal bütünlüğü sağlayan ve görsel hakimiyetin güçlendiği tasarım anlayışları, her bir yapının gelişiminde farklı evreler göstermektedir. Şehzade Mehmet Camii ile başlayan bu süreç, Süleymaniye ve Selimiye camilerinde belirgin şekilde gelişmiştir. Sinan'ın erken dönem yapılarında, özellikle Şehzade Mehmet Camii'nde, kubbenin taşıyıcı sisteminin mekân üzerindeki etkisi daha sınırlı kalmış, ancak zamanla daha karmaşık yapısal ve görsel çözümler geliştirilmiştir. Bu camilerde kullanılan fil ayakları gibi ağır taşıyıcı elemanlar, mekânın algılanabilirliğini sınırlayan engeller oluşturmuş, bu da Sinan'ın ileri dönemlerde daha özgür bir tasarım dili geliştirmesine zemin hazırlamıştır.

Şehzade Mehmet Camii'nin 1414 m²'lik alanı içinde, fil ayaklarının görsel engelleri, mekânın sadece %88'inin girişten itibaren doğrudan algılanabilir olmasına neden olmuştur. Bu sınırlama, Sinan'ın mekân algısını ve girişteki ferahlık hissini ön plana çıkarma çabasının ilk örneği olarak değerlendirilebilir. Öte yandan, Süleymaniye Camii'nde, kubbeyi taşıyan devasa fil ayakları mekâna bakış açısını %83'e kadar daraltırken, Selimiye Camii'nin kubbe altı tasarımı, bu oranı %96'ya çıkararak mekânda büyük bir görsel özgürlük sağlamıştır. Bu ilerleme, Sinan'ın tasarımda odak noktasını daha minimalist bir şekilde, mekânın estetiğine daha fazla önem vererek konumlandırdığını göstermektedir.

Sinan'ın, özellikle Selimiye Camii'ndeki kubbe tasarımındaki yenilikçi yaklaşımı, sadece görsel algıyı değil, aynı zamanda yapısal bütünlüğü de derinden etkilemiştir. Selimiye Camii'nin 31 metre çapındaki kubbesi hem büyüklük hem de taşıyıcı elemanların mekân içindeki hacmini azaltma açısından Sinan'ın mühendislik zekâsının bir yansımasıdır. Kubbenin yaydığı ferah his, ibadet alanındaki merkezi mekânın işlevselliğini artırmış ve ziyaretçiye derin bir manevi deneyim sunmuştur. Bu tür yapısal yenilikler, Selimiye'yi diğer anıtsal camilerden ayıran başlıca özelliklerdir.

Sinan'ın kubbe tasarımındaki evrimi, sadece yapısal bir çözüm arayışı değil, aynı zamanda dini mekânın fonksiyonel ve estetik açıdan nasıl dönüştürülebileceğine dair bir sorgulamanın sonucudur. Şehzade Mehmet Camii'ndeki daha küçük çaplı kubbe ve yarım kubbelerle sınırlı örtü, mekânın daha geleneksel bir yapısal formda kalmasına neden olmuştur. Ancak, Selimiye Camii'nde merkezi kubbenin büyük çapı ve sekizgen taban üzerine oturtulmuş örtü sistemi, mekânın görsel sınırlarını zorlayarak daha özgür bir deneyim alanı ortaya çıkarmıştır. Sinan, her camide örtü sistemini daha ileriye taşıyarak hem estetik hem de işlevsel olarak mekânı dönüştürmüştür.

Sinan'ın camilerde kullandığı örtü sistemlerinin işlevselliği, sadece yapının fiziksel gereksinimlerini karşılamakla kalmamış, aynı zamanda ibadet alanının içsel düzenini ve mekâna hakimiyet duygusunu da güçlendirmiştir. Şehzade Mehmet Camii'ndeki dört yarım kubbe kullanımı, mekânın çeşitli bölümlerine sınırlı ölçüde de olsa derinlik katarken, Selimiye Camii'ndeki tek kubbe ve sekizgen taban tasarımı, mekânın daha geniş ve birleşik bir his uyandırmasını sağlamıştır. Bu tür yapısal yenilikler, Sinan'ın mekâna dair derinlemesine düşünerek hem işlevsel hem de manevi olarak ziyaretçilerin deneyimleyeceği bir bütünsel tasarım ortaya koymasını sağlamıştır.

Sinan'ın erken dönem camilerindeki ayakların (sütunların) ve kubbenin mekân üzerindeki etkileri, onun zamanla daha minimalist, daha özgür ve daha fonksiyonel bir yapı diline geçişine olanak tanımıştır. Selimiye Camii, bu evrimin zirveye ulaştığı bir örnek olup, Sinan'ın hem bir mimar hem de mühendis olarak olağanüstü bir vizyona sahip olduğunu kanıtlamaktadır. Eserlerinde mekânın algısal genişliğini arttırmak ve yapıyı daha işlevsel hale getirmek için yaptığı yenilikler, sadece dönemin estetik ve mühendislik anlayışını değil, aynı zamanda dinsel deneyimin özünü de yeniden şekillendirmiştir.

Sinan'ın tasarım süreçlerinde gösterdiği gelişim hem mimari hem de mühendislik bakımlarından büyük bir ilerleme kaydetmiştir. Her bir cami, önceki yapının ötesinde bir teknik ve görsel başarıyı temsil eder ve Sinan'ın mimari anlayışındaki derinleşmeyi gözler önüne serer. Bu camilerdeki mekânsal bütünlük ve görsel hakimiyet, Sinan'ın sadece bir mimar olarak değil, aynı zamanda bir mühendis olarak da ne kadar ileri bir seviyeye ulaştığını gösteren örneklerdir.

5. Sonuç

Mimar Sinan'ın ustalığı ve dehası, Osmanlı İmparatorluğu'nun en önemli dönemlerinde inşa ettiği Şehzade Mehmet, Süleymaniye ve Selimiye camilerinde derin bir şekilde kendini göstermektedir. Bu üç muazzam eser, aynı zamanda mimari açıdan muhteşem birer şaheserdir. İncelemeler, bu camilerin mekân bütünlüğünün, estetik yapısının ve işlevselliğinin titiz bir şekilde planlanmış olduğunu ortaya koymaktadır. Bu yapılar, Mimar Sinan'ın ustalığını ve tasarım vizyonunu sergilerken, aynı zamanda Osmanlı mimarisinin zirvesini temsil etmektedir.

Mimar Sinan'ın 50 yılı bulan sanatsal serüveni sürekli bir arayış içerisinde geçmiştir. Küçük ölçekli yapılarında mekânsal tasarım üzerinde yoğunlaşan bu arayış, anıtsal yapılarında ise mekân özellikleriyle ilişkili olarak örtü sistemi ve strüktürel çözümlemelerle zirve noktasına ulaşmıştır. Bu nedenle Sinan'ın sanatı ile ilgili bir değerlendirme yapmak gerekirse, onun arayışlarının izlerini anıtsal yapılarında bulmak daha kolay olacaktır.

Sinan'ın anıtsal camileri incelendiğinde, bu eserlere ait teknik veriler bizi, onun arayışlarının ipuçlarına götürür. Örneğin ustalığının zirve eseri Selimiye'den daha önce inşa ettiği ve en büyük yapısı olan Süleymaniye'den sonra daha küçük ölçekli bir eser ortaya koyması, onun arayışlarının mekânsal büyükle ilgili olmadığını gösterir.

Mimar Sinan'ın Şehzade Mehmet, Süleymaniye, Selimiye üçlemesinde gelişimi net bir şekilde kubbede kendini gösterir. Bu üçlemede kubbenin sistematik bir biçimde büyümesi, onun kubbe, yani örtü konusuna özellikle eğildiğini göstermektedir. Çünkü kubbe çapı büyüdükçe kubbenin mekân içindeki izdüşüm alanı, dolayısıyla da ana kubbenin tüm örtü içindeki oranı büyümektedir. Bu durum, Sinan'ın kubbe ile ilgili arayışlarının somut bir göstergesi olarak dikkat çeken önemli bir detaydır.

Kubbeyi taşıyan fil ayaklarının inşası teknik bir zorunluluk olmakla beraber, bu ayaklar mekânın bir bütün halinde görünmesini ve algılanmasını engellemeleri açısından aynı zamanda istenmeyen bir durum da ortaya çıkartırlar. Sinan'ın, Selimiye'de ayak sayısını Şehzade Mehmet ve Süleymaniye'ye göre iki kat artırmış olması, aslında onun taşıyıcı ayak sayısını problem olarak görmediğinin ya da bu

olumsuzluğu başka bir çözüm ile ortadan kaldırabileceğini bildiği için bu noktaya takılmadığının bir kanıtıdır. Sinan Selimiye'de ayak sayısını çoğaltmakla beraber, sekizgen taşıyıcı sistem kullanarak bunları tabiri caizse "göz önünden uzaklaştırması", ayak sayısının -doğru bir çözümleme halinde- önemli olmadığı şeklinde yorumladığını gösterir.

Sinan, Selimiye Camii'nin tasarımında kullanmış olduğu sekizgen sistem ve buna bağlı olarak artırdığı ayakları dış duvarlara daha yakın konumlandırmıştır. Bu yaklaşım, Süleymaniye Camii'nde dört ayakla taşınan örtü sistemi ile karşılaştırıldığında, toplam taşıyıcı taban alanının Selimiye'nin büyük kubbesine rağmen daha küçülmesini sağlamıştır. Bu durum, kubbenin yalnızca statik değil, aynı zamanda estetik olarak da öne çıkmasını amaçlayan bir tercihin sonucudur. Statik bir bakış açısıyla değerlendirildiğinde, eğer Selimiye Camii'nde dört adet fil ayağı kullanılmış olsaydı, her bir taşıyıcının taban alanı, Süleymaniye'deki taşıyıcılardan daha büyük olacaktı. Sinan Selimiye'de ayak sayısını artırarak, iç mekânda karşılaşılabilecek hantal taşıyıcı ayaklardan kaynaklanacak olumsuz estetik etkiyi de ortadan kaldırmıştır.

Selimiye Camii, taşıyıcıların mekâna bakış açısıyla ilgili kısıtlamaları açısından önemli bir farklılık göstermektedir. Mekâna girişteki görsel hakimiyet, mekân algısı bakımından önemli bir faktördür. Ancak Sinan, ikinci anıtsal eseri olan Selimiye Camii'nde -belki de bir zorunluluk olarak- bu özelliği ikinci plana atma eğilimindedir. Bu bağlamda, Süleymaniye Camii'nde Şehzade Mehmet Camii'ne göre kısmi bir gerileme olduğu gözlemlenirken, Selimiye Camii'nde girişe yakın taşıyıcıların sağladığı 96°'lik geniş görüş açısı, diğer iki eserle kıyaslandığında net bir şekilde olumlu fark ortaya koymaktadır. Sinan'ın Şehzade-Süleymaniye-Selimiye cami üçlemesinde, mekâna hakimiyeti en belirgin şekilde sağlayan eser, Selimiye Camii olarak öne çıkmaktadır. Her üç yapı da kubbe altında mekâna hakimiyet açısından farklı özellikler sergilemektedir. Şehzade Mehmet Camii, girişte ve kubbe altında benzer oranda mekân görüşü sunma eğilimindedir. Süleymaniye Camii, fil ayaklarından kaynaklı olarak, büyüklükleri ve konumları itibarıyla diğer yapılar arasında en düşük hakimiyet oranını sunan örnek durumundadır. Selimiye Camii ise geniş görüş açısına sahip girişi ve devasa kubbesi sayesinde, girişten itibaren kubbe altına kadar muazzam bir görüş açısı sunmaktadır. Bu durum, Sinan'ın en önemli hedeflerinden birinin bu mekânsal hakimiyeti elde etmek olduğunu açıkça ortaya koymaktadır. Sinan, Selimiye'de sanat yaşamında zirveye ulaştığı büyük kubbesiyle öne çıkarken, bu kubbeyi taşıttığı sekizgen baldaken sistemiyle de mekân bütünlüğünü mükemmel bir biçimde ortaya koymuştur.

Sanatla Örülen Mimarlık: Ovacık-Kışla Köyü Camii ve Duvar Resimleri

Art-Woven Architecture: Ovacık-Kışla Village Mosque and Wall Paintings

Mehmet MUTLU[1]

Öz

Bu çalışma, Karabük ili Ovacık ilçesine bağlı Kışla köyünde bulunan Kışla Köyü Camii'nin mimari özelliklerini ve zengin duvar resimlerini incelemektedir. Yapı, geleneksel Türk mimarisinin karakteristik unsurlarını barındırmakla beraber, yerel kültürün izlerini de yoğun bir şekilde taşımaktadır. Cami, iki katlı köy odası ile bütünleşik bir yapıya sahiptir. Girişi de köy odasından sağlanan cami, köyün sosyal yapısını ve topluluk ruhunu yansıtan önemli bir mekândır. Yapı mimari detayları, işlevselliği ve estetik unsurları bakımından dikkat çekmektedir. Duvar resimleri, caminin iç mekânını zenginleştiren önemli unsurlardır. Klasik cami içindeki hat levhaları ve dini metinler süslemelerle birlikte görsel bir şölenle sunarken; saat ve halı kompozisyonları, kılıç ve sancak kompozisyonları gibi çeşitli süsleme unsurları, tarihsel ve kültürel bağlamda derin anlamlar taşımaktadır. Bu resimler, sadece estetik bir değer sunmakla kalmayıp, aynı zamanda ibadet ve toplumsal kimliğin pekişmesine de katkıda bulunmaktadır. Kışla Köyü Camii, sadece bir ibadet yeri değil, aynı zamanda köyün kültürel mirasını temsil eden önemli bir yapıdır. Duvar resimleri, yerel sanat anlayışını yansıtarak, ziyaretçilere hem görsel bir deneyim hem de köyün tarihi ve kültürel geçmişi hakkında derin bir bakış açısı sunmaktadır. Bu makale, caminin mimari detaylarını ve iç mekânındaki sanatsal unsurları derinlemesine inceleyerek, Kışla Köyü Camii'nin sanatla örülen mimarlık anlayışını ortaya koymayı amaçlamaktadır.

Anahtar Kelimeler: Ovacık, Kışla Köyü, duvar resmi, cami, halk mimarisi.

ABSTRACT

This study examines the architectural features and rich wall paintings of the Kışla Village Mosque located in Kışla village, within the Ovacık district of Karabük province. The structure embodies characteristic elements of traditional Turkish architecture while also bearing strong traces of local culture. The mosque is integrated with a two-story village room, and its entrance is accessed from this room, making it an important space that reflects the social structure and communal spirit of the village. The building is noteworthy for its architectural details, functionality, and aesthetic components. The wall paintings are significant elements that enrich the interior of the mosque. The calligraphic panels and religious texts within the classic mosque setting are presented alongside decorative elements, creating a visual feast. Various ornamental features such as clocks and carpet compositions, as well as sword and flag motifs, carry profound meanings in historical and cultural contexts. These paintings not only offer aesthetic value but also contribute to the reinforcement of worship and social identity. The Kışla Village Mosque is not merely a place of worship; it is also an important structure that represents the cultural heritage of the village. By reflecting local artistic sensibilities, the wall paintings provide visitors with both a visual experience and deep insights into the village's historical and cultural background. This article aims to explore the architectural details of the mosque and the artistic elements within its interior, thereby revealing the understanding of architecture intertwined with art in the Kışla Village Mosque.

Keywords: Ovacık, Kışla Village, wall painting, mosque, folk architecture.

GİRİŞ:

Türk sanatında mimari unsurlar, tarihsel süreç boyunca çeşitli kültürel ve sanatsal etkilerle şekillenmiş ve gelişmiştir. Bu etkiler, coğrafi, toplumsal ve dini faktörlerin etkisiyle farklı bölgelerde özgün biçimler kazanmıştır. Kırsal mimaride, özellikle camilerde görülen duvar resimleri, bu özgün yapının en dikkat çekici unsurlarından biridir. Bu tür resimler, halkın sanatsal zevklerini ve dini duygularını yansıtmanın yanı sıra, dönemin estetik anlayışını da ortaya koyar. Geleneksel malzeme ve tekniklerle hayata geçirilen kırsal camilerdeki süslemeler, yerel ve evrensel unsurların birleşimiyle oluşmuş benzersiz bir görsel dil oluşturmuştur.

Türklerin resim sanatına olan ilgisi, tarihsel olarak Orta Asya'ya kadar uzanmaktadır. Uygurlar'ın "bezeklik" olarak adlandırılan ve hem kitap minyatürlerinde hem de duvar resimlerinde kendini gösteren sanat anlayışı, Türk resim sanatının ilk önemli örnekleri arasında sayılmaktadır (Arseven, 1956: 61-65; Keskiner, 2008: 9). Bu resimler, dini ve sosyal mekânların süslenmesinde sanatsal bir ifade aracı olarak kullanılmıştır. Türkler'in İslamiyet'i kabulüyle birlikte resim sanatındaki bu gelenek, İslam estetiği ve inanç sisteminin etkisiyle yeniden biçimlenmiştir. Selçuklu Dönemi'nde ise özellikle cami mimarisinde geometrik ve bitkisel motiflere dayalı süslemeler önemli bir yer tutmuş, figüratif tasvirlerden kaçınılması ise İslam sanatının karakteristik özelliklerinden biri olarak ortaya çıkmıştır. Kırsal mimaride de bu süsleme anlayışı devam etmiş ve duvar resimleri bu yapılar için hem sanatsal hem de dini bir anlatım biçimi olarak kullanılmıştır.

Osmanlı İmparatorluğu'nda duvar resimlerinin kırsal mimaride yer bulması, 18. yüzyıldaki Batılılaşma hareketleriyle birlikte hız kazanmıştır. Osmanlı sanatında Batılılaşma'nın başladığı dönem olarak kabul edilen Lâle Devri (1718-1730), mimariden resim sanatına kadar birçok alanda yeniliklerin yaşandığı bir süreç olmuştur (Eyice, 1996: 284; Özcan, 2003: 81-84). Bu dönemde, Avrupa sanatının etkisiyle İstanbul'dan başlayarak Anadolu'ya yayılan bir duvar resmi geleneği oluşmuştur. İlk örnekleri 18. yüzyılın ikinci yarısında görülen bu resimler, genellikle yaş sıva üzerine kalem işi tekniğiyle uygulanmıştır (Erzen, 1997: 488-489). Kare ve dikdörtgen panolar içine yerleştirilen bu tasvirler, daha çok iç mekân süsleme unsuru olarak karşımıza çıkmaktadır.

Kırsal camilerdeki duvar resimleri, Osmanlı sanatının yerel ile evrensel arasında kurduğu köprünün önemli bir örneğidir. İstanbul'daki etkileyici uygulamalardan esinlenen bu resimler, Anadolu'nun kırsal bölgelerinde hem dini hem de sanatsal bir anlam kazanmıştır. Kâbe, cennet ve cehennem tasvirleri, şehir manzaraları ve çeşitli ikonografik unsurlar, bu resimlerin temel temalarını oluştururken; bu eserler aynı zamanda halkın dini bilincini ve görsel kültürünü şekillendirmiştir. Sanatçısı genellikle bilinmeyen bu eserler, mimari yapının ruhunu güçlendiren ve dini mekânlara mistik bir atmosfer kazandıran önemli unsurlar olarak değerlendirilmiştir (Tercanlı, 2020: 374).

Kırsal mimarideki bu duvar resimlerinin tarihsel arka planı, Osmanlı İmparatorluğu'nun sanatsal birikimiyle yakından ilişkilidir. Geleneksel Uygur sanatından başlayarak Osmanlı'ya kadar uzanan bu süreç, resim sanatının mimarideki rolünü sürekli olarak geliştirmiştir. Anadolu'nun kırsal kesimlerinde görülen bu yapılar, yerel halkın yaşamına dokunan, günlük hayatlarına dini ve estetik bir boyut kazandıran eserlerdir. 1900'lü yılların başına kadar süren bu gelenek, özellikle kırsal camilerde varlığını sürdürmüş olup, bugün de bu yapıların önemli birer parçası olarak dikkat çekmektedir.

Mimari yapılarda kullanılan duvar resimleri, Türk sanatının önemli bir parçasıdır. Duvar resimleri, sadece estetik bir değer değil, aynı zamanda ait olduğu topluma has kültürel bir bellek ortaya koyar. Türk sanatında duvar resimlerinin rolü, geçmişin izlerini günümüze taşırken, aynı zamanda yeni nesillere de ilham kaynağı olmaktadır.

Çalışmamızın konusu olan Kışla Köyü Camii, Karabük ili Ovacık ilçesi, Kışla köyünde bulunmaktadır. Bölge, tarih öncesi dönemlerden beri yerleşim almış olup, Roger Matthews, 1998 yılında "Paflagonya Projesi" çerçevesinde yürüttüğü araştırmalarla, bölgedeki ilk yerleşimlerin MÖ 3000-2000 yılları arasındaki erken Tunç Çağı'na ait olduğunu ortaya koymuştur (Çetin, 2019). Hititler Dönemi'nde "Yukarı Ülke" olarak adlandırılan (Akurgal, 1998) geniş bölge içinde yer alan Ovacık, Hititler'in

çöküşünden sonra Frigler, Lidyalılar ve Paflagonyalılar arasında paylaştırılmış, daha sonraki süreçte de Paflagonyalılar'ın kontrolüne girmiştir (Sevin, 1999).

1071 Malazgirt Zaferi ile Anadolu'ya gelen Türkler, Paflagonya Bölgesi'nde de yayılma göstermiştir. Kuzeybatı Anadolu'nun Türk hakimiyetine girmesi, 11. yüzyıl sonları ve 12. yüzyıl başlarına denk gelen bir dönemde gerçekleşmiştir (Ersoy, 2011). Emir Karatekin, 1082 yılında Ovacık'ın da yer aldığı bölgeyi fethederek Türk egemenliğini tesis etmiştir (Sakaoğlu, 1987). Takip eden dönemlerde, Danişmentliler, Çobanoğulları ve Umuroğulları gibi beyliklerin yönetiminde kalan bu bölge, Candaroğlu Beyliği döneminde 1389 yılında Osmanlı İmparatorluğu'nun hakimiyetine girmiştir. Ancak, Candaroğlu ve Osmanlı arasındaki çekişmeler devam etmiş, bu nedenle bölge birkaç kez el değiştirmiştir. Nihayet 1423 yılında Karabük ve çevresi kesin olarak Osmanlı idaresine geçmiştir (Ersoy, 2011).

Cumhuriyet döneminde Ovacık, Çankırı ilinin Çerkeş Kazası'na bağlı bir nahiye olarak varlığını sürdürmüştür. 1959 yılında ilçe statüsü kazanarak Çankırı'ya bağlanmış, 1995 yılında ise Karabük'ün il olmasıyla birlikte idari olarak Karabük iline bağlı bir ilçe haline gelmiştir (Çetin ve Mutlu, 2021a).

Köy odası, Anadolu'nun sosyokültürel tarihine derinlemesine işlemiş, misafirperverlik ve toplumsal dayanışmayı somutlaştıran özgün bir mekân tipolojisidir. İlk örneklerine Selçuklu ve Osmanlı dönemlerinde rastlanan köy odaları, kırsal toplumun sosyal, kültürel ve dini ihtiyaçlarını karşılamak üzere inşa edilmiştir. Fonksiyonel açıdan, köy halkının ortak kullanımına tahsis edilen bu yapılar, hem yolcuların ve misafirlerin konakladığı bir dinlenme mekânı hem de köy içi karar alma süreçlerinin gerçekleştiği bir toplantı merkezi olarak hizmet vermiştir. Özellikle 19. yüzyılda Osmanlı taşrasında yaygınlaşan köy odaları, yerel malzeme ve tekniklerle inşa edilerek geleneksel mimari pratiklerin sürdürücüsü olmuştur. Ahşap, taş ve kerpiç gibi doğal ve erişilebilir yapı malzemeleriyle tasarlanan bu yapılar, aynı zamanda dönemin estetik ve işlevsel gereksinimlerine yanıt veren mimari birer prototip olarak değerlendirilebilir.

Çalışmamızın konusu olan Kışla Köyü Camii, Karabük ili Ovacık ilçesi, Kışla köyünde bulunmaktadır. Ovacık ilçesi ve çevresindeki köylere dair yapılan bilimsel araştırmalar son derece sınırlıdır. Bu konuda gerçekleştirilen çalışmalar, ancak son zamanlarda literatürde yer bulmaya başlamıştır. Çalışmamıza konu olan Kışla Köyü Camii ne mimari özellikleriyle ne de yapının en önemli özelliği olan süsleme özellikleriyle günümüze kadar hiçbir bilimsel çalışmada konu edilmemiştir.

Anadolu'da kırsal mimari örneği olarak dikkati çeken bazı yapılarla ilgili olarak yapılmış, benzer konuları ele alan çalışmalar mevcuttur. Kuyulu (1990) tarafından yapılan ve Kırkağaç Çiftehanlar Camii'ni konu alan çalışma; Rüçhan (1998) tarafından hazırlanan Osmanlı Sanatında Duvar Resimleri konulu çalışma, Okçuoğlu (2000) tarafından hazırlanan 18. ve 19. yüzyıllarda Osmanlı Duvar Resimlerinde Betimleme Anlayışı isimli doktora tezi, Şener (2011) tarafından hazırlanan 18. ve 19. yüzyıllarda Anadolu Duvar Resimleri isimli doktora tezi, Yıldırım'ın (2013) Burhaniye Şahinler Köyü Camii Duvar Resimleri çalışması; Katrancı-Kasalı'nın (2019) Sinirli Köyü Camii Duvar Resimleri isimli çalışması; Eryılmaz ve Özgür Yıldız'ın (2020) Kışlak Eski Camii ve Ahatlar Camii konulu çalışması; Gürbıyık'ın (2020) Demirci Küpeler Köyü Camii Duvar Resimleri isimli çalışması; Tercanlı'nın (2020) Koca Seyfullah Camii ve Koçer'in (2024) Marmaracık-Köylüce-Kızılca Köyleri (Demirci-Manisa) Camileri ve Boyalı Süslemeleri isimli çalışmaları bu çalışmalara örnek gösterilebilir.

Kışla Köyü Cami, Ovacık ilçesindeki bazı ibadet yapılarında görüldüğü gibi bir köy odası ile yakın irtibatlı olarak, odaya entegre biçimde inşa edilmiştir. İlçede bu yapı dışında benzer özellikte inşa edilmiş farklı örnekler de bulunmakla beraber, Kışla Köyü Camii mekânsal büyüklüğünün yanı sıra iç mekânını süsleyen duvar resimleriyle çevredeki benzer örneklerden ayrılmaktadır. Yapı, kırsal yerleşimlerdeki geleneksel mimari yapılarının özgün bir temsilcisi olarak değerlendirildiği için bu çalışma Anadolu'nun kırsal yerleşimlerini taçlandıran bir örnek olarak, bu alandaki literatüre katkı sunulması amacıyla yapılmıştır. Çalışma kapsamında eserin, mimari özelliklerinin yanı sıra süsleme özellikleri de

incelenmiştir. Eserin rölöve planları çıkartılmış, fotoğrafla belgeleme çalışmaları gerçekleştirilmiş, ilçenin faklı mahallelerinde bulunan benzer özellikteki yapıların planları da çalışmaya dahil ederek eserin ünik mimari ve süsleme özellikleri ortaya konulmaya çalışılmıştır. Çalışmanın son bölümünde ise genel bir değerlendirme yapılarak çalışma tamamlanmıştır.

1. Mimari Özellikler

1.1. Köy Odası Bölümü

Yapının kuzey kanadı köy odası, güney kanadı ise cami olarak düzenlenmiştir. Yapı doğu-batı yönünde hafif eğimli bir arazi üzerine inşa edilmiştir. Caminin güney ve batı yönleri yol cephesine açılmakta, kuzey ve doğu cepheleri ise binanın neredeyse sınırından başlayan sık ağaçlıklı araziye yönelmektedir. (Şekil 1).

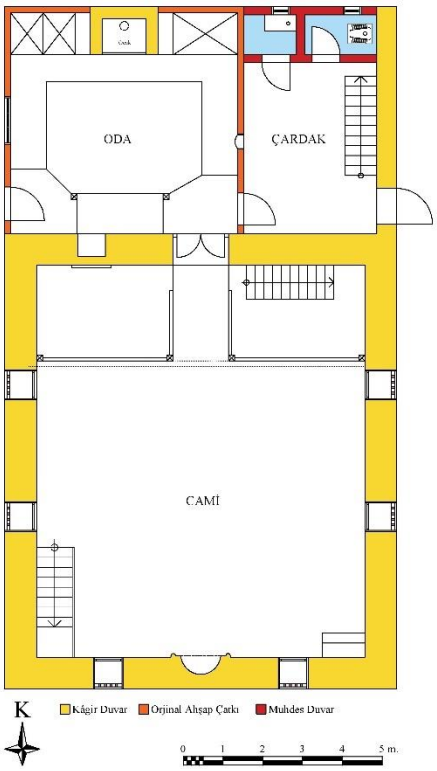
Güneyden görünüm



Şekil 1. Kışla Köyü Camii (ve Köy Odası) Batı, Güney ve Kuzey Yönden Görünümler

Camiye doğrudan giriş bulunmayıp, doğu ve batı cephelerinde bulunan kapılarla öncelikle köy odası olarak düzenlenmiş bulunan bölümün zemin katına girilmekte ve iki mekânlı bu kısmın oda bölümünün güney duvarına açılmış kapıyla caminin harim mekânına giriş sağlanmaktadır. Üst kattaki odanın camiye açılan kapısından ise ibadethanenin fevkaniye kısmına, kadınların ibadeti için tahsis edilmiş olan kadınlar mahfiline ulaşılmaktadır (Şekil 2).

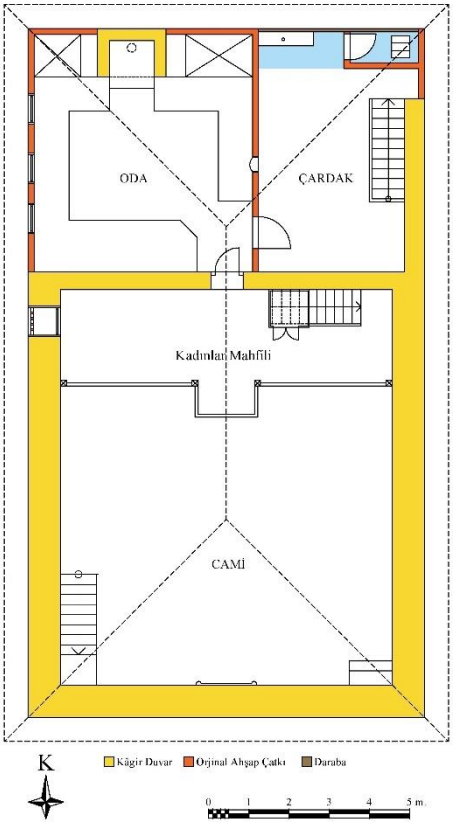
Köy Odası olarak değerlendirilen kısım dıştan dışa yaklaşık olarak 9,85 x 5,85 m ölçülere sahiptir. Doğudaki tek kanatlı kapı ile köy odası bölümünün çardak kısmına giriş sağlanırken, batıdaki tek kanatlı kapı ile iki mekânlı zemin katın oda kısmına ulaşılmaktadır. Odaya girişin sağlandığı batı duvarında giriş kapısının kuzeyinde mekânı aydınlatan pencere yer almaktadır. Geleneksel Türk konut mimarlığının tipik oda özelliklerini taşıyan bu odanın kuzey duvarının ortasında ocak bulunmaktadır. Ocağın her iki tarafında ikişerli gruplar olarak düzenlenen ahşap nişler yer almaktadır. Nişler, tepe kısımları sivriltilmiş at nalı kemer formuna sahip dikdörtgen hücreler olarak yapılmıştır. Bu duvar üzerinde, ocağın doğusunda gusülhane, batısında ise yüklük ile bir adet gömme dolap bulunmaktadır (Şekil 2).

Odanın güney duvarını, caminin kâgir malzemeli kuzey duvarı oluşturmaktadır. Bu kısımda bulunan iki kanatlı ahşap bir kapı ile caminin harim mekânına giriş sağlanmaktadır. Odanın doğusunda bulunan ve oda ile çardağı ayıran ahşap çatkılı duvar üzerinde yer alan bir kapı ile zemin kattaki oda ve çardak birimleri birbirine bağlanmıştır. Bu iki mekânı bölen duvarda, bölgede sivil mimarlık yapılarında sıklıkla kullanılan ve “gözgöre” adı verilen özel küçük pencere bulunmaktadır (Şekil 2). Bu pencere, burada bulunan gaz lambasının her iki mekânı da aynı anda aydınlatması amacıyla kullanılmaktadır (Çetin, 2019 :25). Diğer birimlere geçilen kapı ve ocak hariç, oda sedirle çevrelenmiştir.

Köy odasının zemin katındaki iki bağımsız mekândan birisi olan çardak birimine bu odadan ulaşılabildiği gibi, doğu cephede bulunan bağımsız bir kapı ile çardak mekânına yapının doğu cephesinden de giriş bulunmaktadır. Çardak mekânının kuzey tarafında muhdes ıslak hacimler yer almaktadır. Bu kısımda düzenlenen iki küçük bağımsız birimden doğudaki tuvalet, batıdaki ise lavabo olarak değerlendirilmiştir (Şekil 2).

Şekil 2. Kışla Köyü Camii (ve Köy Odası) Zemin Kat Planı

Zemin kat çardak mekânının doğu duvarına bitişik inşa edilmiş 10 basamaklı ahşap merdivenle üst katın çardak mahalline ulaşılmaktadır.



Üst katın çardak mekânının kuzey tarafı yine ıslak hacim olarak düzenlenmiştir. Alt kattaki muhdes ıslak hacim düzenlemesinin aksine bu kattaki ıslak hacimler özgündür. Tuvalet, geleneksel Ovacık sivil mimarlık yapılarının ıslak hacim özelliklerini taşımaktadır. Tuvalete giriş sağlanan bölümde yer alan lavabo da özgün malzeme özelliğini korumaktadır. Bu kattaki çardak mekânının ıslak hacimlerin bulunduğu kuzey cephesi, havalandırma sağlamak amacıyla tahtaların aralıklı olarak düşey yönde çakılması ile oluşturulan ve yörede "daraba" olarak isimlendirilen teknikle yapılmıştır (Şekil 3).

Şekil 3. Caminin Köy Odası bölümünün 2. katında özgün ıslak hacim

1. katta da çardak ve odayı ayıran ortak duvarda, odaya geçişi sağlayan kapının yanı sıra, alt katta olduğu gibi gözgöre penceresi yer almaktadır. Bu kattaki oda da yine alt kattaki oda gibi tipik Türk konutunun oda özelliklerini taşımaktadır. Kuzey duvarda yer alan ocağın batı tarafında üçlü sıralanmış niş düzenlemesi dikkati çekmektedir. Ocağın doğu tarafındaki nişler, bir kapak ile kapatılarak dolap haline getirilmiş, niş ve dolapların yanları da yüklük olarak değerlendirilmiştir. Oda, batı duvarında bulunan üç adet pencere ile aydınlatılmaktadır. Ocağın önü ve kapıların bulunduğu köşe dışında odayı

çepeçevre dolanan sedir yer almaktadır (Şekil 4). Odanın kuzey duvarında bulunan kapı, caminin kadınlar mahfiline ulaşmayı sağlamaktadır.

Şekil 4. Kışla Köyü Camii (ve Köy Odası) 1. Kat Planı

1.2. Cami Bölümü

Caminin harim mekânı dikdörtgen planlı olup, içten içe yaklaşık 10,30 x 8,60 m ölçülerindedir. Ovacık Müftülüğü tarafından caminin batı cephesine asılan bilgi levhasında inşa tarihi olarak 1905 bilgisi verilse de harim mekânına girilen iki kanatlı kapının harim tarafının üst kısmında kapı genişliğince ve celi tarzda Arapça yazılmış kitabede *"Sene 1370"* ibaresi yer almaktadır (Şekil 15). Hicri takvime göre verilen bu tarih, Miladi olarak 1950-51 yıllarına tekabül etmektedir. Caminin karakteristik mimari özellikleri ve malzeme nitelikleri, eserin daha erken bir dönemde inşa edilme olasılığını güçlendirmektedir. 1 Şubat 1944 günü Bolu-Gerede merkezli yaşanan 7,4 şiddetindeki deprem yakın çevreyi de fazlaca etkilemiştir (Özçelik, 2017: 95; 2022: 3071-3072; Turhan Sarıköse, 2020: 74-75). Herhangi bir yazılı bilgi bulunmamakla beraber, yapının bu depremden etkilenmiş olması ve yaşanan bu depremden yaklaşık 6-7 yıl sonra geniş çaplı bir onarımdan geçirilerek bu onarım tarihinin kayda geçirilmiş olması muhtemeldir.

Alt kattan harim mekânına girilen kapının doğu tarafına kadınlar mahfiline çıkan 11 basamaktan oluşan ahşap merdiven konumlandırılmıştır. Giriş ekseninde mihrabın yer aldığı camide, kıble duvarının batı tarafında ahşap minber, doğu tarafında ise ahşap vaaz kürsüsü yer almaktadır. Harimi aydınlatan altı adet pencereden iki tanesi mihrabın yanlarına açılmıştır (Şekil 5). Diğer dört adet pencere ise doğu ve batı duvarlarına karşılıklı, simetrik olarak konumlandırılmıştır. Pencerelerin dış kısımlarında ahşap malzemeli, kare kesitli düşey konumlandırılmış parmaklıklar bulunmaktadır. Camideki tüm pencereler giyotin pencere olarak yapılmıştır. Doğu duvarının kuzey tarafında bulunan pencere hariç tüm pencereler yatayda üç, dikeyde ise iki bölümlü olarak altı parça halinde bölümlenmiştir. Harimin doğu, batı ve güney duvarları, resimlerle tezyin edilmiştir. Doğu duvarının kuzey tarafında bulunan pencere de yine 6 bölümlü olarak yapılmış olmakla beraber, 3 bölümü daha küçük bölümlere ayrılarak çok sayıda küçük camlı yüzeylere dönüştürülmüştür (Şekil 5).

Harim mekânından genel görünüm

Doğu duvarında bulunan pencereler

Şekil 5. Kışla Köyü Camii harimi ve doğu duvarından ayrıntı

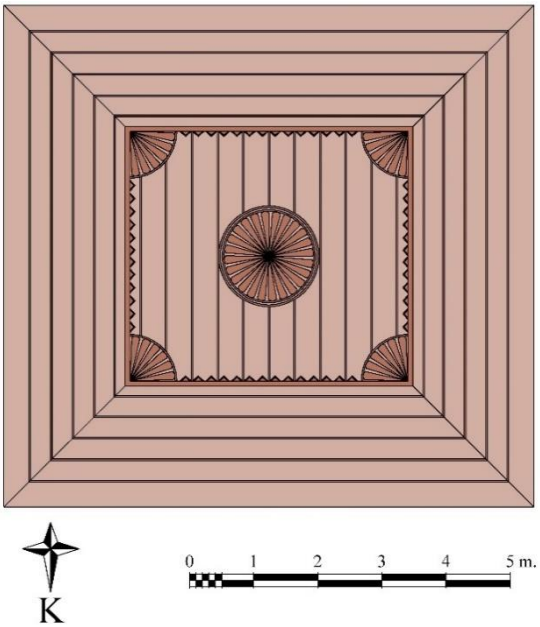
Mihrap, üstte basit bir basık formlu kemerle sonlanmakta olup, mihrap nişinin kavsara kısmı tonoz olarak geçilmiştir. Kemerin kilit taşı kısmına kabartma tekniğinde yapılmış üç yapraklı bitkisel motif yerleştirilmiştir. Kemer, bu motifin olduğu kısımda dışa bir miktar taşırılarak hareketlendirilmiştir. Kemerin üst orta kısmına sütunce üst başlıklarıyla aynı özellikte bir düzenleme yapılmış ve bunun üst kısmına da bir hilal yerleştirilmiştir. Mihrap her iki yanından dairesel sütuncelerle sınırlandırılmıştır. Alt başlığa oturan sütunceler, üst kısımda dairesel üst başlıktan sonra kademeler halinde daralarak sonlanmaktadır (Şekil 6).

Mihrap

Minber

Vaaz kürsüsü

Şekil 6. Caminin mihrap, minber ve vaaz kürsüsünün genel görünümü



Caminin ahşap minberi, oldukça sade görünümde bırakılmıştır. Yan aynalığı kenarları profilli kapak tahtaları ile oluşturulan minberin korkuluk kısmı da yan aynalıkla bütünleşik imal edilmiştir. Dört yüzeyli konik külah kısmı, üzerine yerleştirilen ahşaptan yapılmış alemiyle tavan kotuna kadar uzanmaktadır. Külah bölümünden köşk kısmına geçiş geniş ahşap silmelerle sağlanmaktadır. Köşkün güney cephesi yekpare ahşap malzemenin içinin geometrik formda boşaltılmasıyla oluşturulmuş ve bu bölüm çıtalarla çerçeve içine alınmıştır. Mihrabın şerefe (taht) altı olarak tanımlanan bölümünde (Arbaş, 1992: 106) yine çıtalarla oluşturulmuş dikdörtgen panonun içi boş bırakılmıştır. En alt bölüm ise yine dışı çıtalarla çerçeve içine alınmış bir kapı olarak düzenlenerek minberin altında oluşan küçük alana giriş sağlanmıştır (Şekil 6).

Minberin kuzey tarafındaki kapı düzenlemesinin üst kısmı yekpare ahşap malzeme ile basık kemerli formda düzenlenmiştir. Kemerin üzerinde çıtalarla sınırlandırılmış olan dikdörtgen formlu panonun içi boş bırakılmıştır. Yarım daire formlu taçlık kısmı da yekpare ahşaptan ajur tekniğinde kesilerek basit bir biçimde hareketlendirilmiştir. Minberin kapı söveleri her iki yanda yükseltilerek, stilize minare şeklinde sonlanmaktadır (Şekil 6).

Caminin doğu ve güney duvarlarının kesiştiği köşesine ahşap vaaz kürsüsü yerleştirilmiştir. Masif ahşap malzemeli kürsünün batı yönünde, içi boş bırakılmış, dış kenarları profilli çerçeveli dikdörtgen bir ahşap

pano yer almaktadır. Bu yönünde, içbükey ve dışbükey kıvrımlarla yukarıya doğru genişleyerek form alan vaaz kürsüsünün kuzey cephesi çıtalar çakılmak suretiyle oluşturulmuştur (Şekil 6).

Caminin tavanı ahşap kaplamalıdır. Tekne tavan şeklinde kademelenerek daralan tavanın merkezine 30 dilimden meydana gelen dairesel formlu tavan göbeği yerleştirilmiştir. Tavan göbeğini oluşturan dairesel geometrik süsleme, çeyrek daire kompozisyona bölünmüş olarak tavanın köşelerinde de kullanılmıştır. Tavanın ortadaki düz kısmı ile son kademeyi yapan tekne kademelenmesinin yan yüzeyi çıtalarla oluşturulan küçük üçgenlerle hareketlendirilmiştir. Tavanın geometrik süslemelerle zenginleştirilen orta kısmı, kuzey-güney doğrultusunda birleşme kısımları çıtalarla kapatılmış ahşapla kaplanmıştır (Şekil 7).

Şekil 7. Kışla Köyü Camii'nin harim bölümünün ahşap süslemeli tavan planı

Yapının köy odası bölümünün üst katındaki odadan ulaşılan fevkani kadınlar mahfili yaklaşık 2,40 m genişliğindedir. Doğu, batı ve kuzey yönlerinde cami duvarlarına oturan mahfili, harim yönünde ikisi yan duvarlara bitişik, diğer ikisi ise orta kısımda bulunan kare kesitli dört adet ahşap sütun taşımaktadır. Sütunların üst kısımları yan sütunlarda harime, orta sütunlarda ise her iki yana doğru genişleyecek şekilde başlıklara sahiptir. T şeklinde profilli sütun başlıklarının ön ve arka yüzeyleri ahşap kaplanmışken, yanlardaki profilli yüzeyler ise, vaaz kürsüsünde de olduğu gibi ince çıtalar çakılmak suretiyle yapılmıştır. Kadınlar mahfilinin orta bölümünde harime konsol biçiminde uzanan 165 cm genişliğe, 70 cm uzunluğa sahip bir balkon bulunmaktadır. Kadınlar mahfili, batı cephelerine açılmış, tavan yüksekliğinden başlayan bir pencere ile aydınlatılmaktadır (Şekil 4-8).

Şekil 8. Kadınlar mahfilinin harimden görünüşü

Yapının cepheleri oldukça sade görünümdedir. Yapının en hareketli cephesini oluşturan batı cephesinin ilk kat seviyesinde harim bölümünü aydınlatan iki adet pencerenin yanı sıra köy odasına girişi sağlayan bir kapı ve kapının kuzey tarafında da odayı aydınlatan bir adet pencere bulunmaktadır. Cephenin ikinci kat seviyesinde ise harim kısmının kadınlar mahfili bölümüne açılan bir pencere ile köy odasının ikinci kat mekânını aydınlatan üçlü bir pencere düzenlemesi yer almaktadır (Şekil 1, 2, 4). Doğu cephesinde ise harim kısmının ilk kat seviyesinde, batı cephesindeki pencerelere simetrik olarak yerleştirilmiş iki adet pencere yer almaktadır. Yapının bu cephesinde, kuzey tarafta bulunan kapı ile, köy odası kısmının çardak bölümüne giriş sağlanmaktadır (Şekil 2, 4).

Yapının yola bakan güney cephesi cami bölümüdür. Bu cephenin ilk kat seviyesine açılmış olan simetrik iki adet pencere, caminin harim mekânını aydınlatmaktadır (Şekil 1, 2, 4). Köy odasının meydana getirdiği kuzey cephe ise özgününde sağır olmakla beraber, günümüzde zemin kattaki muhdes ıslak hacimlerin pencerelerinin bu cepheye açıldığı görülmektedir (Şekil 2).

Eserin köşelerinde pencerelerin alt hizasından başlayarak saçak altına kadar devam eden ahşap dikmeler, sade düzenlenmiş cepheleri hareketlendiren bir uygulama olarak dikkati çekmektedir. Cephede dikkat çeken bir başka husus da pencerelerde bulunan ahşap parmaklıkların günümüzde halen özgün şekilde varlığını sürdürüyor olmasıdır (Şekil 1).

Yapı, karma strüktürle inşa edilmiştir. Eserin cami bölümü kâgir malzemeden inşa edilmişken, köy odası bölümü ise ahşap strüktürlüdür. Cami bölümünde yaklaşık 80 cm genişliğe sahip duvarlar moloz taş malzeme ile örülmüş ve kireç harcı ile sıvanmıştır. Yakın dönemde cephelere yapılan gelişigüzel müdahalelerde çimento kullanıldığı görülmektedir. Köy odası kısmında ise özgün strüktür, ahşap karkas sistemin taşıdığı hımış tekniğidir. Ancak günümüzde zemin katta, çardak kısmının kuzeyindeki ıslak hacimlerde briket, betonarme ve moloz taş kullanılmak suretiyle özgün malzeme dokusunun bozulduğu görülmektedir.

Yapı günümüzde kırma çatı ile örtülüdür. Çatı, kırmızı renge boyanmış oluklu sac levha ile kaplanmıştır (Şekil 1, 4).

2. Duvar Resimleri

Kışla Köyü Camii'nin harim mekânının doğu, batı ve güney duvarları, duvarları süsleyen resimleri ve aynı ustanın kaleminden çıkmış olduğu anlaşılan mahalli üslupla yazılmış hat yazılarıyla dikkat çekicidir (Şekil 9). Mekân içindeki duvar resimlerini konuları bakımından mimari resimler, saat resmi, bitkisel resimler, duvar halısı resimleri, bazı nesnel obje resimleri ve yazılar olarak altı alt başlıkta incelemek mümkündür.

Güney (Kıble) Duvarı | Doğu Duvarı | Batı Duvarı

Şekil 9. Harim mekânının resimlerle süslenmiş duvarları

2.1. Mimari Betimlemeler

Caminin kıble duvarında, mihrabın doğu ve batı taraflarında, kemer hizasında iki adet cami betimlemesi yer almaktadır. Doğu taraftaki caminin ana kubbe ve minareleri görünüş tekniğinde resmedilmişken, yapının ana bölümü ise kesit tekniğinde betimlenmiştir. Dışı siyah renkli kontur çizgileriyle sınırlandırılmış olan caminin döşeme, tavan ve duvarlar bordo renk ile boyanmıştır. Orta kısımda

mihrabın bulunduğu kompozisyonda kahverengi ile boyanan mihrabın her iki yanında geometrik desenli sütunlar resmedilmiştir (Şekil 10).

Resimde, caminin doğu tarafında üzeri kubbe ile örtülü olduğu görülen bir çeşme, lülesinden su akar vaziyette gösterilmiş ve lülenin altına da çeşmede dolmakta olan bir kova resmedilmiştir. Çeşme, beyaz renge boyanmış ve içi karelerle desenlenmiştir. Mekânın batı tarafında iki adet merdiven görülmekte olup bunlardan birisi yapının dam kısmına kadar devam ederken, diğeri ise yapının yarısında sonlanmaktadır. Mekânın duvar zemini hardal sarısı renk ile renklendirilmiştir. Caminin üst bölümünde, kubbenin her iki tarafına simetrik olarak yerleştirilmiş altı adet minare bulunmaktadır. İkişerli grup halinde farklı yükseklikte resmedilen minarelerden ikisi üçer, ikisi ikişer ve son ikisi de birer şerefeli olmak üzere toplam 12 şerefeli olarak betimlenmiştir. Minarenin gövde kısımları da çeşmede olduğu gibi beyaz zemin üzeri karelerle süslenmiş olarak gösterilmiştir. Minarelerde bulunan şerefelerin tamamı siyah renge boyanmıştır. Minarelerin üst kısımları ay-yıldız şekilli alemle sonlanırken, caminin kubbesi alemsiz olarak resmedilmiştir. Mekânın dış kısmına, her iki tarafında konumlandırılan servi ağaçları ile kompozisyon tamamlanmıştır (Şekil 10).

Mihrap nişinin batı tarafındaki cami, doğudakine göre daha farklı resmedilmiştir. Doğu taraftaki cami ile aynı büyüklükte olmakla beraber, caminin ana mekânının içine, mahalli üsluplu bir hat ile Arapça olarak besmele yazılmıştır. Mekânı sınırlayan döşeme, tavan ve duvar renkleri ile zemin rengi, doğuda resmedilmiş olan cami ile aynıdır. Caminin üst örtüsü, birisi ana kubbe olmak üzere her iki tarafa simetrik olarak yerleştirilmiş toplam beş adet kubbeden meydana gelmektedir. Ana kubbe yeşil, diğer kubbeler ise bordo ve lacivert renklerle renklendirilmiştir. Doğudaki camide olduğu gibi, bu caminin kubbeleri de alemsiz resmedilmiştir. Camide aynı büyüklükte dört adet minare yer almakta olup, her birisinde üçer tane olmak üzere toplam 12 adet şerefe bulunmaktadır. Minarelerin tamamının tepesinde ay-yıldızlı alem mevcuttur. Minarelerin çizim tekniği, doğudaki caminin minareleriyle aynıdır. Bu camide de yapının dışında, her iki yanına resmedilmiş servi motifleri yer almaktadır (Şekil 10).

2.2. Saat Betimlemesi

Caminin kıble duvarının doğu tarafında büyükçe bir sarkaçlı saat resmi yer almaktadır. Dikdörtgen formlu kasasının düzenlemesi, cami resimlerinin mekân betimlemeleri ile aynıdır. Dairesel zemine sahip saatin rakamları Arapça olarak yazılmıştır. Rakamların bulunduğu zeminde 5 rakamının olduğu kısma yakın dairenin içinde ise saniye bilgisini veren iç kadran yer almaktadır. Zamanı 12.10 olarak gösteren saattin alt kısımda, orta bölümde sarkaç, sarkacın her iki yanında ise uçları tutamaklı kurma zincirleri bulunmaktadır (Şekil 10).

Cami betimlemeleri

Saat betimlemesi

Şekil 10. Güney (Kıble) duvarı üzerinde cami ve saat betimlemeleri

2.3. Bitkisel Betimlemeler

Harimde en yoğun kullanılan süsleme unsuru bitkisel betimlemeler olmakla beraber, bunların çoğu birbirini tekrar eden resimlerdir. "Cami Takımı" adı verilen (Berk, 2021: 463) ve Allah, Muhammed, Ebubekir, Ömer, Osman, Ali, Hasan ve Hüseyin isimlerinin yazılı olduğu; çiçeğin kuşbakışı görüntüsünün üsluplaştırılmasıyla elde edilen penç motifi biçiminde şekillendirilen kompozisyonlar, bu düzenlemeyi dıştan kollarının içine alan bitkisel motiflerle süslenmiştir (Şekil 11).

Doğu duvarının güneye yakın kısmında birbirinin aynısı olarak resmedilmiş iki adet bitkisel motif süslemesinin konusunu hurma ağacı oluşturmaktadır. Hurma ağacı; üç ayaklı, ayak ve boyundan gövdeye doğru genişleyen şişkin gövdeli ve iki yanda kulplu bir vazonun içerisinden yükselmektedir. Gövdesi oldukça ince tutulmuş olan hurma ağacı, merkezinde yukarı doğru uzanan bir adet ve iki yönde aşağıya sarkan üçer hurma dalı; en altta ise hurma meyvesinin bulunduğu kıvrımlı birer dal şeklinde tasvir edilmiştir. Aynı kompozisyon güney tarafta, vaaz kürsüsünün bulunduğu doğu duvarı bölümünde de tekrar edilmiştir (Şekil 11).

Bitkisel süsleme (Batı duvarı) Hurma ağacı (Doğu duvarı) Karanfil (Batı duvarı)

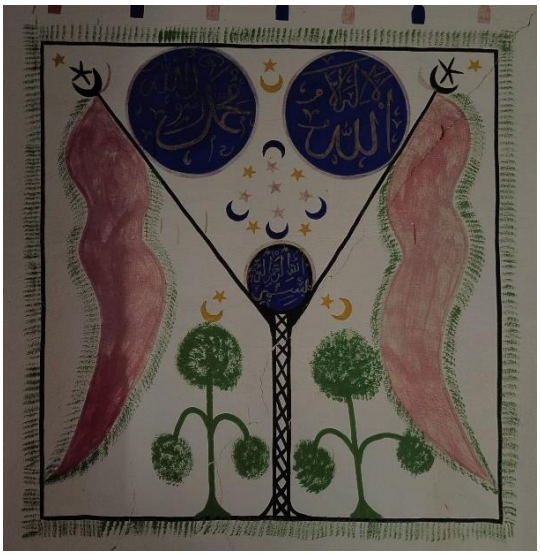
Şekil 11. Harim mekânından resimler.

Harim mekânında bulunan üçüncü süsleme ise çok daha sade olarak yan yana üç ayrı dal olarak resmedilmiş karanfillerdir. Karanfil resimleri batı duvarında, minber ile bu duvar üzerinde bulunan duvar halısı biçiminde resmedilmiş kompozisyonun arasına konumlandırılmıştır (Şekil 9-11).

2.4. Duvar Halısı Betimlemeleri

Caminin harim mekânında altı adet duvar halısı olarak resmedilmiş kompozisyon bulunmakta olup, bunlardan iki tanesi harimin doğu duvarında, iki tanesi harimin batı duvarında, iki tanesi de kadınlar mahfilinde yer almaktadır. Kadınlar mahfilinde bulunan örneklerden bir tanesi doğu duvarı üzerindeyken, diğeri ise kuzey duvarının batıya yakın kısmındadır (Şekil 8-9).

Harim kısmında doğu duvarında bulunan halı resimlerinin ilki, bu cephedeki iki pencere arasında yer almaktadır. İki tarafı püsküllü olarak resmedilen kompozisyonda püsküller gerçekçi görünüme uygun biçimde, aşağı doğru dökümlü olarak gösterilmiştir. Lacivert zemin üzerine, sarı ve siyah renkli çizgilerle oluşturulan çerçevede bordo renkli köşelikler yer almaktadır. Altın sarısı renkte yazılan Arapça metinde Kelime-i Tevhit, *"Lâ ilahe illallah Muhammed'ün Resulullah"* ifadesi yer almaktadır (Şekil 12, 1. görsel).



Bu cephedeki ikinci örnek, duvarın güney tarafındadır. Bu örnek de iki tarafı aşağıya sarkan vaziyette püsküllü olarak resmedilmiştir. Düz çizgilerden oluşan iki sıra halindeki çerçevelerden dıştakinde açık kahverengi-siyah; içtekinde ise mavi-beyaz renkler kullanılmıştır. Yeşil zemin dolgusu olarak resmedilen köşeliklerle bordo renkli zemin, dört adet paralel çizginin oluşturduğu çerçeve ile sınırlandırılmıştır. Göbekteki lacivert geometrik şeklin dışlarına dörderli sıralar halinde noktalar konulmuştur. Göbeğin orta kısmında Arapça olarak altın sarısı renkte yazılan *"Muhammed"* ifadesi silinmeye yüz tutmuş durumdadır (Şekil 12, 2. görsel).

1. Görsel (Harim doğu duvarı)

2. Görsel (Harim doğu duvarı)

3. Görsel (Harim batı duvarı)

4. Görsel (Harim batı duvarı)

5. Görsel (Kadınlar mahfili doğu duvarı)

6. Görsel (Kadınlar mahfili kuzey duvarı)

Şekil 12. Harim ve kadınlar mahfili mekânından duvar halısı biçimli resimler ve yerleri

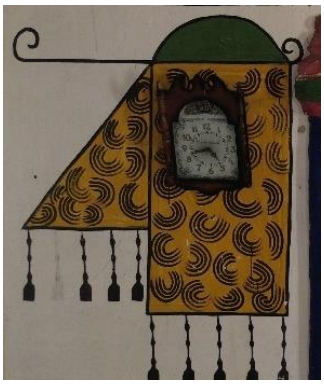
Harim kısmında duvar halısı betimlemesi içeren üçüncü örnek, batı duvarında, minberin basamaklarını bulunduğu kısmın üstünde yer almaktadır. Kare formunda ve dört tarafı da püsküllü resmedilen kompozisyonu meydana getiren unsurlar içinde esas dikkati çeken öge, sancaktır. Sancaklar ortadaki bir ana direğin üzerine belli bir yükseklikte yerleştirilmiş, uç kısımlarına ay-yıldız motifi yerleştirilmiş iki adet sancak direğinde ve bordo renkli olarak resmedilmiştir. Sancak direklerinin sınırlandırdığı ortadaki üçgen alanın üst iki köşesine lacivert tonda iki adet madalyon çizilerek sağdakinin içine Arapça olarak *"Allah Lâ İlahe İllallah"*, soldakinin içine ise *"Muhammedün resûlullah"* ifadesi yazılmıştır. Üçgenin alt köşesinde ise daha küçük çaplı ve aynı renkli madalyonun içinde ise *"Bismillâhirrahmânirrahîm"* yazmaktadır. Alt bölümde ana direğin her iki tarafında yeşil renkle boyanarak elde edilmiş iki adet bitkisel süsleme, kompozisyonda dikkati çeken bir başka ögedir. Bu bitkisel süslemenin hemen üzerine, iç kısma bakışık vaziyette ve sarı renkte iki adet ay-yıldız motifi yerleştirilmiştir. Aynı motif üstteki

madalyonların arasında, yukarıya bakar vaziyette tekrar etmektedir. Kare düzenlemenin üst köşelerinde yine yıldızlar yer alırken, lacivert madalyonların ortasındaki boşlukta ise dört adet siyah renkli ay ile dokuz adet sarı renkli yıldızdan oluşan düzenleme kullanılarak kompozisyon tamamlanmıştır (Şekil 12, 3. görsel).

Batı duvarındaki ikinci halı resmi, pencerelerin arasına konumlandırılmıştır. Harimin doğu duvarındaki 1. görsel ile tamamen aynı şekilde oluşturulan kompozisyonun tek farkı, içinde bulunan hat metnidir. Kompozisyonun içine Fetih Suresi'nin 1. ayeti olan *"İnna fetahnâ leke fethan mûbîna"* ifadesi yine altın sarısı renk kullanılarak yazılmıştır (Şekil 12, 4. görsel).

Camide yer alan halı resmi örneklerinin son ikisi, kadınlar mahfilinde yer almaktadır. Bunların ilki, doğu duvarı üzerindedir. Harim mekânının doğu duvarında bulunan (Şekil 12, 2. görsel) kompozisyonun aynen tekrar edildiği bu resimde, kullanılan renkler farklılaşmaktadır. Bu örnekte düz çizgilerden oluşan iki sıra halindeki çerçevelerden dıştakinde kırmızı-siyah; içtekinde ise diğer örnekte olduğu gibi mavi-beyaz renkler kullanılmıştır. Yine köşeliklerin yeşil zemin dolgusu ile resmedildiği uygulamada kırmızıya çalan renkteki zemin, kırmızı-siyah ve kırmızı-beyaz renklerden ve dört paralel çizgiden oluşan iki ayrı çerçeve ile sınırlandırılmıştır. Göbekteki lacivert geometrik şeklin dışlarına dörderli sıra ile siyah ve beyaz noktalar şaşırtmalı olarak yerleştirilmiştir. Göbeğin orta kısmı boş bırakılmıştır (Şekil 12, 5. görsel).

Kadınlar mahfilindeki diğer örnek ise mahfilin kuzey duvarında, batı köşeye yakın konumda bulunmaktadır. Bu resim de harim mekânının doğu (Şekil 12, 1. görsel) ve batı duvarında (Şekil 12, 4. görsel) bulunan duvar halısı resimleriyle büyük benzerlikler göstermektedir. Buradaki tek fark, üzerinde bulunan metin olup, metinde *"Şefaat ya Resulallah"* ifadesi yazmaktadır (Şekil 12, 6. görsel).



2.5. Nesnel Betimlemeler

Caminin süsleme programını oluşturan nesnel ögeler en üst bölümde perde, doğu duvarı üzerinde bulunan iki adet kılıç ve mihrabın her iki tarafındaki tekstil ürünü süslemesidir.

Caminin örtüsünden hemen sonra başlayan, alt kısmından toplanmış görünümdeki perde deseni, bu kotta tüm harim mekânının doğu, batı ve güney duvarlarını dolanmaktadır. Yarım daire formunda ve iç içe çizilmiş yarım dairelerle verilen perde formunda yarım dairelerin her birinin içlerine bordo renkte irice birer nokta konularak desen oluşturulmuştur. Yarım dairelerin her birinin arasından, ucunda püskül bulunan ipler sarkıtılmıştır. Farklı uzunluklarda sarkıtılan püsküller, ritmik olarak kahverengi ve siyah renklerde boyanmıştır (Şekil 12).

Kılıç betimlemesi
(Doğu duvarı)

Tekstil ürünü betimlemesi
(Güney duvarı)

Üst bölümde perde deseni
(Örtü altı kotu)

Şekil 13. Harimde nesnel konulu resimler

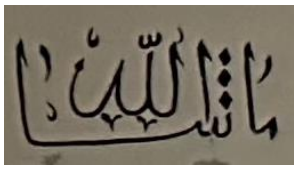
Camideki dikkat çeken nesnel betimlemelerden birisi de kılıçtır. Harim mekânının doğu duvarında bulunan cami takımından *"Ali"* isminin yer aldığı tablonun dışına, simetrik iki adet kılıç resmedilmiştir. Tutamak kısmında birer adet sarkan püskül bulunan kılıcın dış kısımlarındaki ikişer adet dairesel asma bölümü, resimde dikkat çeken bir başka detaydır. Kılıçların sap kısımları sarı, uç kısımları bordo renk ile

ifade edilmiş, uç kısımları küt bırakılmıştır. Püsküllerin rengi ise kuzeydekinde bordo iken, güneydekinde sarı renklidir (Şekil 13).

Kıble duvarının her iki yanına, cami resimlerinin altında, süsleme tekniğinden tekstil ürünü olduğu anlaşılan nesneler resmedilmiştir. Düzenlemede dikdörtgen formlu bir parçaya eklenen üçgen formlu diğer parçanın alt kısmından kademeli olarak sarkıtılmış beşer adet püskül bulunmaktadır. Dikdörtgen bölümün üzeri yeşil renkli yarım daire ile sonlanmaktadır. Hardal sarısı renkle boyanarak oluşturulan zeminin içinde, gelişigüzel serpiştirilmiş, dört sıra halinde iç içe geçen yarım dairelerden oluşan motifler kullanılmıştır (Şekil 13).

2.6. Hat Yazıları

Mihrap nişinin üzerinde, mihrap duvarının doğu tarafındaki saat resminin üzerinde ve harim mekânına açılan iki kanatlı kapının üst kısmında hat yazıları mevcuttur. Ayrıca cami takımı levhaları olarak, Allah, Muhammet, Ebu Bekir, Ömer, Osman, Ali, Hasan ve Hüseyin isimleri, mekândaki yazı programını oluşturmaktadır.



Mihrap ekseninde en üstte Arapça olarak *"lâ ilâhe illallah Muhammedün resûlullah Şefaat ya Resûlallah"* yazılı bir levha bulunmaktadır. Levhanın çerçevesi, cami ve saat betimlemeleriyle aynı teknikte oluşturulmuştur. Yöresel üslup kullanılarak siyah zemin üzerine sarı boya ile yazılan metni çevreleyen çerçevenin batı tarafında, kısa kenar ortasında bir hilal resmi yer almaktadır (Şekil 14).

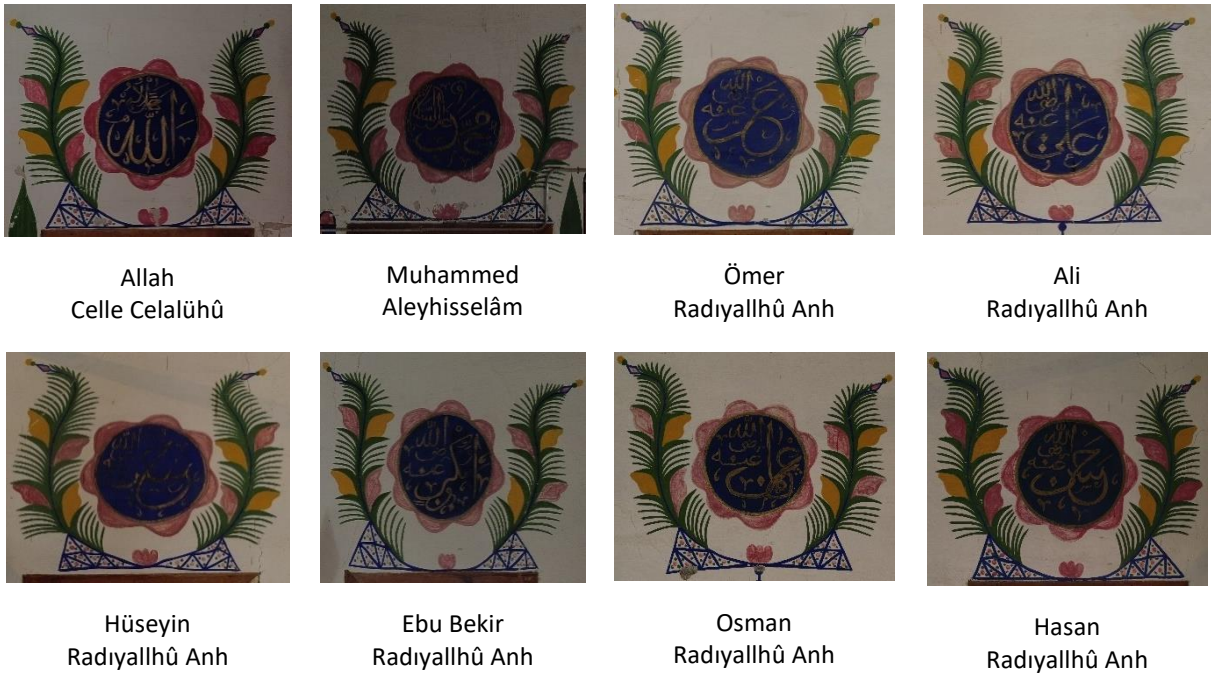
En üst kottaki yazı levhası
(Güney duvarı)

Mihrap ayeti levhası
(Güney duvarı)

Maşallah levhası
(Güney duvarı)

Şekil 14. Harim mekânının kıble duvarında bulunan hat yazıları.

Mihrap nişinin üzerinde camilerde sıkça görülen ve mihrap ayeti olarak bilinen Âli İmran Suresi'nin 37. ayetinin bir bölümü olan *"kullemâ dehale aleyhâ zekeriyyal mihrâbe"* (Kur'an-ı Kerim, 2019: 54) ifadesinin yer aldığı bir levha bulunmaktadır. Çerçeve, zemin ve hat özelliği olarak üstteki örnekle aynı niteliklere sahip levhada, çerçevenin kısa kenarlarının ortasına dışa bakan, karşılıklı birer hilal motifi yerleştirilmiştir (Şekil 14).



Güney duvarında bulunan son hat metni ise duvarın doğu tarafındadır. Bu kısımda resmedilen saatin üzerine, doğrudan duvar zeminine Arapça olarak *"Maşâallah"* ifadesi yazılmıştır (Şekil 14).

Caminin harim mekânına odadan girişi sağlayan iki kanatlı ahşap kapının üzerinde, harim tarafında, kapı genişliğiyle aynı ölçüde tarih bilgisi veren bir kitabe bulunmaktadır. Lâcivert zemin üzerine sarı renkle Arapça olarak yazılan kitabede *"Sene 1370"* ifadesi okunmaktadır (Şekil 15).

Şekil 15. Harim tarafında, giriş kapısının üzerinde yer alan kitabe.

Harim mekânında yazı içeren son örnekler ise hattatlar tarafından "Cami Takımı" olarak isimlendirilen, sekiz ismin yazılı olduğu grubu oluşturan örneklerdir. Tamamı aynı teknikte hazırlanan kompozisyonlarda tek fark, iç kısma yazılan isimlerdir. Yazılar, sekiz yapraklı bir penç motifinin lâciverte boyanmış zemini içine sarı renkli boya ile oluşturulmuştur (Şekil 16).

Şekil 16. Harim mekânındaki cami takımı yazıları

Yazı unsuru içeren çalışmaların hiç birisinde tarih, hattat ya da nakkaş bilgisine rastlanmamıştır.

SONUÇ:

Ovacık ilçesindeki köylerde yer alan geleneksel yapılar, mimari özellikleri, kullanılan malzemeler ve inşa yöntemleri bakımından dikkat çekici özgün örnekler sunmaktadır. Fakat, ekonomik durumlar, değişen yaşam biçimleri, kentleşme ve teknolojik gelişmeler ile hızla azalan nüfus gibi etkenler, bu yapıların günümüzde sürdürülebilirliklerinin sağlanmasını zorlaştırmaktadır (Çetin ve Mutlu, 2021b).

Kışla Köyü Camii, mimari özellikleri ve duvar resimleri ile hem geleneksel hem de yerel unsurları başarılı bir şekilde harmanlayan bir yapıdır. Cami, geleneksel Türk köy camilerinden mimari olarak ayrılmasa da iç mekân düzenlemeleri ve dekoratif unsurlarıyla özgün bir karakter kazanmıştır. Köy odası ile birleştirilmiş bir yapı olması, camiyi sadece ibadet yeri olmaktan çıkarıp köyün sosyal yaşamının bir merkezi haline getirmiştir. Bu, Osmanlı Dönemi'nden günümüze kadar gelen köy odası kavramının sürdürüldüğüne dair önemli bir göstergedir ve caminin topluluk içerisindeki sosyal işlevselliğini artırmaktadır.

Köy odalarının cami veya mescit ile bir arada planlanması Ovacık köy odalarında sıkça karşılaşılan bir tipoloji oluşturur. Bu tipin ilçenin kırsal yerleşimindeki örnekleri olarak; Alınca Köyü, Bölükören Köyü Ortaca Mahallesi, Sarılarsonya Köyü Sonya Mahallesi, Ahmetler Köyü Aydınlar Mahallesi ve Doğanlar Köyü Yiğitler Mahallesi'ndeki ibadet mekânı ile ortak fonksiyona sahip köy odaları gösterilebilir (Şekil 17). Bu ibadet alanları, kimi zaman daha tasarımın başlangıcında planlanmışken, bazı durumlarda ise işlevsel bir değişiklikle sonradan köy odasının bir bölümünün ibadet mekânına dönüştürülmesiyle oluşmuştur. Plan özellikleri itibarıyla değerlendirildiğinde, Kışla merkez köy odası, başından beri cami olarak tasarlanmış bir bölüme sahip olmasıyla bu uygulamanın dikkat çeken örneklerinden biridir (Mutlu, 2024: 8). İki katlı olarak inşa edilen bu yapıda, cami kısmı iki kat yüksekliğinde tutulmuş ve üst katla bağlantılı olan mahfil alanı kadınlara ayrılmıştır.

Caminin iç mekânını süsleyen duvar resimleri, yerel sanat anlayışı ve köy halkının tarihsel-kültürel mirasını yansıtan unsurlardır. Mimari, saat, bitkisel, duvar halısı, kılıç, perde ve sancak gibi nesnel betimlemelerle, resimlerle aynı tekniğin kullanılarak yazıldığı hat unsurları, duvar süslemesinin temalarını oluşturmaktadır. Bu temalardan kılıç, sancak gibi savaş unsurları, yerel kültürde kahramanlık ve tarih bilincinin bir sembolü olurken; saat ve halı motifleri ise günlük hayatın ve zamanın akışının

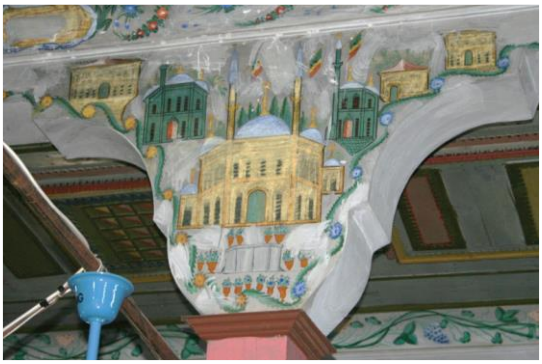
simgesel temsilleri olarak değerlendirilebilir. Bu resimler caminin ruhani atmosferine estetik ve anlam katarken, topluluğun geçmişini, değerlerini ve kimliğini de pekiştirdiği görülmektedir.

Şekil 17. Ovacık ilçesinde cami ve ibadet mekânının birlikte olduğu örnekler (Mutlu, 2024,16)

Duvar resimlerindeki hat levhaları ve dini metinler, İslam sanatında önemli bir yere sahip olup, caminin kutsal atmosferini derinleştirirken, aynı zamanda mekânda görsel ve manevi bir bütünlük sağlar. Bu anlamda Kışla Köyü Camii, sadece ibadet edilen bir mekân olmanın ötesinde, sanat ve inancın iç içe geçtiği, sosyal ve kültürel değerleri yücelten bir mimari örnektir.

Eserin harim mekânında, kıble duvarına resmedilmiş iki adet cami, mekânda kullanılan mimari süslemeleri temsil etmektedir. Kırsal mimaride camilerde görülen "cami resmi" konulu süslemeler, geleneksel Türk sanatının ve halk sanatının önemli bir parçasıdır. Bu süslemeler genellikle yerel ustaların, dini yapıları süsleme amacıyla geliştirdikleri teknikler ve estetik anlayışlar doğrultusunda yapılır. Özellikle Anadolu'daki köy camilerinde sıkça görülen bu tür süslemeler hem sanatsal hem de dini bir mesaj taşır. Bu cami resimli süslemeler, bölgenin doğal malzemeleri ve yerel estetik anlayışıyla uyum içinde yapılır. Köy camilerinde duvar resimlerinde kullanılan boya, genellikle doğal boyalar olup, işçilik basit ve sade olabilir. Bu süslemelerde cami motifleri genellikle minyatür tarzında, büyük bir sadelikle ve çoğu zaman da perspektif kaygısı güdülmeden çizilir. Caminin kubbeleri, minareleri ve genel mimari unsurları çok stilize edilmiş bir şekilde aktarılır. Gerçekçi detaylardan ziyade, sembolik anlam ön plandadır.

Cami resimleri, İslam'daki mekânsal kutsallığı vurgulamak için kullanılır. Bir mekânda cami motifinin bulunması, oranın kutsal bir alan olduğunu işaret eder. Ayrıca, cami süslemeleri cenneti ya da uhrevi dünyayı sembolize edecek şekilde tasarlanabilir. Camilerde tercih edilen tür resimler, halkın inancını görsel olarak yansıtmak ve cemaatin ibadet ederken kendini manevi bir atmosferde hissetmesini sağlamak amacı taşır. Bu bağlamda cami resimleriyle süslenmiş cami örneklerine kırsal ya da şehir ayrımı olmaksızın her bölgede rastlamak mümkündür. Öte yandan kırsal bölgelerdeki örneklerde karşılaşılan cami resimlerinde doğal olarak yerel ve halk sanatına özgü motiflerin yoğunluğu dikkat



çeker. Örneğin, cami resimlerinin çevresinde bitkisel motifler, lale figürleri, geometrik desenler ya da hayali cennet bahçeleri yer alabilir. Bu süslemeler, caminin iç mekânını hem estetik açıdan zenginleştirir hem de halkın dini bilgilerini görselleştirir. Kışla Köyü Camii'nde kullanılan cami betimlemelerinin her ikisinin de yanlarında resmedilmiş olan servi ağaçları, bu bağlamda değerlendirilebilir.

Kırsal camilerdeki süslemeler genellikle profesyonel sanatçılardan ziyade köy halkı ya da yerel zanaatkârlar tarafından yapıldığından, bu örneklerde sanatın mükemmeliyetinden çok, samimiyet ve içtenlik ön plandadır. Resmedilen yapı çoğu zaman bilinen bir camiyi ya da o bölgenin tarihî camisini simgeleyen yapılar olur. Bununla beraber Kışla Köyü Camii'nde resmedilen iki adet caminin Türk sanatında hangi cami yapılarını simgelediği konusunda bir sonuca varmak mümkün olmamıştır.

Kırsal mimarideki cami resmi konulu süslemeler, bir yandan cami mekânını süslerken, diğer yandan dini ve kültürel değerlerin görsel bir anlatımını sunar. Bu süslemeler, köy halkının kolektif hafızasını, dini kimliğini ve yerel estetik anlayışını bir araya getirir. Sanatsal olarak incelendiğinde, bu resimler halk sanatı içinde önemli bir yere sahiptir ve kırsal mimaride cami mekânlarının estetiğini zenginleştirir. Anadolu'da caminin cami resimleri ile süslendiği çok sayıda örnek görmek mümkündür. Samsun, Bafra Ulu Camii'nin son cemaat mahallinde (19. yy) (Yetiş, 2018: 1001); Muğla Keyfoturağı Camii'nin (1870) harim güney duvarındaki pano üzerinde (Aydın, 2021: 9); Kütahya, Şaphane, Koca Seyfullah Camii'nin (1892) güney duvarında (Tercanlı, 2020: 385); Manisa, Kula, Emre Köyü Carullah Bin Süleyman Camii'nin (1547) mihrap duvarında (Ongan, Sayın ve Baysal, 2022: 432); Çorum, Mecitözü, Doğla Camii'nin (19. yy) hariminin doğu duvarında (Karaçay, 2021: 605); Manisa, Demirci Kışlak Eski Camii'nin (19. yy) hariminin batı duvarında (Eryılmaz ve Özgür Yıldız, 2020: 95); İzmir, Ödemiş, Lübbey Camii'nin (19. yy) mihrabının her iki yanında (Top ve Özbek, 2019: 250); Manisa, Turgutlu, Sinirli Köyü Camii'nin (1874-75) son cemaat mahallinde ve harim kemer köşeliklerinde (Katrancı Kasalı, 2019: 610, 613) olduğu gibi çok sayıda örnekte duvar resmi olarak yapılmış cami temalı süslemelere rastlamak mümkündür (Şekil 18).

(Karaçağ, 2021: 605)

Şekil 18. Anadolu'da cami temalı duvar resmi ile süslenmiş bazı camilerden örnekler

Kışla Camii'nde duvar resmi olarak kullanılan objelerden birisi de duvar saatidir. 18. yüzyılda yaygınlaşmaya başlayan saatler, 19. yüzyılda Osmanlı mimarisinde saat kuleleri aracılığıyla kendini göstermiş ve bu dönemde şehir merkezlerinde çok sayıda saat kulesi inşa edilmiştir (Acun, 2011: 7). Zamanla, saat kuleleri de duvar resimleri programına girmiş ve gerek şehir manzaralarında ve gerekse yapıların süslemelerinde sıkça rastlanan motifler haline gelmiştir (Çetinaslan ve Yavuzyılmaz, 2016: 322). Kışla Camii'nde resmedilen duvar saati, Kırşehir, Mucur'daki Emine Hanım (Çarşı) Camii'nde (1679-89) kullanılan duvar saatiyle (Tay, 2017: 700) büyük benzerlik göstermektedir. Yine bu süsleme türünün Türk sanatındaki örnekleri arasında Manisa, Demirci, Marmaracık Köyü Camii'nin (1811-12) hariminin güneydoğu duvarında (Koçer, 2024: 371) bulunan örneği saymak mümkündür (Şekil 19).

Kırşehir, Mucur Emine Hanım Camii
(Tay, 2017: 700)

Manisa, Demirci, Marmaracık Köyü Camii
(Koçer, 2024: 371)

Şekil 19. Cami süslemelerinde duvar saati temaları

Osmanlı camilerinde harim mekânının uygun yerlerine Allah, Muhammed, Ebubekir, Ömer, Osman, Ali, Hasan ve Hüseyin isimlerinin bulunduğu hüsn-i hat levhalarının asılması gelenek haline gelmiştir. Bu grup levhalara "Cami Takımı" adı verilmektedir (Berk, 2021: 463). Zaman içinde artık tüm camilerin neredeyse olmazsa olmaz süslemeleri haline gelen cami takımı, Kışla Camii'nde de bulunmaktadır. Taşınabilir bir levha şeklinde olabilen cami takımları, duvara resmedilerek de ifade edilebilir. Çalışmamıza konu olan caminin cami takımları, duvar resimlerinde kullanılan tekniklerle güney, doğu ve batı harim duvarlarının üst bölümlerine konumlandırılmıştır.

Kışla Camii'nde, sekiz adet ismin yer aldığı cami takımı, ihtiva ettikleri yazı ile hat sanatının konusu iken, kompozisyonlarını meydana getiren bitkisel unsurlarla da bitkisel süslemenin konusudurlar. Bu bağlamda yazıların etrafını çevreleyen sekiz kollu penç motifinin yanı sıra bu düzenlemeyi adeta kolları içine alan her iki taraftaki bitkisel süslemeler, yapraklı ve iki renkli meyveli olarak resmedilmiştir.

Kışla Köyü Camii'nin doğu duvarında da iki örnekle temsil edilen hurma ağacı, cami süslemelerinde çok karşılaşılan bitkisel süslemelerden birisidir. Kur'an-ı Kerim'de cennet bitkileri arasında sayıldığını bildiğimiz (Bozkurt, 1998: 392) ağaçlardan olan hurma ağacının resminin Anadolu'daki çok sayıdaki örneği temsilen Manisa, Demirci Küpeler Camii'nin (19. yy) harim kısmının güney duvarında (Gürbıyık, 2020: 155) ve Manisa, Kula, Emre Köyü Carullah Bin Süleyman Camii'nin (1547) mihrap duvarında (Ongan, Sayın ve Baysal, 2022: 435) karşılaşılan örnekler sayılabilir (Şekil 20).

Çiçek ve yaprak motifleri, camilerde yaygın kullanılan bitkisel süslemelerin başında gelir. Bunlar genellikle stilize edilerek cami kapıları, minber, mihrap ve sütunlar gibi yerlerde kullanılır. Gül, karanfil, sümbül gibi çiçeklerin motifleri, çini ve fresklerde de sıklıkla tercih edilir. Çalışmamıza konu olan Kışla Köyü Camii'nde bitkisel süsleme olarak karanfilin de kullanıldığı görülmektedir. Camide karanfil resmi, batı duvarı üzerine, minberin bulunduğu kısımda, tek renk olarak ve detaylarına girilmeden üçlü grup halinde resmedilmiştir.

Tarih boyunca savaşçı bir millet olarak bilinen Türklerde kılıç, kahramanlık ve güç sembolüdür. Türklerin İslam'ı kabulünden sonra da bu sembolizmi dini yapılarında devam ettirmişlerdir. Özellikle Osmanlı döneminde, fetih ve zafer kavramları camilerle birlikte anılır hale gelmiştir. Kışla Camii'nde kullanılan

iki kılıç figürünün bu anlamda değerlendirilmesi mümkündür. Caminin batı duvarına resmedilen halı desenlerinden birisinin üzerine Kur'an-ı Kerim'den Fetih Suresi'nin 1. ayeti olan ve *"Doğrusu biz sana apaçık bir fetih ihsan ettik"* anlamındaki *"inna fetahna leke fethan mübinâ"* ayeti ile birlikte değerlendirildiğinde milli duygulara hitap eden bu tür unsurların camide yaşatılması başka bir anlam kazanmaktadır.

Manisa, Demirci, Küpeler Camii
(Gürbıyık, 2020: 155)

Manisa, Kula, Emre Köyü Carullah Bin Süleyman Camii
(Ongan, Sayın ve Baysal, 2022: 435)

Şekil 20. Cami süslemelerinde hurma ağacı temaları

Kışla Köyü Camii, mimari yapısı ve duvar resimleriyle hem kültürel mirasın korunması hem de yerel sanatın yaşatılması açısından önemli bir örnektir. Yapının köy odası ile birleşik olması, camiyi bir ibadet mekânı olmanın yanı sıra bir sosyal toplanma alanı haline getirmiştir. Bu yönüyle cami, köy halkının günlük yaşamında önemli bir rol oynamış ve zaman içinde köyün kimliğinin bir parçası haline gelmiştir.

Duvar resimleri ise camiye estetik bir derinlik kazandırmanın ötesinde, tarihsel ve kültürel semboller aracılığıyla köyün geçmişine ışık tutmaktadır. Resimlerdeki unsurlar, köy halkının savaşlar, kahramanlık hikâyeleri ve geleneksel yaşamla olan bağını yansıtırken, dini metinler ve hat örnekleri ise caminin manevi atmosferini desteklemektedir.

Bu çalışmada ele alınan Kışla Köyü Camii, sanatla örülen mimarlık anlayışının somut bir örneği olarak değerlendirilebilir. Yapı, sadece dini bir mekân olmanın ötesinde, köyün tarihini, kültürel mirasını ve topluluk ruhunu yansıtan bir simge olarak köy halkı ve ziyaretçiler için derin bir anlam taşımaktadır. Bu yapı, geleneksel Türk mimarisi ve yerel sanatın uyumlu bir şekilde harmanlandığı, kültürel mirasın korunmasına ve yaşatılmasına katkıda bulunan önemli bir eser olarak gelecekte de değerini koruyacaktır.

Etik Standartlara Uyum

Çıkar Çatışması: *Yazar / yazarlar, kendileri ve / veya diğer üçüncü kişi ve kurumlarla çıkar çatışmasının olmadığını veya varsa bu çıkar çatışmasının nasıl oluştuğuna ve çözüleceğine ilişkin beyanlar ile yazar katkısı beyan formları makale süreç dosyalarına ıslak imzalı olarak eklenmiştir.*

EXTENDED SUMMARY:

Research Problem:

Each example of vernacular architecture in different regions of Anatolia exhibits unique characteristics, incorporating distinctive technical and artistic elements. The aim of this study is to examine the architectural features and wall paintings of the Kışla Village Mosque in the Ovacık district of Karabük province and to contribute this analysis to the academic literature.

Research Questions:

How can the architectural and functional relationship between the village room adjacent to the mosque and the mosque itself be explained? What are the meanings, origins, and connections of the motifs used in the wall paintings with local art? Considering the lack of historical information about the structure and its decorations, how can a comparative analysis with similar examples contribute to addressing these questions? Finally, how can the importance of this mosque and similar rural structures in preserving cultural heritage be evaluated?

Literature Review:

Architectural studies conducted in the rural areas of Ovacık have unfortunately not yet found sufficient representation in the international literature. At the national level, architectural and artistic features have not been the subject of scientific research until the past few years. The study by Özköse and others (2018), which focuses on preserving ecological values through rural architecture, is significant as it represents the first architectural research in this area. One of the most comprehensive studies in the field is the work by Çetin (2019), which examines rural architectural structures in the village of Dudaş. In this study, Çetin thoroughly analyzes traditional houses. Similarly, the research conducted by Çetin and Mutlu (2021b), which investigates the architectural structures in the same village in terms of material usage, can also be considered one of the first studies on the region. A more recent study by Mutlu (2024), which examines and provides a typological classification of village rooms commonly found in the Ovacık district and its rural areas, has earned its place in the literature.

In addition, numerous studies focus on examples of vernacular architecture in different regions of Anatolia and their features in the context of wall paintings. Examples of such studies include Wall Paintings of Burhaniye Şahinler Village Mosque by Yıldırım (2013), Wall Paintings of Sinirli Village Mosque by Katrancı-Kasalı (2019), Two Mosques with Wall Paintings in Demirci, Manisa: Kışlak Old Mosque and Ahatlar Mosque by Eryılmaz and Özgür Yıldız (2020), Wall Paintings of Demirci Küpeler Village Mosque by Gürbıyık (2020), An Example of a Mosque Depiction in Kütahya: Koca Seyfullah Mosque by Tercanlı (2020), and The Mosques and Painted Decorations of Marmaracık-Köylüce-Kızılca

Villages (Demirci-Manisa) by Koçer (2024). These works represent studies conducted in various regions and on different structures, offering parallels to the current topic.

Methodology:

The mosque we identified in Kışla village, located in the Ovacık district, differs from similar examples due to its construction alongside a village room. Additionally, the fact that the prayer hall's walls are adorned with intriguing mural paintings necessitated a detailed study of the structure. In this context, a comprehensive literature review was conducted to determine whether the mosque had been previously examined in any scientific studies. As a result of our research, it was found that no prior studies had been conducted on the structure, and fieldwork was initiated. Initially, the building's plans were drawn based on on-site measurements, and the drawings were completed. Simultaneously, detailed photographic documentation of the structure was carried out, including both general and detailed shots. To document the murals located on the upper parts of the walls from a better perspective, drone photography was utilized. During the writing phase, a comparative analysis of the architectural and decorative features of the mosque was conducted, taking into account similar examples from Anatolia.

Results and Conclusions:

Numerous examples that embody the ancient culture of Anatolia have persisted for thousands of years. While artworks created in urban centers are easily valued due to their more generalized styles, rural examples often disappear without being identified, unable to withstand the ravages of time. Therefore, identifying and ensuring the sustainability of architectural and artistic works in rural areas is of great importance. The Kışla Village Mosque stands out as an exceptional example due to its architectural features and the mural paintings that adorn it.

From an architectural perspective, the construction of the mosque alongside a village room and the access to the mosque from this room is not a common practice in examples of village rooms across Anatolia. Access to both the men's section and the women's section on the first floor of the mosque is provided from the ground and first floors of the village room. Almost all the walls of the prayer hall are embellished with mural paintings, which include a variety of elements such as floral motifs, clocks, swords, carpets, and rugs. It is quite remarkable that such extensive decorations are found in a rural village mosque. There is no information available regarding the date of the decorations of this structure, which is believed to have been built in the early 19th century. Additionally, no artist's signature has been found on the paintings.

The mosque and its murals, which are the focus of this study, can be regarded as a concrete example of an architectural understanding woven with art. Beyond being merely a place of worship, this structure carries profound significance for the village community and visitors as a symbol that reflects the village's history, cultural heritage, and communal spirit. As an important work that harmoniously blends traditional Turkish architecture with local art, this mosque will continue to hold its value in contributing to the preservation and continuation of cultural heritage.

YILDIZ SARAYI'NDA PENCERE PANJURLARI: OSMANLI SARAYINDA BİR MİMARİ DETAYIN ANALİZİ

Abdülhamit Tüfekçioğlu* Mehmet Mutlu**

Gönderilme Tarihi: 12.10.2025 - Kabul Tarihi: 15.12.2025

Özet

Bu çalışma, Yıldız Sarayı'nda yer alan pencere panjurlarını inceleyerek Osmanlı saray mimarisinde işlevsel ve estetik bir detay olarak panjurların kullanımını değerlendirmektedir. Makale, Büyük Mabeyn Köşkü, Çit Kasrı, Yaveran ve Bendegân Dairesi, Küçük Mabeyn Köşkü ile Harem Daireleri'ni kapsamaktadır. İncelenen panjurlar, ahşap malzemeden üretilmiş olup, sabit ve hareketli lamellerle farklı mekanik çözümler sunmaktadır. Panjur sistemleri, pencerelerin biçimine, büyüklüğüne ve bulundukları mekâna göre çeşitlilik göstermektedir; bazı panjurlar tamamen sabit, bazıları ise hareketli lameller aracılığıyla güneş ışığını kontrol etme, iç mekân mahremiyetini sağlama ve estetik görünümü destekleme işlevine sahiptir. Ayrıca panjurlarda menteşe, kanca ve metal destekleme elemanları gibi mekanik detaylar, yapının hem estetik hem de işlevsel bütünlüğünü desteklemektedir. Küçük Mabeyn Köşkü kış bahçesinde beyaz panjurlar kullanılarak iç mekânda ferah ve aydınlık bir atmosfer yaratılmıştır. Bu inceleme, Yıldız Sarayı'ndaki pencere panjurların tarihsel, teknik ve estetik değerini ortaya koymakta, Osmanlı saray mimarisindeki özgün cephe detaylarının korunması ve restorasyon çalışmalarının önemini vurgulamaktadır.

Anahtar kelimeler: Yıldız Sarayı, Osmanlı Saray Mimarisi, Pencere Panjurları, Ahşap Lameller, Hareketli Panjur, Sabit Panjur, Küçük Mabeyn Köşkü, Harem Daireleri, Tarihî Cephe Detayları

WINDOW SHUTTERS IN YILDIZ PALACE: AN ANALYSIS OF AN ARCHITECTURAL DETAIL IN THE OTTOMAN COURT

Abstract

This study examines the window shutters of Yıldız Palace, evaluating their functional and aesthetic role as architectural elements in Ottoman palace architecture. The article covers the Büyük Mabeyn Pavilion, Çit Pavilion, Yaveran and Bendegân Apartments, Küçük Mabeyn Pavilion, and the Harem Apartments. The examined shutters are made of wood and feature various mechanical solutions through the use of fixed and movable louvres. The shutter systems vary according to the shape, size, and spatial context of the windows; while some shutters are completely fixed, others employ movable louvres to control sunlight, ensure interior privacy, and enhance visual aesthetics. Moreover, mechanical components such as hinges, hooks, and metal support elements contribute to both the functional and aesthetic integrity of the structures. In the winter garden of the Küçük Mabeyn Pavilion, white shutters were used to create a bright and spacious interior atmosphere. This study reveals the historical, technical, and aesthetic significance of the window shutters in Yıldız Palace and emphasizes the importance of preserving and restoring these unique façade details within Ottoman palace architecture.

Keywords: Yıldız Palace, Ottoman Palace Architecture, Window Shutters, Wooden Louvers, Operable Shutter, Fixed Shutter, Küçük Mabeyn Pavilion, Harem Apartments, Historic Façade Details

GİRİŞ

Yıldız Tepesi, eğimli bir arazi üzerine konumlanmış köşk ve kasırlardan oluşan geniş bir saray yerleşkesidir. Bu alanın bilinen ilk yapısı, III. Selim tarafından annesi Mihrişah Sultan adına inşa ettirilen bir kasırdır. Aynı dönemde, III. Selim'in babası III. Mustafa'nın anısına rokoko üslubunda bir çeşme de yaptırılmıştır. II. Mahmud döneminde, 1834-1835 yılları arasında tepe üzerinde yeni bir köşk inşa ettirilmiş, ancak bu yapı günümüze ulaşamamıştır. Sultan Abdülmecid, mevcut kasırları yıktırarak 1842 yılında annesi Bezmiâlem Vâlide Sultan için Kasr-ı Dilküşâ adıyla yeni bir köşk yaptırmıştır. Günümüzde "Vâlide Sultan Köşkü" olarak adlandırılan yapının, bu dönemde inşa edilen köşkle özdeş olduğu düşünülmektedir. Sultan Abdülaziz devrinde Yıldız Sarayı alanı genişlemiş; Büyük Mâbeyn Köşkü, Çit Kasrı, Malta Köşkü ve Çadır Köşkü gibi önemli yapılar eklenmiştir. II. Abdülhamid döneminde ise Yıldız Sarayı, imparatorluğun fiilî yönetim merkezi hâline gelmiştir. Padişahın Dolmabahçe Sarayı'ndan ayrılarak Yıldız'a taşınmasıyla birlikte yerleşke büyük ölçüde genişlemiş; bu süreçte Küçük Mâbeyn Köşkü, Câriyeler Dairesi, Kızlarağası Köşkü, Şâle Köşkü, Yıldız Camii, harem binaları, tiyatro binası, marangozhane, eczahane, tamirhane, kilithane, çini atölyesi, kütüphane ve çeşitli şehzade köşkleri inşa edilmiştir. Böylece Yıldız Sarayı, 19. yüzyılın son çeyreğinde Osmanlı başkentinin en kapsamlı saray komplekslerinden biri hâline gelmiştir.[1] Saray kompleksinin temelleri III. Selim tarafından atılmış ve II. Abdülhamit dönemine kadar sürekli gelişen ve büyüyen bir dinamik yapılaşma süreci yaşanmıştır. Buna bağlı olarak da sarayın mimari tarzdaki çeşitlilik kendiliğinden ortaya çıkmıştır.[2] II. Abdülhamit döneminde Yıldız Sarayı'nın uzun süre devletin yönetim merkezi olması, merkezi otoritenin II. Abdülhamid ile birlikte tekrardan güçlendirilme isteği ve buna bağlı olarak tüm yönetim kademesinin sarayın sınırları içerisine alınması, saraydaki mekân sayısını da artırmıştır.[3] II. Abdülhamid zamanında Küçük Mabeyn, Harem Binaları, Cariyeler Dairesi, Kızlarağası Köşkü, Şale Köşkü, Yıldız (Hamidiye) Camii, Tiyatro, Marangozhane, Eczahane, Tamirhane, Kilithane, Çini Atölyesi, Kütüphane ve Şehzadeler Köşkleri inşa edilerek bugünkü Saray kompleksi ortaya çıkmıştır. Ancak, Osmanlı döneminin son sarayı olma özelliğini taşıyan bu yapılar bütününde belli bir üslup birliği bulunmamaktadır.[4] Bu dönemle birlikte Yıldız Sarayı "Saray-ı Hümayun" olmuş ve imparatorluk 33 yıl süreyle buradan yönetilmiştir. Yaklaşık olarak 500.000m^2 alana hâkim kompleksin yapı çeşitliliği, planlaması ve yerleşim tertibi Topkapı Sarayı'nı anımsatmakla birlikte Türk saray mimarisinin son geleneksel uygulamasıdır.[5] Sarayın özellikle son dönem yapılarının inşasında Avrupa'da geliştirilen inşa teknikleri ve malzemelerin ciddi biçimde kullanıldığı görülmektedir.[6]

MİMARİDE PENCERE PANJURLARI

Geleneksel duvarda "boşluk" kavramıyla tanımlanan pencere, yapının cephesinde dolu–boş, saydam–sağır karşıtlığını oluşturan; biyolojik ve psikolojik açıdan iç–dış ilişkisinin kurulmasında önemli rol oynayan temel bir elemandır. Cephedeki boşluğun boyutu, oranı, rengi ve ritmi, yüzeyi oluşturan diğer mimari unsurlarla kurduğu uyum doğrultusunda yapının genel görsel etkisini belirler. Bu bağlamda pencere yalnızca bir açıklık değil, aynı zamanda cephe estetiğini şekillendiren dinamik bir bileşendir.[7] Panjur ise, pencerenin dışına takılan, aynaları açılır-kapanı, dar yatay tahtalardan veya plastik parçalardan meydana getirilmiş kanattır.[8] Panjurlar, mimari cephe düzeninde hem işlevsel hem de estetik bir unsur olarak değerlendirilir. Geleneksel mimaride panjur malzemesi olarak özellikle ahşap malzeme tercih edilmiş, panjur kanatları menteşeler aracılığıyla açılır-kapanır biçimde tasarlanmıştır.

İşlevsel açıdan panjurlar, iç mekânın iklimsel konforunu koruma, güneş ışığını ve rüzgârı kontrol etme, mahremiyet sağlama ve güvenliği artırma gibi amaçlarla kullanılmıştır. Özellikle Akdeniz ve Anadolu iklim kuşaklarında, yoğun güneş ışığının iç mekâna doğrudan girmesini engelleyerek gölgelik etkisi yaratır; kış aylarında ise kapalı tutularak ısı kaybını azaltır. Ayrıca, panjurlar dış etkenlere karşı pencere doğramalarını koruyarak yapı ömrünün uzamasına katkı sağlar.

Panjurlar, estetik yönden ise cephe kompozisyonunda ritim, denge ve oran gibi mimari değerleri destekleyen elemanlardır. Panjur, geleneksel Osmanlı yapı elemanı olmayı, daha çok 19. yüzyıl sonu-20. yüzyıl modernleşmesiyle görülür. Özellikle Osmanlı ve erken Cumhuriyet dönemi sivil mimarisinde, panjurların formu, kanat düzeni ve yüzey süslemeleri yapının kimliğini yansıtan önemli detaylar arasında yer alır.

Günümüzde panjur kullanımı, çağdaş malzeme teknolojileriyle birlikte fonksiyonel güvenlik sistemlerine (örneğin metal panjur ve motorlu kepenk sistemleri) evrilmiş olsa da geleneksel mimarideki panjur anlayışı, koruma ve restorasyon çalışmalarında özgün cephe karakterinin önemli bir bileşeni olarak değerlendirilmektedir.

YILDIZ SARAYI PENCERE PANJURLARI

Bu çalışmada, Yıldız Sarayı'nda yer alan pencere panjurları incelenmiştir. İnceleme kapsamına sarayın Büyük Mabeyn, Çit Kasrı, Yaveran ve Bendegân Dairesi, Küçük Mabeyn, Harem Daireleri (Baş Kadın Efendi, İkinci Kadın Efendi, Haznedar Usta ve Cariyeler bölümleri) ile Arabacılar Dairesi'nin Kütüphane bölümü dâhil edilmiştir. Buna karşılık, Hünkâr Dairesi, Sünnet Köşkü, Çukur Saray, Avagatlar (Ağalar) Dairesi, Opera Binası, Musahiban Dairesi, Gedikli Cariyeler Dairesi, Merasim (Şale) Köşkü, Arabacılar Dairesi ve Tamirhane-i Hümayun (Güzel Sanatlar Binası) bölümlerinde restorasyon çalışmaları sürdüğü için bu yapılar araştırma kapsamı dışında bırakılmıştır.

Büyük Mabeyn Köşkü

Saray yerleşkesinin Saltanat kapısından girince hemen sol tarafta bulunan yapıdır. Büyük Mabeyn, Sultan Abdülaziz (1861-1876) zamanında yapılan imar çalışmalarında Çit Kasrı, Malta ve Çadır köşkleriyle birlikte inşa edilmiştir.[9] Eser, Sultan Abdülaziz tarafından 1866 yılında Balyan ailesi mimarlarına dinlenme köşkü olarak yaptırılmıştır. İki kattan meydana gelen kâgir köşk, Sultan II. Abdülhamid'in bazı resmi toplantılarını gerçekleştirdiği, davetler verdiği, resmî odasının da bulunduğu, yerleşke içindeki en büyük binadır.[10]

Cepheden görününüm

İç mekândan görünüm

1 Büyük Mabeyn Köşkü'nün içinden ve dışından görünümler

Büyük Mabeyn Köşkü'nün cephesinde bulunan yoğun pencere düzenlemesinde, binaya girişin yapıldığı orta bölümdeki üçlü pencere düzenlemesinde tam kemerli pencereler kullanılmışken, yanlarda ise basık kemer formlu pencereler tercih edilmiştir. Cephede kullanılan çok sayıdaki büyük boyutlu pencere, köşkün içinin de aydınlık olmasını sağlamıştır. Tam kemer formlu orta bölümde yaklaşık 330 cm, basık kemer formlu bölümde ise yaklaşık 300 cm yüksekliğe sahip olan pencerelerin, kemer formu sebebiyle kavis alan üst kısımları sabit lamelli olarak ve iki bölümlü olarak yapılmıştır. Pencerelerin üstünde yer alan sabit panjurlar, tam kemerli pencerelerde yedi adet, basık kemerli pencerelerde ise üç adet lamelden (yatay ahşap elemandan) meydana gelmektedir. Pencerelerin dikdörtgen forma sahip bölümleri ise iki kanatlı panjurlardan meydana gelmektedir. Her bir kanat, alttaki bölüm üsttekine göre bir miktar kısa tutulacak şekilde düşeyde iki bölüm halinde düzenlenmiştir. Bu düzenlemede alttaki bölüm 15, üstteki bölüm ise 19 adet lamelden meydana gelmektedir.

2 Büyük Mabeyn Köşkü pencere panjur sistemi

Panjurun en önemli bölümünü meydana getiren ahşap lamellerin makta kısımlarına ağaç vidası kullanılarak sac bir levha, sabitlenmiştir. Her iki bölümün de üzerinde yer aldığı panjur çerçevesi pencerelerin dış yanlarından üçer adet menteşe ile tutturulmuştur. Hareketli panjur kanatlarının alt kısımlarında, panjur kanadı açıldığında sabit kalmasını sağlayacak kanca sistemleri bulunmaktadır. Panjur kapalı durumdayken ise cepheye göre sağ tarafta bulunan kanadın üzerine sol taraftaki örtücü kanat gelmekte ve üste gelen kanatta bulunan mekanik sürgülü sistem el ile döndürülmek suretiyle kanatların kapalı vaziyetteyken sabit kalması sağlanmaktadır. İki kanatlı panjurlarda bindirme pervazı, cepheye göre sol taraftaki kanatta bulunmaktadır.

Büyük Mabeyn Köşkü pencere panjurlarının bir diğer özelliği de düşeyde her bir kanadın açılır/kapanır olmasının yanı sıra, her kanatta bulunan ikili düzenlemede, alt bölümde yer alan düzenlemenin aynı zamanda ikinci bir çerçeve ile kanat üzerinde düşeyde de açılıp kapanacak bir sisteme sahip olmasıdır. Bu amaçla bir çerçeveye yerleştirilmiş bulunan panjurlar, ortadan bir kayıtla iki bölüme ayrılan hareketli kanata üstten ikişer adet menteşe ile sabitlenerek hareket özelliği kazandırılmıştır. Dışa doğru açılan bu alt kısım, yanda bulunan kanca sistemi ile açık kalması istendiği zaman sabitlenirken, altında bulunan küçük bir vida düğme ile kullanılmadığı durumlarda kapalı olarak kalması sağlanmıştır.

Panjuru meydana getiren lameller, yanlardan panjur çerçevesine tek bir bağlayıcı eleman ile tutturulmuştur. Muhtemelen ahşap kavela ile yapılan bu bağlantı ile panjuru meydana getiren lamellerin eksenleri etrafında hareket etmesi ile genişleyen ve daralan ara boşluklardan içeriye güneşin girmesi ya da ihtiyaç duyulan zamanlarda mahremiyet açısından tamamen kapatılması mümkün hale gelmektedir. Çok sayıdan parçadan meydana gelen bu lamellerin açılarını aynı anda ayarlayabilmek amacıyla orta kısımlarında düşey bir ahşap öge kullanılmıştır. Bu ahşap parça lamellere birisi kendi üzerinde, diğeri de karşıdaki elemanda olacak şekilde birbirinin içinden geçen iki adet yuvarlak halka ile bağlanmış ve bu mafsallı sistem ile rijitlik ortadan kaldırılarak sisteme hareket özelliği kazandırılmıştır. Böylece hareketli lamellerin bu sistem sayesinde pratik olarak ayarlanması ya da açılıp kapatılması sağlanmıştır.

Çerçeveler köşelerde birbirlerine zıvanalı köşe birleştirme tekniği kullanılarak oluşturulmuştur. Bunun yanı sıra, çerçevelerin daha stabil hale gelmesini sağlamak için köşelerde L şekilli sac lamaların kullanıldığı görülmektedir. Lama demirlerine her iki kol üzerinde ikişer delik açılmış ve bu deliklerden yıldız başlı ağaç vidaları kullanılmak suretiyle yatay ve düşey çerçeve elemanları güçlendirilmiştir. Ahşap malzemelerin birleştirilmesinde vidalar vazgeçilmez bir gereç olma özelliğini günümüzde de sürdürmektedir.[11] Lama ile güçlendirme uygulamaları, pencerelerin içten estetik görünümünü bozmaması amacıyla dıştan yapılmıştır.

Vidaların icadı çok öncelere dayanmaktadır. Mekaniğin kurucusu sayılan Tarentum Archytas'ın, M.Ö. 400'ler civarında günümüzün vazgeçilmezi vidayı icat ettiği bilinmektedir. Bununla beraber günümüzde kullanılan dişli vidalar, imalatı zor olduğu için ancak 17. yüzyıldan sonra yavaş yavaş yaygınlaşma göstermiştir.[12] Yıldız Sarayı Büyük Mabeyn Köşkü'nün inşa edildiği dönemde ağaç vidaları artık kullanılmaya başlamış olmakla birlikte, köşkün pencere panjurlarında tespit edilen ve metal lamalarla birlikte kullanılan bu vidaların, üzerlerinde yer alan şirket bilgilerinden anlaşıldığı üzere, özgün imalata ait olmadıkları; daha çok yakın dönem restorasyonlarında eklenmiş elemanlar oldukları görülmektedir.

Çit Kasrı

Çit Kasrı, Büyük Mabeyn'in sağ tarafında bulunmakta olup, birbirinin içinden geçilen odalardan meydana gelen tek katlı bir yapıdır. Kasır, Sultan Abdülaziz (1861-1876) zamanında yapılan yapılaşma çalışmalarında Büyük Mabeyn, Malta ve Çadır köşkleriyle birlikte inşa edilmiştir.[13]

3 Çit Kasrı'nın cephesinden görünüm

Çit Kasrı'nın ön cephesinde giriş kapısı ve pencereleri düz lentolu tepelikli ve dikdörtgen formludur. 120 cm genişliğe sahip bu cephedeki pencereler 240 cm yüksekliğindedir. Bu cepheye bakan pencereler, ikişer kanatlı ve her bir kanadı düşeyde üçlü düzenlemeye sahip özellikte inşa edilmiştir. İçte bulunan pencere kanatları ile dışta bulunan panjurların arasında yatay parmaklıklar yer almaktadır. Düşeyde üç bölümlü olarak düzenlenen pencerelerin en üstte bulunan kısmın yüksekliği, alttaki kısımlara göre daha az tutulmuş ve bu kısım sabit kasalı olarak düşünülmüştür. Altta ikişer bölümden meydana gelen çift kanatlı bölümde kanatlar içeriye doğru açılmaktadır.

12 https://atlasvida.com/vidanin-tarihcesi/ (16.10.2025)

13 Bilgin, *Türk Saray Mimarisi*, 50.

4 Çit Kasrı'nın ön cephesinde panjur düzenlemeleri ve detaylar

Pencerelerin tamamı pencerenin sabit kanatlı kısımlarını da örtecek biçimde uzun panjurlarla donatılmıştır. Panjurlar, pencerelere uyumlu olarak düşeydeki üçlü düzenlemeye göre, pencerelerin yatay kayıtlarını karşılayacak şekilde üç bölümden oluşan düzenleme özelliği göstermekte olup dışa açılmaktadır. Bu düzenlemede, pencere formuna uygun şekilde en üsteki bölüm daha kısa iken, alttaki bölümler ise daha uzun tutulmuştur. Üsteki kısa bölümde yedi adet lamel bulunmaktayken, ortadaki bölüm 13 ve en alttaki bölüm ise 11 adet lamelden meydana gelmektedir. Çit Kasrı'nın panjur sisteminde kullanılan lameller Büyük Mabeyn Köşkü örneğine göre farklılık arz etmektedir. Burada ahşap lamellerin makta kısımlarında metal koruyucu sac bulunmamaktadır. Lamellerin dışarıya bakan tarafları Büyük Mabeyn Köşkü'nde düz bırakılmışken, Çit Kasrı'nda ise dışarıya bakan kısımlarının üst bölümleri dairesel formda profillendirilmiştir. Panjurlar, her iki yanda bulunan panjur kasana üçer adet menteşe ile sabitlenmiştir.

Çit Kasrı'nın ön cephesinde kullanılan panjur sistemi, Büyük Mabeyn Köşkü'nün panjur sistemiyle aynıdır. Her iki taraftaki panjur kanadı açık tutulmak istendiğinde kasanın alt kısmındaki yatay çerçeve ögesinde bulunan kancanın ucu, panjurun alt kasasında bulunan kanca yuvasına takılarak sabitlenmektedir.

Yaveran ve Bendegân Dairesi

Yaveran ve Bendegân Dairesi sarayın birinci avlusunda, Valide Sultan kapısının girişinde tam karşıda bulunmaktadır. Yapı, sıra odalardan meydana gelmektedir. Yaverlerin yanı sıra telgrafhane ve şifrehanenin bulunduğu yapı Art Nouveau stilinde inşa edilmiş olup, mimarı da Sultan II. Abdülhamid'in baş mimarı Raimondo D'Aronco'dur.[14] Yapı, iki katlı olarak inşa edilmiştir.

Yaveran ve Bendegân Dairesi'nin birinci avluya bakan cephesinde çok sayıda pencere yer almaktadır. Her iki kattaki pencereler tek kanatlıdır ve düşey doğrultuda iki bölüme ayrılmıştır. Alt bölüm, yukarı doğru hareket edebilen bir giyotin pencere sistemiyle açılacak biçimde tasarlanmıştır. Tüm pencerelerde çift kanatlı panjur bulunmakla beraber, panjurlar pencerelerin alttan itibaren yaklaşık 2/3'lük kısmını kapatacak yüksekliktedir.

5 Yaveran ve Bendegân Dairesi'nin cephe görünümleri

Yaveran ve Bendegân Dairesi'nin panjur düzeni, yukarıda açıklanan Büyük Mabeyn Köşkü ve Çit Kasrı'ndaki örneklere kıyasla oldukça sade bir biçimde tasarlanmıştır. Yapıda yer yer kullanılan dar pencerelerde tek kanatlı panjurlar tercih edilirken, daha geniş açıklıklara sahip pencerelerde çift kanatlı panjurlar uygulanmıştır. Hem zemin katta hem de birinci katta bulunan panjurlar 22 lamelden oluşmaktadır. Lameller, panjur çerçevesinin her iki yanında yer alan düşey elemanlara açılmış eğik kanallara sabitlenmiş olduğundan, önceki örneklerde görüldüğü gibi açılarının değiştirilebilmesine olanak tanıyan bir hareket mekanizmasına sahip değildir.

6 Yaveran ve Bendegân Dairesi'nin panjurlarından genel ve detay görünümler

14 Bilgin, *Türk Saray Mimarisi*, 52.

Yaveran ve Bendegân Dairesi'nin pencere panjurları, çerçeve düzenlemeleri bakımından da önceki örneklerden farklılık göstermektedir. Daha önce incelenen iki yapıda panjurlar dikdörtgen bir çerçeve içinde tasarlanmışken, bu yapıda çerçevenin düşey elemanları, her iki tarafta da üst yatay elemanı bir miktar aşacak şekilde uzatılmıştır. Bu uzantılar profilli biçimde şekillendirilerek panjurlarda hareket ve estetik bir dinamizm etkisi oluşturulmak istenmiştir. Çerçeveyi meydana getiren dikey ve yatay ögelerin birleştiği köşelerde ahşap geçmelerin haricinde diğer örneklerde de olduğu gibi L şekilli metal levhalar kullanılmış ve bu levhaların her iki koluna açılan ikişer deliğe sabitlenen ağaç vidalarıyla çerçeve sisteminin sağlamlaştırılması sağlanmıştır.

Panjurlar, pencere kasasına düşey doğrultuda ikişer menteşe ile sabitlenmiştir. Bindirme pervazı, sağ taraftaki panjur kanadında yer almaktadır. Panjurların açık konumda sabit kalmasını sağlamak için, alt çerçevelerinin iç yüzeylerinin dışa yakın kısımlarına metal halkalar monte edilmiştir. Pencere denizliklerine yerleştirilen kancaların bu halkalara takılmasıyla, panjurların açık durumda sabitlenmesini sağlayan bir sistem oluşturulmuştur.

Küçük Mabeyn Köşkü

Küçük Mabeyn Köşkü, ikinci avluya geçiş yapılan kısımda, sağ tarafta bulunmaktadır. Bu köşkü Sultan II. Abdülhamid kendisi için 1900 yılında özel olarak yaptırmıştır.[15] Köşkün mimarıyla ilgili kesin bir bilgi bulunmazken, eserin baş mimar Raimondo D'Aronco tarafından yapıldığı tahmin edilmektedir.[16] İki katlı kâgir yapı, tavanlarını süsleyen ince kalem işleri ve özellikle Boğaz manzaralarını betimleyen resimleriyle dikkat çekmektedir. Küçük Mabeyn Köşkü, II. Abdülhamid'in çalışma, yemek, dinlenme, kabul ve yatak odalarının bulunduğu özel ikametgâhı olarak düzenlenmiştir. Köşkün Türkiye Cumhuriyeti tarihi açısından da bir hatırası bulunmaktadır. Sultan II. Abdülhamid'in tahttan indirilmesinin ardından Osmanlının idare merkezi yeniden Dolmabahçe Sarayı'na taşınmış olsa da son dönem padişahlarından VI. Mehmed Vahdettin zaman zaman bu köşkü kullanmaya devam etmiştir. Atatürk, 15 Mayıs 1919 tarihinde üçüncü Kolordu Müfettişi olarak Samsun'a hareket etmeden önce Sultan Vahdettin ile yaptığı görüşmeyi bu binanın üst katındaki büyük salonda gerçekleştirmiştir.[17]

7 Küçük Mabeyn Köşkü'nün genel görünümü

15 Haluk Şehsuvaroğlu, *İstanbul Sarayları*, İstanbul: İstanbul Kapadokya Kitabevi Yayınları, 1954, 27.

16 Bilgin, *Türk Saray Mimarisi*, 54.

17 Haluk Şehsuvaroğlu, *Tarihi Odalar*, İstanbul: İnkılâp Yayınevi, 1954, 135.

Küçük Mabeyn Köşkü'nün alt kat pencerelerini en dışta düşey demir parmaklıklar kapatmaktadır. Parmaklıkların köşelere gelen kısımları geometrik olarak düzenlenmiş, orta bölümlerine ise dairesel süslemeler yerleştirilmiştir. Yaklaşık 120x310 cm ölçülerindeki alt kat pencerelerinin 220 cm'lik kısmı açılır-kapanır olarak düzenlenmişken, üstte kalan yaklaşık 90 cm'lik kısım ise sabit tutulmuştur. Pencereyi ince 4 adet dikey kanattan meydana gelen panjurlar kapatmaktadır. Bu kanatlardan dışta bulunanlar her iki yana beşer adet menteşe ile sabitlenmiştir. Ortada bulunan panjur kanatları ise yine menteşelerle kasaya sabitlenmiş olan kanatlara bağlanmıştır. Bu şekilde panjurların pencerenin dışında bulunan parmaklık dolayısıyla dış kısma açılamama sorunu çözülmüştür.

Küçük Mabeyn Köşkü'nün alt katında bulunan panjurlar, düşeyde üç bölüme ayrılmıştır. Alt bölüm 21, orta bölüm 17 ve üst bölüm ise 18 lameldan meydana gelmektedir. Alt bölümde bulunan lameller iç orta kısımlarında dikey konumda bulunan metal parçaya hareketli mafsallarla bağlanmış ve bu şekilde düşey çubuk üzerinde bulunan tutma koluyla aşağı yukarı hareket ettirilerek lamellerin açılarının değiştirilebilmesi sağlanmıştır.

Köşkün alt katının arka cephesinde yer alan pencereler, ön cephedeki pencerelere göre biraz daha büyük olup 160x315 cm ölçülerindedir. Ön cephedeki pencerelerde olduğu gibi bu pencerelerde de parmaklıklı bir düzenleme uygulanmış, ancak panjur kanatlarının sayısında farklılık görülmüştür.

8 Küçük Mabeyn Köşkü'nün zemin kat penceresinin genel görünümü ve ön ve arka cepheden panjur detayları

Bu cephede pencereleri kapatan panjurlar altı kanattan oluşmakta ve her iki tarafta üçer kanat olacak şekilde 3+3 olarak simetrik biçimde düzenlenmiştir. Diğer özellikleri bakımından ön cepheyle benzer olan bu panjur sisteminde, üçlü kanat düzenlemesinin pencere kasası ile parmaklık arasında kalan boşluğun gerektirdiği bir çözüm olarak tasarlandığı anlaşılmaktadır.

Köşkün üst katındaki pencereler, alt kattakilerden farklı olarak parmaklık kullanılmadan inşa edilmiştir. Buna karşın, panjur sistemi alt kat pencerelerinde uygulanan sistemle tamamen aynıdır. Her iki katta bulunan panjur kanatları yanlardan beşer menteşe ile sabitlenmiştir. Özgün sistemde bütün lameller hareketli olduğu halde, günümüzde alttan 20 lamel hareketli özellikteyken, üzerinde bulunan lameller ise sabitlenmiştir.

İki kattan meydana gelen Küçük Mabeyn Köşkü'nün üst katında Art Nouveau akımının süsleme özelliklerini gösteren kış bahçesi bulunmaktadır.

9 Küçük Mabeyn Köşkü'nün arka cephesinden ve kış bahçesinden görünüm

İki kattan meydana gelen Küçük Mabeyn Köşkü'nün üst katında Art Nouveau akımının süsleme özelliklerini gösteren kış bahçesi bulunmaktadır. Cephesi her yönden pencerelerle çevrili bulunan kış bahçesinin tüm pencereleri panjurlu olarak yapılmıştır. Pencereler 165 cm yüksekliğindeyken genişliklerde küçük farklar olmakla beraber ortalama 40 cm'dir. Kış bahçesinde bulunan pencerelerden bazıları tek kanatlı iken, çoğunluğu ise çift kanatlı olarak yapılmıştır. Dört kanatlı pencereler de bulunmakla beraber bu pencereler ortadaki iki kanadı hareketli olacak şekilde çift kanatlı pencere gibi düzenlenmiştir.

Kış bahçesindeki pencere panjurları, tek çerçeve bölümünden oluşmakta olup her biri 26 adet lamelden meydana gelmektedir. Lameller, yanlarda yer alan panjur çerçevelerine sabitlenmiştir. Sağ taraftaki panjur kanadı bindirme çıtalı olup kapatıldığında kilitlenmesini sağlayan bir kulp sistemine sahiptir. Kanatların alt kısmında, yatay çerçeve elemanının üzerinde bir kanca demiri bulunmaktadır. Bu kanca, kullanılmadığı zamanlarda aynı çerçeve üzerindeki kanca yuvasına takılarak sabitlenmektedir. Panjur kanadının açık konumda kalması istendiğinde ise kanca yuvasından çıkarılarak pencere kasasının altındaki yatay ögedeki yuvaya takılmış ve böylece panjur kanadı sabitlenmiştir.

Yıldız Sarayı'ndaki yapıların panjurları genellikle hâkî renkte iken, Küçük Mabeyn Köşkü'nün kış bahçesinde kullanılan panjurların beyaz renkte olduğu görülmektedir. Bu tercih, panjurlar kapalı durumda olsa bile kış bahçesinin iç mekânında aydınlık ve ferah bir atmosferin oluşmasını sağlamaktadır.

Küçük Mabeyn Köşkü'nde bulunan panjurlar günümüzde de özgün biçimleriyle varlığını sürdürmektedir.

10 Küçük Mabeyn Köşkü'nün kış bahçesinde bulunan panjurlardan genel ve detay görünüm

Harem Dairesi

Çalışmamızda Yıldız Sarayı'nın Harem Dairesi'nin yapı gruplarından, Baş Kadın Efendi, Hazinedar Usta ve Cariyeler dairelerinin panjur sistemleri incelenmiştir. Harem Dairesi'ni meydana getiren yapılar, II. Abdülhamit zamanında inşa edilmiştir. Yapılar birbirlerine dar ve basit koridorlarla bağlanmıştır. İki katlı olan bu yapı grupları, bağdadi tekniğiyle inşa edilmiştir.

Baş Kadın Efendi Dairesi'nin 105x255 cm ölçülerindeki pencereleri, üst kısmı basık kemer formunda tasarlanmıştır. Bu bölümde kullanılan panjur sistemi, sarayın diğer bölümlerindekinden tamamen farklıdır. Düşeyde ikiye bölünmüş çift kanatlı pencereye uygun biçimde, panjur çerçevesi de iki bölümden oluşturulmuştur. Her bir çerçevenin içine yerleştirilen 19 adet lamel, çerçevenin orta ve yan elemanlarına açılan kanallara sabitlenerek sabit lamelli bir panjur sistemi meydana getirilmiştir.

11 Harem Dairesi'nin farklı bölümlerinden cephe görünümleri

Pencerelerin yalnızca bir kanadı açılır özelliktedir. Geniş ve dışa doğru taşkın pencere kasalarının dış yüzeyine dikey kanallar açılmış, panjur kanadı ise bu kanalların içine yerleştirilmiştir. Tek parça hâlinde düzenlenen panjur kanadı, yukarı ve aşağı yönde hareket eden bir giyotin pencere sistemiyle çalışmaktadır. Yaklaşık 1 metre yüksekliğindeki panjur, yukarı kaldırıldığında sabit kalabilmesi için kasanın yan taraflarına yerleştirilen kilitleme mekanizmalarıyla tutulmaktadır.

Baş Kadın Efendi Dairesi'nin pencere panjurları yakın zamanda tamamen yenilenmiştir.

12 Baş Kadın Efendi Dairesi'nin pencere sistemi ve panjur düzenlemesi

Haznedar Usta (Kalfa) ve Cariyeler Dairesi'nin pencere panjurları, sarayın diğer bölümlerindekilerden farklı olarak kendine özgü bir düzenlemeye sahiptir. 155x220 cm ölçülerindeki pencere yüzeyini tamamen kaplayacak biçimde tasarlanan panjur, düşeyde ikiye, yatayda ise üçe bölünerek altı bölümlü bir kompozisyon oluşturmuştur.

Üst bölümde yer alan panjur çerçevesi sabit durumdadır. Ancak bu bölümde, her iki tarafta yedişer lamelden oluşan elemanlar açıları ayarlanabilir biçimde hareketli olarak düzenlenmiştir. Alt kısımda yer alan dört bölüm ise düşey doğrultuda açılıp kapanabilen iki kanat şeklinde tasarlanmıştır. Her bir kanat yatayda iki eşit parçaya ayrılmış olup, bu parçaların her biri 11 lamelden oluşmaktadır. Hareketli panjur kanatları, yanlardaki kasalara üçer adet menteşe ile sabitlenmiştir.

13 Haznedar Usta (Kalfa) (solda) ve Cariyeler (sağda) dairelerinin cephe görünümleri

Yapılarda bulunan panjur düzenlemeleri günümüzde sabit lamel olarak işlev görmektedir. Ancak alt taraftaki panjur bölümünde yer alan lamellerin ortasında bulunan, hareketli mafsallarla lamellere tutturulmuş olan hareket sisteminden, lamellerin önceden hareketli sisteme sahip iken, sonradan sabit sisteme dönüştürüldüğünü göstermektedir.

Haznedar Usta (Kalfa) ve Cariyeler dairelerinin pencere düzenlemelerinde bir başka dikkat çeken husus da bu pencerelerde kullanılan parmaklıklardır. Çit Kasrı'nda pencere ve panjur arasında, Küçük Mabeyn Köşkü'nde ise panjurun dışında yer alan parmaklıklar, pencerenin tamamını kaplamaktayken, Haznedar Usta (Kalfa) ve Cariyeler dairelerinin pencerelerinde bulunan parmaklıklar pencerelerin alttan yaklaşık 60 cm'lik bir kısmında bulunmaktadır. Düşey ve yatay metal çubukların arasına yerleştirilen iki farklı çaptaki çemberlerden meydana gelen parmaklıklar, Çit Kasrı örneğinde olduğu gibi pencere kanadı ile panjurun arasında yer almaktadır.

14 Haznedar Usta (Kalfa) Dairesi'nin ve pencere panjurunun içten ve dıştan görünümü

DEĞERLENDİRME VE SONUÇ

Yıldız Sarayı'nda incelenen pencere panjurları, Osmanlı saray mimarisinde işlevsellik, estetik ve teknik titizliğin bir arada ele alındığı, özgün bir detay mimarisini gözler önüne sermektedir. Sarayın farklı bölümlerinde kullanılan panjur sistemleri, yapıların konumu, kullanım amacı ve dönemin mimari anlayışı doğrultusunda çeşitlilik göstermektedir. Büyük Mabeyn Köşkü, Çit Kasrı, Yaveran ve Bendegân Dairesi, Küçük Mabeyn Köşkü ve Harem Daireleri'nde gözlemlenen örnekler, bu çeşitliliğin hem tasarım hem de işlev açısından nasıl biçimlendiğini ortaya koymaktadır. Büyük Mabeyn Köşkü'nde yer alan panjurlar, çok parçalı ve hareketli lamelli bir yapıya sahiptir. Bu sistem, iç mekânın ışık, hava ve mahremiyet koşullarını kontrol etmeye olanak sağlayarak hem fonksiyonel hem de estetik bir çözüm sunmaktadır. Lamellerin menteşe, bindirme pervazı ve kanca sistemleri ile donatılması, dönemin malzeme ve işçilik anlayışının yüksek bir düzeyde uygulandığını göstermektedir. Hareketli lamellerin birbirine geçmeli mafsallı sistemle bağlanması, lamellerin eksenleri etrafında hareket etmesini mümkün kılarak ışık kontrolü ve mahremiyet açısından esnek bir kullanım imkânı sunmaktadır. Ayrıca çerçeve birleşimlerinde zıvanalı köşe tekniklerinin uygulanması ve köşelerde L şekilli metal levhaların kullanımı, yapının yapısal sağlamlığını desteklemektedir. Bu özellikler, Büyük Mabeyn Köşkü'nün cephe kompozisyonunda ritim ve dengeyi sağlayan teknik bir zekâyı ortaya koymaktadır.

Çit Kasrı'nda ise panjurlar, Büyük Mabeyn Köşkü'ne kıyasla daha sade bir düzenlemeye sahiptir. Cephedeki pencereler ikişer kanatlı olup, her kanat düşeyde üç bölüme ayrılmıştır. Üstteki kısa bölüm sabit kasalı olarak tasarlanmış, alttaki iki bölüm ise açılır şekilde düzenlenmiştir. Lamellerin üst yüzeyleri dairesel profillendirilmiş ve dışa doğru açılabilme özelliği ile kullanıcıya estetik ve işlevsel bir kullanım imkânı sunulmuştur. Pencerelerin her iki yanında bulunan kasalara üçer adet menteşe ile tutturulmuş olan panjur kanatları, dışa doğru açılabilmekte ve kanca sistemleri ile açık konumda sabitlenebilmektedir. Çit Kasrı örneği, Büyük Mabeyn Köşkü'ndeki daha karmaşık mekanizmaların aksine, sade fakat işlevsel bir çözüm sunarak sarayda farklı yapı tipleri için çeşitlilik gösteren panjur sistemlerinin kullanımını ortaya koymaktadır.

Yaveran ve Bendegân Dairesi'ndeki panjurlar, önceki örneklerden farklı olarak tek kanatlıdır ve düşey doğrultuda iki bölüme ayrılmıştır. Alt bölüm, giyotin pencere sistemi ile açılabilirken, üst bölüm sabit olarak bırakılmıştır. Lamellerin sabitlenmiş olması, önceki örneklerde görülen hareket mekanizmasının sınırlanması anlamına gelmektedir. Bu durum, yapının estetik dinamizmi ile işlevsellik arasındaki tercihi yansıtmaktadır. Ayrıca panjur çerçevelerinin dikey elemanlarının üst yatay elemanı aşacak şekilde uzatılması, profilli biçimde şekillendirilerek, cephe kompozisyonuna görsel bir hareket kazandırmakta ve panjurların estetik değerini artırmaktadır. Panjurların menteşelerle sabitlenmesi ve bindirme pervazı ile kanca sistemlerinin uygulanması, işlevsel güvenliği destekleyen detayların önemini göstermektedir. Bu örnek, sarayda farklı yapı gruplarının kullanım amacına göre panjurların tasarımında esneklik ve çeşitlilik sağlandığını göstermesi bakımından önemlidir.

Küçük Mabeyn Köşkü ve Harem Daireleri'ndeki panjur sistemleri, hareketli ve sabit lamellerin birlikte kullanıldığı, son derece dikkatli bir tasarım anlayışını ortaya koymaktadır. Baş Kadın Efendi Dairesi'nde basık kemerli pencerelerde kullanılan sabit lamelli panjurlar, yapıların iç mekânlarını ışık ve mahremiyet açısından kontrol etme amacına hizmet etmektedir. Haznedar Usta ve Cariyeler Daireleri'nde ise panjurlar alt bölümde hareketli lamellere sahip olup kullanıcıya daha fazla esneklik sunmaktadır. Bu sistemlerin sonradan sabit hale getirilmiş olması, yapının tarihî süreç içinde geçirdiği değişimleri ve restorasyon müdahalelerini göstermektedir. Parmaklık uygulamaları, yapılar arasında farklılık göstererek, güvenlik ve estetik kaygıların panjur tasarımına nasıl yansıtıldığını ortaya koymaktadır. Küçük Mabeyn Köşkü kış bahçesinde kullanılan beyaz renkli panjurlar, kapalı durumda olsalar bile mekâna ferahlık ve aydınlık kazandırarak kullanıcı konforunu ön plana çıkarmaktadır.

Kış bahçesinin cephelerini çevreleyen panjurlar, tek veya çift kanatlı olarak tasarlanmış, lameller hareketli sistemlerle donatılmıştır. Bu düzenleme, Art Nouveau akımının süsleme ve fonksiyonellik anlayışıyla bütünleşen bir estetik çözüm sunmaktadır.

Yıldız Sarayı panjurları, Osmanlı saray mimarisinde hem estetik hem de teknik açıdan yüksek bir titizlik ve işçilik düzeyini göstermektedir. Farklı yapı gruplarında kullanılan panjur tipleri, hareket mekanizmaları ve malzeme uygulamaları, saray yaşamının gereksinimlerini ve padişah ile saray mensuplarının kullanım alışkanlıklarını anlamak açısından önemli bilgiler sunmaktadır. Hareketli ve sabit lamelli sistemlerin bir arada kullanımı, ışık kontrolü, mahremiyet, güvenlik ve estetik kaygıların bütüncül olarak ele alındığını ortaya koymaktadır. Bunun yanı sıra lamellerin menteşe, kanca ve mafsallı mekanizmalarla donatılması, işlevselliği destekleyen teknik bir zekâyı göstermektedir. Ahşap lamellerin makta kısımlarına vidalar ve metal levhalar ile yapılan bağlantılar, cephe estetiğini bozmadan yapının dayanıklılığını artırmaktadır. Bu durum, Osmanlı saray mimarisinde hem malzeme seçimi hem de işçilik kalitesine verilen önemi vurgulamaktadır.

Yıldız Sarayı'ndaki pencere panjurları, yapının mekânsal ve estetik kimliğinin önemli bir parçası olarak değerlendirilebilir. Cephelerdeki ritim, denge ve oran, panjurların tasarımıyla doğrudan ilişkili olup, farklı bölümlerde kullanılan sistemler sarayın tarihî süreç içindeki gelişimini ve dönemin mimari tercihlerini yansıtmaktadır. Hareketli lameller, ışık kontrolü ve mahremiyet açısından kullanıcıya esneklik sağlarken, sabit lameller ve parmaklık sistemleri güvenlik ve yapısal bütünlüğü desteklemektedir. Böylece Yıldız Sarayı, Osmanlı saray mimarisinin son dönemlerinde estetik ve işlevin dengeli bir biçimde bir araya getirildiği seçkin örneklerden biri olarak öne çıkmaktadır.

Sonuç olarak, Yıldız Sarayı'ndaki pencere panjurları yalnızca işlevsel bir eleman değil, aynı zamanda yapının kimliğini ve saray yaşamının sosyal, kültürel ve teknik dinamiklerini yansıtan özgün bir mimari detaydır. İncelenen örnekler, farklı yapı gruplarındaki panjurların kullanım amacına göre çeşitlendiğini ve her sistemin hem estetik hem de teknik açıdan titizlikle tasarlandığını göstermektedir. Hareketli ve sabit lamelli sistemlerin bir arada kullanılması, ışık ve hava kontrolünden mahremiyetin korunmasına, estetik bütünlükten yapı dayanıklılığına kadar pek çok amaca hizmet eden bütüncül bir yaklaşımı ortaya koymaktadır. Bu bağlamda, çalışmada ortaya konan sistematik inceleme, panjurların özgün niteliklerinin korunmasına yönelik restorasyon ve koruma çalışmalarına önemli bir temel sunmakta, Osmanlı saray mimarisinin son dönemlerinde detaylara verilen önemi ve teknik ustalığı anlamak açısından değerli bilgiler sağlamaktadır. Yıldız Sarayı panjurları, mimari detay anlayışı ve işlevselliği bir arada sunan nadir örnekler olarak hem tarihî hem de kültürel miras açısından büyük önem taşımaktadır.

Abstract

Türkiye is a country rich with heritage. Among numerous cities with such heritage, Safranbolu, stands out. In such cities, new constructions are expected to be integrated into the historic texture of the older parts, with an approach to produce independent 'new' in harmony with the old. Often, new buildings come into being as a result of population growth, economic progress, and land prices. The modern fast build-and-sell system also adds to these pressures. Undeniably, the new buildings play a major role in invading the cities with modern construction materials and the destruction of the green areas leading monotony and sameness that did not exist in the past. In fact, Safranbolu suffers from these new developments. It has not received sufficient attention to the protection of the historical environments. Indeed, it is giving way to the construction of new buildings with different materials and systems, both on empty parcels, and demolishes the existing old buildings. In this context, this paper examines the Bağlar Region houses in Safranbolu.

It employs a case study approach looking into one of the streets: the Değirmenbaşı Street. Data is collected through on-site observations, photographic documentation, and archival research. The paper reveals the different façade characteristics of the old and the new houses of Değirmenbaşı Street and to what extend they either integrate with each other or not. Thus, it maps out the extent to which the character of the city has changed. It concludes that the constructions in the Bağlar district are not harmonious to each other except their building order, floor number, and maximum height. The re-constructed houses have led to the degeneration of the city. It argues that the historical environments should be conserved, adapting to the existing conditions and henceforth. This requires that planning authorities must recognize the importance of the past of the city for establishing its urban identity.

Keywords: Bağlar Region of Safranbolu, houses, façade characteristics, Turkey.

Introduction

Today, cities contain both the reality of survival and renewal together in it. Especially, historical environments have lost their functions and have become almost unrecognizable. Some old structures have been demolished as a result of socio-cultural and economic changes, and the new buildings that have come up are devoid of aesthetic values.In fact, they are foreign to their environment. They have been built in place of them. In this way, the historical buildings have increasingly lost their influence in the built environment. This transformation nourishes conflicts between the old and the new buildings that produce several complexities, threatening the visibility of historical values and their continuity. Increasingly, the disappearance of familiar building - sespecially in visual sense - causes cultural estrangement that influences negatively on both cities and urbanites. This issue is associated with a planning mentality based on the market economy. According to the visual form reflected to space of consumption, almost all cities look like each other.

In this regard, the study examines the ways in which the new is integrated with the old in the Bağlar district in Safranbolu city of Karabük province. This district is located within the urban conservation area (since 27 November 1990). It also reflects the physical and social identity of the city, and demonstrates the alterations and transformations in its physical space.

Therefore, the study aims to expose modified architectural formation of the Bağlar Region, particularly Değirmenbaşı Street.. Its objctives are as follows.

- To establish existing architectural façade characteristics of both the old and new buildings
- To determine similarities and differences between the old and the new structures in historical environments

Theoretical Framework

Concepts of Cultural Heritage and Historic Environment

Since the mid-twentieth century, the concept of “heritage” has undergone a profound transformation following the destructive impacts of the Second World War on cities and the subsequent loss of urban identity. During this period, it became evident that cultural heritage was not limited solely to monumental structures but also encompassed ordinary buildings, settlements, and urban fabrics. This understanding was first internationally recognized through the 1964 Venice Charter, which expanded the notion of heritage from a focus on the “monument” to include the broader dimensions of “site” and “place” (Alici, 2021). The broadening of this definition enabled the built environment to be perceived as an integrated whole and has established conservation as a collective responsibility (Assi, 2000).

This perspective reveals that today, the concept of “historic environment” should be evaluated not only in terms of physical protection but also in the context of social, cultural, and spatial continuity. The historic environment can be defined as a cultural heritage area where identity, memory, and ways of life carried over from the past periods to the present are embodied.

New Constructions within the Historical Environments: An Approach in the Light of ICOMOS Charters

The design of new buildings within historical environments is regarded as an act that must be conducted in accordance with international conservation principles, respecting identity, scale, and intrinsic values of the existing urban fabric. The 1964 Venice Charter of ICOMOS emphasizes that any new construction should be designed “in a harmonious relationship with the historic setting in terms of form, scale, proportion, and material expression.” According to this principle, new architecture should not imitate the historical fabric, but rather establish a respectful dialogue with it, responding to contemporary needs without compromising the

authenticity of the context. In this way, the new structure becomes both a product of its own time and a contributor to the continuity of the environment in which it is situated.

These principles have been further elaborated at the urban scale in the 1987 Washington Charter (Charter for the Conservation of Historic Towns and Urban Areas), which underlines that new constructions should not damage the spatial integrity or the silhouette of historic towns. Here, the focus is not merely on formal compatibility but on the relationship established with the cultural context. A new building should support historical continuity through its sensitivity to urban memory, patterns of use, circulation systems, and the configuration of open spaces.

The Burra Charter (Australia ICOMOS, 1999) extends this perspective by introducing a value-based approach to conservation, emphasizing that preservation encompasses not only physical heritage but also its meanings and social values. Accordingly, any new design should respond to 'spirit of place' by considering the emotional, social, and symbolic dimensions that the environment embodies. Similarly, the Nara Document on Authenticity (1994) asserts that authenticity should be sought not solely in materials but also in the forms, functions, techniques, and environmental contexts. Consequently, new buildings are understood not as mere additions, but as contemporary interpretations of historical continuity, contributing to the ongoing narrative of the built environment.

The Relationship Between Historical Environment and Cultural Heritage

Rapoport (1969; 1982) defines architecture not merely as a physical process of production but as a form of cultural expression. Every settlement, according to him, is shaped by the value systems, lifestyles, and beliefs of the society that produces it. Therefore, the 'historical environment' can be understood as a materialized cultural text that embodies the social order and cultural behavior patterns of the past. In this context, not only the formal characteristics of these environments but also the social norms and systems of meaning that generated them are essential components that must be preserved. Consequently, cultural heritage should not be viewed solely as the survival of the physical fabric, but rather as the continuity of meaning that it conveys (Rapoport, 1969; 1982).

In his seminal work 'The Meaning of the Built Environment,' Rapoport (1982) emphasizes that people perceive and experience space not primarily through its formal qualities but through symbolic and semantic relationships. Within this framework, the historical environment becomes more than an aesthetic or technical entity—it is a carrier of collective identity and cultural memory. The historical value of a place is thus determined not only by its age but by the persistence of its meanings; once this continuity is broken, the essence of cultural heritage is lost, even if the physical form remains intact.

Through the "culture–meaning–architecture" triad, he developed in the 2000s, Rapoport provides a theoretical framework for contemporary interventions within historical contexts. The design of new buildings, he argues, should not imitate historical forms but instead comprehend and reinterpret their underlying cultural logic within the present context. True contextual sensitivity in architecture arises not only from physical compatibility but from the ability to regenerate meaning (Rapoport, 2000). Thus, the preservation of the historical environment lies not in the replication of its forms, but in the capacity to sustain and reinterpret its meanings in the contemporary settings.

A Conceptual Evaluation of New Architectural Designs within the Historical Fabric

Zeren (2010) perceives the historical environment not merely as a physical assemblage of buildings, but as a holistic organism that embodies cultural identity. In this sense, the façades, stylistic characteristics, and organically evolved street patterns layered over time represent a spatial memory that has developed naturally throughout history. Therefore, each building constitutes a historical datum that defines the identity of its surrounding environment.

At this point, the concept of "context" in architecture gains particular importance. Capon (1999) identifies context as comprising both physical and cultural dimensions, while Güleç (2011) defines physical context as "the spatial characteristics of a place" and cultural

context as "the identity of the users for whom the design is produced." Anderson (2014) further argues that by integrating topography, climate, orientation, material, and local lifestyles into the design process, it becomes possible to develop an authentic and environmentally compatible architectural language.

Designing new structures within historical environments requires from the architect not only formal proficiency but also interpretive competence. In this regard, Akbıyık (2013) emphasizes that the design process necessitates a holistic understanding of both physical and cultural factors, and that new buildings should be integrated into the life cycle of the historical environments. Through such integrations, the new structure becomes an element accepted by its surroundings and contributes to the continuity of the place.

Moreover, Kılıç (2015) argues that there is no single formula for designing within a historical fabric, as each design is shaped by the specific conditions and cultural dynamics of its context. Hence, the question of how new constructions should be articulated in terms of forms, materials, techniques, and styles remains a central issue in contemporary architectural discourse. For designers, the critical dilemma lies in whether a new building should replicate the existing fabric or be conceived as a contemporary interpretation that connects to the historical environment (Kılıç, 2015; Ateş Can & Uyguralp, 2022).

These discussions generally converge into two primary approaches: the approach of harmony/similarity and the approach of contrast/opposition. The former prioritizes formal coherence and historical continuity, while the latter seeks to establish a critical dialogue between the past and contemporary architecture. Indeed, both these provide the theoretical framework for this study.

Review of Literature

Academic studies conducted on Safranbolu have addressed the multilayered historical structure, cultural heritage, and spatial transformation processes of the city from diverse perspectives. Although these studies predominantly focus on the *Çukur* (*Eski Çarşı*) district, they collectively provide significant insights into understanding the relationship between the historical environment and the new architectural interventions across the entire city.

Selvinaz Gülçin Bozkurt's (2022) analyzes the Çukur (Eski Çarşı) area through cultural landscape criteria such as aesthetic, identity, social, historical, artistic, and scientific values. The study systematically reveals the impacts of urbanization on cultural heritage and emphasizes the necessity of developing conservation, planning, and sustainability oriented strategies to prevent the deterioration of the cultural identity of Safranbolu, its social cohesion, and artistic values.

Adding to this, Oral (2019) examines the relationship between modern architecture and historical identity in Safranbolu. Through a morphological, typological, and aesthetic analysis of contemporary residential and public buildings, Oral argues that the pursuit of "visual harmony" in historical settings often remains superficial, as the symbolic and identity dimensions of traditional architecture tend to be neglected in modern design practices.

Moreover, Kartal and Dinçer (2023) investigate the formal harmony between the old and new houses in the *Babasultan* neighborhood using a three-dimensional fractal analysis method. Supported by quantitative data, they demonstrate that new buildings achieve a high degree of formal and proportional compatibility with the historic fabric, and that fractal analysis provides an effective and objective tool for measuring such harmony.

Similarly, Yetiş, Turcan, and Dinçer (2021) explore the spatial development of the city from the 14th century to the present. Their findings show how the morphogenetic structure of Safranbolu has been shaped by conservation plans and how new urban planning policies have influenced its historic texture. Indeed, they conclude that the city has developed a dynamic balance between the efforts to preserve its traditional fabric and the pressures of new construction, influenced by industrialization, population growth, and evolving planning approaches.

Collectively, these studies provide a multi-dimensional theoretical foundation for understanding the historical environment of Safranbolu, offering crucial insights into the

formal, semantic, and spatial compatibility of new architectural designs within the historic fabric. However, since literature has largely concentrated on the *Eski Çarşı (Çukur)* district, the Bağlar region's ongoing transformations require further academic investigation to achieve a more comprehensive understanding of the contemporary urban dynamics of Safranbolu.

Research Methods

This study employs a case study approach looking into one of the streets: the Değirmenbaşı Street. Data is collected through the following data gathering techniques.

- Examination of the archives of relevant institutions
- On-site observations
- Photographic documentation of the street character and buildings

Following conceptual research and a comprehensive review of the related literature, information about the study area was collected. Within this scope, the construction dates and registration data of the residential buildings located along the street studied were obtained in 2012 from the Safranbolu Municipality Archive and the Safranbolu Land Registry Office Archive. In 2012, interviews were conducted with the users of the recently constructed houses to obtain information about their construction years.

Field observations were carried out on multiple occasions in 2012 and 2025, allowing for both macro-scale analysis of the surrounding urban fabric and micro-scale examination of individual buildings and their components. Visiting the area at different times made it possible to directly observe the physical changes and development of new constructions over time. During these field studies, both the overall street character and the individual buildings were photographed by the authors.

In addition, in 2025, measurements of the residential buildings and their immediate surroundings along the street were taken, and based on these data, a comprehensive digital street silhouette was drawn. Utilizing both the field data and archival sources, individual façade analysis tables were prepared for each residential building on the street. The template used for these tables was adapted from the doctoral dissertation of the corresponding author Süheyla Birlik's titled *"Tarihi Çevrelerde Kentsel Kimlik Değişiminin Eşik Analizi: Trabzon'da Bir Deneme"* (*Threshold Analysis of Change in Urban Identity in the Historical Environments: A Case Study in Trabzon*) (Birlik, 2006).

The Case Study

Safranbolu, located in the Western Black Sea Region of Türkiye, is a district of Karabük (Fig. 1). Safranbolu's known history descends to the B.C. 3000 years. The name of the region in antiquity period was Paphlagonia. People living here descendng from the prehistoric period were Kaskians, Paphlagonians, Grecians, Romans, and Byzantines. With the people beginning to settle in Anatolia of the Seljuks, Safranbolu was ruled by Principalities of Çobanoğulları and Candaroğulları. According to Gönenç (1994), Padishah Yıldırım Beyazıt added the region to the Ottoman territory in 1392.

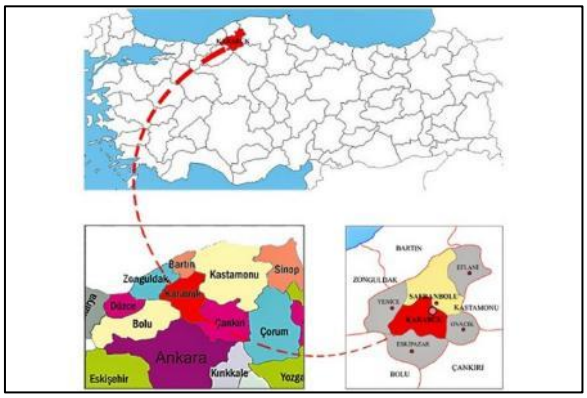

Fig. 1: The location of Safranbolu.

According to Emecen (2003), the present formation of the city has come into being during the Ottoman period. It deserves its actual reputation from its houses. In fact, the houses are perfect samples of old civil architecture, reflecting the Turkish social life of the 18th and 19th centuries. Another important factor was its strategic position, because Safranbolu was an important stopping place on the Kastamonu-Gerede-Istanbul part of the Silk Road (trade route). In this way, Safranbolu was included in the 'List of World Inheritance' by UNESCO (United Nations Educational, Scientific and Cultural Organization) at the end of 1994 and became a world city because of its success in preservation of its heritage as a whole (Safranbolu Tourism Office, 1995).

Safranbolu consists of three traditional distinct districts: Çarşı, Bağlar, Kıranköy (Fig. 2 and Fig. 3). The Çarşı district (Eski Çarşı/old town) is in a valley hollowed out and shaped by the Akçasu and Gümüş streams. It has once been a center for commerce, and here, the Muslim population was living in the winter. The Bağlar district (orchard) is situated on a gentle slope inclining towards the city. It served once as a summer residential area when the people wanted to escape from the scorching heat in the valley and enjoy the wealth of fruits of the months from May to October. The Kıranköy district or the new town is situated over the cliff that forms the Western boundary of the valley. It has been occupied by the non-Muslims until their compulsory immigration in 1923.

The Turkish population settled here later.

In the first zoning plan of Safranbolu in 1936, areas surrounding the historical centers were opened for development, anticipating that the establishment of the iron and steel factory in nearby Karabük would generate a new housing demand (Yetiş et al., 2018). As a result of the construction of the factory, the Bağlar district became a primary location for new residential developments (Ongun, 1936). The jury report of the 1968 zoning plan, which was prepared through a design competition, emphasize that the new residential areas were planned without damaging the fabric of the old town, reflecting a design approach based on the principles of preservation (Bankası, 1968). One of the most significant contributions of the plan was its promotion of cooperative housing production (Çabuk et al., 2016).

After 1975, apartment blocks built through housing cooperatives have begun to appear along both sides of Sadri Artunç Avenue, located between the Kıranköy and Bağlar districts. Over time, this area has become the new urban center of Safranbolu (Yetiş et al., 2018). In the 1990 Conservation Zoning Plan, the Bağlar district has been designated as a development area (Okyay, 1990). Up until 2010, new buildings constructed around the historical centers displayed façades that aimed to resemble traditional architecture. However, due to their apartment-scale massing and building heights, these structures have negatively affected the urban silhouette (Yetiş, 2016). In 2010, a new zoning plan was approved that included the urban conservation areas (Çarşı, Kıranköy, and Bağlar) and their buffer transition zones. Since then, the city has experienced rapid expansion and densification. The plan also intervened in the existing built character established by the previous plan, particularly in terms of building height, levels of eaves, and mass proportions. Over time, the development between and around the historic zones has produced a new urban texture, leading to a transformation in the cultural landscape of the city.

Adding to these, the opening of new university faculties in recent years has significantly increased the number of students in Safranbolu, contributing further to the acceleration of new constructions. With a population approaching 70,000, this rapid urban growth has placed increasing pressure on the historical environment, often resulting in new urban images that are incompatible with the traditional fabric. As a city renowned for its tourism, Safranbolu has also undergone spatial transformations driven by tourism activities. However, such transformations are concentrated mainly in the Eski Çarşı (Çukur) district, while the Bağlar district has been comparatively less affected.

Değirmenbaşı Street is one of the key access axes within the Bağlar district. The main vehicular routes connecting the Safranbolu city center converge onto this street, making it a highly active public space with intensive vehicular and pedestrian movement. The public transportation line of the city also passes through here. As a result, Değirmenbaşı Street is one of the most prominent locations where the historic fabric of Bağlar is most perceptible. These characteristics have been influential in defining the study area.

On both sides of the street, traditional houses are situated. One side features large cultural landscape gardens and a few registered heritage buildings, while the other side includes a higher density of housing, comprising both historic and newly constructed structures. The coexistence of old and new buildings, and the visible contrast between authenticity and transformation, make this section particularly suitable as a representative study area for analyzing the interactions between the traditional and contemporary architectural layers of Safranbolu (Fig 4).

Findings

General

Today, the Safranbolu houses are determined mainly by the topography (no house prevents the view of another), narrow cobbled streets, gardens separated from the street with rough stone walls. Large double wing doors leading to the yard and sometimes directly into the house. Door knockers, and wooden cages called 'gliste' allow light to come inside and help dry out the fire-wood which is stacked behind it at the same time, hayat (paved hall at the entrance/at the first floor), huge furnaces, cellars, stables, haylofts, and stairs demonstrate the best examples of wood-craft. A central hall called 'sofa' (the main access place; the living room where daily activities took place), rooms, wooden cupboards and shelves, sedir or divan in front of the windows, gusülhane (small bathroom inside the wooden cupboard called 'yüklük'), ceilings with wooden ornaments add to these. The narrow and long windows have their numbers change according to the size of the room. Wooden shutters and cages called 'muşabak', as well as bay windows (the outward surge of the main walls on the façade) and hipped roofs covered with mission tiles produce an adorable character.

In fact, they all come together to form an incomparable architectural aesthetics (Fig. 5). The ground floors of the houses, which are made of stone, form at the same time, the basis of the buildings. They are generally windowless. The other floors consist of half-timber frames. The middle floor has a low ceiling. In this floor, there is a kitchen. The daily life usually passes at the mid-floor. The top floor has a great number of windows and its façades are go-go because of the bay windows. The ceiling here is higher and the rooms are used as the bedrooms.

Fig. 5: Traditional Safranbolu houses.
Source: Author Birlik, 2012.

When the summer arrives, the inhabitants of Safranbolu, having spent the winter months within the valley, settle to the plateau above. Interestingly, the economic prosperity of the town has made it possible for its inhabitants to own a second house (Gülersoy, 1997). Thus, the areas with vineyards and orchards have been turned into summer residence areas and hence the Bağlar district has developed (Günay,1999).

The Bağlar district is situated in the North-West of the winter district on a gentle slope facing the South. The houses are within large gardens, and they have an infrequent settlement pattern. The topography here is not as interesting as in the Çarşı district. However, the roads winding among the gardens give the impression that you are walking in a very large part of the

city. In fact, there are always many surprises. Nevertheless, in reality, the total distance is only 1500 m. (Günay,1999). Today, the Bağlar district, blended with green, wood, and stone, demonstrates the new constructions in addition to its old houses. Therefore, its identity has partly changed (Fig. 6).

Façade Characteristics of Değirmenbaşı Street

In this study, seven consecutively aligned houses located on Değirmenbaşı Street in the Bağlar district of Safranbolu (sheet no: 106.110.E, block no: 54, plots no: 6–10–11–12–13–14–15) were analyzed (Fig. 7). For each of these buildings, a detailed table was prepared presenting the specific characteristics of their façades (Tables 1–7). These tables include information on the registration status, building names, addresses, materials, and spatial attributes, as well as all the façade components categorized under the main headings such as forms, horizontal and vertical bands, entrance configurations, and bay windows (oriels).

Analysis of the Findings

On Değirmenbaşı Street, well-preserved traditional buildings stand alongside altered historical structures and newly reconstructed houses. Each of these buildings has been numbered in the analysis tables, and their locations have been indicated on the site plan. Accordingly, House Nos. 1, 4, and 6 (inventory numbers: 916, 879, 880) are original historical buildings, whereas House Nos. 2 and 3 have been renovated. House Nos. 5 and 7 have been completely rebuilt.

Information on the construction dates of the houses was obtained from the Safranbolu Municipality Archive, the Safranbolu Land Registry Office Archive, and from the residents of the houses. According to this information, the earliest registration belongs to Mehmet Ergin House. However, it is renewed and has lost its originality. The construction dates of all the examined buildings are presented below in the Table 8.

Table 8: Date of construction information of the houses
Source: Safranbolu Municipality Archive, 2012; Safranbolu Land Registry Office Archive, 2012; residents of the houses, 2012.

House Number	Date of construction
1	1889
2	1902
3	1887
4	1889
5	1975
6	1895
7	1909 (1971)

Within the traditional settlement fabric of Değirmenbaşı Street, the historic building walls, entrance doors, bay windows (oriels), garden walls, trees, and traditional water channels running along the street line collectively constitute the defining elements of the streetscape. However, it has been determined that certain changes in the recent developments have weakened this overall integrity. In order to illustrate the coexistence of the old and new structures, a street silhouette drawing was prepared as part of the study, showing the buildings and their surrounding components together, and interpretative analyses were carried out based on this representation (Fig. 8).

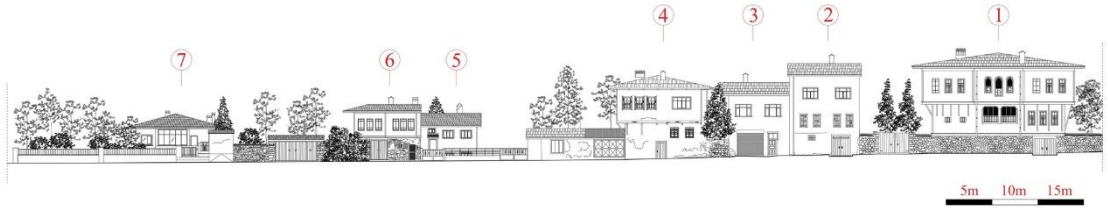

Fig. 8: Silhouette of Değirmenbaşı Street.
Source: Author

In the traditional architectural fabric, the front façades of the historic houses define the street boundary, whereas the two later-built structures (House Nos. 5 and 7) are set back approximately five meters from the street line. While this setback could be interpreted as a respectful gesture toward the adjacent historic buildings, it nonetheless weakens the spatial continuity of the street, which was originally defined by the façades of traditional houses and their adjoining garden walls. Material differences are also notable along the street. While traditional houses employ local materials such as stone, adobe, and timber, these materials are absent in the newer constructions—except for the roof structures. The traditional garden walls, typically high and built of unplastered stone, create a tactile surface texture and architectural pattern that enriches the streetscape. Same condition is observed on the ground floors of the

registered Houses No. 1 and 6. In contrast, the newer garden walls are lower and are constructed with iron or aluminum railings, resulting in visual discontinuities in the overall façade texture of the street (Fig. 8). Another factor disrupting the coherence of the streetscape is the variation in window layouts and proportions. As in most Safranbolu houses, the traditional dwellings in the study area display differences in the window sizes and numbers between the floors, influenced by the functional needs, privacy considerations, climatic factors, and the structural characteristics of the wall materials. Nevertheless, a consistent logic and proportional order governs these window arrangements. This differentiation becomes most evident on the ground floors, where solid surfaces dominate, and openings are minimized. Along the street, the ground floors of the historic houses and their adjoining garden walls reinforce this solid continuity, both of which define the identity of the street and integrates the buildings with their surroundings.

However, the newly constructed House Nos. 5 and 7 lack these characteristics. In these buildings, the window organization on the lower and upper floors exhibits similar configurations, and the ground floors contain a higher proportion of transparent surfaces, contrary to the traditional pattern. Furthermore, since the ground floors lie below the street level, their windows are only partially visible in the street silhouette, making the building volumes less perceivable from the street. While traditional houses exhibit rhythmic movement and proportional harmony in their window arrangements, House Nos. 5 and 7 deviate from this rhythm and proportion, thereby disrupting the continuity of façade character within the historic environment.

Bay windows (oriels) are one of the defining identity elements of the traditional urban fabric. They serve to establish a strong spatial relationship between the private interior and the public street, enabling visual connections to different vistas. Indeed, they allow maximum penetration of natural light into the interior spaces. In the study area, the registered traditional houses (House Nos. 1, 4, and 6) all feature street-facing bay windows on their upper floors (Fig. 9). These volumetric extensions not only break the monotony of the façades and create spatial expansion, but also emphasize the entrance and provide protection against climatic conditions. In cases where the cantilever depth increases (as seen in the House Nos. 1 and 4), brackets (consoles) are used as structural supports, arranged rhythmically - similar to the window organization. These rhythmic repetitions across building elements contribute to a coherent architectural character for both the building group and the street as a whole.

In contrast, the later-built House No. 5 lacks a street-facing bay window (Fig. 9). The absence of this volumetric articulation - commonly found in traditional façades - has resulted in a divergent architectural language and has weakened the sense of unity within the streetscape. In contrast, House No. 7 features a bay window on its entrance (upper) floor, designed in imitation of traditional architecture, thereby referencing historical forms while lacking the structural and contextual authenticity of the originals.

Fig. 9: Old houses with bay windows (projections) and a new house without a bay window (right)
Source: Author Fidan, 2025.

The doors and windows of the older houses (Nos. 1, 2, 3, 4, and 6) along the studied street are made of wood (Fig. 10). The entrance gates of their gardens are also constructed from wood. The windows feature wooden shutters designed as protection against the climatic conditions. However, in the later-built houses (Nos. 5 and 7), steel doors and PVC windows have been used instead (Fig. 11). These material differences have weakened the continuity of local material use that characterizes the traditional streetscape.

Fig. 10: Use of wooden materials in historic houses along the street.
Source: Author Fidan, 2025.

Fig. 11: Use of PVC windows and steel doors in newly built houses (Nos. 5 and 7) along the street.
Source: author Fidan, 2025.

In the registered houses (Nos. 1, 4, and 6), timber framing elements are visible on the façades, particularly at the beam levels between the floors and at corner posts. In the façade of the house No. 5, a similar framing pattern has been imitated using different materials to create horizontal and vertical stripes (Fig. 9). However, this application is a poor imitation, lacking both the craftsmanship and the functional intent of the originals.

The Bağlar district has also gained its identity through the presence of large gardens historically used for agricultural production. Today, however, most of these productive activities have largely disappeared. On both sides of the street, vegetation is prominent, and trees are densely distributed (Fig. 12). In contrast, the garden of house No. 5, a later construction, has a higher proportion of paved surfaces and fewer trees compared to the surrounding environment. In the street silhouette, this discontinuity is evident where the continuity of green texture is interrupted by this particular house (Fig. 8).

Fig. 12: Vegetation along the street.
Source: author Fidan, 2025.

Traditional houses in Safranbolu have been designed in harmony with the natural topography, developing solutions that respect the surrounding environment. In areas with steeper slopes, multiple-level entrances were often created by taking advantage of the terrain. However, in the analyzed area, the later-built house No. 5 does not adapt to the topography, unlike the traditional houses. On its front façade, a sunken area has been created to allow light into the lower floor, which lies below the street level (Fig. 13). Instead of green landscaping, this open space is covered with hard surfaces, resulting in weak spatial use and limited integration with its context.

Fig. 13: The sunken area created in front of the lower floor of house No. 5.
Source: Author Fidan, 2025.

One of the main factors disrupting the overall street silhouette is the construction of low-quality add-on spaces and the lack of coherence in material language used in new additions. The semi-open space later added to the entrance level of House No. 7 fails to establish any design unity with the adjacent building. Its roof covering is made of corrugated metal sheets, the entrance is enclosed with PVC tarpaulin, and its structural columns are made of iron. These poorly executed and deteriorated materials appear inconsistent both among themselves and with the refined architectural character of the surrounding context (Fig. 14). In front of the House No. 5, a white wall separates the open area from the street, topped with gray aluminum railings and balustrades, while the two gates providing access from the street are made of black iron. The gates emphasize vertical divisions, whereas the railings emphasize horizontal lines. This contrast in color and design language among small-scale architectural elements again leads to visual disharmony (Fig. 15). Furthermore, the roof of the storage/garage structure adjacent to the registered House No. 4 also shows a mix of materials — one half is covered with clay tiles, while the other half uses corrugated metal sheets (Fig. 15). However, corrosion has developed on the metal sheet surface, causing the material to lose its original properties, further degrading the visual integrity of the structure and its surroundings.

Fig. 14: The incompatibility of the semi-open addition in front of House No. 7 with the surrounding context.
Source: Author Fidan, 2025.

Fig. 15: Examples of material inconsistencies observed along the street.
Source: Author Fidan, 2025.

The window alterations in House Nos. 2 and 4 (registered) within the study area have partially compromised their originality (Fig. 16). In the House No. 2, the intermediate floor displays a rhythmic window arrangement with a 1/2 proportional system, which is notably absent on the upper floor. Similarly, in the registered House No. 4, beside the original upper-

floor windows, there are later replacements featuring different proportions and colors. These inconsistencies disrupt not only the overall harmony of the historical fabric but also the visual composition of the individual building façades.

Fig. 16: Different window applications in Houses No. 2 and No. 4.
Source: author Fidan, 2025.

Among the houses examined, the registered House Nos. 1 and 6 have successfully preserved their authenticity due to careful restoration work. The later-built Houses No. 5 and No. 7 are also in good condition due to recent material renewals on their façades and applications such as painting and thermal insulation. However, the remaining three houses have suffered or are currently suffering from structural deterioration as a result of lack of regular maintenance and abandonment. This state of disuse has also contributed to the loss of the former vitality of the street.

In addition to the integration deficiencies previously discussed, there are also certain similarities that establish a degree of harmony between the old and the new. The registered and renovated houses are lined up consecutively along the street. The later-built houses, on the other hand, have been set back slightly from the street alignment to show respect for their neighboring structures. In this recession, the continuous façade line created by the older houses that define the street edge has been used as a reference, and the new houses have been positioned parallel to this alignment.

Another aspect of harmony lies in the mass forms of the buildings. The older houses generally exhibit rectangular façades and articulated massing. Their pitched roofs have been designed to adapt to climatic conditions, and their wide eaves provide additional protection. While the registered House Nos. 1, 4, and 6 feature hipped roofs, the House Nos. 2 and 3 have gable roofs (Fig. 8). These volumetric configurations contribute not only to functional performance but also to aesthetic coherence. Similarly, the later-built House Nos. 5 and 7 adopt rectangular forms and gable roofs, consistent with the surrounding fabric. However, the absence of volumetric articulation on the street façade of House No. 5 weakens this visual harmony. When viewed as a whole, the building heights across the street remain within a human scale. While House Nos. 1 and 2 have three stories, the others are two stories high. The mass and heights of Houses No. 5 and 7 are kept respectful to the adjacent registered buildings (Fig. 17). Their roof ridge heights are positioned below the maximum heights of the neighboring structures, and their horizontal mass proportions are also restrained, ensuring compatibility with the scale of the historic environment.

Conclusions

As living conditions, needs, and expectations evolve, cities tend to lose their distinctive values and regional characteristics, increasingly resembling one another. This process weakens the unique identity of historical environments and demonstrates that qualified architectural contexts are often neglected. The analysis of Değirmenbaşı Street reveals that, in the Bağlar district of Safranbolu, the relationship between the traditional urban fabric and new constructions has been partially maintained at a formal level, yet a comprehensive spatial and semantic integration has not been achieved.

Among the residential buildings in the study area, similarities are observed in terms of building order, number of floors, and maximum height. However, significant differences exist in material use, façade proportions, window rhythm, garden wall character, and topographical adaptation. These differences weaken the overall visual continuity of the street and interrupt its meaningful relationship with the traditional environment. Although certain new buildings incorporate traditional architectural elements such as bay windows (oriels), eaves, and horizontal bands, these features are often applied without understanding their structural and spatial logic. Consequently, the connection between the new and the historic remains superficial-revealing partial attempts at harmony that are insufficient for true integration and even contain contradictions.

The findings indicate that while there are certain similarities in façade composition, these do not extend to the interior spatial organization or patterns of use. In traditional Safranbolu houses, interior layouts have been shaped by social use, privacy principles, and climatic conditions, whereas contemporary houses now follow standardized plan schemes. The absence of traditional spatial practices in new dwellings underscores the influence of the changing social structure. Hence, while some degree of visual coherence is achieved on the façades, the cultural continuity that defines historical identity is not sustained within the interior spaces.

The results also suggest that, although new constructions in the Bağlar district partially respect local materials, proportions, and scales, they fail to reproduce the spatial integrity of the historical environment. The placement of new buildings among the old ones disrupts overall continuity, fragmenting the street rhythm, garden wall texture, and green landscape sequence.

This condition indicates that recent architectural interventions have not been developed within a contextual understanding that considers the “spirit of place” (Burra Charter, 1999). In this sense, it is evident that qualified architectural contexts have not been sufficiently addressed. Therefore, future architectural practices within historical environments should move beyond formal resemblance and focus instead on the historical and cultural meanings of place.

It is thus concluded that, the buildings in the Bağlar district are not fully compatible with one another, except for similarities in building order, floor numbers, and maximum height. Although attempts at achieving harmony are visible, these efforts have been insufficient to

ensure complete integration. Therefore, it is necessary to protect historical environments through urban planning regulations and conservation policies that prevent the construction of new buildings disregarding façade character and historical identity. Urban design guidelines should emphasize the preservation of urban identity, façade features, and the continuity of meaning as essential criteria for sustainable development within the historical environments.

Finally, while this study is limited to a single street scale (Değirmenbaşı Street), this limitation also serves as one of its strengths, as it allows for direct observation of the impact of new constructions on the historical environment. The findings provide valuable insights for urban design, façade rehabilitation, and conservation planning in similar historical contexts. Future research that expands the scope to include user habits, interior spatial organizations, and socio-cultural transformation processes will contribute to developing a meaning-based and context-sensitive approach to new architectural design within historical environments.

Fuar tasarımı
UNİCERA 2024

Özet

UNICERA 2024 İstanbul Fuarı, seramik ve banyo sektörlerinde yenilikçi tasarım ve sürdürülebilirliği bir araya getiren önemli bir etkinliktir. Makale, Creavit markası için tasarlanan sergi alanının (800 m²) tasarım sürecini; iç mekân tasarımı, kullanıcı deneyimi ve çevresel sürdürülebilirlik açısından değerlendirmektedir. Çalışmada literatür taraması, saha gözlemleri, tasarım analizi ve 2023 ile 2024 yıllarındaki sergi alanlarının karşılaştırılması yöntemleri kullanılmıştır. Araştırma bulgularına göre, Creavit sergi alanı fonksiyonellik ve estetiği dengeli bir şekilde bir araya getirmiştir. Açık plan düzeni, stratejik giriş noktaları ve geniş koridorlar ziyaretçi hareketliliğini artırırken, dijital paneller ve etkileşimli unsurlar marka kimliğini güçlendirmiştir. Sonuç olarak, Creavit'in sergi alanı, ferah, içe dönüklükten uzak ve sürdürülebilir sergi tasarımına örnek oluşturmaktadır. Kullanıcı odaklı mekânsal düzenlemeler, sürdürülebilir malzeme kullanımı ve ileri teknolojilerin entegrasyonu, serginin başarısını artırmıştır. Gelecekteki fuar tasarımları için gelişmiş dijital entegrasyon, daha kapsayıcı erişilebilirlik çözümleri, genişletilmiş sosyal alanlar, ek sürdürülebilirlik önlemleri ve hibrit sergi modellerinin uygulanmasında rol model bir stant tasarımı olmayı hedeflemiştir.

UNICERA 2024

Abstract

UNICERA 2024 Istanbul Fair is a significant event that brings together innovative design and sustainability in the ceramics and bathroom sectors. This article examines the design process of the 800 m² exhibition space created for the Creavit brand, evaluating it in terms of interior design, user experience, and environmental sustainability. The study employs literature review, on-site observations, design analysis, and a comparative evaluation of the exhibition spaces from 2023 and 2024. According to the research findings, the Creavit exhibition space successfully balances functionality and aesthetics. The open-plan layout strategically placed entry points, and wide corridors facilitate visitor movement while digital panels and interactive elements strengthen brand identity. In conclusion, Creavit's exhibition space serves as a model for spacious, open, and sustainable exhibition design. User-centred spatial arrangements, the use of sustainable materials, and the integration of advanced technologies have enhanced the exhibition's success. The exhibition stand aims to be a role model for future fair designs by incorporating advanced digital integration, more inclusive accessibility solutions, expanded social areas, additional sustainability measures, and hybrid exhibition models.

GİRİŞ

Fuar alanları, tarih boyunca ulusal ve uluslararası ticaretin gelişmesine olanak tanıyan, yenilikçi fikirlerin ve teknolojilerin sergilendiği alanlar olarak ekonomik ve kültürel dönüşümde kritik bir rol üstlenmiştir. Sanayi devriminden bu yana gelişen fuarcılık anlayışı, zaman içinde ürün ve hizmetlerin tanıtımının ötesine geçerek, deneyim tasarımının ve marka iletişiminin bir parçası haline gelmiştir. Özellikle 20. yüzyılın ikinci yarısından itibaren, fuar alanları mimarlık, iç mekân tasarımı ve çevre düzenlemesi gibi disiplinlerin kesişim noktasında birer kültürel ve teknolojik merkez olarak konumlanmıştır (Osborne&Fox, 2018; Bennett, 2020).

UNICERA 2024 İstanbul Fuarı hem Türkiye'nin hem de uluslararası platformların önde gelen banyo ve seramik etkinliklerinden biri olarak, ticari hedefler ile estetik değerlerin buluştuğu bir platform sunmaktadır. Creavit markası için tasarlanan sergi alanı, yalnızca markanın kimliğini yansıtmakla kalmayıp, aynı zamanda kullanıcı deneyimi ve sürdürülebilirlik odaklı tasarım anlayışıyla dikkat çekmektedir. Bu çalışma, UNICERA 2024 özelinde, fuar tasarımının fonksiyonel ve estetik boyutlarını analiz etmeyi ve modern fuarcılık anlayışına dair bir çerçeve sunmayı amaçlamaktadır. Konuyla bağlantılı olarak literatür taraması yapıldığında devam eden alt bölümlerde her paragraf fuar ve fuarcılık ile alakalı yayınların kısa bir özeti olarak sunulmuştur. Fuarların ve Fuarcılığın, Kongre turizmi ve fuar organizasyonlarının ekonomik etkilerini ve uluslararası ticaretteki rollerini ele alır. Türkiye'nin bu alandaki potansiyeli analiz edilmiş ve gelişim için stratejik öneriler sunulmuştur. Kongre ve fuar organizasyonlarının turizm gelirlerini artırmadaki etkileri ve yerel ekonomiye olan katkıları vurgulanmıştır. Ayrıca, bu organizasyonların planlama süreçleri ve yönetim stratejileri detaylı bir şekilde incelenmiştir (Aymankuy, 2006).

Ticaret fuarlarının, işletmelerin önemli müşterileriyle ilişkilerini geliştirmedeki rolünü vurgular. B2B pazarlama bağlamında ticaret fuarlarının, müşteri sadakatini artırmada ve yeni iş fırsatları oluşturmada kritik bir araç olduğu belirtilmiştir. Çalışma, ticaret fuarlarının stratejik kullanımıyla ilgili pratik öneriler sunarak işletmelerin rekabet gücünü artırma yollarını tartışmaktadır (Blythe, 2002).

Kongre ve fuar organizasyonlarının yönetimiyle ilgili temel kavramları, organizasyonel süreçleri ve etkinlik planlama yöntemlerini ele alır. Organizasyonların başarıya ulaşması için lojistik destek, pazarlama stratejileri ve bütçe planlamasının önemi vurgulanır. Türkiye bağlamında, kongre ve fuar organizasyonlarının sektörel katkıları ve karşılaşılan zorluklar da detaylandırılmıştır (Çakıcı, 2013).

Sergi alanlarındaki aydınlatma tasarımının kullanıcı algısı üzerindeki etkilerini incelemektedir. Doğru aydınlatma tekniklerinin, sergilenen ürünlerin vurgulanmasında ve mekânın estetik çekiciliğinin artırılmasında oynadığı rol ele alınmıştır. Çalışmada, sergi tasarımında kullanılan aydınlatma düzenlemelerine yönelik öneriler sunulmuştur (Şahin, 2024; Uslu ve Bölükbaşı, 2024).

Kullanıcı deneyimini geliştirmeye yönelik iç mekân tasarımında ergonomi, mekânsal düzenleme ve estetik unsurların önemi fuar alanımızda tasarım ekibi olarak tarafımızca vurgulanmıştır. Bu unsurların, kullanıcı memnuniyetine katkı sağlama potansiyeli detaylandırılmış ve özellikle ticari alanlarda etkili bir şekilde uygulanabilme yöntemleri birlikte alışmış olduğumuz ajanslar tarafından ele alınmıştır.

Şehirlerin turistik ürün olarak pazarlanmasında kullanılan yöntemleri ve bu süreçte kongre ve fuar organizasyonlarının oynadığı rolü incelemektedir. Şehirlerin

marka değerlerini artırma stratejileri ve Türkiye'nin bu alandaki potansiyel şehirleri detaylı bir şekilde analiz edilmiştir (Giritlioğlu, İ., &Avcıkurt, 2010).

İstanbul'un kongre turizmindeki rekabet gücünü değerlendirmektedir. Kongre altyapısı, uluslararası etkinliklerdeki başarılar ve bölgesel avantajlar incelenmiş, İstanbul'un küresel pazardaki konumunu güçlendirme stratejileri önerilmiştir (Heper, & Sarıışık, 2015).

Fuar organizasyonlarının başarısını organizatörlerin perspektifinden değerlendirmektedir. Katılımcı memnuniyetinin artırılması, lojistik hizmetlerin iyileştirilmesi ve organizasyonel süreçlerde verimlilik sağlanması gibi konular ele alınmıştır. Çalışmada, fuarcılık sektörüne yönelik iyileştirme önerileri sunulmuştur (Acartürk, 2013; Ayçiçek, 2021).

Ticaret fuarlarının mekânsal tasarımında kullanılan stratejileri ve bu tasarımların kullanıcı deneyimine olan etkilerini analiz etmektedir. Yazar, görsel unsurların ve mekânsal organizasyonun markayı ve ürünleri nasıl daha etkili bir şekilde tanıtabileceğini tartışmaktadır (Lawson, 2017).

Uluslararası fuarların kültürel ve zihinsel mesafe kavramları çerçevesinde analizini yapmaktadır. Çalışma, farklı kültürel geçmişlerden gelen katılımcıların etkileşim süreçlerini ve bu süreçlerde karşılaşılan zorlukları ele almaktadır. Kültürel farkındalık ve stratejik adaptasyon önerileri sunulmuştur (Sungur, & Aytuğ, 2020).

Bölgesel turizm planlamasının Türkiye bağlamındaki uygulamalarını ele alır ve fuarların bölgesel kalkınmadaki önemine dikkat çeker. Araştırma, turizm altyapısının güçlendirilmesi, yerel ekonomilerin desteklenmesi ve bölgesel planlamada fuarların stratejik kullanımı konularında öneriler sunmaktadır. Ayrıca, turizmin bölgesel kalkınmadaki uzun vadeli etkileri vurgulanmıştır (Tosun, &Jenkins, 1996).

Türkiye'nin kongre turizmi pazarındaki konumunu değerlendirir ve İstanbul ile Antalya gibi şehirlerin kongre turizmindeki potansiyeline odaklanır. Çalışma, kongre turizminin ekonomik faydalarını, pazar genişleme stratejilerini ve Türkiye'nin bu alandaki gelişim fırsatlarını detaylı bir şekilde analiz etmektedir (Pektaş ve Aydın, 2021).

Kongre ve fuar turizminin teorik çerçevesini ele alırken, organizasyonel süreçlerin yönetiminde dikkate alınması gereken unsurları detaylandırmaktadır. Kitap, kongre ve fuarların turizm gelirlerine, yerel ekonomiye ve uluslararası tanıtıma olan katkılarını kapsamlı bir şekilde incelemekte ve Türkiye'nin bu sektördeki fırsatlarını değerlendirmektedir (Usta, 2008).

Modern ticaret fuarlarında sürdürülebilirlik ve dijital entegrasyonun önemini vurgulamaktadır. Yazar, artırılmış gerçeklik (Augmented Reality - AR), sanal gerçeklik (Vitual Reality - VR) ve interaktif ekranlar gibi dijital araçların kullanıcı deneyimine olan katkılarını incelemekte ve geri dönüştürülebilir malzemeler ile enerji verimli sistemlerin uygulanmasını detaylandırmaktadır. Çalışma, sürdürülebilir ve teknoloji odaklı tasarımın gelecekteki fuar organizasyonlarındaki potansiyelini ortaya koyar (Partarakis, 2025).

EMITT 2020 Fuarı'nda katılımcıların performans algısını değerlendirmektedir. Çalışmada, fuarın ticari başarıları, katılımcı memnuniyeti ve organizasyonun genel etkinliği detaylı bir şekilde incelenmiştir. Ayrıca, EMITT örneği üzerinden fuar organizasyonlarının ekonomik katkıları ve pazarlama stratejileri tartışılmıştır (Yılmaz, 2019).

Çukurova Sanayi ve Ticaret Fuarları üzerinden fuarların bölgesel kalkınmadaki etkilerini incelemektedir. Araştırma, fuarların yerel işletmelerin ulusal ve uluslararası pazarlara erişimini kolaylaştırdığı, bölgesel ekonomiyi desteklediği ve altyapı gelişimine katkıda bulunduğunu ortaya koymaktadır. Çalışma, bölgesel kalkınma stratejilerinde fuarcılığın önemini vurgulamaktadır (Yücel, & Ata, 2006).

Kongre ve fuar organizasyonlarının turizm sektörüne olan katkılarını EMITT örneği üzerinden analiz eder. Çalışmada, uluslararası fuarların yerel ve ulusal turizme sağladığı ekonomik faydalar, uluslararası ziyaretçi çekme potansiyeli ve istihdam yaratma kapasitesi detaylandırılmıştır. EMITT örneği, kongre ve fuarların şehir tanıtımındaki etkisini somut bir şekilde ortaya koymaktadır (Şengelvd, 2018).

Uluslararası ticaret fuarlarının firmalar için sunduğu fırsatları ve pazarlardaki etkilerini ele alır. Özellikle, Türk firmalarının uluslararası fuar etkinliklerinde karşılaştığı zorluklar ve bu zorlukların aşılması için stratejik öneriler sunulmuştur. Araştırma, fuarların markalaşma ve yeni pazar bulma süreçlerindeki önemine vurgu yapmaktadır (Güven, & Ceylan, 2019).

Türkiye'de milli fuarcılığın mevcut durumunu analiz eder ve sektörü geliştirmek için öneriler sunar. Milli fuarların yerel ekonomiye olan katkıları, yerli üreticilerin uluslararası pazarlara erişimi ve organizasyonel süreçlerin verimliliği detaylandırılmıştır. Yazar, milli fuarcılığın gelecekteki potansiyelini artırmak için öneriler geliştirmiştir (Badak, 2018).

Türkiye'de uluslararası fuarcılığın geliştirilmesi için gereken sistematik yaklaşımları ele almaktadır. Araştırma, uluslararası fuarların ekonomik ve kültürel etkilerini değerlendirirken, Türkiye'nin bu alandaki rekabet gücünü artırmak için öneriler sunmaktadır. Çalışma, global pazarda daha etkin bir yer edinmek için stratejik yaklaşımlar önermektedir (Badak ve Özdaşlı, 2019).

20 kaynağı inceleyecek olursak; fuarcılığın ekonomik, sosyal, tasarımsal ve teknolojik boyutlarını kapsamlı bir şekilde ele almaktadır. Çalışmalar, fuarların yerel ve ulusal ekonomilere sağladığı katkılara odaklanarak istihdam oluşturma, turizm gelirlerini artırma ve yerel işletmelere yeni ticari fırsatlar sunma gibi avantajlarını vurgulamaktadır. Ayrıca, fuar organizasyonlarının iç mekân tasarımındaki işlevsel ve estetik dengesi ile kullanıcı deneyimi üzerindeki etkileri detaylı bir şekilde incelenmiştir. Özellikle aydınlatma, mekânsal düzenleme ve teknoloji entegrasyonu gibi unsurların sergi alanlarını daha etkili hale getirdiği belirtilmiştir. Sürdürülebilirlik ve dijitalleşme ise modern fuarcılıkta öne çıkan temalar arasında yer almış, geri dönüştürülebilir malzemeler ve Artırılmış Gerçeklik (Augmented Reality-AR) ve sanal gerçeklik (Virtual Reality - VR) teknolojilerinin kullanıcı deneyimini zenginleştirdiği tartışılmıştır. Bununla birlikte, uluslararası ticaret fuarlarının kültürel farklılıklar ve zihinsel mesafeler bağlamında sunduğu zorluklar ve fırsatlar ele alınmış, bu fuarların marka bilinirliği ve pazar genişletme konusundaki önemi vurgulanmıştır. Son olarak, kongre ve fuar turizminin şehir markalaşması ve bölgesel kalkınmadaki rolü, özellikle Türkiye bağlamında değerlendirilmiş, organizasyonel süreçlerin iyileştirilmesine dair öneriler sunulmuştur. Bu kapsamda, kaynaklar fuarcılık sektörünün çok yönlü doğasını anlamak ve geliştirmek için değerli bir rehber niteliğindedir.

Taranan makalelerin genel anlamda mimarlıkla ilgisinin zayıf olduğu ve tasarım süreçlerine değinilmediği görülmektedir. Uygulama sürecinde de birçok detayın olduğu fuarcılık sektörünün çalışmayla tasarım süreçlerine ve uygulamaya katkı sağlanması planlanmaktadır.

Fuar Alanlarının Tarihsel Gelişimi

Fuarlar, tarih boyunca ticaretin, kültürün ve teknolojinin gelişim süreçlerinde önemli bir araç olarak kullanılmıştır. İlk olarak yerel pazar yerleri ve panayırlar şeklinde ortaya çıkan fuar anlayışı, sanayi devrimiyle birlikte evrilmiş ve günümüzdeki modern fuarcılığın temelleri atılmıştır. Bu bağlamda, fuar alanlarının tarihsel gelişimi hem mimari hem de işlevsel açıdan ticaretin ve toplumların değişimine ışık tutmaktadır.

Tarihsel olarak fuarların ilk örnekleri, Mezopotamya ve Antik Yunan gibi medeniyetlerde düzenlenen pazar yerleri ve festivallere dayanmaktadır. Bu alanlar, ticaretin yanı sıra sosyal etkileşim ve kültürel paylaşımlar için de bir platform sunmuştur (Ünal Kestane, 2015). Ancak modern anlamda fuarcılığın başlangıcı, 19. yüzyılın ortalarında gerçekleşen sanayi devrimi ile ilişkilendirilir.

1851 yılında Londra'da düzenlenen Büyük Sergi (The Great Exhibition), modern fuarcılığın dönüm noktası olarak kabul edilmektedir. Sergiye ev sahipliği yapan Crystal Palace, dönemin mimari yeniliklerini ve sanayi devriminin teknolojik başarılarını sergilemek üzere tasarlanmıştır. Yaklaşık 6 milyon ziyaretçiyi ağırlayan bu etkinlik, uluslararası ticaretin yanı sıra fuar alanlarının mekânsal ve estetik gereksinimlerini de belirlemiştir (Osborne&Fox, 2018).

20. Yüzyılın başlarında, fuarlar yalnızca ticaret ve ürün tanıtımı için değil, aynı zamanda uluslararası ilişkiler ve kültürel etkileşimler için önemli platformlar haline gelmiştir. Expo 1900 Paris, dönemin teknolojik ve sanatsal birikimini sergileyen önemli bir etkinlik olarak öne çıkmıştır. Bu fuarda elektrik enerjisi, otomasyon ve modern tasarım yaklaşımları geniş bir katılımcı kitlesine sunulmuştur (Lawson, 2017).

İhtisas fuarları yaygınlaşmış ve belirli sektörlere yönelik etkinlikler düzenlenmeye başlanmıştır. Özellikle II. Dünya Savaşı'ndan sonra, fuar alanları küreselleşme ve sanayileşme süreçlerinin etkisiyle daha profesyonel organizasyonlara dönüşmüştür. Fuarcılık sektörü, modern mimarlık ve iç mekân tasarımıyla birlikte evrilmiş ve kullanıcı odaklı alanlar haline gelmiştir (Yücel ve Ata, 2006).

Türkiye'de fuarcılık, özellikle Cumhuriyet döneminde hız kazanmıştır. 1930'lu yıllarda düzenlenmeye başlayan İzmir Enternasyonal Fuarı, Türkiye'nin ilk uluslararası fuarı olarak modern fuarcılığın temelini atmıştır. İzmir Kültürpark' ta gerçekleşen bu fuar, yalnızca ekonomik değil, aynı zamanda kültürel bir etkinlik olarak da önemli bir yer edinmiştir (Karpat, 2009).

Samsun Fuarı, Anadolu'da düzenlenen ilk milli fuar olarak 1963 yılında kurulmuştur. Bölgenin ekonomik ve sosyal kalkınmasına katkı sağlayan bu etkinlik, zamanla eski gücünü yitirmiş ve 1992 yılında son kez düzenlenmiştir (Badak, 2018). Türkiye'de fuarcılık sektörü, 1980'lerden itibaren uluslararası standartlara uygun fuar merkezlerinin inşasıyla hız kazanmıştır. İstanbul, İzmir ve Antalya gibi şehirler hem ulusal hem de uluslararası etkinliklere ev sahipliği yaparak sektörde önemli bir yer edinmiştir (Acartürk, 2012).

Günümüzde fuar alanları, dijital teknolojiler ve sürdürülebilirlik odaklı yaklaşımlar sayesinde büyük bir dönüşüm geçirmektedir. Dijital ekranlar, artırılmış gerçeklik (AR) ve sanal gerçeklik (VR) gibi teknolojiler, modern fuar alanlarının vazgeçilmez unsurları haline gelmiştir. Bu uygulamalar, ziyaretçilerin ürünlerle daha interaktif bir şekilde etkileşim kurmasını sağlamaktadır.

Sürdürülebilirlik, modern fuar tasarımlarında öncelikli bir tema olarak öne çıkmaktadır. Çevre dostu malzemelerin kullanımı, enerji tasarruflu sistemler ve geri

dönüştürülebilir sergi elemanları, fuar alanlarının çevresel etkisini azaltmayı hedeflemektedir (Bennett, 2020). Pandemi süreciyle birlikte, sanal fuarlar ve hibrit etkinlikler daha yaygın hale gelmiş, dijital platformlarla fiziksel alanların bir arada kullanıldığı bir model benimsenmiştir.

Fuar alanlarının tarihsel gelişimi, ticaret ve kültürel etkileşim açısından önemli bir dönüşümü yansıtmaktadır. Sanayi devrimiyle başlayan modern fuarcılık anlayışı, 20. yüzyıl boyunca gelişerek günümüzde dijitalleşme ve sürdürülebilirlik odaklı yaklaşımlarla birleşmiştir. Türkiye'deki fuar organizasyonları, bu küresel dönüşümün bir parçası olmuş ve uluslararası standartlara uygun yapılarla fuarcılık sektörüne katkı sağlamıştır.

Son Yüzyılda Fuarcılıkta Yaşanan Gelişmeler

Son yüzyılda fuarcılık sektörü, teknolojik yenilikler, dijitalleşme ve küreselleşmenin etkisiyle köklü bir dönüşüm geçirmiştir. Geleneksel ticaret ve sergi alanlarından, ziyaretçilerin interaktif deneyimler yaşadığı çok yönlü mekânlara evrilen fuar alanları, ekonomik ve kültürel anlamda toplumların gelişimine katkı sağlamaktadır. 20. yüzyılın başlarında fuarlar, genel endüstriyel ürünlerin sergilendiği büyük etkinlikler şeklinde düzenlenirken, zamanla sektör odaklı ihtisas fuarları ön plana çıkmıştır. Özellikle otomotiv, tarım, teknoloji ve sağlık alanlarına yoğunlaşan bu fuarlar, belirli sektör uzmanlarını bir araya getirmiştir (Lawson, 2017). Bu dönüşümün erken örneklerinden biri olan 1929 Barcelona Uluslararası Sergisi, mimarlık ve tasarımın sergi alanlarında nasıl bir dönüşüm geçirdiğini göstererek, modern mimarinin fuar tasarımlarındaki rolünü güçlendirmiştir (Osborne, &Fox, 2018).

20. yüzyılın ikinci yarısında küreselleşmenin etkisiyle fuarcılık sektörü uluslararası bir boyut kazanmış, II. Dünya Savaşı sonrası ekonomik iş birliğini teşvik eden fuarlar, ülkeler arası ticaretin gelişimine katkı sunan önemli platformlar haline gelmiştir. 1967'de Expo Montreal, sürdürülebilirlik ve teknolojik yenilikleri odağına alarak uluslararası fuar anlayışını dönemin koşullarına uyarlamıştır. Bu süreçte fuarlar, sadece ticari ürünlerin tanıtıldığı organizasyonlar olmaktan çıkıp kültürel ve sosyal mesajların aktarıldığı platformlara dönüşmüştür (Frost ve Laing, 2018). 1980'lerden itibaren dijitalleşmenin hız kazanması, fuar organizasyonlarının yapısını köklü biçimde değiştirmiştir. Dijital ekranlar, bilgisayar destekli tasarımlar ve multimedya sunumları yenilikçi ziyaretçi deneyimleri sunarken, 2000'li yıllarda artırılmış gerçeklik (AR) ve sanal gerçeklik (VR) gibi teknolojiler, ziyaretçilerle daha interaktif iletişim imkânı sağlamıştır (Duman, 2024).

Hannover Messe gibi uluslararası teknoloji fuarları, robotik sistemler ve yapay zekâ uygulamalarını tanıtarak teknoloji odaklı fuarcılığın gelişimine katkı sağlamıştır (Özer, 2021). Son yıllarda ise sürdürülebilirlik, fuar tasarımlarının temel unsurlarından biri haline gelmiştir. Enerji verimli aydınlatma sistemleri, geri dönüştürülebilir malzemeler ve çevre dostu yaklaşımlar, modern fuar organizasyonlarının ayrılmaz bir parçası olmuştur. 2015 Expo Milano, sürdürülebilir tarım ve çevre temalarıyla fuarların küresel sorunlara dikkat çekme potansiyelini gözler önüne sermiştir (Bennett, 2020).

Covid-19 pandemisi, fuar sektöründe yeni bir dönemin başlamasına neden olmuş, fiziksel etkinliklerin kısıtlandığı süreçte sanal fuarlar ve hibrit modeller yaygınlaşmıştır. Online platformlar üzerinden düzenlenen sanal fuarlar, küresel katılımcılara erişimi kolaylaştırırken, fiziksel katılımın sunduğu deneyim eksikliği hibrit fuar modellerini ön plana çıkarmıştır. Bu model hem dijital hem de fiziksel deneyimleri bir araya getirerek

katılımcıların farklı beklentilerine yanıt verebilmektedir ve gelecekte fuarcılığın dönüşümünde önemli bir rol oynayacaktır (Lawson, 2017).

Türkiye'de fuarcılık sektörü de bu dönüşüm sürecine paralel olarak gelişmiştir. İzmir Enternasyonal Fuarı gibi köklü etkinliklerin yanı sıra İstanbul Fuar Merkezi ve Antalya Expo gibi modern fuar alanları, Türkiye'nin uluslararası fuar sektöründeki konumunu güçlendirmiştir. Dijital teknolojilerin entegrasyonu ve sürdürülebilirlik odaklı yaklaşımlar, Türkiye'deki fuar organizasyonlarının dikkat çeken unsurları arasında yer almaktadır. Örneğin, UNICERA Uluslararası Seramik Banyo Fuarı hem yerel hem de küresel katılımcıları bir araya getirerek Türkiye'nin seramik sektöründeki gücünü uluslararası arenada temsil etmektedir. Günümüzde fuarcılık sektörü, endüstri odaklı organizasyonlardan, dijitalleşme ve sürdürülebilirlik ekseninde gelişen, kullanıcı deneyimine odaklanan etkinlik alanlarına evrilmiştir. Hem Türkiye'de hem de dünyada fuar alanlarının bu değişimlere hızla uyum sağladığı görülmektedir. Teknolojik yenilikler, çevresel farkındalık ve hibrit modeller, gelecekte fuarcılık sektörünün yönünü belirleyen temel faktörler olacaktır (Acartürk, 2012).

KAVRAMSAL ÇERÇEVE

Tasarım, bireylerin yaşam alanlarını estetik ve işlevsel bir şekilde düzenlemeyi amaçlayan çok yönlü bir süreçtir. Fuar alanları gibi dinamik ve geçici mekanların tasarımı ise, estetik, işlevsellik ve deneyim odaklılık gibi farklı boyutları bir araya getirir. Bu bölümde, iç mekân kavramı, fuar alanlarının tasarım yaklaşımları ve bu mekanların kullanıcı deneyimi üzerindeki etkileri detaylandırılmaktadır.

İç Mekân Kavramı

İç mekân, yapıların sınırları içerisinde bulunan ve bireylerin fiziksel, sosyal ve psikolojik ihtiyaçlarına cevap veren alanlar olarak tanımlanır. İç mekânın sadece fiziksel bir düzenleme değil, aynı zamanda bireylerin duygusal bağ kurduğu bir alan olduğunu belirtmiştir. Bu bağlamda iç mekân, kullanıcılara hem işlevsel hem de estetik bir deneyim sunar.

İç mekân tasarımının, kullanıcıların mekanla olan etkileşimlerini optimize etmek için yapılandırıldığını ifade eder. İç mekân, işlevsellik, estetik, ergonomi ve sürdürülebilirlik gibi unsurların dengeli bir şekilde bir araya getirilmesiyle oluşturulur (Lawson, 2017). Fuar alanlarında iç mekân tasarımı, esneklik ve modülerlik gerektirir (Dikeç, 2013). Geçici mekanların tasarımında hızlı kurulum ve sökülme süreçlerinin yanı sıra, kullanıcı dostu düzenlemelerin önemine dikkat çekmiştir. Bu özellikler, fuar alanlarının sürekli değişen ihtiyaçlara uygun şekilde yapılandırılmasını sağlar.

Fuar Alanları ve Tasarım Yaklaşımları

Fuar alanları hem estetik hem de işlevsellik açısından bir araya gelen karmaşık mekanlardır. Bu alanlar, ziyaretçilerin kolaylıkla erişebileceği, yönlendirici ve görsel olarak çekici bir şekilde tasarlanmalıdır. Fuar alanlarının tasarımında şu yaklaşımları öne çıkarmaktadır.

Fonksiyonel tasarım, fuar alanlarının kullanıcı akışını kolaylaştıran, ürünleri ve hizmetleri en verimli şekilde sergileyen düzenlemelerdir. Geniş koridorlar, açık plan düzenlemeler ve net yönlendirme elemanları, fonksiyonel tasarımın temel unsurlarıdır. Estetik, mekanların ziyaretçilerde olumlu bir ilk izlenim yaratmasını sağlarken, tematik tasarım, belirli bir marka veya ürünle ilişkilendirilen unsurların sergilenmesini içerir. Fuar

alanlarında kullanılan malzeme, renk ve aydınlatma seçimlerinin ziyaretçi algısını doğrudan etkilediğini belirtmektedir (Beril Bal ve Bekar, 2025).

Dijital teknolojilerin modern fuar alanlarının ayrılmaz bir parçası haline geldiğini ifade etmektedir. Artırılmış gerçeklik (AR), sanal gerçeklik (VR) ve interaktif ekranlar, kullanıcıların sergilenen ürünlerle daha derin bir bağ kurmasını sağlar (Duman, 2024).

Sürdürülebilirlik, modern tasarım projelerinin temel bir bileşenidir. Enerji verimliliği sağlayan aydınlatmalar ve geri dönüştürülebilir malzemelerin hem çevresel hem de ekonomik faydalar sunduğunu vurgulamaktadır (Akbulut, & Güvenç, 2016).

Fuar Alanlarında İç Mekân Tasarımının Kullanıcı Deneyimine Etkisi

İç mekân tasarımı, ziyaretçilerin fuar alanıyla kurduğu etkileşimde belirleyici bir rol oynar. Ziyaretçi deneyimini şekillendiren temel unsurlar şunlardır:

Mekansal Akış ve Ergonomi

Fuar alanlarında mekânsal düzenlemenin akıcı bir şekilde tasarlanması, ziyaretçilerin alanı kolayca keşfetmesini sağlar. Bu yaklaşım hem kullanıcı memnuniyetini artırır hem de sergilenen ürünlerin daha fazla dikkat çekmesine katkıda bulunur.

Teknolojik Entegrasyon

Artırılmış gerçeklik (AR) ve sanal gerçeklik (VR) gibi teknolojiler, ziyaretçilerin ürünlerle daha derin bir etkileşim kurmasını sağlar. Dijital ekranların ve etkileşimli uygulamaların, ziyaretçilerin bilgiye hızlı ve kolay erişimini sağladığını vurgulamaktadır (Partarakis, 2025).

Dinlenme ve Sosyal Alanlar

Fuar alanlarında yer alan oturma ve dinlenme alanları, ziyaretçilerin rahatlamasını sağlayarak deneyimlerini daha keyifli hale getirir. Bu sosyal alanlar, ziyaretçilerin fuar alanında daha uzun süre vakit geçirmesine ve genel memnuniyetlerinin artmasına katkı sağlar. Tasarım kavramları, fuar alanlarının başarısını şekillendiren temel unsurlardır. İç mekân ve çevre tasarımı, fonksiyonel, estetik ve sürdürülebilir yaklaşımlarla birleştirilerek kullanıcı deneyimine katkıda bulunur. Türk ve uluslararası kaynaklardan elde edilen bilgiler, modern fuar alanlarının dinamik yapısını anlamamıza yardımcı olmaktadır.

Araştırmanın temel amacı, UNICERA 2024 İstanbul Fuarı'nda Creavit için tasarlanan sergi alanının tasarım ilkelerini ve kullanıcı deneyimine etkilerini değerlendirmektir. Araştırma, modern fuar alanlarında iç mekân tasarımının rolünü irdeleyerek, bu alanların ticari ve estetik hedeflere nasıl hizmet ettiğini anlamayı hedefler.

Çalışmada, aşağıdaki sorulara yanıt aranmıştır:

- İç mekân ve çevre tasarımı, fuar alanlarında kullanıcı deneyimini nasıl etkiler?
- Creavit' in marka kimliği, fuar tasarımında hangi unsurlarla desteklenmiştir?
- Modern fuar tasarımlarında sürdürülebilirlik ve dijitalleşme ne ölçüde ön plana çıkmaktadır?

Bu sorular, UNICERA 2024 örneği üzerinden ele alınarak, ticari fuar tasarımının gelecekteki uygulamaları için çıkarımlar sunulması hedeflenmektedir.

UNİCERA 2024 İSTANBUL FUARI VE FUAR MERKEZİ

Bu bölümde, UNICERA 2024 İstanbul Fuarı'nın düzenlendiği İstanbul Fuar Merkezi'nin özellikleri, katılımcı profili, önceki yıllara ait istatistikler, altyapı olanakları ve yerleşim planı ele alınmaktadır (Görsel 1).

Görsel 1.İstanbul Fuar Merkezi, fuar salonları yerleşim planı
(Bölüm 1: İstanbul Fuar Merkezi, 2023)

İstanbul Fuar Merkezinin Alan Büyüklüğü ve Kapasitesi

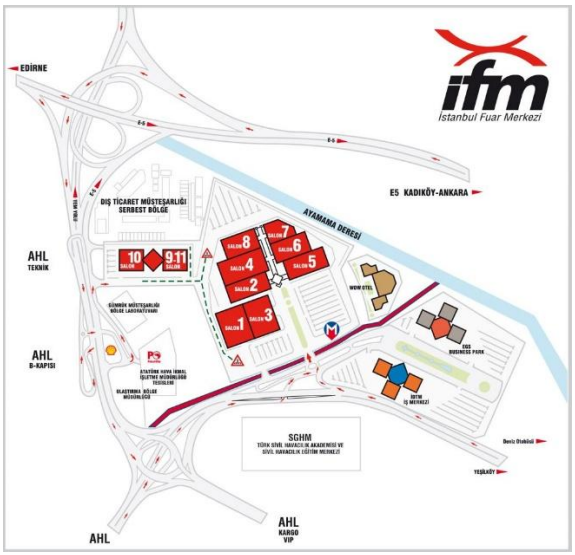
İstanbul Fuar Merkezi (İFM), Türkiye'nin en büyük ve kapsamlı fuar merkezlerinden biridir. Toplamda yaklaşık 500.000 metrekarelik bir alan üzerine kurulu olan merkez, 96.000 metrekarelik kapalı alana sahiptir. İFM hem ulusal hem de uluslararası etkinliklere ev sahipliği yaparak birçok sektör için önemli bir platform sunmaktadır. Geniş kapasitesi ve çok sayıda salonuyla, aynı anda birden fazla etkinliğin düzenlenmesine de olanak tanımaktadır (İstanbul Fuar Merkezi, 2023).

Fuar Katılımcı Profili ve Firma Sayısı

UNICERA İstanbul, seramik, banyo ve mutfak sektörlerinde dünya çapında tanınan bir fuar olarak her yıl binlerce profesyoneli bir araya getirmektedir. Katılımcı profili, inovasyon ve tasarım odaklı firmalardan oluşmaktadır. 2024 yılında fuara toplamda 330'dan fazla katılımcı firma iştirak etmiştir. Bu firmalar, seramikten banyo ürünlerine, mimari çözümlerden teknolojiye kadar geniş bir ürün yelpazesi sunmaktadır (UNICERA, 2024).

Önceki UNICERA Fuarlarında Katılımcı İstatistikleri

Geçmiş UNICERA Fuarları, katılımcı ve ziyaretçi sayıları bakımından önemli bir başarı elde etmiştir. Örneğin, 2023 yılında düzenlenen fuar, toplamda 88.728 ziyaretçiyi ağırlamış ve 327 katılımcı firma yer almıştır. Ayrıca, 110 farklı ülkeden 12.798 yurt dışı ziyaretçi fuara katılım sağlamıştır (Expo Turkey, 2023). Bu veriler, UNICERA Fuarı'nın uluslararası çekiciliğini ve sektördeki önemini göstermektedir (Görsel 2).

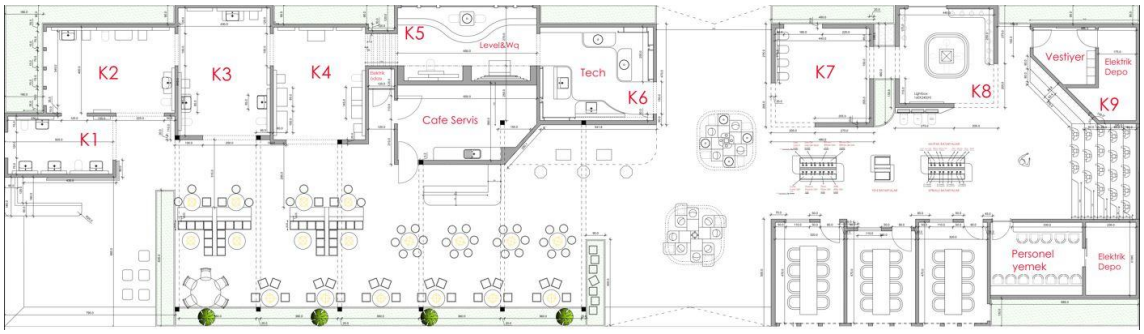


Görsel 2. İstanbul fuar merkezine UNICERA 2024 için gelen katılımcılar ve ülkeleri
(Expo Turkey, 2023)

Otopark ve Altyapı Olanakları

İstanbul Fuar Merkezi, geniş otopark ve altyapı olanaklarıyla katılımcı ve ziyaretçilerin konforunu sağlamayı hedeflemektedir. 7.500 araç kapasiteli otoparkı, restoranlar, kafeler ve bankacılık hizmetleri gibi sosyal alanları ile İFM, ziyaretçiler için ideal bir ortam sunmaktadır (URL:4). Ayrıca, fuar alanında teknik destek ve güvenlik hizmetleri gibi altyapı unsurları da yer almaktadır.

Fuar Alanının Haritası ve Yerleşim Planı



UNICERA Fuarı'nın yerleşim planı, katılımcı firmaların ve ziyaretçilerin fuar alanında kolaylıkla hareket edebilmesi için detaylı bir şekilde hazırlanmıştır. İstanbul Fuar Merkezi, 11 adet fuar salonundan oluşmaktadır ve her bir salon belirli sektörlere veya ürün gruplarına tahsis edilmiştir. Ayrıca, fuarın resmî web sitesinde interaktif haritalar ve katılımcı firmaların stant yerleşimlerini gösteren salon planları bulunmaktadır (Görsel 3) (UNICERA, 2024).

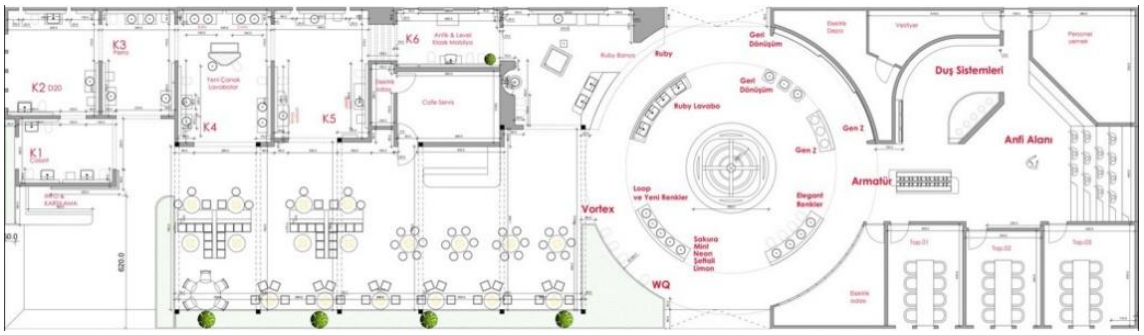
(Bölüm 2: İstanbul Fuar Merkezi, 2023)



TASARIM SÜRECİ VE PROJE ÖZELLİKLERİ

İstanbul Fuar merkezi (İFM) de yapılan 04-08 Kasım 2024 Tarihleri arasında düzenlenmiş olan UNICERA 2024 İstanbul Fuarı'nda Creavit için tasarlanan sergi alanı hem markanın kimliğini yansıtmak hem de kullanıcı deneyimini zenginleştirmek amacıyla oluşturulmuştur. Bu bölümde, tasarım sürecinin aşamaları, proje özellikleri ve teknik detaylar ele alınmıştır. Projenin çıkış noktası sergileme alanları ile misafirlerin ağırlanacağı, toplanma alanı ve üniversitelerden sektör ile alakalı bilgi verilmesi hedeflenen öğrencilere yapılacak olan sunumun başlangıcı olan amfinin dengeli bir biçimde alan içerisinde kurgulanması sağlanmıştır. 15 metre genişliğinde ve 53 metre uzunluğundaki fuar alanı tasarım faaliyetlerini zorlaştırsa da lineer bir çözümle sergileme ve ağırlama bölümleri çözümlenmiştir. 2023 fuar alanından başlayan tasarım kurgusu 2024 yılında olgunluğa ulaşmıştır (Görsel 4).

Görsel2. UNICERA 2023 Creavit fuar alanı yerleşim planı
(Yazar fotoğraf arşivi, 2024)

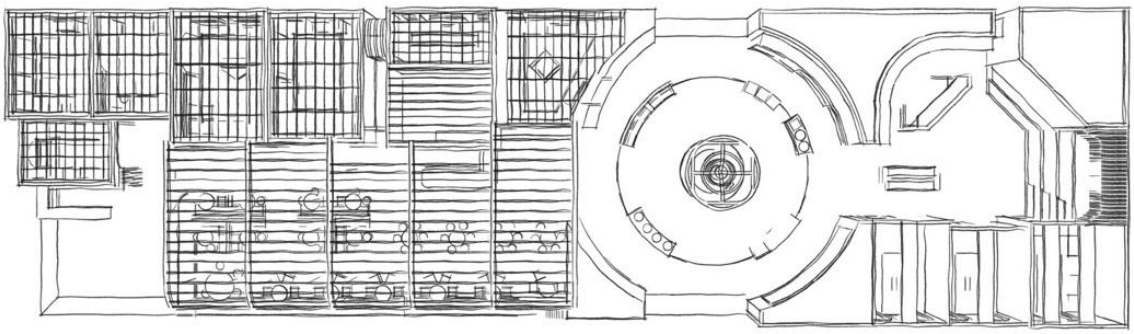
2023 ve 2024 yılında görüldüğü üzere tasarımda değişiklikler yapılmıştır. İlerleyen bölümlerde yapılmış olan değişikliklerden ve mevcut değişikliklerin fuar alanına olan katkılarından bahsedilecektir (Görsel 5).

Görsel3. UNICERA 2024 Creavit fuar alanı yerleşim planı
(Yazar fotoğraf arşivi, 2024)

Fuar Tasarım Eskizleri ve Çizimler

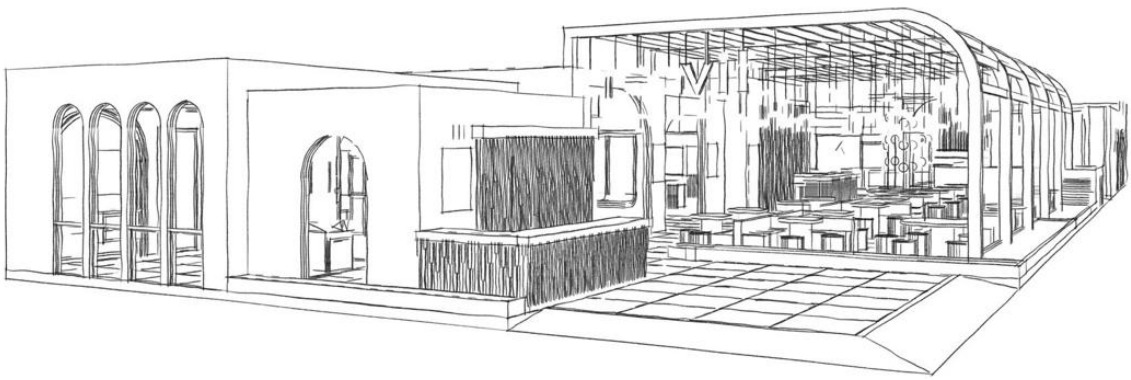
Tasarım sürecinin başlangıç aşaması, konsept geliştirme ve ilk eskizlerin hazırlanması olmuştur. "Vision" teması, Creavit 'in sürdürülebilirlik ve yenilikçilik değerlerini ön plana çıkarmak için belirlenmiştir. Şirketin mottosu haline gelmiş olan "bakış açını değiştir", "banyo bu tarafta", "herkes bakar, görüyor musun" gibi reklam sloganları ise bakış açımızı oluşturmakta önemli katkılar sağlamaktadır. Bu bağlamda, eskizlerde aşağıdaki düzenlemeler yapılmıştır (Görsel 6).

- Giriş Alanı: Creavit logosu ve multimedya ekranlarla ziyaretçileri karşılayan etkileyici bir alan.
- Ürün Sergileme Alanları: Her ürün ailesine ayrılmış kütleler.



- Dinlenme Alanları: Modern oturma gruplarıyla ziyaretçilere rahat bir mola alanı sunulması.
- Etkileşim Alanları: Ziyaretçilerin dijital araçlarla ürünlerle etkileşim kurabileceği bölümler.

Fuar alanlarının tasarımında, marka kimliğini ön plana çıkaran düzenlemelerin, ziyaretçilerde olumlu bir etki yarattığı dikkate alınmıştır. Bu doğrultuda, işlevsellik ile estetik unsurlar bir araya getirilerek dengeli bir mekânsal düzen sağlanmıştır (Görsel 7).

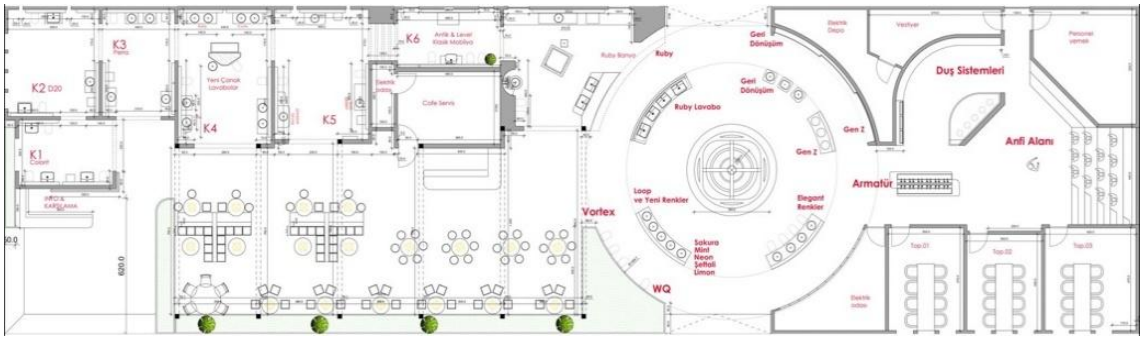


Teknik çizimler, mekânsal organizasyonu ve detayları içermektedir:

- Kat Planı: Ürün sergileme üniteleri, giriş alanı ve dinlenme bölümlerinin yerleşim düzenini gösterir.
- Aydınlatma Planı: Vurgu aydınlatmalarının ve genel ışıklandırma elemanlarının konumları belirtilmiştir.
- Modüler Sistemler: Taşınabilir sergi ünitelerinin ölçüleri ve yerleşim özellikleri detaylandırılmıştır.

Fuar tasarımı sürecinde teknik çizimlerin hem mekânsal verimliliği hem de ziyaretçilerin mekânda rahat hareket edebilmesini sağladığını vurgulamaktadır (Lawson, 2017).

Görsel 4. UNICERA 2024 eskiz plan çalışmaları
(Yazar fotoğraf arşivi, 2024)



Görsel 7. UNICERA 2024 giriş bölümü eskiz çalışmaları
(Yazar fotoğraf arşivi, 2024)

Proje Özellikleri, Render ve Teknik Detaylar

Tasarım, 795 m² bir alan üzerine kurulmuş ve aşağıdaki özelliklere göre düzenlenmiştir. Fuarlarda sergi alanlarının tasarımı, kullanıcı deneyimini optimize etmek ve markanın etkili bir şekilde temsil edilmesini sağlamak amacıyla belirli kriterler doğrultusunda şekillendirilmektedir. Bu analizler, saha gözlemleri, literatür incelemeleri ve önceki fuarlardan elde edilen veriler ışığında gerçekleştirilmiştir. Alanın genel yerleşimi, ziyaretçi hareketliliği, ürün sunumu ve mekânsal düzenlemeler, elde edilen

bulgular doğrultusunda değerlendirilmiştir. Bu bağlamda, Creavit'in UNICERA 2024 sergi alanında uygulanan tasarım kararları; alanın farklı misafir grupları için etkin şekilde kullanılmasını sağlayan esneklik modeli, bu esneklikle paralel bağlantıda koridor genişlikleri ve yönlendirmelerin misafir ağırlama stratejisiyle birlikte daha geniş uygulanması ve özel teşhirleri diğerlerinden ayırmak adına aydınlatma vurgusu kullanılarak ziyaretçiler tarafından dikkat çekmesi sağlanmaktadır (Görsel 8 ve 9).

- Esneklik : Modüler sistemler, alanın farklı etkinliklere uyarlanabilmesini sağlamaktadır.
- Ziyaretçi Akışı : Koridorların geniş tutulması ve ürün kimliklerinin doğru yerleştirilmesiyle akıcı bir hareket sağlanmıştır.
- Odak Noktaları : Öne çıkan ürünlerin sergilendiği bölümler, özel aydınlatmalarla vurgulanmıştır.

Görsel 8. UNICERA 2024 Creavit fuar planı
(Yazar fotoğraf arşivi, 2024)

Görsel 9. UNICERA 2024 Creavit fuar planı renderı
(Yazar fotoğraf arşivi, 2024)

Stant seçiminde ise hem sürdürülebilirlik hem de 2023 yılından kullanabileceğimiz birçok malzemeyi sürdürülebilirlik adına tekrardan kullanmayı benimsediğimiz bir proje tasarımı olmuştur. Aşağıda tekrardan kullandığımız stant, mobilya, reklam panoları ve elektrik aydınlatma armatürleri sıralanmaktadır.

- Giriş bankosu mobilyası (Görsel 8 ve 9),
- Cafe alanı, bankosu ve mobilyaları,
- Cafe alanı konstrüksiyonu (Görsel 8 ve 9),
- Zemin malzemesi (Görsel 8 ve 9),
- Meydanda bulunan lale revizyonu (Görsel 9),
- Toplantı alanı mobilyaları ve koltukları,
- Tüm pencere ve kapılar,

- Amfi alanı ve Ruby parametrik tasarımı (Görsel 11),
- Elektrik ve aydınlatma malzemeleri,
- Reklam pano dili ve kutu harf tabelaları.

Görsel 10. UNICERA 2023 Creavit fuar alanı giriş fotoğrafı
(Yazar fotoğraf arşivi, 2024)

Görsel 11. UNICERA 2024 Creavit fuar alanı giriş fotoğrafı
(Yazar fotoğraf arşivi, 2024)

2023 yılında 2,8 mm kalınlığında çelik sac ile yaptırmış olduğumuz standın uyumu plan ile uyumlu olmaktaydı (Görsel 12).

Görsel 12. 2023 yılına ait çelik konstrüksiyon
(Yazar fotoğraf arşivi, 2024)

2024 yılında ise anıtsal bir meydan oluşturma isteğinden ötürü mevcut çelik standın etrafına eklentilerle meydan ile aynı formu oluşturmak istenmiştir (Görsel 13).

Görsel 13. 2024 yılına ait düzenlenmiş çelik konstrüksiyon
(Yazar fotoğraf arşivi, 2024)

Ziyaretçi deneyimini artırmak için teknoloji odaklı çözümler projede yer almıştır:

- Dijital Deneyimleri: Ziyaretçilerin Creavit ürünlerini sanal ortamda incelemesine olanak tanımıştır.
- İnteraktif Paneller: Ürün bilgilerine hızlı erişim sağlanmıştır (Görsel 14)
- Multimedya Ekranlar: Markanın hikayesi ve ürünlerinin kullanım videoları gösterilmiştir (Görsel 15).

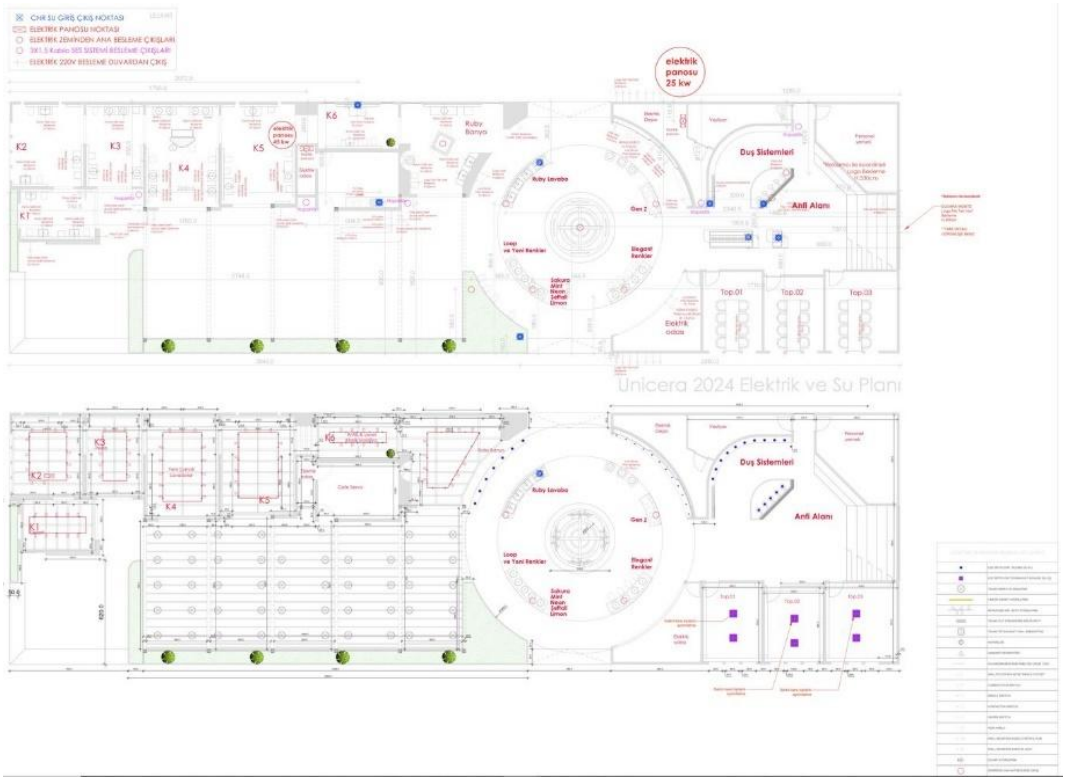
Dijital teknolojilerin fuar tasarımında ziyaretçilerin ilgisini artırmada ve markanın yenilikçi yönünü yansıtmada önemli bir araç olmuştur.

Görsel 14. Banyo özelliklerini anlatan interaktif paneller
(Yazar fotoğraf arşivi, 2024)

Görsel 15. Curve dijital ekran
(Yazar fotoğraf arşivi, 2024)

Sürdürülebilirliği korumaya çalıştığımız bir diğer stant ise parametrik tasarım olan Ruby standı. 2023 yılında ürünün fuar içerisinde gösterimine uygun olması adına stant antrasit rengine boyanmıştır (Görsel 16).

Görsel 16. 2023 yılında kullanılan parametrik tasarım ve amfi alanı
(Yazar fotoğraf arşivi, 2024)



2024 yılında fuar alanı içerisindeki ruby ürününün gösterimine uygun olması amacıyla kullanılan malzeme aynı olup montaj sonrası beyaza boyanmıştır. Saha da koyu bir rengi açık bir renge çevirmek oldukça zorlamıştır. 5 kat boya ile antrasit etkisi tamamen beyaza dönmüştür (Görsel 17).

Görsel 17. 2023 yılında kullanılan parametrik tasarım ve amfi alanı
(Yazar fotoğraf arşivi, 2024)

Aydınlatma, ürünlerin sergileniş biçimini ve mekânın atmosferini etkileyen önemli bir tasarım unsuru olarak belirlenmiştir.

- Vurgu Aydınlatmaları: Sergilenen ürünleri ön plana çıkarmak için LED spot ışıklar kullanılmıştır.
- Dolaylı Aydınlatmalar: Mekânın genel atmosferini desteklemek için yumuşak ışıklandırma uygulanmıştır (Görsel 18).

Görsel 18. UNICERA 2024 Creavit aydınlatma ve elektrik yerleşim projesi
(Yazar fotoğraf arşivi, 2024)

Sergi alanlarında aydınlatma düzenlemelerinin, ziyaretçi deneyiminde odaklanmayı artırmak için stratejik bir şekilde tasarlanması gerektiğini ifade etmektedir (Çelik, 2017). UNICERA 2024 Fuarı için Creavit sergi alanı, sürdürülebilirlik, teknolojik entegrasyon ve kullanıcı deneyimini ön planda tutan bir tasarım süreciyle gerçekleştirilmiştir. Eskizlerden teknik detaylara kadar her aşamada, marka kimliğini ve yenilikçi yaklaşımı destekleyen bir tasarım hedeflenmiştir.

Projenin Nihai Fotoğrafları

Tüm detaylarının projeye uygun şekilde tamamlandığını bilmek ölçeği büyük projelerde başarı olarak kabul edilmektedir. Planlama aşamasında tüm detayların projesini çizmek üreticiler için kolaylık sağladığı için projenin kurulum sürecinde zamana karşı yarışırken tüm ürünlerin eksiksiz ve hatasız olarak alanda bulunması gerekmektedir. 7 günlük kurulum sürecinde herhangi bir kaza veya aksaklık olmadan fuar kurulumu tamamlanmıştır. Fuar alanının bitmiş haline ait fotoğraflar aşağıda gösterilmektedir (Görsel 19, 20, 21 ve 22).

SONUÇ

UNICERA 2024 İstanbul Fuarı'nda Creavit için tasarlanan sergi alanı, modern fuar tasarımının sürdürülebilirlik, estetik ve kullanıcı deneyimi odaklı yaklaşımını yansıtan bir proje olmuştur. Bu bölümde, projenin genel değerlendirmesi yapılmış, elde edilen bulgular detaylandırılmış ve gelecekteki çalışmalara yönelik öneriler sunulmuştur.

Proje, Creavit ‘in yenilikçi vizyonunu ve sürdürülebilirlik değerlerini yansıtan bir tasarım anlayışıyla gerçekleştirilmiştir. Tasarım süreci, markanın kimliğini güçlendirme, kullanıcı deneyimini iyileştirme ve sektörde öne çıkma hedeflerine uygun olarak planlanmıştır. Fuar alanı hem teknik hem de estetik açıdan bir bütünlük sunmuş, ziyaretçilere etkileyici bir deneyim yaşatmayı amaçlamıştır.

Doğal malzemelerin kullanımı ve enerji verimli aydınlatma elemanları, çevresel duyarlılığı ön plana çıkarmış ve Creavit ‘in sürdürülebilirlik hedeflerini desteklemiştir. Bu yaklaşım, modern fuar tasarımında çevre dostu uygulamaların önemini bir kez daha vurgulamaktadır. Bir önceki senelerden kalan aydınlatma elemanları tamir edilip kullanılmıştır. Bununla birlikte reklam tabelalarından da tüm ışıklı kutu harfler tamir edilip kullanılması özellikle desteklenmiştir. Ahşap stant elemanları küçük değişikliklerle bir önceki senelerden farklılaştırarak; boya rengini değiştirerek günümüzde kullanılmıştır.

Dijital deneyimleri ve interaktif paneller, ziyaretçilere ürünleri daha iyi anlama ve deneyimleme imkânı sunarak marka ile kullanıcı arasındaki etkileşimi artırmıştır. Teknolojinin bu şekilde entegre edilmesi, fuar alanlarının daha dinamik hale gelmesini sağlamıştır. Geçtiğimiz senelerden farklı olarak ilk defa büyük ekran panelini curve (eğik) şeklinde kurarak fuar tarihinde bir ilk oluşturulmuştur.

Mekânsal düzenlemelerin açık planlı ve yönlendirme elemanlarının etkili bir şekilde yerleştirilmiş olması, ziyaretçilerin alanda kolayca hareket etmelerini sağlamıştır. Bu durum, ziyaretçi memnuniyetini artırarak fuarın genel başarısına katkı sağlamıştır. Fuarın çevresindeki koridorlardan geçen ziyaretçilerde bu şekilde açık bir planlamanın fuar standımıza baka baka yürümeleriyle göstermiştir. Sadece stant içinden değil stant dışından geçen ziyaretçilerde bu ferahlığı ve dikkat çekiciliği gözlemlendiği tespit edilmiştir.

Sergi alanının estetik detayları, renk seçimleri ve malzeme kullanımı, Creavit ‘in modern ve yenilikçi kimliğini ziyaretçilere etkili bir şekilde aktarmıştır. Meydan tarafında bulunan çelik konstrüksiyon lale tasarımı renkli lavabolarımızı tij yardımıyla asmamıza vesile olurken aynı zamanda anıtsal bir öğe olarak dikkat çekicilik sağlamıştır. Neredeyse tüm misafirlerimiz renkli asılı lavabolarımızın önünde fotoğraf çektirmiştir.

Gelecek fuar projelerinde, yapay zekâ tabanlı yönlendirme sistemleri ve daha gelişmiş AR/VR uygulamalarının dahil edilmesi önerilmektedir. Bu yenilikler, ziyaretçilerin mekanla daha fazla etkileşim kurmasını sağlayabilir. Daha fazla geri dönüştürülebilir malzeme kullanımı, yenilenebilir enerji kaynaklarına dayalı aydınlatma sistemleri gibi uygulamalar sürdürülebilirlik vurgusunu güçlendirebilir. Gelecek tasarımlarda, engelli ziyaretçilerin ihtiyaçlarını karşılayacak daha kapsayıcı düzenlemeler yapılması önerilmektedir. Ziyaretçilerin yoğun tempoda dinlenebileceği daha fazla sosyal alan eklenmesi, deneyim kalitesini artırabilir.

UNICERA 2024 İstanbul Fuarı için tasarlanan Creavit sergi alanı, modern fuar tasarımının tüm gerekliliklerini karşılayan bir proje olarak dikkat çekmiştir. Sürdürülebilirlik, teknolojik entegrasyon ve estetik yaklaşımların bir araya getirildiği bu tasarım, marka kimliğini etkili bir şekilde ziyaretçilere aktarmış ve kullanıcı deneyimini zenginleştirmiştir. Gelecekteki çalışmalar, daha fazla dijitalleşme ve sürdürülebilirlik odaklı yaklaşımlarla bu başarıyı ileriye taşıyabilir.

Dijitalleşmeyi firmaların daha etkin kullanarak birbirlerine örnek olması gerekmektedir. 5 gün süreyle ziyaretçi ağırlayan fuar sistemi harcanan paraların önemli ölçüde kısılmasına katkı sağlayabilir.

EXTENDED ABSTRACT

Introduction

UNICERA 2024 Istanbul Fair is a significant event where innovative designs and sustainability in the ceramics and bathroom sectors converge. This study examines the design process of the exhibition space created for the Creavit brand, evaluating its contributions within the context of interior design and environmental planning. The research aims to explore the role of exhibition design in enhancing user experience and promoting sustainable practices while aligning with Creavit's brand identity. Additionally, it investigates how contemporary fair designs address evolving demands such as technology integration and environmental awareness.

Method

The study adopts a mixed-methods approach, incorporating qualitative and quantitative frameworks to analyze Creavit's exhibition space at UNICERA 2024 Istanbul Fair. Methods include a literature review, on-site observations, design analysis, and comparative evaluations of past and current designs. The study focuses on spatial organization, material selection, technological integration, and aesthetic features. Design sketches, technical drawings, and photographs were used as visual documentation. Furthermore, the study compares exhibition spaces from 2023 and 2024, aiming to achieve a more efficient and functional fair layout.

Findings

The study identifies several key findings regarding Creavit's exhibition space:

Spatial Organization: The 15x53-meter exhibition area strikes an effective balance between functionality and aesthetics. Open-plan layouts strategically positioned entry points, and spacious corridors facilitated visitor movement and enhanced product visibility. Interactive panels and clear directional signage enriched the user experience. The design successfully catered to both professional and individual visitors, optimizing visitor engagement. The observation of visitors entering through the designated entry points confirmed the success of the layout design.

Brand Identity and User Experience: Creavit’s brand values were effectively reflected in the exhibition through thematic elements, slogans, digital displays, and innovative lighting. Vibrant colors and dynamic structures enhanced brand recognition, leaving a lasting impression on visitors. Social and rest areas improved user comfort and satisfaction. Additionally, digital panels and interactive screens presenting product stories fostered visitor engagement. Feedback highlighted the positive impact of these features on user experience.

Sustainability Practices: The project implemented sustainable practices such as reusing materials from previous exhibitions, energy-efficient lighting, and modular design elements. Recyclable materials and adaptive structures reduce waste typically associated with temporary spaces. This approach serves as a model for environmentally conscious fair design. Local materials were prioritized to minimize carbon footprints, and energy-efficient technologies significantly contributed to environmental sustainability goals.

Technological Integration: Interactive screens and advanced technologies like augmented reality (AR) and virtual reality (VR) provided visitors with innovative ways to interact with the products. These features not only enhanced the user experience but also reinforced the brand's innovation-driven identity. Technological elements effectively conveyed product specifications and applications to visitors, fostering a deeper connection with the brand.

Aesthetic Appeal: The exhibition emphasized elegance and modernity through clean lines, minimal visuals, and thematic motifs. A central installation featuring suspended lavatories stood out as a distinctive aesthetic element, encouraging social media interaction. Lighting design throughout the exhibition highlighted the products while creating a warm and inviting atmosphere. Variations in lighting schemes across different sections of the space provided visual diversity for visitors.

Conclusions and Recommendations

The Creavit exhibition space at UNICERA 2024 Istanbul Fair emerges as a model for innovative and sustainable exhibition design. By integrating functional, aesthetic, and technological elements, the project successfully met contemporary design standards and increased visitor engagement. Key takeaways include.

Importance of User-Centric Design: The inclusion of spatial arrangements and social areas underscores the necessity of prioritizing user needs in exhibition design. Ergonomics and aesthetics should harmonize to enhance user satisfaction.

Role of Sustainability: Sustainable practices, such as material reuse and energy-efficient solutions, play a critical role in aligning with global environmental goals. These approaches also provide cost-saving benefits for future exhibitions.

Value of Technology: Advanced digital tools such as AR/VR create dynamic and engaging experiences for visitors, positioning the brand as an innovator in its sector.

The study offers the following recommendations for future fair designs: Advanced Digital Integration: Incorporate AI-powered navigation systems for real-time guidance and personalized visitor experiences.

Enhanced Accessibility: Design inclusive spaces catering to diverse visitor needs, including individuals with disabilities, to attract a broader audience.

Expanded Social Zones: Develop more rest and interaction areas to increase visitor satisfaction and prolong engagement with the exhibition.

Further Sustainability Measures: Utilize renewable energy sources, biodegradable materials, and waste-reduction strategies to minimize environmental impacts, making exhibitions eco-friendlier and more cost-effective.

Hybrid Exhibition Models: Combine physical and digital elements in hybrid formats to enhance accessibility and foster more dynamic interactions. Strengthening the connection between digital and physical spaces can expand participation and engagement.

EĞİTİM YAYINEVİ GRUBU

BAŞKENT ANKARA'DA ÖZGÜN İŞLEVİ DIŞINDA MÜZEYE DÖNÜŞTÜRÜLEN CUMHURİYET DÖNEMİ KAMU YAPILARI ÜZERİNE BİR DEĞERLENDİRME

Ayşen Esra Bölükbaşı Ertürk[1]

1. Giriş

Ankara'nın başkent olmasıyla Cumhuriyet rejiminin öngördüğü yeni bir yapılanma hem fikri hem de fiziki olarak başlamıştır. Kentin imar planları hazırlatılmış, başta idari ve yönetim binaları olmak üzere sağlık yapıları ile eğitimin her kademesinde hizmet verecek, çağdaş eğitimin yolunu açacak yeni binalar inşa edilmiştir. Diğer yandan ekonomik kalkınmada önemli olan başta yönetim binaları olmak üzere banka, sağlık ve diğer hizmet binalarının inşası da tüm bu yapılanma içinde yer almaktadır. Cumhuriyet'in kurulduğu bu yıllarda, Türk Ulusçuluğu düşüncesi, her alanda olduğu gibi mimaride de etkili olmuştur (Bozdoğan 2008; Onur Işıkoğlu, 2018). Yeni başkentin imarı, mimarlık tarihi açısından ele alındığında Milli Mimari Üslubu, Neoklasik Üslup, Erken Cumhuriyet Dönemi Mimarisi olarak da adlandırılan I. Ulusal Mimarlık Dönemi (Sözen 1984; Aslanoğlu, 2010; Yaldız&Parlak 2018; Hasol 2020, vd.) ile başlayarak, II. Ulusal Mimarlık Dönemi, Modernizm ve sonrasına kadar uzanmaktadır.

Cumhuriyet ideolojisini yansıtan siyasi, ekonomik ve sosyal açıdan yeni bir başlangıcın yapıldığı Ankara'da kent belleğini oluşturan ancak gelişen ve değişen şartlar nedeniyle kullanımları özgün işleviyle sonlanan tarihi yapıların yeni bir işlevle tekrar kent hafızasında yerini koruması önem taşımaktadır. Bu nedenle bir koruma yöntemi de olarak da ele alınan yeni işlev kazandırma ile bu tarihi yapılar tekrar cazibe merkezi haline gelmektedir.

1 Doç. Dr., Karabük Üniversitesi, Safranbolu Başak Cengiz Mimarlık Fakültesi, Karabük, Türkiye.
E-mail: esrabolukbasi@karabuk.edu.tr ORCID: 0000-0002-9218-0728

Başkent olması kararlaştırılan küçük bir Anadolu kenti olan Ankara'nın yapılanmasında önemli olan kamu binalarının Cumhuriyet'in 100. yılında geçirdikleri değişim sürecini müze işlevi bağlamında ele almak bu çalışmanın amacını ve çıkış noktasını oluşturmakla beraber işlev değişikliği olan tarihi yapıların özgün kimliklerinin yeni işlev ve buna bağlı düzenlemelerin gölgesinde kalmadan sürdürebilir olması ve bundan yüzyıl sonra da ilk yapı özelliklerinin okunabilir olması gerekliliğini vurgulamaktır.

2. Ankara'da Özgün İşlevinden Ayrı Müzeye Dönüştürülen Kamu Yapıları

2.1. I. Türkiye Büyük Millet Meclisi Binası -Kurtuluş Savaşı Müzesi

1915 yılında İttihat ve Terakki Fırkası'nın kulüp binası olarak inşasına karar verilerek halkın yardımlarıyla yapılan projesi Mimar Salim Bey tarafından yapım işi ise askeri mimar olan Hasif Bey tarafından gerçekleştirilmiştir (Aysal 2020:224).

23 Nisan 1920 ile 15 Ekim 1924 yılları arasında TBMM olarak daha sonra ise A.Ü. Hukuk Fakültesinin öncül yapılanmasını oluşturan Hukuk Mektebi olarak kullanılmıştır.

1957 yılında Milli Eğitim Bakanlığı tarafından müzeye dönüştürülmesi kararlaştırılmıştır.

23 Nisan 1961 yılında TBMM Müzesi, 23 Nisan 1981 yılında ise Kurtuluş Savaşı Müzesi adını almıştır (URL 1).

Bina I. Ulusal Mimarlık akımı / Milli Mimari Üslubu özelliklerine sahip olarak bodrum üzerine tek katlı inşa edilmiştir. İç mekânda geniş bir koridorun her iki yanına odalar simetrik olarak yerleştirilmiştir. Plan düzeni açısından meclis toplantı salonu ile bu salonun uzantısı ve dinlenme mekânı olarak kullanılan kulis merkeze alınmıştır. Geniş çatı saçakları, sivri kemerli pencereleri, kemer köşeliklerindeki kabaralarla dönemin özeliklerini gösterir.

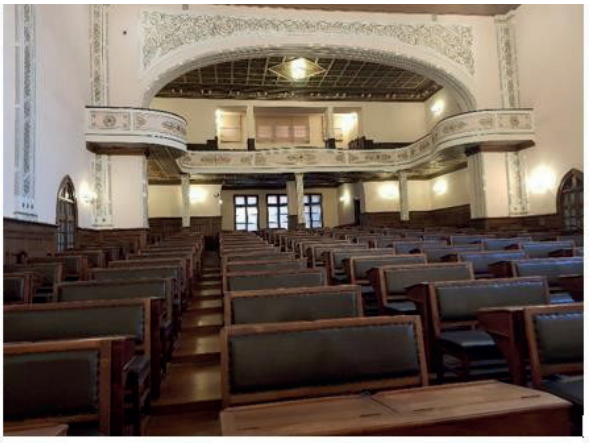
Bodrum kat, depo, fotoğraf atölyesi vd. mekânları içermektedir. Üst katta ise kurtuluş savaşını anlatan belgeler, antlaşma metinleri, madalyalar, sikke ve fotoğraflar ile diğer eşyalar sergilenmektedir.

Meclis toplantı salonu ahşap kürsü ve mebuslar için oturma sıralarıyla özgün haliyle sergilenmektedir (Fotoğraf 2-3). Koridorun her iki yanında bulunan mekânlarda sergileme yapılmaktadır.

Fotoğraf 1. I. Meclis Binası- Kurtuluş Savaşı Müzesi. (URL-1) Kaynak:(https://www.ktb.gov.tr/TR-96356/ankara---kurtulus-savasi-muzesi-i-tbmm-binasi.html)

Fotoğraf 2-3. I. Meclis Binası- Kurtuluş savaşı Müzesi. Meclis Toplantı Salonu (Bölükbaşı Ertürk 2023)

2.2. II. TBMM Binası- Cumhuriyet Müzesi



1923 yılında Mimar Vedad Tek tarafından tasarlanan yapı I. Ulusal Mimarlık dönemi özelliklerini yansıtmaktadır (Fotoğraf 4). Bodrum üzerine iki katlı olan yapıda iç mekânın ortasında iki kat boyunca yükselen meclis salonunu çevreleyen birimler yer alır (Fotoğraf 5).

I. TBMM binası yeterli gelmeyince meclis binası olarak düzenlenmiş ve 18 Ekim 1924 tarihinde hizmete açılmıştır. Binada; Türk Siyasi tarihinde önemli yeri olan II. TBMM, 1924-1960 yıllarında Atatürk ilke ve devrimlerinin gerçekleştirilmesi, önemli yasaların çıkarılması, uluslararası anlaşmaların imzalanması ve çok partili sisteme geçiş gibi Türkiye siyasi tarihinin önemli olayları gerçekleşmiştir. (Hasol 2020: 41)

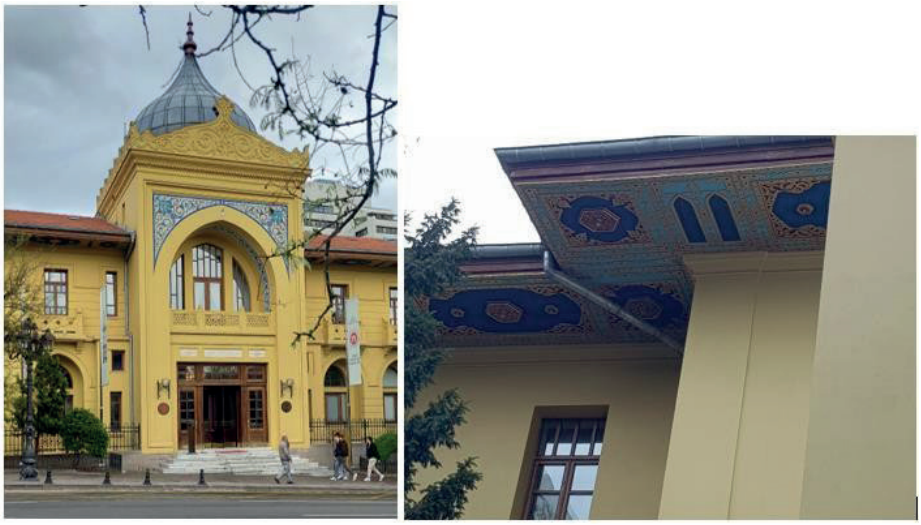
Fotoğraf 4. II. TBMM Binası- Cumhuriyet Müzesi. (URL-2) Kaynak: (https://tarihvakti.com/tbmmnin-acilmasi/)

Fotoğraf 5. II. Meclis- Cumhuriyet Müzesi – Meclis Toplantı Salonu (Bölükbaşı Ertürk 2023)

2.3. Ankara Vakıf Oteli- Ankara Palas Müzesi

İlk dönemlerinde Evkaf Müdürlüğü'ne bağlı olduğundan "Evkaf Oteli" olarak da anılan (Sumbas 2013:178) Ankara Palas, Ankara'nın başkent olması nedeniyle burada yürütülen çalışmalara katılmak için çevre illerden gelen milletvekilleri ile yabancı devlet yetkililerinin konaklaması ve ağırlanması için inşa edilmiştir. Binanı ilk mimarı Vedad Tek'in görevden ayrılmasıyla Mimar Kemalettin Bey binanın tasarım sürecini ve yapımını devam ettirmiştir.

Bodrum üzerine iki katlı binanın zemin katı, ortada üstten ışık alan balo salonu ve bunu çevreleyen bir hol etrafındaki farklı ölçülerdeki mekânlardan oluşmaktadır. Binada dikey sirkülasyon merdivenlerle sağlanmış olup üst katta otel odaları bulunmaktadır.



I. Ulusal Mimarlık akımının özelliklerine uygun olarak, girişin öne çıkarılarak vurgulanması, bina köşelerinin cepheden dışa taşkın ve yüksek yapılarak geniş saçaklı çatılarla örtülmesi, cephedeki mukarnas, sivri kemer, çini vd. unsurlarla Selçuklu ve Osmanlı dönemi mimarisindeki cephe düzeni ve bezeme özelliklerine gönderme yapması dikkat çekicidir. Bunların yanında betonarme karkas olarak inşa edilmesi (Aslanoğlu 2010:269), kalorifer tesisatı, elektrik ve sıcak su gibi konfor koşullarının oluşturulması o denem için yenilikçi yaklaşımlar olarak değerlendirilebilir. Milli Mimari mirasının yeni malzeme ve yapım teknikleriyle buluşturan anlayış hâkimdir.

Ankara Palas 1968'de Vakıflara devredilmiş ve 1972'ye kadar onarılmıştır. Bir ara Oleyis Sendikasına otel olarak kiralanmış; 1975'te tekrar Vakıflara geçmiş ve 1976-81 arasında Sanayi ve Teknoloji Bakanlığı'nca kullanılmıştır. 1981 başında Bayındırlık Bakanlığı'na devredilmiş; eskisine sadık kalınarak restore edildikten sonra Devlet Konukevi olarak 1983 yılında kullanıma açılmıştır (Sumbas 2013: 193 dipnot 16). 22 Şubat 2024 tarihinde Milli Saraylara bağlı müze olarak ziyarete açılmıştır.

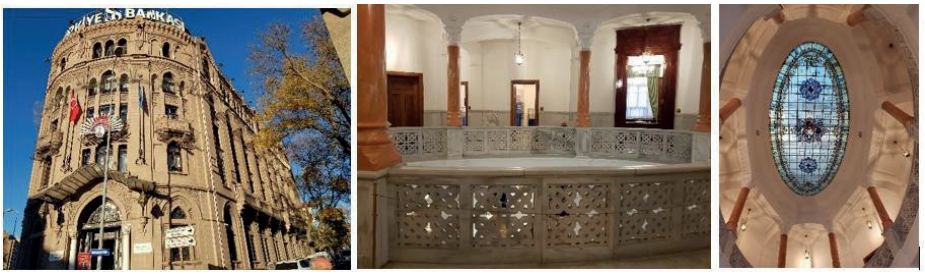
Ankara Palas Müzesi Erken Cumhuriyet yapısı olması tarihi kimliğinin yanı sıra özgün mimari özellikleriyle değer bulmuş ve müze konsepti içinde ele alınmıştır. İç mekânda özgün tefriş ve o dönemde kullanılan eşyalar sergilenmektedir. Balo salonu başta olmak üzere burayı çevreleyen mekânlarda serbest vitrinler, dijital bilgi panoları ve duvar vitrinleri ile sergileme yapılmaktadır. Ayrıca müzede son dönem Osmanlı eserleri de sergilenmektedir. Günümüz kullanımında binanın üst katı ofis ve idari kat olarak, bodrum kat ise konferans, toplantı gibi etkinliklere ayrılmıştır.

Fotoğraf 6. Ankara Palas -Ankara Palas Müzesi (Bölükbaşı Ertürk 2025)

Fotoğraf 7-8. Ankara Palas-Ankara Palas Müzesi Mimari ve Süsleme Detayları (Bölükbaşı Ertürk 2025).

Fotoğraf 9. Ankara Palas -Ankara Palas Müzesi. Sergi Salonu. (Bölükbaşı Ertürk 2025)

Fotoğraf 10. Ankara Palas -Ankara Palas Müzesi. Sergi Salonu. (Bölükbaşı Ertürk 2025)

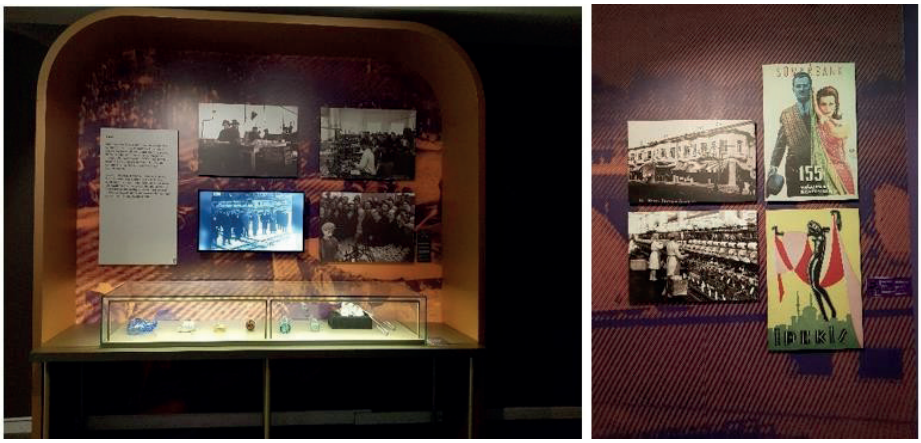


Fotoğraf 11-12. Ankara Palas. Solda Yapıya Ait Özgün Detaylar. Sağda Kalorifer Peteği (Bölükbaşı Ertürk 2025).

2.4. Türkiye İş Bankası-İktisadi Bağımsızlık Müzesi

İtalyan Mimar Giulio Mongeri tarafından 1929 yılında İş Bankası'nın üçüncü Genel Müdürlük binası olarak inşa edilmiştir**.** Bodrum üzerine, simetrik olarak planlanmış, beş katlı, ortası avluludur. Bina köşe parsele konumlandırılmış

«Hâkimiyet-i Milliye» meydanına bakan köşesi yuvarlatılarak ikizkenar üçgen biçiminde tasarlanmıştır. Bu cephedeki ana girişten başka yan cephelerden de yapıya girilmektedir.



Fotoğraf 13. Türkiye İş Bankası – İktisadi Bağımsızlık Müzesi Cephe (solda) ve İç Mekân (ortada) ve (oval tepe ışıklığı) (Bölükbaşı Ertürk 2023)

Erken Cumhuriyet dönemi mimarisinin günümüze ulaşmış en önemli örneklerinden biri olan tarihi binada, Osmanlı mimari özelliklerinin yanı sıra cephenin yatay olarak silmelerle bölünerek vurgulanması ve girişin üzerindeki cam gölgelik Art Nouveau akımının etkisini göstermektedir. Yapının arka ve bir yan cephesine 1956 ve 1973 yıllarında eklemeler yapılmıştır (Aslanoğlu 2010).

Türkiye İş Bankası İktisadi Bağımsızlık Müzesi 2 Mayıs 2019 tarihinde açılmıştır. Binanın müze olarak düzenlenmesiyle; Bodrum katında kiralık kasa dairesi ziyaretçiyle buluşturulmuştur. Giriş katında banko ve vezneler özgün olarak sergilenmektedir. Ayrıca bu kattaki bir diğer sergileme dijital pano, fotoğraf, film, belge ve çeşitli objelerle bankanın iktisadi kalkınma için yaptığı sanayi yatırımları anlatılmaktadır.

Fotoğraf 14-15. Türkiye İş Bankası – İktisadi Bağımsızlık Müzesi İç Mekân Sergileme (Bölükbaşı Ertürk 2023)

Fotoğraf 16-17. Türkiye İş Bankası – İktisadi Bağımsızlık Müzesi (Bölükbaşı Ertürk 2023)

Fotoğraf 18-19. Türkiye İş Bankası – İktisadi Bağımsızlık Müzesi Sanayi Yatırımlarının Anlatıldığı Sergileme (Bölükbaşı Ertürk 2023)

Birinci katta toplantı odaları yer alır. İkinci katta geçmiş yıllardaki banka reklamları ve banka faaliyetleri tanıtılmaktadır. Üçüncü kat, ağırlıklı olarak güncel sanat eserlerinin sergilendiği sanat galerisi olarak düzenlenmiştir. Dördüncü katta Kurtuluş savaşını konu alan devamlı sergi bulunmaktadır. Beşinci kat ise eğitim ve çeşitli faaliyetler için kullanılmaktadır. Burada çocuk ve yetişkin gruplarına yönelik atölye ve seminerler düzenlenmektedir.

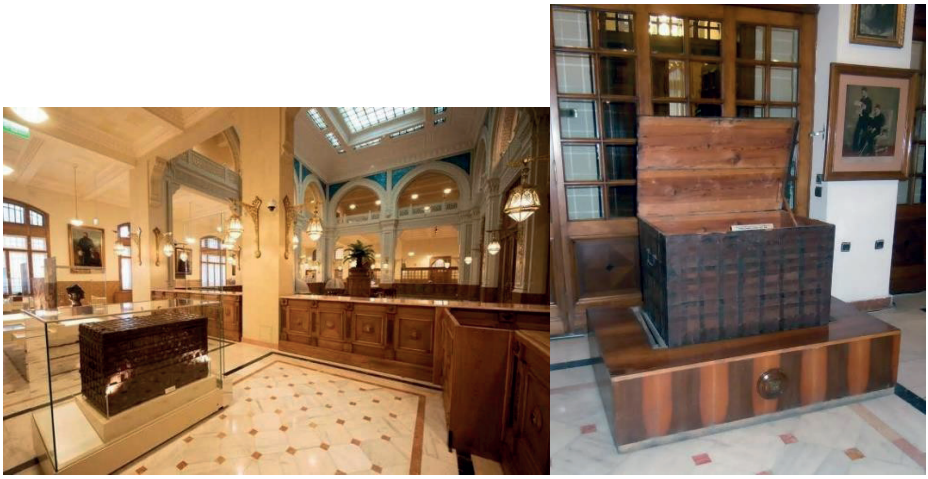
İş Bankası idare meclisi salonu tüm donatı ve tefrişiyle özgünlüğü korunarak ziyaretçiye açılmıştır. İdare meclisi her yıl bankanın kuruluş yıldönümünde burada toplantı yaparak bankanın kuruluş amacı ve Cumhuriyet'in ilk yıllarında yapılan faaliyetler açısından belleğin canlı tutulmasını sağlamaktadır.

Fotoğraf 20-21. İdare Meclisi Salonları (Bölükbaşı Ertürk 2023)

2.5. Ziraat Bankası- Ziraat Bankası Müzesi

Milano doğumlu olan ancak uzun yıllar Türkiye'de yaşayan ve İstanbul Sanayi-i Nefise Nefise Mektebi'nden mezun olan Giulio Mongeri tarafından tasarlanmıştır. 1926 yılında başlanan inşaatı 1929 yılında tamamlanmıştır (Hasol 2020).

Bina bodrum katı, zemin katı, asma kat, birinci ve ikinci kat ile çatı katından oluşmaktadır. Katlarda mekânlar ortada banka holü çevresine yerleştirilmiştir. Betonarme iskelet sistemi uygulanmıştır (Aslanoğlu 2010: 240). Simetrik cephe düzeni olan yapıda köşeler dışa taşkın kule görünümündedir. Geniş saçakların alt yüzeyleri Selçuklu motifleriyle bezenmiştir. Girişin cepheden öne çıkartılarak vurgulanması, kabaralar, sivri kemerli cepheler, mukarnas ve kıvrık dala bağlı rumi motifinin kullanıldığı kemer köşelikleri ile korkuluklarda geometrik motiflerin kullanımı Selçuklu ve Osmanlı mimarisinin etkisini göstermektedir.



Fotoğraf 22-23. Ziraat Bankası- Ziraat Bankası Müzesi (Bölükbaşı Ertürk 2023)

Müze, Ziraat Bankasının 118. kuruluş günü olan 20 Kasım 1981 tarihinde açılmıştır. Zemin katta özgün yapı korunarak dijital uygulamalarla desteklenmiş bankanın tarihçesi anlatılmaktadır. Ayrıca yevmiye defterleri kinin dağıtım ve satışına ilişkin o dönem için önemli olan çeşitli defterler, yazı ve kristal hokka takımları hesap makinaları sergilenmektedir. Ayrıca o dönemin yardımlaşma ve dayanışma fikrinden çıkan 1863 yılına ait "memleket sandığı" sergilenmektedir. Memleket Sandıkları, çiftçilerin dayanışma ve ekonomik birliktelikleri esasına dayanmakta olup aynı zamanda Ziraat Bankası'nın temeli olan sistemdir. (URL 3). Ziraat Bankasının kuruluşu, etkinlikleri, sanat koleksiyonları ziyaretçilerle buluşturulurken çağdaş sergileme yöntemleri kullanılmıştır.

2.6- Milli Emlak ve Eytam Bankası- PTT Pul Müzesi

Türk halkının inşaat yatırımlarını desteklemek ve gerekli kredileri sağlayabilmek için kurulan Emlak ve Eytam Bankası'nın Ulus'ta bulunan binasının mimari tasarımı 1933-1934 yılları arasında Clemens Holzmeister tarafından yapılmıştır (Aslanoğlu 2010:253; Hasol 2020:76). Bina, bodrum, zemin ve üzerindeki iki kattan oluşmaktadır. Üst katlar güney yönünde geriye çekilmiş olup çalışma alanları bir koridor üzerinde tasarlanmıştır. Ön cephede zemin katın dışa taşkın tasarlanması, birinci katta açık bir balkon oluşturmuştur. Bu sütunlu cephe düzenlemesi binanın kütleselliğini kırarak neo-klasik etki yaratmıştır. Betonarme iskelet sistemi uygulanan yapıda Ankara taşı ve mermer

kullanılmıştır. Milli mimari üslubunun dışına çıkılarak yapılmış bina tasarımı, Başkentin modern mimarlık anlayışında tasarlanmış öncül yapıları arasındadır.

Daha sonra Emlak Bankası Uluş şubesi olarak kullanılan yapı, restorasyonu tamamlandıktan sonra PTT Pul Müzesi olarak 2013 yılında müze işleviyle açılmıştır.

Müzede haberleşme tarihinin yanı sıra geçmişten günümüze pullar konularına göre sergilenmektedir. Özel günler ve anı pullarının yanı sıra zarflara da yer verilmiştir. Tarihi binanın pul ve haberleşme temalı materyallerle buluşturulmasının dışında çok amaçlı salon, çocuk oyun alanı, pul satış bölümü ve kafeterya gibi sosyal alanlar oluşturulmuştur. İç mekânda PTT'nin hâkim rengi olan sarının özellikle vurgulayıcı olarak kullanılması, tarihsel süreçte her zaman önemli olan haberleşme teşkilatının kurumsal kimliğin hafızada canlı kalmasına yardımcı olmaktadır.

Fotoğraf 36. Sergi Salonu-PTT Pul Müzesi (Bölükbaşı Ertürk 2023)

2.7. Ankara Türk Ocağı Binası- Resim Heykel Müzesi

1926 yılında açılmış olan bir yarışma sonrasında kazanan Arif Hikmet Koyunoğlu tarafından tasarlanmış ve 1927-1930 yılları arasında inşa edilmiştir (Aslanoğlu 2010:194). İlk olarak Türk Ocakları Merkez Binası olarak inşa edilen daha sonra Ankara Halkevi olarak hizmet veren ve günümüze kadar pek çok kurumun kullanımına verilmiştir.

Türk Ocakları Merkez Binası, 1931 yılı başlarında Türk Ocakları'nın kapanmasından sonra 10 Haziran 1931 tarihinde Cumhuriyet Halk Fırkası (Partisi)'na devredilmiş, 1932 yılında Türk halkının eğitim ve kültürel yönden

kalkınmasını sağlamak amacıyla Halkevlerinin açılması üzerine Ankara Halkevi binası olarak kullanılmıştır. 1952-1961 yılları arasında Türk Ocağı, Devlet Tiyatrosu, Ankara Belediyesi Nikâh Dairesi, 1961'de Milli Eğitim Bakanlığı ve Türk Ocakları Derneği, 1965'de Köy İşleri Bakanlığı ve Türk Ocakları Derneği, 1971'de Milli Savunma Bakanlığı, 1972'de Milli Eğitim Bakanlığı – Ankara Halk Eğitimi Merkezi ve Akşam Sanat Okulu olarak hizmet vermiştir 1975'de Kültür Bakanlığı'nın bünyesinde yer alışının ardından, aslına uygun restore edilmiştir. 2 Nisan 1980'den bu yana "Devlet Resim ve Heykel Müzesi" olarak kullanılmaktadır (Merdim, 2011).

Bodrum üzerinde iki katlı binada akustik değerler ve teknik olarak sahne donanımının bulunduğu tiyatro sahnesi bulunmaktadır Namazgah Tepesi olarak da bilinen yerde Etnografya Müzesi'nin yanındadır. Birinci Ulusal Mimarlık döneminin cephe özelliklerini gösteren bina dönemin simetrik anlayışına uygun olarak tasarlanmıştır. Merdivenlerle ulaşılan giriş eksende yer alır. Ayrıca binanın yan ve arka cephelerinde de girişler mevcuttur (İnci Fırat, 1998).

Ankara'nın Cumhuriyet döneminde kültür sanat etkinliklerine ev sahipliği yapması, ilk opera ve tiyatroların gerçekleştirilmesi amacıyla kullanılması önem taşımaktadır (Kırmızı 2022:42-43) Ankara Resim ve Heykel Müzesi koleksiyonuna, görsel sanatlar alanında 19. yüzyılın sonundan günümüze kadar Türkiye'de değişen sanat anlayışlarına ve tarihsel süreçlere tanıklık eden eserleri görmek mümkündür. Müzenin koleksiyonu resim, heykel, seramik, özgün baskı, Türk süsleme sanatı ve fotoğraftan oluşmaktadır.

2.8. Ankara Devlet Demir Yolları Cer Atölyesi- Cer Modern

Ankara'daki endüstri arkeolojisinin sınırlı örneklerinden olan ve Türkiye Cumhuriyeti Devlet Demiryolları tarafından tren ve vagonların bakım ve onarımlarını yapıldığı atölyelerdir. Birbirine bitişik dört birimden oluşan yapı grubu yeni bir yapının eklenmesiyle U formunda, önündeki giriş avlusu ile tasarlanmıştır. 1990'lı yıllara kadar atıl bir vaziyette kalan atölye binaları restorasyon sonrasında 2010 yılında Cer Modern adını alarak önceleri Çağdaş Sanat Müzesi" daha sonra ise "Modern Sanatlar Merkezi" olarak yeni işleviyle kullanıma açılmıştır. Bodrum katta ek galeriler, oditoryum, atölyeler ve servisler yer alırken avlu katında, atölyelerden dönüştürülen ana sergi salonlarının yanı sıra giriş holü, müze mağazası ve kafe bulunmaktadır. Avlu hem kafenin uzantısı olarak hem de sanat etkinliklerinde zaman zaman kullanılmaktadır.

2.9. Ankara Merkez Kapalı (Ulucanlar) Cezaevi - Ulucanlar Cezaevi Müzesi

Tarihi Ulucanlar Cezaevi, Ankara'da Altındağ ilçesi sınırlarında, günümüzde müze işleviyle kent hafızasını oluşturan önemli bir bileşen olarak ziyarete açılmıştır. 1925 yılında askeri bir deponun hapishane yapısına dönüştürülmesiyle (Meral 2015: 72) tarihi yapı, Cebeci Tevkifhanesi, Cebeci Umumi hapishanesi, Ankara Hapishanesi, Ankara Merkez Kapalı Cezaevi, Ankara Cebeci Sivil Cezaevi (Meral, 2015: 53-85; Öztürk 2023: 208) ve özgün işleviyle son olarak Ulucanlar Cezaevi olarak anılmıştır.

Tarihi binaya eklenen avlu ve koğuşların yanı sıra yarı açık cezaevi alanının da bulunduğu bütün içinde kent belleğinin kalıcı bir parçası olarak Ulucanlar Cezaevi Müzesi ve kültür -kongre merkezi olarak düzenlenmiştir. 2006 yılında cezaevi nakil yoluyla boşaltılmış, KTVKK tarafından tescillenerek koruma altına alınmış ve bu doğrultuda restorasyon çalışmalarına başlanarak 2010 yılında kapalı kısım müze olarak, daha sora 2012 yılında ise yarı açık olan kısım kültür sanat etkinliklerinin yapılacağı merkez olarak açılmıştır.

Ana bina ile ona eklenen avlu ve koğuşlardan oluşan yapı topluluğu içinde pek çok birimi barındırmaktadır. Tarihi yapının giriş ve idari bölümü Ulucanlar Caddesi yönünde bulunmaktadır. Cezaevindeki koğuş, zindan vb. yerlerde balmumundan yapılmış heykellerle canlandırma tekniğini kullanılarak, vaktiyle burada kalmış ülkenin önemli şahsiyetleri ve onlara ait eşyalar sergilenmektedir.

Buna ek olarak sergilemeye ses unsurunun dâhil edilmesi buradaki zor şartları daha da vurgulayarak izleyiciye yansıtmaktadır.

2.10. Ankara Hukuk Mektebi 1927 -Ankara Vakıf Eserleri Müzesi

Ankara'da bir Hukuk Mektebi'nin açılmasının gündeme gelmesiyle (İnan 1974), 1928 yılına kadar çeşitli binalarda eğitim öğretim faaliyetine devam eden okul, 1927 yılında yapımına başlana bir ilkokul binasının tahsis edilmesiyle 1928 yılı sonlarından itibaren başlamak üzere Ankara Hukuk Mektebi olarak

günümüz Ankara Vakıf eserleri müzesi binasında eğitime başlamış ve 1941 yılında okulun Ankara Hukuk Fakültesi adıyla yeni binasına taşınmasına kadar bu binada eğitimi sürdürmüştür. (URL-17). 1941 yılından günümüze kadar Diyanet İşleri Başkanlığı, Ankara Müftülüğüne ait hizmet binası ve Akşam Sanat Okulu olarak kullanılmıştır. 2004 yılında Vakıflar Genel Müdürlüğü tarafından yapılan restorasyon çalışmalarının ardından 2007 yılında Ankara Vakıf Eserleri Müzesi olarak açılmıştır.

Bodrum üzerine zemin ve bir kat olarak tasarlanmış bina yığma ve kâgir olarak, plan ve cephe düzeni açısından simetrik anlayışla inşa edilmiştir. Ön cephe kolonlar ile dışa çıkıntı yapacak şekilde vurgulanmıştır. Aynı zamanda bu özelliğiyle tarihi binanın cephesine hareket kazandırılmıştır. Halı, kilim, ahşap, maden, çini, tekstil, el yazması vb. eserlerin sergilendiği binada, sergi salonlarının yanı sıra laboratuvar, kütüphane, seminer odası, idari hizmet birimlerini içeren mekânlar bulunmaktadır.

2.11. Maliye Vekâleti Binası -Ankara Sosyal Bilimler Üniversitesi Hazine Müzesi

Erken Cumhuriyet Dönemi'nin ilk bakanlık binası olarak 1925 yılında inşa edilen yapının mimari tasarımı Yahya Ahmet tarafından yapılmıştır. Binada Maliye Bakanlığı, Gümrük ve Tekel Bakanlığı, ortadaki kısım ise Başbakanlık olarak kullanılmıştır.1927 yılından sonra yapılan eklentilerle ana kütlede dışa taşkın olan girişin de bulunduğu orta bölüm, köşeler ve merdivenli ikincil girişlerin bulunduğu akslar yükseltilmiş ve kule görünümü almıştır

(Hasol 2020:44). I. Ulusal Mimarlık akımının mimari ve cephe özelliklerini yansıtmaktadır.

Ankara Sosyal Bilimler Üniversitesi'ne tahsis edilen ve Rektörlük biriminin de bulunduğu yapı bütündeki eski Maliye Vekâleti Binası, ASBÜ Hazine Müzesi olarak düzenlenerek değerli iktisadi evrakların aynı sıra kıymetli evrak, para ve ticaretle ilgili tarihsel sürece ait sergileme yapılmıştır. Türkiye Cumhuriyeti'nin

ilk hazine kasa dairesi de burada bulunmaktadır. Altı farklı anahtarı olan ve bunların bir arada çalıştığı güvenlik sistemine sahip kasa dairesi Cumhuriyet dönemine ışık tutan binanın önemli bir bölümünü oluşturmaktadır.

3. Sonuç ve Değerlendirme

Erken dönemden başlamak üzere Cumhuriyet dönemi Ankara'sında mimari yapılanma, yukarıda ele alınan farklı işlevlerdeki yapılarla kentin fiziki biçimlenişi yanında düşünce yapısı ve yaşam tarzına da etki etmiştir. Yeni başkentin bu öncül kamu yapıları Cumhuriyet ideolojisini mimari aracılığıyla ortaya koymuştur. Ankara'da Ulus ve çevresi, inşa edilen yapılarla yönetim merkezi olmasının yanında ekonomik ve sosyal açıdan da yenilikçi yaklaşımla kamusal bir merkez olma özelliğine kavuşmuştur.

I. Ulusal Mimarlık Dönemi, II. Ulusal Mimarlık Dönemi ve Modernizm etkisinin de görüldüğü bu yapıların özgün işlevi ilerleyen yıllarda değişen yaşam koşulları, teknolojik sebepler ya da binaların ihtiyaca cevap verememesi gibi nedenlerle sonlanmış olsa da, Cumhuriyetle birlikte süreçte yaşanan tarihe tanıklığı yeni nesillere aktarmak bu yapıların güncel misyonu olmuştur.

İnşa edildikleri dönem itibariyle sahip oldukları özgün işlevleri zaman içinde sonlanmış olan bu tarihi binalar yapılan restorasyon çalışmaları sonrasında müze işlevi verilerek tekrar kullanıma açılmıştır.

Yeniden işlev kazandırma yoluyla var olan tarihi yapı stoğunun yeniden kullanıma açılması sonrasında, tarihi yapının yıllar içinde ve nesiller arasında özgün kimliğinin önce ikinci planda kalması, sonrasında ise unutularak yeni işlevine uygun anılması bu çalışmanın vurgulamak istediği noktadır. Çalışmaya dâhil edilen ve yeniden işlevlendirilen tarihi kamu yapıları "müze" olarak eğitim, kültür ve bilgi amaçlı kullanım ile yeniden düzenlenmiştir. Tarihi yapılarda hem yapının kendi özgün donatısının yerinde sergilenmesi hem de döneme ışık tutacak eserlerin, belge ve objelerin sistematik sergilemesi yapılmıştır. Tüm bunlar çağdaş müzecilik ve sergileme yöntemleri açısından ele alındığında balmumu heykellerle canlandırma tekniği, dijital panolar, çeşitli vitrin sistemleri, ses ve görüntü düzenleri vd. yöntemlerin yanında ziyaretçi yönetim planı ile desteklenmiştir. Kent hafızasını oluşturması açısından önemli olan bu düzenlemeler tarihi yapının özgün adıyla değil de yeni işlevini öne çıkaran adıyla anılması ile çoğu zaman kuşaklar arası geçişte bir boşluk yaratmakta ve yeni nesil tarafından sadece son işlevi ile bilinmektedir. Bu durum kent hafızasında ve ülke tarihinde mimari yoluyla ortaya konulan kimliğin önce ikincil olması sonra da unutulması tehlikesini de gündeme getirmektedir. Her biri döneminin öncü mimarları tarafından tasarlanan ve kendi kurumsal kimlikleri altında «Cumhuriyet» fikri ve ideolojisinin anlaşılmasında ve yaşatılmasında varlıklarını sürdürmekte olan bu tarihi binaların her koşulda özgün yapı kimlikleri hatırlatılmalı ve kent hafızasında sürdürülebilirliği sağlanmalıdır.

CUMHURİYET DÖNEMİ MİMARLIK MİRASININ YANGINA KARŞI KORUNMASINDA YAPISAL ÖNLEMLER

Bilgehan Bakırhan[1]

1. Giriş

Afetler, toplumların büyük ölçüde zarar görmesine yol açan; kökenini bazen doğa olaylarından, bazen de insan kaynaklı etkenlerden alan olağandışı olaylardır (Varol & Gültekin 2016). Bu olaylar genellikle jeolojik, atmosferik, biyolojik veya antropojenik olmak üzere dört ana başlıkta sınıflandırılır (Erler, 2002). Her ne türden olurlarsa olsunlar, doğal afetlerin tümü, birey açısından beklenmedik ve kontrol dışı gelişen kazalar kategorisine girer; bu kazaların tarihsel süreçte oynadığı rol ise modern tarih yazımı tarafından yoğun tartışmalara konu edilmiştir (Zachariadou, 2001). Bu bağlamda, yangınlar da depremler gibi ani ortaya çıkan ve kısa sürede büyük tahribata neden olan afetler arasında yer alır (Tanış, 2018).

Yangınlar, yalnızca insanların yaşamını ve mal varlığını tehdit etmekle kalmaz; aynı zamanda tarihî mimarlık mirasının devamlılığı açısından da ciddi tehlikeler oluşturur. Tarihî yapıların yok olmasında başlıca faktörlerden biri olan yangınlar, can ve mal kaybının ötesinde, gelecek kuşaklara devredilen belge değerlerinin ve bu sayede toplumsal hafızanın da silinmesine yol açar (Bakırhan & Beyhan, 2021). Bu nedenle, tarihî eserlerin yangına karşı korunması stratejik bir önceliktir. Bu kapsamda, alevlerin ve toksik dumanın içeride yayılımını durdurmaya yönelik alınan yapısal tedbirler pasif yangın güvenliği önlemleri arasında yer alır. Bu önlemler, yangın anında yapının dayanıklılığını artırarak hem kullanıcıların güvenli tahliyesine olanak tanır hem de yapısal bütünlüğün korunmasını sağlar.

Bu çalışmanın temel amacı, Türkiye'de 1923–1950 yılları arasında inşa edilen yapıların pasif yangın güvenliği açısından nasıl kurgulandığını, bu yapılarda

1 Arş. Gör., Karabük Üniversitesi, Safranbolu Başak Cengiz Mimarlık Fakültesi, Karabük, Türkiye.
E-mail: bilgehanbakirhan@karabuk.edu.tr ORCID: 0000-0001-6940-9902

yer alan yapısal önlemleri ve dönemin kentleşme politikaları ile mevzuatlarının bu önlemlere olan etkisini ortaya koymaktır. Yangın güvenliği, özellikle tarihî yapılar söz konusu olduğunda yalnızca bir topluma ait somut değerlerin emniyetini sağlamak değil, aynı zamanda kültürel mirasın sürdürülebilirliği ve gelecek nesillere aktarılması açısından stratejik bir müdahale alanıdır. Çünkü yangın, telafisi mümkün olmayan fiziksel kayıplara neden olmakla kalmayıp, yapıların taşıdığı tarihsel, kültürel ve sembolik değerleri de geri dönülemez şekilde tehdit etmektedir (Feilden, 2003; ICCROM, 1996).

Bu çalışmada erken Cumhuriyet döneminin mimarlık pratiği içinde yangına karşı alınan pasif önlemler; yapı malzemesi tercihi, yangın duvarları, saçak ve çıkma detayları, döşeme sistemleri, merdivenler ve yapı içi kompartımanlaşma gibi unsurlar üzerinden değerlendirilerek, dönemin yangın güvenliği yaklaşımına bütüncül bir bakış sunulması hedeflenmektedir. 1923–1950 yılları arasında Türkiye genelinde inşa edilmiş farklı işlevlere sahip kamu ve özel yapılar bu çalışmanın kapsamını oluşturarak ele alınmış; coğrafi olarak ise başta İstanbul, İzmir ve Trabzon gibi dönemin kentsel gelişiminde rol oynamış şehirler örneklem olarak ele alınmaktadır. Analiz kapsamında, yapıların mimari planları, kent imar belgeleri, yapı yönetmelikleri, arşiv kayıtları ve dönemsel fotoğraflar incelenmiş; bu veriler doğrultusunda yapısal pasif yangın önlemleri irdelenmiştir. Bu kapsamda ulaşılan veriler, görsellerle sunulmuş ve hem tarihî yapıların korunması hem de günümüz uygulamaları için referans oluşturabilecek şekilde derlenmiştir. Çalışmada, nitel araştırma yöntemi benimsenmiş; belge taraması ve mimari analiz yöntemi birlikte kullanılmıştır.

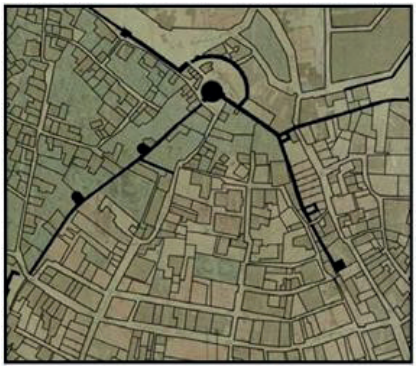
2. Pasif yangın güvenliği bağlamında yapısal önlemler

Pasif yangın güvenliği önlemleri, yapıların yangın anında can ve mal kaybını en aza indirecek şekilde tasarlanmasını ve inşa edilmesini sağlayan, yapının fiziksel özelliklerine entegre edilmiş önlemler bütünüdür. Bu önlemler, yangının başlamasını engellemekten ziyade, başladığında yayılmasını yavaşlatmayı, belirli bölgelerde sınırlandırılmasını sağlamayı ve kullanıcıların güvenli bir şekilde tahliyesine olanak tanımayı amaçlar. Yangına dayanıklı yapı malzemelerinin kullanımı, yangın duvarlarıyla bölgeleme (kompartımanlaştırma), yangın yalıtımı, duman kontrol sistemleri, kaçış yollarının düzenlenmesi ve merdiven çekirdeklerinin izole edilmesi gibi bileşenler bu kapsamda değerlendirilir (Karlsson & Quintiere, 2000; Buchanan, 2001). Bu tür yapısal önlemler, aktif sistemlerin (sprinkler, alarm vb.) aksine dış müdahale ya da kullanıcı etkileşimi gerektirmez; bu yönüyle de özellikle tarihî yapıların korunmasında ve sürekli denetimin mümkün olmadığı ortamlarda önemli avantajlar sunar (British Standards Institution, 2008). Ayrıca, pasif önlemler çoğu zaman yapı tasarımının erken aşamalarında belirlenir ve yapının ömrü boyunca işlevselliğini korur.

Tarihî mirası oluşturan mimari eserlerin büyük çoğunluğunun günümüze değin ulaşmasında hiç şüphesiz dönemin korumacılık anlayışını temel alan uygun müdahalelerin alınması rol oynamaktadır. Bu tedbirlerden biri olan edilgen (pasif) yangın korunumu; Cumhuriyet Dönemi süreci içerisinde özellikle sivil yapılarda olmak üzere yapı öğelerinin oluşumunu, detay çözümlemelerini ve malzeme kullanımlarını konu alan müdahale yöntemlerini içermektedir (Çelik, 1998).

3. Cumhuriyet'in ilk yıllarında yangına dayanıklı yapılaşma politikaları

Cumhuriyet'in ilk yıllarında, özellikle 1923–1950 döneminde Türkiye'de yangına dayanıklı yapılaşma, modern kentleşme politikalarının ayrılmaz bir parçası olarak ele alınmıştır. Bu dönemde yangınla mücadele sadece teknik bir sorun değil, aynı zamanda medeniyet, modernleşme ve kamusal düzenin yeniden inşasıyla ilişkilendirilmiştir (Bozdoğan, 2001). Osmanlı'dan devralınan itfaiye teşkilatı, Cumhuriyet döneminde mevcut koşullara ve uluslararası standartlara uygun şekilde yeniden yapılandırılmış; bu kapsamda yasal altyapılar oluşturulmuş ve eğitim kurumları tesis edilmiştir. 25 Eylül 1923 tarihinde itfaiye hizmetlerinin askeriyeden belediyelere devredilmesiyle, itfaiye teşkilatları günümüzdeki hâlini almıştır (İBB İtfaiye Daire Başkanlığı, 2016). Bu gelişme, yangınla mücadelede yerel yönetimlerin rolünü artırmış ve itfaiye hizmetlerinin daha etkin bir şekilde sunulmasını sağlamıştır. Bu gelişmeler, sadece yangınla mücadele kapasitesini artırmakla kalmamış, aynı zamanda halkın yangınlara karşı bilinçlenmesini ve toplumsal dayanışmanın güçlenmesini sağlamıştır. İstanbul İtfaiyesi'nin bu süreçte öncü rol üstlenmesi, yangına dayanıklı yapılaşmanın ve toplumla ilişkili güvenlik politikalarının kurumsallaşmasında önemli bir adım olmuştur (Şekil 1 ve 2).



Şekil 1. 1929'da kurulan itfaiye tahrip müfrezesi / İstanbul (Tekin, 2015).

Şekil 2. 1932'de Yangın söndürme araçları ve itfaiyeciler / İstanbul (Tekin, 2015).

Yangınların sıklıkla büyük yıkımlara neden olduğu Osmanlı kent dokusuna karşılık, Cumhuriyet yönetimi yangına dayanıklı yapı üretimini teşvik eden bir dizi mevzuat ve planlama yaklaşımı geliştirmiştir. 14 Nisan 1930 tarihli ve 1580 sayılı Belediye Kanunu'nun 15. maddesinin 22. fıkrası, yangına karşı alınacak mimari ve yapısal tedbirleri belediyelere yasal sorumluluk olarak yüklemiştir. Bu kapsamda; imalathane, fabrika ve dükkân gibi mekânlarda yangına karşı koruyucu donanımların bulundurulması, kamusal yapılarda yangın gözetleme ve ihbar sistemlerinin kurulması, sokak dokusu içinde itfaiye araçlarının ulaşımına uygun altyapıların planlanması ve gerektiğinde stratejik noktalarda yangın havuzları veya sarnıçlarının inşası gibi fiziksel düzenlemeler öngörülmüştür. Örneğin, 1888 ve 1890 yıllarında meydana gelen büyük yangınların ardından, Galata Kulesi çevresinde yangın güvenliğini artırmaya yönelik çeşitli önlemler alınmıştır. Bu kapsamda, kule etrafındaki dar ve düzensiz sokaklar genişletilmiş, böylece yangının yapı adaları arasında hızla yayılmasının önüne geçilmesi amaçlanırken itfaiye araçlarının kolaylıkla erişimine olanak sağlamıştır. Aynı zamanda bu müdahale, bölgenin kentsel dokusuna daha planlı ve kontrollü bir biçim kazandırmaya yönelik ilk adımlardan biri olmuştur (Şekil 3 ve 4).

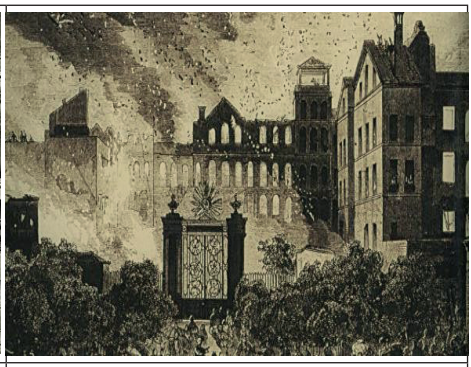
Şekil 3. 1888 ve 1890 yangınları sonrası Galata Kulesi çevresindeki yol genişletme çalışmaları (Özyurt, 2007).

Şekil 4. 1888 ve 1890 yangınları sonrası Galata Kulesi çevresindeki yol genişletme çalışmaları (Özyurt, 2007).

Bir başka güvenlik tedbiri ise yangınların erken tespit edilmesi, yerinin belirlenmesi ve müdahale sürecinin hızlı başlatılması açısından tarihî kent dokusunda hayati bir işleve sahip olan yangın gözetleme kuleleridir. Bu kuleler, erken cumhuriyet döneminde özellikle İstanbul gibi sık ve büyük çaplı yangınların yaşandığı yerlerde, hem kontrol noktası olarak işlev görmüş hem de itfaiye organizasyonlarının mekânsal planlaması açısından önemli bir yapı türü olmuştur. Yüksek bina olmaları sayesinde geniş görüş alanı sağlayan kuleler, yangın güvenliğini destekleyen pasif gözlem ağı oluşturmuş ve aynı zamanda kent peyzajının ayrılmaz bir unsuru hâline gelmiştir (Şekil 5). Beyazıt Yangın Kulesi, Cumhuriyet'in ilanından sonra yangın gözetleme amacıyla kullanılmaya devam etmiştir (Şekil 6). 1962 yılında, havanın açık olduğu bir

günde Büyükada'da çıkan bir yangın, kulede görevli olan itfaiyeci tarafından tespit edilerek, yangının yeri sokağına kadar belirlenmiş ve bu sayede hızlı müdahale sağlanmıştır (İBB İtfaiye Daire Başkanlığı, 2016).

Şekil 5. Beyazıt Yangın Kulesi / İstanbul (İstanbul Üniversitesi, 2020).



Şekil 6. Beyazıt Kulesi ve çevresi/ İstanbul (İstanbul Üniversitesi, 2020).

Osmanlı'da özellikle İstanbul'da evlerin ahşap malzemeden inşa edilmiş olması yangınla mücadaleyi zorlaştıran etmenlerden biridir. Ayrıca evlerin birbirine bitişik olması, nispeten kuvvetli rüzgârların bulunması ve bina saçaklarının yangın yayılımını kolaylaştırması durumu güçleştirmiştir (Sakaoğlu, 1994). 1870 yılında meydana gelen büyük Pera yangını, İstanbul'un ve Türkiye'nin yapılaşma politikalarında köklü değişikliklerin başlangıcını oluşturmuştur (Şekil 7 ve 8).

Şekil 7. 5 Haziran 1870 Pera Yangını – Beyoğlu/İstanbul (GZT, 2021).

Şekil 8. 5 Haziran 1870 Pera Yangını – Beyoğlu/İstanbul (GZT, 2021).

Bu yıkıcı olayın ardından, yangınların tekrarını önlemek amacıyla kâgir yapı sisteminin zorunlu hale getirilmesi kararlaştırılmıştır. Bu bağlamda, özellikle alt katları taş, üst katları ise tuğla duvarlarla örülen tam kâgir yapıların teşvik edilmesi önemli bir adımdır. Sadece duvar malzemeleriyle sınırlı kalınmamış; ahşap döşeme kirişleri ve çatı sistemlerinin de yangına karşı daha dirençli olması gerektiği vurgulanarak, bu elemanların demir ya da bakır gibi yanmaz malzemelerle değiştirilmesi önerilmiştir (Çelik, 1998). Yapılarda çatı

tutuşmalarını önlemek amacıyla ahşap malzemeye göre yangına daha fazla mukavemet gösteren pişmiş toprak kullanılarak yangın duvarı detayları tercih edilmiştir (Şekil 9 ve 10).

Şekil 9. Yangın Duvarı – Fatih / İstanbul (Erdem Meydan Arşivi)

Şekil 10. Yangın Duvarı – Samatya / İstanbul (Yavuz Tiryaki Arşivi)

Yapı adalarının yangın duvarlarıyla ayrılması, geniş yol akslarının ve meydanların planlanması ve inşaat mahallerinin geometrik biçimlerinin kurallar çerçevesinde yapılması gerektiği ile çıkmaz sokakların yapılmasına izin verilmeyeceği gibi ilkeler devreye sokularak yangın güvenliği tesis edilmek istenmiştir (Tankut, 1990). Beyoğlu Pera yangını sonrasında tulumba ile söndürme sürecinin yerini modern itfaiye teşkilatı devralmıştır. Avrupa'nın en modern itfaiye teşkilatlarından biri olan Macaristan İtfaiye'sinin başında bulunan Szechenyi Paşa 26 Eylül 1874'te İstanbul'a getirilmiş ve ilk itfaiye alayını kurmuştur. (Şekil 11 ve 12).

Şekil 11. İstanbul İtfaiye Amiri Ödön Széchenyi Paşa, 1874 (İstanbul Büyükşehir Belediyesi İtfaiye Daire Başkanlığı, 2016.)

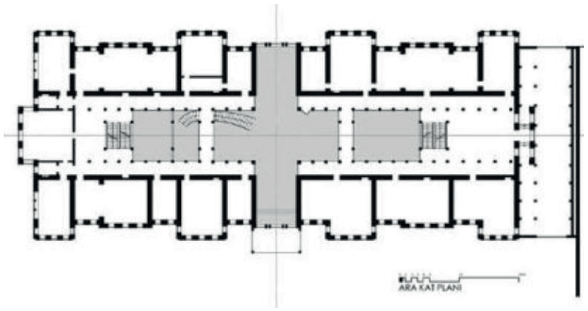
Şekil 12. İstanbul İtfaiye Alayı, 1874 (GZT, 2021).

1930 yılında 1580 sayılı Belediyeler Kanunu ve 1933 yılında Alman şehir plancısı Hermann Jansen'in önerdiği Ankara İmar Planı yayımlanarak; yangına karşı önleyici yapısal düzenlemeler kurumsallaştırılmış ve tüm yurtta zorunlu hâle getirilmiştir. Ayrıca, dönemin kamu yapılarında betonarme teknolojisinin

yaygınlaşması ve yıllara göre artış göstermesi pasif yangın güvenliği açısından bir dönüm noktası olarak değerlendirilmelidir (Özer, 2020) (Tablo 1). Tüm bu gelişmeler, yangın riskine karşı daha dirençli bir kentsel çevrenin inşa edilmesine yönelik bütüncül bir iradenin göstergesidir.

Tablo 1. 1930 yılı ve sonrasında inşa edilen bazı kâgir ve betonarme binalar

Yapı Adı	Malzeme	Konum	Yıl
Ankara Etnografya Müzesi	Kâgir ve Betonarme	Ankara	1930
İstanbul Sirkeci Posta ve Telgraf Binası	Kâgir ve Betonarme	İstanbul	1930
Atatürk Lisesi	Kâgir ve Betonarme	İzmir	1930
Gazi İlkokulu	Kâgir ve Betonarme	Eskişehir	1932
Ulus İş Hanı (Işıklar Hanı)	Kâgir ve Betonarme	Ankara	1937
Ankara Tren Garı	Kâgir ve Betonarme	Ankara	1937
Saraçoğlu Mahallesi (Memur Evleri)	Kâgir ve Betonarme	Ankara	1944



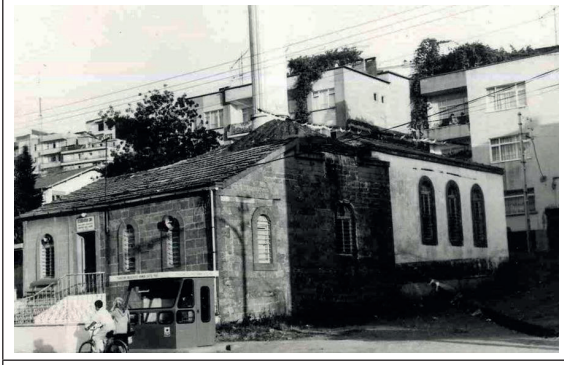
4. Örnek yapı incelemeleri ve dönemsel analiz

Cumhuriyet'in erken döneminde yangına karşı geliştirilen yapısal stratejilerin somutlaştığı mimari örnekler, bu politikaların sahadaki yansımalarını ortaya koyma açısından önemli bir veri kaynağı sunmaktadır. Bu bölümde, Cumhuriyet'in erken döneminde alınan yapısal önlemlerin mimari izdüşümleri, çeşitli kentlerde inşa edilmiş seçili yapılar üzerinden irdelenmiştir.

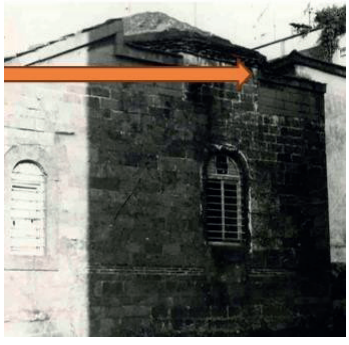
İstanbul Mimar Sinan Güzel Sanatlar Üniversitesi Ana Binası (Sanayi-i Nefise Mektebi)

Cumhuriyet'in erken dönemlerinde yangın güvenliği bilinci, yalnızca yeni yapılaşmalarda değil, mevcut eğitim ve kültür yapılarının iyileştirilmesinde de önemli bir tasarım kriteri olarak ele alınmıştır. Bu bağlamda, Sanayi-i Nefise Mektebi olarak inşa edilen ve Cumhuriyet döneminde İstanbul Devlet Güzel Sanatlar Akademisi olarak işlevine devam eden MSGSÜ Ana Binası'nda gerçekleştirilen müdahaleler dikkat çekicidir. 1949 yılında Sedad Hakkı Eldem ve Mimar Mehmet Ali Handan'ın öncülüğünde yürütülen yenileme sürecinde, özellikle ana merdiven tasarımı pasif yangın güvenlik önlemleri açısından değerlendirilebilecek nitelikler taşımaktadır. Merdiven kurgusu; yangın anında güvenli tahliyeyi sağlamak amacıyla geniş sahanlıklar, taş basamaklar ve yangına dayanıklı taşıyıcı elemanlar kullanılarak tasarlanmıştır (Nezih, 2013). Ayrıca, merdivenin zıt yönlü konumlandırılmasıyla bina içerisindeki kaçış yollarının

doğrudan ve kesintisiz olması hedeflenmiş (makas merdivenler), böylece yangın sırasında hızlı ve güvenli tahliye için yapısal bir çözüm geliştirilmiştir. Dönemin yapı tekniği ve koruma anlayışı göz önüne alındığında, Eldem'in bu müdahalesi yalnızca estetik bir tercih değil, aynı zamanda erken Cumhuriyet döneminin yangın güvenliği politikalarına uygun bilinçli bir tasarım kararı olarak değerlendirilebilir (Şekil 13 ve 14).



Şekil 13. MSGSÜ Ana Binası'ndaki Makas Merdivenler (Nezih, 2013).



Şekil 14. MSGSÜ Ana Binası'ndaki Makas Merdivenler (Yanar, 2012).

Trabzon Hatuncuk Hatun Camii

Trabzon'un tarihî dokusunu yansıtan ve cumhuriyet dönemi mimari mirasının izlerini taşıyan cami, ilk olarak tekke olarak inşa edilse de 1925 yılında tekkelerin kapatılması ile camiye dönüştürülmüştür. Hem mimari özellikleri hem de dini işlevi açısından dönemin sosyo-kültürel yapısını ve dönüşüm sürecini yansıtır. Yapıda yer alan kirpi saçak, yağmur ve kar suyunu binadan uzaklaştırmak amacıyla yapılmış bir tasarımdır. Bu detay yangının çatıya ulaşmasını engelleyerek aynı zamanda yangın güvenliği açısından da önemli bir işlevi yerine getirir (Şekil 15 ve 16).

Şekil 15. Hatuncuk Hatun Camii (Otyakmaz, 2022).

Şekil 16. Hatuncuk Hatun Camii Kirpi Saçak Detayı (Otyakmaz, 2022).

İzmir Cumhuriyet Meydanı

1922 yılında İzmir'de büyük bir yangın çıkmış ve sonrasında kentin yeniden imar sürecinde, kamusal alanların artırılması ile yangın güvenliğinin tesisi açısından stratejiler oluşturulmuştur. Geniş meydanlar, bulvar ve park alanları, olası yangın senaryolarında hem yangının yayılımını fiziksel olarak sınırlamak hem de tahliye ve müdahale süreçlerini kolaylaştırmak amacıyla tasarlanmıştır. Özellikle Cumhuriyet Meydanı gibi büyük alanların planlanması, yangın anında toplanma, kaçış ve itfaiye erişim noktaları oluşturmak açısından önemli bir fonksiyon üstlenmiştir. Bu yaklaşım, modern şehircilik ilkeleriyle uyumlu olarak, yangına karşı dayanıklı kent dokusu oluşturmanın bir parçası olarak görülmüştür (Güngördü, 2022) (Şekil 17 ve 18).

Şekil 17. 1922 Yangını Sonrasında İzmir Cumhuriyet Meydanı (Serçe vd., 2003).

Şekil 18. İzmir Cumhuriyet Meydanı'nın Konumu (Güngördü, 2022).

5. Değerlendirme ve Sonuç

Bu çalışma, Türkiye'de inşa edilen yapılar üzerinden erken cumhuriyet döneminin pasif yangın güvenliği yaklaşımlarını ortaya koymayı hedeflemiştir. Elde edilen bulgular, dönemin yangına karşı yapısal önlemlerinin yalnızca teknik gereklilikler değil, aynı zamanda modernleşme ve kamu güvenliğinin tesisine yönelik bütüncül bir vizyonun parçası olarak ele alındığını göstermektedir.

Cumhuriyet'in ilk yıllarında yürürlüğe konan yasa ve yönetmeliklerle, yangına dayanıklı malzeme kullanımı, yapı adalarının yangın duvarlarıyla ayrılması, geniş sokak akslarının planlanması ve yangın gözetleme kuleleri gibi fiziksel önlemler sistematik bir biçimde teşvik edilmiştir. Bu dönemde kâgir ve betonarme yapı teknolojisinin yaygınlaşması, yangın güvenliğinde önemli bir aşama olarak öne çıkmış; özellikle kamu binalarında dayanıklı ve modern yapı sistemlerinin tercih edilmesi, kentlerin yangına karşı daha dirençli hâle getirilmesine katkı sağlamıştır.

Ayrıca, itfaiye hizmetlerinin askeriyeden belediyelere devredilmesi, yerel yönetimlerin yangınla mücadelede daha etkin bir rol üstlenmesine olanak

tanımış, yangın riski yüksek olan bölgelerde planlama ve altyapı yatırımları hız kazanmıştır. Bu durum, sadece fiziksel mekân düzenlemelerinde değil, aynı zamanda toplumsal bilinç düzeyinde de yangın güvenliği kültürünün yerleşmesine katkıda bulunmuştur.

Örnek yapı incelemeleri ve dönemsel belgeler, erken cumhuriyet döneminde pasif yangın önlemlerinin yapı tasarımında ve kent planlamasında bilinçli tercihlerle şekillendiğini ortaya koymuştur. Yapısal düzenlemelerin hem kent ölçeğinde hem de bina bazında sistemli bir biçimde kurgulanması, günümüz koruma ve restorasyon yaklaşımları için de değerli bir referans sunmaktadır.

Sonuç olarak, erken cumhuriyet dönemi mimarlık mirası yalnızca estetik ya da işlevsel değerleriyle değil, aynı zamanda dönemin yangın güvenliği politikalarının somutlaştığı örnekler olarak da değerlendirilmelidir. Bugün bu yapıların korunmasında, dönemin özgün pasif yangın önlemlerinin anlaşılması ve bu doğrultuda restorasyon stratejilerinin geliştirilmesi büyük önem taşımaktadır. Bu çalışma ile dönemin yangına karşı dirençli tasarım prensipleri belgelenmiş ve hem tarihî çevre koruma çalışmalarına hem de günümüz yangın güvenliği politikalarının geliştirilmesine katkı oluşturmak amaçlanmıştır.

RESEARCH GENEALOGIES AND EPISTEMOLOGICAL TRAJECTORIES IN MODULAR CONSTRUCTION, CONSTRUCTION TECHNOLOGY AND ENERGY-EFFICIENT BUILDING RESEARCH (1970–2020)

DAMLANUR İLİPINAR [1]

1 Dr. Research Assistant, Karabuk University, Faculty of Architecture, 0000-0001-6523-3487

1.INTRODUCTION

The development of scientific studies is seen as a cumulative process progressing step by step. Scientific studies, which develop and grow through a layered approach, do not follow a linear path, especially since the industrialization period, with the blurring of sharp boundaries, the increasing interrelationships between different fields, the emergence of interdisciplinary studies, and the proliferation of studies in social sciences. This study focuses on the evolution of developments in the field of 'Modular structure, construction technology, and energy-efficient buildings' by examining the research conducted on this topic. It investigates how the boundaries of the field have evolved in relation to technological advancements and changing industrial priorities. It explores how these boundaries are shaped by the interaction and relationships between research agendas, production technologies, construction practices, and broader socio-economic conditions.

The aim of this research is to present a historical and epistemological analysis of the scope and methodology of research in the field of 'modular structure, building technology, and energy-efficient buildings' from the 1970s to 2020, based on doctorate thesis produced in this area. Within this long time period, the study critically examines the question: How was knowledge in this field produced and structured over time? This question also answers the reasons and mechanisms behind methodological changes and transformations in the research area.
